Among the Antients, Nature was said to be the Cause and Principle of all the Motions of the Body: But they called the Mind the *Source and Principle of Knowledge and Perception*: Whereas Nature is, by *Hippocrates*, pronounced, absolutely without Knowledge and Intelligence: With respect to this, there is a memorable Passage in *Cælius Aurelianus, Lib. 1. de Passibus acutis*, in which he mentions *Asclepiades*, who called the Soul *A Collection of the Senses*; and affirmed, that in the human Body, all things happened necessarily; and every Phenomenon had its respective Cause; that Nature was no more than the Body, or its Motion; and that she was capable not only of being beneficial, but, also, of being injurious; for whether the Soul, which in Men is the Principle of Determination, and

in Brutes the Source of voluntary Motion, is only sensitive, or at once sensitive and rational, yet it can perceive nothing without Ideas, that is, without Motions impressed from external Objects: But these Motions are only received by various Sensories, destined for that End. Where, therefore, the various Sensories are defective, there, also, the Perception and Direction of the Motions are defective; for Touch is absolutely insufficient for accounting for, and understanding, the Nature, Figure, Motion, noxious Qualities, and Force of material morbid Causes: Hence, also, it is easily understood, that in Diseases the particular Direction of the Motions corresponding to the Nature of the morbid Cause can by no means be received by the Soul.

It is indeed true, that Nature is highly observant of Number, Order, Time, and Place, as is obvious in the Formation, Nutrition, and Conformation of the Body, the Cure of Diseases, and the carrying on of the Excretions. But this happens not by any Intelligence of the Things with which she acts, and an arbitrary Power of performing particular Motions, or of directing them to a particular End, of which she is entirely ignorant: But rather those Effects directed to a certain End, are produced alone, by mechanic Laws, and the Influence of Bodies acting and re-acting on each other, under a certain Measure, Degree, and Proportion; which is obvious from this, that these natural Motions may be at Pleasure suspended, increased, or diminished, by mere corporeal Actions. Besides, we have a manifest Instance of a regular and organic Structure in Vegetables, the Fabric of which expressing great Order and Art, does not depend upon any intelligent Faculty, but on a merely necessary Efficacy of Motion, though not without Order. But, without insisting any longer on this, we shall only observe, that it is of great Importance in Medicine, not to confound those Effects of Diseases, which flow from merely necessary Causes, with those which have, in Conjunction with them; a certain free and immaterial Principle of Action, as is obvious in the Passions of the Mind, where there is a great Difference between the Mind and the Disease, since the Disease is only called that, to the Production of which merely corporeal Causes concur; whilst a Passion of the Mind is said to be produced, when the Mind labours under any Disorder, though it often produces a morbid Effect of the Body.

From what has been said we conclude, that a Fever is not to be called *salutary*, because Nature knows the internal Matter to be peccant, and for that Reason endeavours at certain Times and Places to eliminate it from the Body, according to the different Quality of its Peccancy, in a certain Degree and Proportion. This may be granted, with respect to the Mind, when put in a Passion, upon the Presentation of some external Object of the disagreeable Kind; but it cannot be applied to Motions merely mechanical: For as a Passion of the Mind is different from a Disease, so, also, Anger is different from a Fever; but every Fever does not suppose an immaterial and ideal Act or Perception of the Mind. A Fever cannot, therefore, be properly called a salutary and useful Thing, excited for a good End, since Nature, and even the sensitive Soul, is absolutely ignorant of the Condition of the morbid Causes, the Ways, Places, and Ends intended by Nature, which are internal. A Fever, therefore, is not, in my Opinion, to be called *A Motion in itself salutary*, neither with respect to its Principle, or efficient Cause, nor with respect to its End or Effect; because it is often hostile, and even fatal, to human Nature; but only because it sometimes, by Accident, produces a salutary Effect. But to illustrate this by an Example: Thus the strong spasmodic Constriction of the Coats of the Stomach, or Intestines, by an Emetic or Purgatives, is not in itself a good and salutary thing, since it is plainly preternatural, and, consequently, morbid, and the Source of violent Symptoms; yet, as it removes the impure, viscid, and corrupted Sordes from these Parts, it does, for that very Reason, produce a salutary Effect. Thus, also, Spasms of the internal Parts, which generally produce spontaneous Hemorrhages, are not of themselves good, because they sometimes excite mortal Hemorrhages; but at other times, when the Blood is redundant, they accidentally produce this Effect in a salutary manner. The same holds true of a Fever, which, considered in itself, can neither be said to be useful nor salutary, since Half of Mankind are destroyed by it: Yet it often produces a salutary Effect, by restoring the impure morbid Body to perfect Health.

We now come to inquire, in a particular manner, in what Patients, and by what means, a Fever proves a salutary Medicine. But we must first of all observe, that the Cause which excites the febrile Commotion in the muscular System, is often not only a Redundance of Blood and Juices, but, also, a Collection of impure excrementitious and viscid Sordes, both in the *Primæ Viæ*, and in the Vessels: Which two Causes generally proceed both from a retarded Circulation of the Blood, and an Infarction and Obstruction of the Emunctories, as generally

generally happens in burning Fevers, a bilious *Synocha*, a continual Tertian, a catarrhus Fever, and others of a like Nature. In order, therefore, to expel the Cause of these Misfortunes, Nature arms herself not by a kind of Free-will, but from a physical Necessity, stimulated by the Action of the hostile and peccant Matter, whilst the spasmodic Motion, not only of the external and membranaceous Parts, but, also, of the Muscles, and especially of the Heart, is increased by a greater Influx of the Spirits; for both a more strong and intense intestine and progressive circulatory Motion are required, that the redundant and peccant Juices, formed under this double and languid Motion, may be eliminated from the Body, after the Obstructions are resolved, and the Humours prepared and disposed for an Evacuation; for the Antients justly observed, that the Cures performed by Nature, were performed, first, by Maturation and Concoction; then, by Discussion and Rarefaction; and, lastly, by Solution and Excretion. See *Hallerius, in Schol. ad Aphor. Hippocrat.*

By Concoction, or Maturation, they understood that of the pathologic Kind, a fitting of the excrementitious Matter for Excretion, just as physiological Concoction is a fitting of the Substance of the Aliments for Nourishment: For as the crude, coarse, partly immoveable Humours, and such as are not fitted to the Pores of the Emunctories, are morbid, these are first to be prepared for an Evacuation, that is, the viscid Matter is to be incised and absterged; that which is thick is to be rendered fluid, the intemperate and acrimonious Humours are to be tempered and corrected; all which were included in Maturation and Concoction among the Antients, who order, that not crude, but concocted Matter, should be expelled from the Body, both by Nature and Art.

But as the Excretion of the peccant Matter is less commodiously carried on, unless the Passages are previously free, and the Emunctories open, hence the Obstructions are to be resolved, and the stagnant Humours, fixed in the capillary and excretory Vessels, are to be resolved and colliquated. After these Ends are obtained, the Excretion of the peccant Matter afterwards succeeds happily.

These are the usual Manners; this the common Method; and this the Order used by Nature, in curing Diseases, or removing morbid Causes from the Body: But she brings about all these Ends by one Instrument, which is Motion.

But the Motion of the Blood is twofold; one, the hot intestine Motion of the sulphureous Parts; the other progressive and circular: Both these Motions are necessary, in order to prepare and, afterwards, eliminate the peccant Matter; for certainly the Circulation of the Blood alone, though intense and brisk, is not sufficient for these Purposes, unless when accompanied with an increased intestine Motion, or an Increase of Heat: And though it cannot be denied, that in Fevers an excessive Heat does Harm to the Body, yet Nature requires both an increased Circulation, and an accelerated, hot, intestine Motion, in order to subdue and remove the febrile Cause; for what more happily dissolves glutinous and viscid Humours than Heat? What is more efficacious or expeditious in removing Obstructions brought on by these Sordes, or in opening the obstructed Emunctories, than hot and fluid Blood? What sooner lessens the Redundance of the Blood and Humours, and renders that which is thick and immoveable, fluid, than Heat? Hence the Antients justly esteemed the febrile Heat necessary to concoct, that is, to incise, attenuate, and prepare the peccant Matter for Evacuation. And that moderate Heat is in itself highly beneficial to the Body, is sufficiently obvious from this, that Men of hot Constitutions, young Persons, and such as use Exercise, and drink warm Liquors, are rarely subject to chronical Disorders, and Obstructions of the Viscera. And this is, also, the Reason why all intermittent Fevers, especially those of the Quartan kind, as *Hippocrates* observes, if they seize in the Summer, are far shorter, and more easily cured, than if they happen in the Autumn and Winter; for the Summer Intermittents often cease spontaneously, in the Month of June, when the Air is most intensely hot. Besides the greater Heat is perceived in the febrile Paroxysms, the sooner the Fever is terminated; and, on the contrary, the more languid and slow the Heat is, the more fixed and radicated is the Cause of the Disorder. In order to destroy this Doctrine, it may be replied, that such Effects are to be ascribed not so much to Heat, as to an increased Circulation of the Blood, which is necessarily productive of Heat. But though an increased Circulation of the Blood cannot happen without an Increase of Heat, yet, as we have already observed, every Heat in the Body is not produced by an accelerated Circulation; since very often, when the Pulse is languid and frequent, and the Extremities cold, the interior Parts are hot, the Tongue dry and black, and the Thirst insatiable: Besides, as the intestine Motion is absolutely different from the Circulation of the Blood; so, also, the former, in a different manner, contributes to Life: Nor, if the

Circulation alone, and Excretion of the useless Parts, were sufficient for the Purposes of Life, would a certain Temperature, Mixture, and Moderation of the Elements of the Blood, and especially of the Sulphur, which is the Foundation of the intestine Motion, be necessary to the Preservation of Life and Health; the asserting the contrary of which is, however, absurd.

Hence the Antients justly asserted, that Life consisted in Heat; that Nature, by means of Heat, attacked the morbid Causes of Disorders; and that there was no Animal, in the Blood and Juices of which there was not some hot Substance; because, without an hot intestine Motion, there can be no Generation, no Life, nor any vital Motion performed: Nor does it hence follow, that there is no Heat which is not perceptible by the Touch; for the Senses are not the only Test by which Heat is to be judged of. The hot intestine Motion may be said to happen, partly with respect to Cold, and partly with respect to its Effect, especially that of the rarefactive Kind; so that, in order to oppose this Doctrine, it is to no purpose to assert, that Fishes may live without Heat: But Heat is absolutely necessary in Animals, to promote the spirituous Quality of the Humours, to preserve them fluid, to keep the Pores open; and to carry on Nutrition and Excretion. Hence *Galen*, in his *Treatise de Usu Partium, Lib. 14. Cap. 6.* calls Heat the first Instrument of Nature: For the same Reason, Nature, in subduing Diseases, uses a strong and preternatural Heat, as is obvious in Fevers; for, by means of Heat, the peccant Matter is not only subdued and attenuated, but, also, rendered fit for Excretion; for though it cannot be denied, that an intense Heat is prejudicial to the Body, by obstructing the Evacuations, especially that by Sweat; yet, if we carefully examine the Matter, we shall find, that Nature does not so much cure Diseases by Evacuation, as by a Dissolution and Rarefaction of the Humours. And if the Matter is to be evacuated, Nature disposes it for Excretion, concocts it, and opens the Pores, which Ends are commodiously answered by Heat; since a Cure consists not so much in the Evacuation, as in the Correction of the morbid Cause: Hence, in my Opinion, those are greatly mistaken, who imagine, that the Matter which, after the Height of the Disease, is evacuated on the critical Days, is the morbid Cause. It is not, however, to be doubted, but the Evacuations in Fevers, carried on in due Quantities, and at proper Times, are excellent Signs that the Patient recovers; and that Nature is superior to the morbid Cause; because they evince, that every Thing is calm in the Body; that a free and equable Circulation of the Blood is restored; and that the spasmodic Contractions of the Parts have ceased: Whence the Evacuations not only of the morbid Matter, but, also, of other excrementitious Humours, generated under the febrile Commotion, are freely carried on: Hence such critical Evacuations are salutary, and, consequently, not to be checked: For it is to be observed, that the morbid Causes of Disorders act principally by Spasms; and, under Spasms, the Circulation of the Blood, and the Excretions, are disturbed. Hence, if the Evacuations are duly carried on, it is a good Sign, that the morbid Cause is subdued; that the morbid Motions are allayed; and that every Thing is again returning to a natural State: For as soon as the Evacuations of the critical, but not of the symptomatic, Kind begin to be duly carried on, in consequence of a proper Circulation of the Blood, the Force of the Disease forthwith remits.

We, therefore, affirm, that a Fever is salutary, because, by the hot intestine Motion, and an increased Impulse of the Blood through all the Vessels, the viscid Crudities are attenuated and dissolved; the Obstructions of the Glands removed; the stagnant Humours rendered fluid; the corrupted and redundant Juices evacuated, and the excessive Humidity of the Habit dissipated: So that a Fever is often an excellent depurating and evacuating Remedy. This Doctrine is confirmed, not only by Authorities, but, also, by Experience. Thus *Hippocrates*, in *Aph. 70. Sect. 5.* informs us, that they who are seized with a Quartan Fever, are not subject to Convulsions; and that they who are afflicted with Convulsions, are freed from their Disorder, upon the Approach of a Quartan; for no Fevers are more salutary than those of the Tertian and Quartan kind, as is universally known: For, if these Fevers are periodical, and not too long continued; or if they happen before the Strength is consumed, or Old-age comes on, they excellently deplete the Blood, powerfully remove Obstructions about the Veins of the Mesentery, and resolve and carry off the coagulated, thick, and viscid Humours, which are the Cause of the Spasms: They, also, dry the too moist Nerves, and corroborate such as are paralytic and lax: Hence arises the Opinion of the common People, that a Quartan produces Strength; and that the Person who is seized with a Tertian or Quartan, will for some Years live free from all Diseases. This Doctrine is, also, confirmed by *Aph. 26. of Sect. 2.* where we are told, that "It is better a Fever should succeed Convulsions, than Convul-

"*fiens a Fever.*" But it is here to be observed, that the Convulsions here meant must arise from a Redundance, and not from a peccant Quality of the Juices; because both the intestine Motion, and the Circulation of the Blood, attenuates and discusses the thick, viscid, and compact Matter lodged in the Brain, Nerves, and *Prima Via*. But *Hallerius*, in his Commentary on the same Aphorism, justly observes, that every Fever does not put an End to Convulsions, but only one of the moderate Kind, which is neither too weak, nor so violent and malignant as to impair the Strength. *Hippocrates*, also, tells us, in *Epidem. Lib. 6.* that a Quartan cures Melancholy, the Epilepsy, the Leprosy, and the Itch: For these terrible Disorders arise almost from the same Cause which produces a Quartan; that is, a Stagnation of impure and viscid Blood, about the abdominal Viscera; and an Infarction and Induration of the Spleen, Liver, and Pancreas. But, as in a Quartan, a due febrile Motion dissolves obstinate and old Obstructions, these violent Disorders are by this means removed. *Langius*, in *Epist. 16. Lib. 1.* informs us, that upon the Crisis of Fevers, especially those of the Quartan kind, he has often seen the Itch spontaneously removed, without the Assistance of any Medicines. As for an Epilepsy, *Hippocrates*, in *Epidem. Lib. 5. T. 6.* informs us, that "Persons labouring under a Quartan are not seized with an Epilepsy; or if they have formerly been subject to it, they are freed from it by a succeeding Quartan." And this Assertion is expressly confirm'd in *Secl. 5. Aph. 20.* where we are told, that those afflicted with a Quartan are not easily subject to Convulsions; and, if they have formerly laboured under them, they are freed from them by a supervening Quartan.

Nor is it a difficult Task to assign a Reason for this; since it is universally agreed upon, that a chronical Epilepsy is produced by Obstructions, and the partly viscid Impurities arising thence, and which Nature, by an universal Spasm principally arising in the Meninges of the Brain, and extending itself through the whole muscular System, endeavours to remove. But such Obstructions, and viscid Humours, hindering the free Circulation of the Blood through the Vessels of the Head, are resolved, discussed, and eliminated, by the Heat and Horror of a Quartan: For certainly, by such a strong Motion of the Fibres, and such an increased Impetus of the Blood, as is observable in febrile Paroxysms, Obstructions are more effectually removed, and stagnant Humours more thoroughly discussed, than by any other Remedy, how valuable soever, whether of the sudorific, or of the aperient and evacuating Kind. It is, also, owing to this, that those who have formerly laboured under a Quartan, are not easily seized with an Epilepsy; because a regular Quartan, by resolving Obstructions, frees the Body from those Causes which produce an Epilepsy.

Besides, a gentle Apoplexy is discussed by a Fever: Thus *Hippocrates*, in *Aph. 5. Secl. 5.* informs us, that if drunken Persons are suddenly depriv'd of their Voice, they die convulsive, unless they are forthwith seiz'd with a Fever. In Drunkenness, when the Body is less perspirable, especially in consequence of a large Quantity of generous Wine, it may happen, that the Head may be filled with too large a Quantity of Blood, which too much distending the Arteries, and Veins of the Plexus Choroideus, intercepts the Passage of the Spirits: But in a Fever, the accelerated Circulation of the Blood not only opens the obstructed Vessels of the Brain, but, also, powerfully discusses the Matter, whether aqueous or viscid, which is stagnant in its Pores.

Hippocrates, also, pronounces a Fever a peculiar Remedy in hypochondriac Disorders, since in *Aph. 40. Secl. 6.* he informs us, that "A Pain of the Hypochondria, without an Inflammation, but arising from Obstructions, Flatulencies, or a cold unequal Temperament, is removed by a supervening Fever." It is perpetually inculcated by *Hippocrates*, that such Disorders as proceed from Obstructions, a viscid Sordes, or Infarctions of the Viscera, are commodiously terminated by a Fever; because in a Fever, the increased intestine, and progressive Motion of the Blood, attenuates, incides, and resolves the immoveable Matter, and disposes and prepares that which is fixed and stagnant, to an Evacuation. I have often observed in Practice, that hysteric Symptoms and Spasms in the abdominal Region of old Women, after a Suppression of the Menes, have been removed by a Fever, accompanied with an effectual Heat and Horror. And if we carefully consider the Thing, we shall find that the spasmodic and febrile Motions, so familiar to hypochondriac Patients, especially in the Autumn and Winter, are useful in carrying off, through the Emunctories of the Body, the excrementitious Sordes, lodged in the Mass of Blood and Humours.

But that a Fever is the salutary Instrument of Nature, by which she frees herself from present Danger, is obvious from this, that the Redundance of Serum, whether pure or tainted with excrementitious, acrid, or bilious Salts, by which Nature is oppressed, is by a strong febrile Motion, excited in the mus-

cular System, commodiously carried through proper Emunctories; as is obvious in catarrhus, rheumatic, and arthritic Fevers; as, also, in an Erysipelas, the Measles, Small-pox, and Purple Fever, where there is always a certain febrile Commotion; and a subsequent salutary and critical Evacuation. Besides nothing is more common than for a Fever of the inflammatory Kind to succeed an Extravasation and Stagnation of the Humours; and this Fever is not, in my Opinion, excited by the arbitrary Determination of the Mind, in order to remove the stagnant Humours tending to Corruption; but it is rather a mechanical and necessary Effect, whilst the peccant Matter, not only by its Redundance, but, also, by its irritating and hostile Quality, stimulates the Fluid which actuates the Membranes and Muscles to an exorbitant Motion, which, being afterwards increased, though preternatural, is nevertheless, if duly managed, of singular Service in discussing and resolving the extravasated Blood: Hence it is obvious, that *Hippocrates*, and the Antients, were in the right, when they asserted, that Nature was the best Curer of Diseases, that is, by an increased and intense Motion, which is of the febrile Kind: Hence, also, it is obvious, that *Asclepiades*, according to *Celsus*, in *Lib. 3. Cap. 4. de diversis Curationum Generibus*, was in the right, when he said, that, in the Cure of Diseases, he used the Fever as a Remedy. *Sydenham*, also, affirms, that a Fever is the Instrument by which Nature separates the impure from the pure Parts.

From what has been said, we may deduce the following Considerations, very useful in Practice: First, As a Fever is so beneficial to the Body, Physicians ought not in the Beginning to suppress febrile Commotions, because such a Practice, in continual and acute Fevers, such as the Measles and Small-pox, an Erysipelas and the Gout, induces not only immediate Danger, but, also, sometimes Death; and intermittent Fevers, when too soon suppressed, are found from Experience to terminate in violent Obstructions of the Viscera, and slow Fevers resulting thence, an Hectic, a Dropsy, and spasmodic and convulsive Disorders: The whole Skill of a Physician seems to consist in distinguishing those febrile Motions of Nature which may produce a good Effect, and be esteemed salutary and critical, from those which are prejudicial, symptomatic, and pernicious. The former are not to be immediately suppressed; but, if languid, promoted; and, if excessive, moderated: But they ought never to be totally checked, nor too much heightened; since the best Intention the Physician can pursue, is to attack the morbid Cause of these hot Commotions, and lessen it gradually till it is quite removed. It is, therefore, imprudent to abuse the *Peruvian Bark*, which, if rightly used, is a divine Medicine, as, also, Opiates, and Substances possessed of a styptic Quality, in the Cure of Intermittents: Those Physicians, therefore, err, who judging a Fever to be a bad Thing, whereas it is the Effect of a good Cause, immediately endeavour to suppress it; in which they are as faulty as those who immediately suppress the Menes, or Hæmorrhoids, by Astringents; a Practice generally productive of the worst of Symptoms. A Physician is, therefore, never to attempt the Suppression of a Fever; but to try the Removal of its Cause: And when that cannot be commodiously done, he is to moderate the Fever; which, also, tends to prepare and expel the morbid Cause.

From what has been said, 'tis obvious, that all Aliments and Medicines, which refrigerate too much, coagulate the Humours, and which, by their Viscidity, their Acidity, or their anodyne Quality, retard the Motion of the Blood, are so far from being useful in the Cure of Fevers, that they are rather injurious. The Physician ought rather to render the Humours fluid, and promote the Circulation of the Blood through all the Emunctories. Hence *Helmont*, in *Tr. de Febris*, *Cap. 9.* justly affirms, that Diaphoretics are the only specific Remedies for Fevers. Nor are Venesections, Evacuations, and Alteratives, any farther conducive to the Cure of Fevers, than as they promote a free Circulation and Transpiration; for if it is true, that Fevers generally arise from any obstructed Transpiration, and a diminished Circulation of the Blood, they must of course be cured by an Increase of the Circulation and Transpiration. It is, also, obvious from what has been said, that Medicines are most commodiously exhibited when Nature is in a Commotion; for, by this means, she the more easily produces the designed Effects. With respect to this, *Helmont*, in *Lib. de Febris*, *Cap. 9.* tells us, that, if on the Day of the Access, and at a proper time, Medicines are exhibited, Fevers are often removed by one Dose. The proper time is, about an Hour before the Paroxysm, on an empty Stomach, that thus the Medicine may be sufficiently actuated; for if the Medicine is exhibited on the Days of Intermission, or long after the Paroxysm is begun, it is used in vain, whilst it is not assisted by Nature, either in actuating, or expelling, the Matter, which is the occasional Cause of the Disorder. Besides, at such times, the Medicine

is rather hurtful than beneficial, because it proves a Stimulus to Nature, when she is inclined to Rest.

From what has been said, we, also, learn, that it is a bad Sign, when a violent Cause, or Obstruction, is present, if the Fever is slow or slight, or if the febrile Motion does not correspond to the Cause. Hence *Hippocrates*, in *Aphor.* 40. *Secl.* 4. justly affirms, that it is never a good Sign, when the Body is sometimes hot, and sometimes cold; for this is a Proof, that the Disorder will be long protracted. Hence, also, the Reason is obvious, why in weak Bodies, and those in which the Motions of the Humours towards the external Parts are not sufficiently free, there are no genuine Evacuations, but the Patient is afflicted with Translations and Abscesses, not to be cured without great Difficulty. We, also, observe in Practice, that those Fevers are far worse, and of a more malignant Nature, which do not discover themselves by Heat, a quick Pulse, and Thirst, than those which appear with these Symptoms, tho' excessive. I have, also, observed, that in slow Fevers, the Suppression of an hot Fever with Horror is an excellent Sign of Recovery.

From what has been said, we conclude with *Hippocrates*, in *Epidem. Lib. 2.* that 'tis sometimes the Business of a Physician to excite Fevers; for, says he, in *Epidem.* that which Nature does spontaneously, ought to be done by the Art of the Physician. But in *Aph.* 21. *Secl.* 5. he expressly advises the exciting of such a Fever; "For, says he, sometimes in a Tetanus without an Ulcer, in young and fleshy Persons, a pouring on of cold Water recalls the Heat, and that Heat resolves the Distemper." He, also, confirms this Method of Cure in *Lib. 3. de Morb.* in the following manner: "Pour a large Quantity of cold Water on the Patient; then cover him with warm and thin Cloths, but let Fire be removed; and this Method is to be used both in a Tetanus, and in an Emprosphotonus." For when cold Water is poured upon a young Body in the Middle of the Summer, the Pores and Fibres are seized with a Rigor and Horror, and the Blood is repelled to the internal Parts; and thus, stimulating the Muscles of the Heart, it excites violent Motions, which are highly beneficial in removing the Causes of chronical Disorders; for, as *Hippocrates* in *Lib. 2. de Morb. Secl.* 5. affirms, a greater or slighter Fever always succeeds a Rigor. Without finding Fault with this Method, we shall only observe, that it is far safer by powerful Medicines, which convey Motion to the Blood and Humours, to remove the Causes of chronical Disorders. Hence the Reason is obvious, why Decoctions of the Woods, mineral Waters, Mercurials, Sudorifics, and Diaphoretics, are of such singular Efficacy in removing obstinate chronical Disorders.

Besides, 'tis certain from Experience and Observation, that by violent Anger the most obstinate chronical Disorders have sometimes been removed; for which no other Reason can be assigned, than that in Anger, as well as in a Fever, the Blood and Humours are moved with a kind of preternatural Impetus, as is obvious from the Vehemence and Quickness of the Pulse, the Heat of the Body, and the quick Respiration. Thus *Variola*, in *Obs. Med. 4. Lib. 2.* informs us, that a certain Man was cured of a Quartan, which would yield to no Medicines, by being put into a violent Passion by his Friends. The same Author, also, informs us, that a Relation of his own, after being convulsed for about six Years, in such a manner; that he could not work, his Hams being contracted, was by a sudden Passion, whilst he endeavoured to beat a Servant, cured of his Misfortune, because, in that Attempt, his Body was so violently exagitated, that the Nerves of his Legs being relaxed, and his Hams softened, he was not only able to walk and stand straight, but, also, remain'd free from his Disorder during the Remainder of his Life. Besides, says the same Author, I knew a Man cured of a Palsy of one Side of the Body, which would yield to no Medicines, by the sole Influence of Dread and Anger exagitating the Body. And in *Paulin's Fascicul. Obs. ad Acad. Nat. Curios. Dec. 2. An. 6. annex.* we have an Instance of the total Cure of a Palsy produced by Anger alone. *Frederic Hoffman.*

PYRGITÆ, πυργίται, from πυργός, a Tower. Sparrows, thus called, because they usually build their Nests; and inhabit Towers.

PYRIA, πυρία, or πυρίν. Any kind of Heat applied to the Body by way of Fomentation; or, a Fomentation in general.

PYRIASTES. The same as **PROTOGALA**.

PYRIATERION, πυριατήριον. A Laconic Bath, Bagnio, or Sweating-room.

PYRIATOS. A heated Brick.

PYRICAUSTA, πυρίκαυστα. Burns, or Scalds.

PYRIEPHTHOS. The same as **PROTOGALA**.

PYRIFORMIS MUSCULUS. This is a small oblong Muscle, of the Figure of a flat Pear, or Pyramid, from whence it has its Name. It is situated almost transversely between the

Os Sacrum and Isthium, being covered and hid, by the first two *Glutæi*.

It is fixed to the inferior lateral Part of the Os Sacrum, by fleshy Fibres, and to the neighbouring Part of the anterior, or concave Side, of that Bone, by three Digitations lying between the anterior Holes. It is, likewise, fixed by a small Insertion to the *Ligamentum Sacro-sciaticum*, and Edge of the great Sinus of the Os Ilium.

From thence it runs transversely towards the Joint of the Hip, its Fibres contracting in Breadth, and end, in a small Tendon, which is inserted in the Middle of the internal Labium of the upper Edge of the great Trochanter, by two or three Branches. The upper Part of this Tendon receives several Fibres from the *Glutæus Medius*; and its lower Part is united to the *Gemellus Superior*, and Tendon of the *Obturator Internus*.

Sometimes there are two *Pyriformes* separated by the *Nervus Sciaticus*.

See the Uses of this Muscle under the Article **QUADRATUS**. *Winslow's Anat.*

PYRIMACHUS, or **PYROMACHUS**, πυρίμαχος. Antimony reduced to a stony Hardness, Copper fused with Sulphur, and thus rendered hard, is by some thus called.

PYRINE, πυρίν. The Name of a Plaster described by *P. Egineta*.

PYRIPHLEGES, πυρίπληγής. An Epithet for a Person labouring under an excessive febrile Heat.

PYRISTIRION. The same as **PYRETERION**.

PYRITES. *Offic. Boet.* 516. *Fabr.* 29. *Charlt. Foss.* 17. 52. *Aldrov. Mus. Metall.* 570. *Worm.* 39. 129. *Schw.* 388. *Lapis Pyrites.* *Math.* 1381. *Marchasita varia, seu Pyrites.* *Mer. Pin.* 212. *Marchasita.* *Moderni.* **FIRE-STONES.**

It is found in almost all Mines, being the most fruitful Matrix of almost all Metals, Salts, and Sulphurs; for it is not purely a Stone, but seems to be the most fertile of all Minerals. There are great Varieties of it, with respect to Colour, Figure, Mixture with Metals, Stones, and other Fossils; for it enters in various Proportions the Composition of Iron, Lead, Tin, Silver, Copper and Alum, and, also, that of black Flints, Pit-coal, Lime-stones, Chalk-stones, and others. *Dal.*

The *Pyrites* is a kind of Stone, of which Copper is made. The best Sort resembles Copper, and easily emits Sparks of Fire when struck. They burn it in the following manner: They wash it over with Honey, then put it into a gentle Fire of Charcoal, and continue to blow till it becomes red-hot. Others put the Stone, first well washed with Honey, into a great Fire of burning Charcoal; and, when it begins to be red-hot, take it out; and, blowing away the Ashes, wash it over with Honey; and burn it again, till it becomes equally friable in all Parts; for it frequently happens, that the Superficies only is burnt; when it is thus well burnt and dry'd, they lay it aside, to be used as Occasion offers. If it requires Washing, it must be washed in the same manner as *Cadmia*.

The *Pyrites*, whether crude or burnt, is of an heating and absterfivè Quality. It deterges such things as darken the Sight, and concocts and dissolves Hardnesses. Made into a Plaster with Rosin, it represses Excrecences of the Flesh, by somewhat of an heating join'd with an astringent Quality. Some call it, when burnt, as before described, *Diphryges*. *Dioscor.*

PYRIUS PULVIS. Gunpowder. This is made of Charcoal, Brimstone, and Saltpetre, intimately mixed together, in different Proportions, according as the Maker would have it more or less strong.

When a Spark of Fire drops upon this Mixture, it immediately catches the black Oil in the Charcoal, which, in this Case, may be considered as a kind of Tinder: This sets Fire to the Brimstone, and the Brimstone lays hold on the Acid of the Nitre or Saltpetre, which, expanding itself suddenly with great Violence, bursts through, or carries along with it, whatever opposes it.

The following Account is generally given of the Invention of Gunpowder: That it was first discovered by one *Constantine Anelzen*, a Monk of *Fribourg*, and a Chymist; who, having put a Mixture of Charcoal, Saltpetre, and Brimstone, in a Mortar, and covered it with a Stone, it happened to take Fire, and blew up the Stone; which Accident, occasioning him to make farther Reflections and Experiments, gave Rise to this surprising Invention. But others affirm *Bartholdus Schwartz* to be the Discoverer, and that it was first used by the *Venetians* about the Year 1380. during their Wars with the *Genoese*.

But this Account is contradicted by others, who tell us, that in the Year 1343. the *Moors*, being besieged by *Alphonfus*, the Eleventh of that Name, King of *Castile*, defended themselves by shooting off a kind of Iron Mortars, which made a Noise like Thunder: And that, in a Sea-fight between the King of *Tunis* and the *Moorish* King of *Seville*, above four hundred Years ago, those of *Tunis* made use of certain Iron Tuns or Barrels, where-

wherewith they threw Thunder-bolts of Fire. To which may be added what *Du Cange* asserts, that Gunpowder is expressly mentioned in the Register of the Chamber of Accounts in France, as early as the Year 1338.

However, this is certain, that *Roger Bacon*, one of our Countrymen, and a Frier of *Merton College* in *Oxford*, so famous among the Commonalty for the romantic Story of his Brazen-head, was well acquainted with the Nature and Composition of Gunpowder, at least an hundred and fifty Years before *Schwartz* was born; as appears from his Treatise *de Nullitate Magiæ*, published at *Oxford* in 1216. where Mention is made of both in the following exprefs Terms: "You may raise Thunder and Lightning at Pleasure, says that excellent Frier, by only taking Sulphur, Nitre, and Charcoal, which singly have no Effect; but, mixed together, and confined in a close Place, cause a Noise and Explosion, greater than that of a Clap of Thunder."

But there is Reason to believe, that the Force of Gunpowder was known long before, and discovered by some Nations in very early Ages of the World, though not brought to the great Perfection it is in at present: And it is probable, that these People kept it as a Secret, either for their own Defence, or, perhaps, out of a more generous and humane Principle; that is, for Fear of the Mischief it might do Mankind; or 'tis possible, that the Art may have been lost and recovered again at different Periods of Time.

The *Chinese* pretend to have had the Knowledge of Gunpowder long before the *Europeans*; and it seems very probable they had; for we have an Account in History, that *Bacchus* was drove from the Siege of a Town in *India* by Thunder and Lightning: And we farther read of something of the like Nature happening to *Alexander*, in his *Indian Expedition*. Now, if it be considered, that these two Conquerors penetrated at least as far as the Borders of *China*, it will not seem unlikely, that this Thunder and Lightning was the Effect of Gunpowder, and that the *Chinese* were acquainted with it before the Expedition of *Bacchus*; and this seems still more probable, because the *East-Indies* naturally afford vast Quantities of Nitre, or Saltpetre, without any artificial Preparation.

The Fable of *Salmeus* says, that he attempted to imitate the Thunder and Lightning of *Jupiter*; and that *Jupiter*, for his Insolence, killed him with real Lightning. The Conjecture does not seem far-fetched, if we should suppose *Salmeus* was acquainted with the exploding Property of Nitre, and to have play'd Tricks with it, in order to terrify his Subjects, and keep them in Awe; and the Circumstance of his being killed with real Lightning, seems to confirm this; for it is easy to suppose, that *Salmeus*, not thoroughly understanding the Danger of his artificial Lightning, might accidentally destroy himself therewith; and the People, ignorant of the Cause, might attribute it to *Jupiter*.

PYROLA.

The Characters are;

The Leaves are alternate; the Flower is rosaceous, pentapetalous, shaped like a Hat, with a recurvated Pistil, and disposed in a Spike; the Fruit is roundish, striated, umbilicated, quinquecapular, and full of small Seeds.

Boerhaave mentions two Species of *Pyrola*; which are,
1. *Pyrola*; rotundifolia; major. *C. B. P.* 191. *Tourn. Inft.* 256. *Boerb. Ind. A.* 278. *Pyrola*. *Offic.* *J. B.* 3. 94. *Raii Hist.* 2. 1223. *Synop.* 3. 363. *Ger.* 330. *Emac.* 408. *Pyrola nostras vulgaris*. *Park. Theat.* 508. WINTER GREEN.

The Leaves of Winter Green do somewhat resemble those of the Pear-tree, but are hardly so large; they grow on Foot-stalks, two or three Inches long, smooth, and of a firm Texture. The Stalks grow to be about a Foot high, bearing on their Tops several small five-leaved white Flowers, having a few Stamina in the Middle, growing one above another in a loose Spike, which are succeeded by cornered Seed-vessels full of very small Seed; the Root is small, slender, and fibrous. It grows in Woods, in divers Parts of *England*, both north and west, and flowers in *July*.

The Leaves, which are the only Part used, and that not often, are cooling and drying, and a good Vulnerary, both for inward and outward Wounds and Hæmorrhages, Ulcers in the Kidneys or Bladder, as, also, against making bloody Water, and the Excess of the Catamenia. *Miller's Bot. Off.*

2. *Pyrola*; rotundifolia; minor. *C. B. P.* 191. *Boerb. Ind. alt. Plant.*

Besides the foregoing Species of *Pyrola*, *Dale* mentions the following;

Pyrola altera. *Offic.* *Pyrola folio mucronato serrato*. *C. B. P.* 181. *Raii Synop.* 3. 363. *Tourn. Inft.* 256. *Pyrola folio*

* *Galen*, on this Place, supposes, that by *πυρρός*, here *Hippocrates* is to be understood of all the Colours between pale and yellow, which have any Mixture of White or Red; such as the *σφοδρὸν λευκόν*, or *ξανθὸν λευκόν*; since the Sands, or other Substances which subside in Urine, are varied, according to the Colour or Quality of the Blood.

serrato. *J. B.* 3. 536. *Raii Hist.* 2. 1233. *Pyrola tenerior*. *Park. Theat.* 509. *Pyrola secunda tenerior Clusii*. *Ger. Emac.* 408. SMALLER WINTER GREEN.

It is found in Woods, but it is somewhat scarce, and flowers in *June*. The Herb, which is of Use in Medicine, agrees in Virtues with the *Pyrola*; rotundifolia; major. *Dale*.

PYRONOMIA. The Art of regulating Fire in chymical Operations.

PYROPHAGUS. A Person who has the Art of swallowing Fire; a Trick very frequent among Mountebanks.

PYROPUS. A Ruby, or Carbuncle. It has some other Significations, which are foreign to Medicine.

PYROS, *πυρρός*. Wheat.

PYROSIS, *πύρωσις*, from *πῦρ*, Fire. An intense Redness and Heat in the Face, such as happens to Persons travelling in excessive hot Weather.

PYROTECHNIA, from *πῦρ*, Fire, and *τέχνη*, Art. Chymistry.

PYROTICOS, *πυροτικός*. Caustic.

PYRRHOCORAX, from *πυρρός*, red, and *κόραξ*, a Crow. The red Crow, a Bird of no Use in Medicine.

PYRRHOS; *πυρρός*, is, by all the Translators, render'd *rufus*, redish; yet it signifies, also, *fulvus*, fallow, or a yellow Colour inclining to white, the same which we call flaxen; and is so commonly observed in the Hair of Boys and Youth, before the Years of Manhood. Thus *Galen*, *Lib. 2. de Temp.* and *Aristot. Quest. Nat.* write, that the *Germans*, *Illyrians*, *Dalmatians*, *Scythians*, and those who inhabit cold and humid Countries, have *πυρρὰς τρίχας*, "yellowish or flaxen Hair." The Difference between the *πυρρὸν* and the *τὸ ξανθόν*,

the *fulvum* and the *flavum*, or the pale and bright yellow, which seem to come nearest their Signification in *English*, is thus stated by *Galen*, *Lib. 1. de Crif. ἑγγυτάτω τὴν φύσιν ἐστὶν τὸ πυρρὸν χρῶμα τῷ ξανθῷ*, &c. "The *Pyrrhos* (*fulvus*) comes very near the *Xanthos* (*flavus*); but they differ, in that the former is more inclining to Whiteness, and the other to Splendor; for bitter Bile sometimes appears *fulva* (*πυρρὰ*) of a palish Yellow; sometimes *flava* (*ξανθὴ*) of a bright Yellow; and frequently of a pale Colour (*ῥαχὰ*): For while it is whiter, and more turbid than ordinary, it is of the pale Yellow; but when it begins to brighten up, and be purified, it becomes of a splendid or bright Yellow; for whatever is of an igneous Quality, and sparkles in Bile, renders it of a brighter Yellow (*ξανθότερον*); and as much as the *πυρρὸν* (*fulvum*) is whiter than the *ξανθόν* (*flavum*), so much is the *ῥαχὸν* (the *pallidum*, or pale) whiter than the *πυρρὸν*. And, again, as much as the *ξανθόν* is less white than the *πυρρὸν*, so much is the *ἐρυθρὸν* (*erythron*, red) less white than the *ξανθόν*."

From hence we may infer, that the Colours signified by the Words *rufus* and *fulvus*, both comprehended under the *Greek* *πυρρὸς*, are a Mean between the *flavus*, *ξανθός*, and the *pallidus*, or pale, *ῥαχὸς*; as this last is a Mean between the *ξανθός*, *flavus*, and the *λευκός*, *albus*, the white. The Epithet of *fulvus* is variously applied by the *Latins*; as to Stars, Gold, (by *Virgil* called, also, *flavum*, as he uses, also, *fulvum* for *flavum*) a Lion, Sand; and by *Hippocrates*, as signified by *πυρρὸς*, to the Sand discharged in nephritic Affections*. *Πυρρὸν ἔσθ' ἐξ* *Progn.* is rendered by *Celsus*, *Cap. 6. Lib. 2. Urina rubra*; and *ὑποπυρρὸν*, spoken of the Stools, by *rufus*, *Lib. 2. Cap. 3.* And, to mention no more Particulars, *Hippocrates*, *Lib. 2. περὶ γυναικ.* calls the Yolk of an Egg *ὡς τὸ πυρρὸν*.

PYRRHULA. See RUBICILLA.

PYRUS.

The Characters are;

It is taller, and more erect, than the Apple-tree; the End of the Pedicle runs into an oblong Ovary, whose upper Margin becomes a Crown, which is expanded like a Calyx, after the manner of a Star, into five Segments, and is hollow in the Centre; the Flower growing on the Ovary has five Petals, expanded like a Rose, and arising from the Interstices of the Segments of the Crown; it is, also, furnished with twenty, or more, Stamina, which, too, arise from the Edge of the Calyx; from the Centre of the upper Part of the Ovary are produced five Tubes, which terminate in a scabrous, orbicular Apex; and the Ovary itself becomes an oblong, turbinated, quinquecapular, fleshy, and umbilicated Fruit.

Boerhaave mentions but one Sort of *Pyrus*; which is, *Pyrus*; fativa. *C. B. P.* 439. *Boerb. Ind. A.* 2. 247. *Tourn. Inft.* 628. *Park. Theat.* 1500. *Raii Synop.* 3. 452. *Pyrus*. *Offic.* *Raii Hist.* 2. 1450. *Ger.* 1267. *Emac.* 1455. *J. B.* 1. 35.

THE PEAR TREE.

This is a Tree very well known to every Body, and of which there are several Kinds and Varieties cultivated in Gardens.

The Fruit is generally cooling and refrigent; but as I know not of any medicinal Use they are put to, I shall forbear saying any more about them. *Miller's Bot. Off.*

PYTAHAIA. The Name of an Indian Tree, which grows in rocky Soils, bearing a red Fruit as large as an Orange, in Taste like a Pomegranate.

PYTHON. A Serpent celebrated for Sharpness of Sight, large Eyes, and a triple Row of Teeth.

PYULCUM, πυυλιν, from πύον, Pus, and ἔλω, to draw out. An Instrument for extracting Pus out of deep Sinuses; perhaps a *Canula*.

PYXACANTHA. A Name for the LYCIUM.

PYXINUM COLLYRIUM. The Name of a *Collyrium* described by *Celsus*, *Lib. 6. Cap. 6. Sect. 25.*

PYXIS. The Name of an *Acopon*, described by *Paulus Aegineta*, *Lib. 7. Cap. 19.*

PYXIS EMPLASTRUM. A Plaster described by *Aetius*, *Tetrabib. 4. Serm. 3. Cap. 14.*

PYXIS, in Anatomy, is the ACETABULUM. Or *Pyxidis* is the *Os Occipitis*. It is, also, a Surgeon's Box, divided into Compartments, for containing various Sorts of Salves, or Unguents.

Q.

QUA

Q. For the Signification of this Letter in the Chymical Alphabet, see *Alphabetum Chymicum*. Q. or q. in Prescriptions, imports Quantity.

QUADRAGESIMUS DIES. The fortieth Day. The Antients fixed upon this Day as the last to which acute Distempers could extend; calling all those chronical, which continued longer. I have, however, seen an acute Disorder continue sixty Days.

QUADRANS. The fourth Part of a Pound, that is, three Ounces.

QUADRANTAL. The same as AMPHORA.

QUADRATUS imports plump. But *Quadratus* is the Name of several Muscles. Thus there is the *Quadratus Genæ*, see CAPUT. And the *Pronator Quadratus* of the *Ulna*, and *Radius*. See PRONATOR.

QUADRATUS FEMORIS. This is a small flat fleshy Muscle, of the Figure of an oblong Square, from whence it has its Name. It is situated transversely between the Tuberosity of the Ischium and the great Trochanter.

It is fixed by one Extremity along that obtuse Line which runs from under the Acetabulum toward the lower Part of the Tuberosity of the Ischium; from thence it runs directly toward the great Trochanter, and is inserted in almost all the lower Half of the oblong Eminence in that Apophysis, but principally in the small Riling, or Tuberosity, in the middle of that Eminence.

This Muscle, the *Pyriformis*, and *Gemelli*, called, also, by the common Name of *Quadrigeni*, are Congeneres in their Uses; and these have been confined by Anatomists to the Rotation of the *Os Femoris* about its Axis from before outwards: But this Use they cannot have, except when we stand, or lie at full Length: For, in sitting, or when the Thigh is bent in any other Posture, they carry the Thigh outward, or separate the two Thighs from each other, when bent.

All the four co-operate in these two Uses, of Rotation and Abduction; but they co-operate equally or unequally, according to the different Degrees of the Extension or Flexion of the Thigh. For Instance, when we stand strait up, they all perform the Rotation equally; but if the Thigh be then carried a little forward, the *Pyriformis* is more in Action than the *Quadratus*; and if the Thigh be carried backwards, the *Quadratus* acts most.

These Muscles, by means of their Adhesion to the orbicular Ligament of the Joint of the Hip, may, likewise, serve to hinder that Ligament from being squeezed between the Bones, in the different Motions of the Thigh.

QUADRATUS LUMBORUM, SIVE LUMBARIS EXTERNUS.

This is a small, oblong, flat Muscle, irregularly squared, narrower at its upper than at its lower Part, lying along the Sides of the Vertebrae Lumborum, between the last false Rib and the *Os Ilium*.

It is fixed below to the external Labium of almost all the posterior Half of the *Crista Ossis Ilium*, to the *Ligamentum Sacro-Iliacum*, and a little to the *Os Sacrum*, by a fleshy Plane, the Fibres whereof run obliquely backward.

From thence it runs up between the *Sacro-Lumbaris* and *Psoas*, by both which it is partly hid, and is inserted in the Extremities of all the transverse Apophyses of the Loins by oblique tendinous Digitations. It is, likewise, fixed by a broad Insertion, in the twelfth Rib, on the Inside of the Ligament

QUA

that lies between it and the *Longissimus Dorsi*, by which that Rib is connected to the first Vertebra of the Loins.

I have observed, likewise, a small *Lumbaris Externus* adhering very closely to the back Side of the *Quadratus*, and fixed by tendinous Digitations to the Extremities of the second, third, and fourth transverse Apophyses of the Loins; from thence its fleshy Fibres run up obliquely over the *Quadratus*, and then mix with it at its Insertion in the last false Rib.

The *Quadratus Lumborum*, and *Psoas Parvus*, are of the same Use to the Vertebrae of the Loins, as the *Scaleni* to those of the Neck; when both *Quadrati* act, they keep the Lumbar Pillar strait, that is, so as not to incline to either Side; and then they may assist the *Recti* of the Abdomen in the Inflections forward, and the superior Portions of the *Obliqui* in lateral Inflections.

They may, likewise, serve to support the Haunches alternately in walking; and, in standing on one Foot, the *Quadratus* of the opposite Side may support the Haunch of that Side, in which Action they co-operate with the *Transverso-spinales*, and posterior Parts of the *Obliqui Abdominis*. *Winflow's Anatomy.*

QUADRIFOLIUM. A Name for the *Trifolium*; *quadrifolium*; *bortense album*.

QUADRIGEMINI MUSCULI. Four Muscles, which assist in moving the Thigh-bone, are thus call'd; the *Pyriformis*, *Gemellus superior*, *Gemellus inferior*, and *Quadratus*.

QUADRUPES. A Quadruped. That is, an Animal furnished with four Feet.

QUAUHYAC OCULENSIUM, *Nieremberg*. The Name of a very large Indian Tree, bearing Leaves resembling those of the Citron. The Bark is astringent, heating, drying, and of a strong Smell: It restrains a Diarrhoea, and excites a Sweat. The Juice, snuffed up the Nose, causes Sneezing, purges the Head, and thus removes Fevers, and Pains in the Head; for which Reasons, it is preserved in Families, as a popular Remedy. *Raii Hist. Plant.*

QUAMOCLIT.

The Characters are;

The Root is annual; the Stalk voluble, and scandent; the Flower monopetalous, funnel-shaped, and multifid; and the Fruit like that of the *Convolvulus*.

Boerhaave mentions two Sorts of *Quamoclit*; which are,

1. *Quamoclit*; foliis tenuiter incis & pennatis. T. 116. *Convolvulus*, pennatus, exoticus, varior, *Quamoclit*. Col. 1. *Observ. 72. Jasminum, Millefolii folio. C. B. P. 398.*

2. *Quamoclit*; Americana; folio Hederæ; flore coccineo. *Commel. Rar. 21. Boerh. Ind. alt. Plant.*

The *Hist. Plantarum*, ascribed to *Boerhaave*, informs us, that it is cathartic, like the *Convolvulus*.

QUANDROS. The Name of a white Gem, said to be found in the Brain of a Vultur. It is said to increase Milk in the Breasts; but the Virtues, and the Thing itself, seem to be equally fabulous.

QUANLI. Lead. *Rulandas*.

QUAQUILA. The COTURNIX.

QUARTANA FEBRIS. A Quartan, or Ague.

Among the Intermittent Fevers, a Tertian is, both with respect to Violence, and Obstinacy, surpassed by that which seizes every fourth Day, with two entire Days of Intermission, and is called a Quartan Fever.

QUA

This Disorder generally, in the Afternoon, about Four or Five o' Clock, and sometimes sooner, or later, seizes the Patient with a considerable Languor of the Body, a Pandiculation, and a heavy Pain of the Head, Back, Loins, and Legs; then the Hands and Feet become cold, the whole Body pale, the Countenance and Nails livid; after which succeeds the Horror and Rigor familiar to this Species of Fever: The Tongue and Lips tremble, the Breathing is difficult, the Præcordia are uneasy, the Body is restless, and the Pulse contracted, hard, and sometimes unequal: All these Symptoms last generally for two or three Hours, during which time, most Patients are coſtſive; whereas, in ſome, there is a Stimulus to diſcharge the Fæces and Urine; and, in others, eſpecially old Perſons, there is an Effort to vomit, a real Vomiting, and a Diſcharge of the Excrements. In many Patients, alſo, eſpecially thoſe far advanced in Years, the Head is ſurpriſingly diſturbed, and ſuch an Alienation of Mind brought on, that the Perſon ſpeaks many incoherent Things; then ſucceeds, ſlowly, a Heat, which though not very intenſe, is, yet, troubleſome, on account of the Dryneſs of the Skin, with which it is accompanied: Then the Rigor is removed, and the Pulse becomes equal, quicker, and larger: There remains, however, an obſcure Pain of the Head, accompanied with a Vertigo; and, at laſt, the Skin becomes moderately moiſt, till, after four or ſix Hours, the Heat, and other Symptoms, diſappear, when the Paroxyſm of the Fever is removed. Though the Patient, on the two Days of Intermiſſion, generally gets out of Bed; yet he is afflicted with a certain Senſe of Pain in his Limbs and Feet, the Bones of which ſeem, as it were, to be bruised, or oppreſſed, with a great Weight. In moſt Patients there is, alſo, a Senſe of Weight in the Head, and a certain preternatural Uneaſineſs of Mind. The Urine, alſo, which, during the Paroxyſm, was thin and aqueous, is now thick, and depoſites a Sediment.

The Symptoms which appear under the Paroxyſm, ſufficiently evince, that, in a Quartan Fever, the whole nervous System is affected, and ſpaſmodically conſtricted; ſo that the proximate and immediate Cauſe of this Diſorder muſt, undoubtedly, conſiſt in an univerſal and violent ſpaſmodic Stricture of the nervous Parts; which, proceeding, principally, from the ſpinal Marrow, preternaturally affects not only the Coats of the Veſſels, but, alſo, the whole Nerves and Fibres; by which means, the Motion of the Solids and Fluids is greatly diſturbed.

The material Cauſe which throws the nervous Parts into ſuch exorbitant Commotions, was, by the Antients, thought to be an extravafated, putreſcent, melancholic Humour: But as in all Fevers, ſo, alſo, in a Quartan, there is an active Matter, poſſeſſed of a cauſtic Acrimony, ſtimulating the internal highly-ſenſible Parts to ſpaſmodic Contractions: Yet, becauſe this Matter is mixed with the pancreatic Juice, which has ſomewhat of an acido-viſcid Quality, it affords a conſiderable Reſpite, is not ſo ſoon collected, nor ſo quickly conveyed from the Primæ Viæ to the Membranes of the ſpinal Marrow: For when it is in a ſufficient Quantity collected in the Primæ Viæ, and ſucceſſively enters the Maſs of Blood, being, at certain ſtated Periods, conveyed to the Membranes of the Spine of the Back, it excites thoſe febrile Commotions ſpecified under the Article TERTIANA FEBRIS.

If we inveſtigate the Origin of this febrile Matter, we ſhall find, that it proceeds from a ſlow Circulation of the Blood through the depuratory and ſecretory Viſcera of the Abdomen, eſpecially the Liver, Spleen, and Pancreas, and a ſucceeding Inſarction and Obſtruction of theſe; for, by this means, the fermentative, gaſtric, lymphatic, and ſalival Humours loſe their temperate, ſubtil, and ſpirituous Quality, and aſſume a fixed and acid Nature; ſo that they become leſs fit for the intimate Diſſolution of the Aliments, and the Extraction of the Chyle, but produce a large Quantity of acid and viſcid Crudities; and theſe Crudities, in Proceſs of time, contracting a worſe Quality, and other external Cauſes, inducing Acrimony, concurring, a Quartan Fever is at laſt produced.

That the languid circulation of the Blood through the abdominal Veſſels, is the Cauſe of this Diſorder, is ſufficiently obvious, from this, that Quartan Fevers are moſt incident to Adults, and thoſe advanced in Years; to Perſons of melancholic Habits, and thoſe who have contracted not only a Redundance, but, alſo, a Spiſſitude, and Impurity of the Juices, in conſequence of a ſedentary Life, an Intermiſſion of uſual Venefection, coarſe unſalutary Food, an exceſſive Uſe of acid and ſpirituous Liquors, a Suppreſſion of uſual critical Evacuations of Blood, or immoderate Paſſions. That the peccant Matter is of a cauſtic Quality, is certain, from this, that Quartans generally appear in the Autumn, after the acrid Sordes are excluded from the Body by the Heat of the Summer; that they are ſometimes terminated by the Itch, or Purples; that they return when theſe are repelled; that they are removed upon the Eruption of the Small Pox; that they are generated by Tertians; that they terminate in Tertians; and that, like Ter-

QUA

tians, they are very epidemic in marſhy Places; where the Air is impregnated with a large Quantity of acrid Recrements.

Quartan Fevers are of different Sorts, ſince ſome are of the ſimple, and others of the double Kind. The ſimple is that already deſcribed; but a Quartan is ſaid to be double, when, within four Days, two ſucceeding Paroxyſms happen, in ſuch a manner, that each preſerves its proper Type, and peculiar Time of Acceſſion, alternately correſponding to the preceding Paroxyſm, and the third Day, only, being totally free from the Fever. This frequently happens when a ſimple Quartan is prepoſterouſly cured, or when any Error in Regimen is committed.

Quartans are, alſo, either legitimate, or ſpurious. The former obſerves its Period of Return, which is the Afternoon; more exactly than any other Species of Fevers; but a ſpurious Quartan has not a certain Period for its Return, which, however, is generally in the Forenoon. The Heat, alſo, is greater, and afflicts the Patient more, than the cold Fit.

Sometimes every fourth Day the Paroxyſm returns; after previous Pandiculations and Horripilation, but does not very exactly obſerve its Period; nor, when the Paroxyſm abates, does it totally intermit, but is only milder on the intermediate Days, than on that in which the Paroxyſm happens: The Heat is, alſo, preternaturally intenſe, the Pulse increaſed, the Appetite languid, the Strength low, the Mouth dry, the Head giddy, the Sleep reſtleſs, the Urine red, thick, and with a high-coloured Sediment; for which Reaſon, it is, by Phyſicians, called a continual Quartan.

Quartan Fevers are generally epidemic, eſpecially after an exceſſively hot and dry Summer, in conſequence of which, a large Quantity of acrid and bilious Recrements are generated in the Body. An Inſtance of this is mentioned by *Sennerſtus*, in *Lib. 2. Cap. 20.* as happening in the Year 1606. *Bartholine*, in *Centr. Hiſt. Anat. 95.* mentions the ſame as happening in the Year 1652; and I can, from Experience, affirm, that the like happened in the Years 1684, 1719, 1726, and 1728. And becauſe, in conſequence of the exceſſive Heat, large Quantities of cold aceſcent Liquors are often drank, and the cold Night Air acts upon the Body, the Perſpiration of the acrid Sordes is obſtructed, and the Blood and Humours inſpiffated.

Quartan Fevers are epidemic in ſome Countries, and Parts of the World; ſuch as *Weſtphalia*, *Pomerania*, and other Northerly Climates, whoſe Inhabitants uſe heavy, coarſe, and crude Aliments; for, almoſt every Autumn, long-protracted Quartans rage very much in theſe Parts. The ſame thing happens in marſhy Countries, and Places whoſe Atmosphere is impregnated with noxious Exhalations; in which Tertians are very frequent in the Spring, and Quartans in the Autumn; and the Patients are often ſubject to Relapſes, in both Caſes.

Quartans are of different Kinds, according to the Diverſity of the Patients they ſeize; for when they happen to Perſons who, in Conſequence of a ſedentary Life, or the Uſe of coarſe and heavy Aliments, contain a large Quantity of thick Blood, to thoſe afflicted with the hypocondriacal Diſorder, or who have long indulged themſelves in Grief, they are generally obſtinate, and dangerous: For which Reaſon, great Care, with reſpect to Regimen, is requiſite in the Patient, and great Judgment in the Phyſician, with reſpect to Medicines. When Quartans happen in cacoſymical Conſtitutions, or in Perſons where the Matter of the Purples lies latent in the Blood, they are accompanied with more terrible Symptoms, and the Strength is more impaired; the Patient is, alſo, afflicted with Watching, Alienation of Mind, an Anxiety of the Præcordia, and, at laſt, the Purples appear; and when theſe are by any Cauſe, however ſlight, repelled, the febrile Paroxyſms are increaſed, and afflict the Patient more violently.

Quartans, in Patients whoſe Strength is exhausted by old Age, Indiſpoſition, a bad Regimen, or exorbitant Paſſions, eaſily degenerate into continual Fevers, which are known from a Languor of the Strength after the Paroxyſm, the Frequency of the Pulse, the ſlow Heat, and the Loſs of Appetite; which Symptoms place the Patient in conſiderable Danger. When Quartans, after hot Summers, ſeize young and vigorous Perſons, the Paroxyſms laſt long, the burning Heat terminates in a profuſe Sweat, and the Thirſt, and Languor of the Stomach, are greater than in other Patients. As Infants and Children with Reluctance take Medicines, do not obſerve the Rules of a proper Regimen, catch Cold by throwing the Bed-cloaths off them in the Night, and have not only a lax Habit of Body, fit for retarding Perſpiration, but, alſo, Stomachs fit for collecting Crudities, ſo they are long afflicted with Quartans, more frequently ſubject to Relapſes than others, or afterwards expoſed to the Attacks of other Diſeaſes.

Quartan Fevers are, however, generally pretty ſafe, and rarely prove mortal, except in old Perſons, thoſe whoſe Strength is exhausted, thoſe of tender Conſtitutions, or ſubject to epileptic Fits, or when the Fever has not only been excited, but augmented

augmented, by the Passions of the Mind; or when such a Fault is committed, either by the Patient or Physician, that the Quartan passes into a Quotidian, or some chronical and fatal Disorder.

The Safeness, however, of Quartan Fevers, scarcely atones for their Violence and Obstinacy; for they are generally long protracted, and often prove the Reproach of the Physician, because they elude the Force of his best-chosen Remedies. This principally happens in such Quartans as arise in the Autumn, and continue throughout the Winter; for these are rarely removed till the Vernal Solstice; at which Time, the Pores being opened, and the Juices attenuated, by the Serenity of the Air, they generally disappear spontaneously. Quartan Fevers are, also, highly obstinate, when the Disorder is deeply rooted in the Viscera, especially the Liver, Spleen, and Pancreas; or when the whole Mass of Humours is contaminated, and impure, or the nervous System excessively weak, and disposed not only to conceive; but, also, to cherish such anomalous Motions; and especially when the Patient, by his Voracity, continually collects and increases the Matter of the Fever.

When, on the contrary, a Quartan happens in the Spring, or Summer, it is more easily cured, since the Temperature and Serenity of the Air greatly contribute to its Removal: Quartans, also, arising from irregular Living, or Crudities collected in the *Primæ Viæ*, whilst, at the same Time, the Viscera are found, as, also, Quartans arising from a Suppression of Transpiration, are easily cured, and often happily removed, by one Vomit, or one Dose of some proper diaphoretic Medicine, exhibited before the Paroxysm: Those Quartans are, also, easily cured, unless through some Fault of the Patient, or Physician, which seize young and vigorous Persons; especially if they rather proceed from Bile, than from an acid and tenacious Humour, which principally happens in such epidemical Quartans as rage in the Summer.

Nor is an anomalous Quartan, which does not retain its Type, returns at uncertain Periods, or passes from the simple to the double Kind, so dangerous as it is commonly thought; for these Circumstances are Signs that the peccant Juices are not very tough, and deeply impacted in the Viscera; but that they are still disposed to Motion, and that Nature makes some Efforts for eliminating the Matter which produces the Disease: Besides, the due Return of the Paroxysms contributes greatly to dissolve the viscid, and disperse the stagnant Humours. So that the more frequently these Paroxysms recur, the sooner the Cause of the Fever is removed, and, by the Assistance of Nature, the Cure perfected by a few proper Medicines.

Though a Quartan has generally no critical Excretion, yet it is sometimes happily terminated, by an Eruption of Pustules, Spots, small Ulcers, and the Itch, all over the Body; as, also, by the hæmorrhoidal Discharge. In Children I have, also, seen Quartans terminate successfully in the Small Pox; and I have found, that pregnant Women, labouring under Quartans, have not got rid of them till after the Delivery; at which Time, the Infants have been affected with the same Disorder.

Quartan Fevers are sometimes highly beneficial, not only in preventing, but, also, in removing other Disorders, those especially of a chronical Kind: For the increased Motion of the Solids and Fluids, under the Paroxysm, attenuates the tough Juices, forces them from their Seats, and greatly contributes to remove those old Obstructions, which are deeply seated in the minute Vessels, Glands, and nervous Parts. Hence the most skilful of the antient Physicians, such as *Hippocrates*, *Asclepiades*, *Galen*, and *Celsus*, affirm, that they looked upon Quartan Fevers as Remedies for some other Disorders; and they are certainly of singular Efficacy in removing hypochondriac Symptoms. *Hippocrates*, in *Lib. 6. Epidem.* highly extols Quartans, as beneficial in Epilepsies and convulsive Motions. Practical Authors have furnished us with Instances, in which convulsive Asthmæ, the Stone, and Gout, have been happily removed by the Course of a Quartan Fever, duly and skilfully treated. *Aulus Gellius*, in his *Noct. Attic. Lib. 17. Cap. 12.* informs us, from *Plato*, that Quartan Fevers not only free the Patient from Disorders of the Viscera, but, after their Removal, leave the Body stronger, so that they are not, for the future, so subject to other Disorders, or Relapses into the same. I myself have, also, known many live to a great Age, after Quartan Fevers. Hence we cannot enough admire the Bounty of indulgent Heaven, which has given an incomparable medicinal Virtue to some Diseases seemingly the most destructive of Health.

But when Quartans are protracted too long, the Juices conceive a Dyscrasy; and, if the Humours are thin and bilious, the Purples appear, or the spirituous, rascid, and nutritive Parts, being dissipated, the remaining Fluids become tough, are corrupted, and bring on chronical Disorders. Quartans, ill treated, degenerate into violent and fatal Disorders; such as a Dropsy, an Anasarca, an Ascites, a scorbutic Cachexy, oedematous Tumors, slow and hectic Fevers of the continual

Kind, a dry Asthma, a Jaundice, a Chin-cough in old Persons, comatous Disorders and Hemiplegies; in young Persons, the hypochondriac Disorder; and, in Infants, violent Convulsions, which miserably distort the Spine of the Back, together with other Parts, both in the anterior and posterior Regions of the Body: And, in all these, after Death there is found some conspicuous Fault of the Viscera, especially of the Liver, Spleen, and Pancreas; together with an Infarction, Obstruction, and Corruption of the meseraic Glands.

They who are taken off by a Quartan Fever, die under the Rigor of the cold Fit, and an uncommon Perturbation of Mind. On this Occasion, as I have observed in two Adults, the Violence of the Spasms is so increased, that no Degree of Heat succeeds, whilst Symptoms, plainly resembling those produced by Poison, appear, and, at last, destroy the Patient: And, in Infants, the spasmodic Strictures manifestly degenerate into fatal convulsive Motions.

After a Recovery from a Quartan Fever, the Patient ought, for some Time, carefully to observe a due and proper Regimen; for this Species of Fever easily recurs, and, upon the slightest Occasion, resumes its former Tenor. Those who, having surmounted a Quartan, indulge themselves in Gluttony, and overload their extenuated Bodies with a large Quantity, especially of unsalutary Aliments, easily relapse, in Consequence of a fresh Collection of Crudities in the *Primæ Viæ*. The same Misfortune is incident to those who have their Perspiration obstructed, expose their Bodies to the cold and moist Air, or drink large Quantities of cold Liquors when they are excessively hot: Those, also, who have been long under the Influence of violent Passions, especially excessive Grief, easily relapse into Quartans. It, also, happens, though more rarely, that Quartans, which had ceased upon the Expulsion of the peccant Matter to the Surface of the Body, either under the Appearance of the Itch, Pustules, Ulcers, or Purples, forthwith return, when these are repel'd.

THE GENERAL METHOD OF CURE.

In the Cure of a Quartan, the following Intentions are to be pursued.

1. The viscid, acid, and bilious Crudities, gradually conveyed from the *Primæ Viæ* with the Lymph and Chyle to the Blood, and exciting febrile Commotions in the nervous System, are to be corrected, and evacuated, by proper Emunctories.

2. The Circulation of the Blood through the abdominal Viscera, especially those to which the *Vena Portæ* is distributed, is to be render'd free and uninterrupted, whilst the Congestion, Infarction, and Obstruction, are to be removed; or, at least, their Increase prevented.

3. The violent spasmodic Constriction of the nervous System, which is the Cause of the terrible Symptoms, is to be allayed, and mitigated. And,

4. The impaired Strength of the Viscera, Stomach, and nervous Parts, is to be restored; by which means, not only future Paroxysms, but, also, a Relapse, are prevented.

The first of these Intentions is answered by all those Remedies which obtund Acids, incise tough Juices, correct such as are acrid, and cleanse the *Primæ Viæ*. Of this Class, the most considerable are, alkaline Medicines, such as the Salts of Plants prepared by Incineration, especially the Salts of Wormwood, and *Carduus Benedictus*: Neutral Salts are, also, excellent, for answering this Intention, especially depurated Sal Ammoniac, the *Terra foliata Tartari*, and the digestive Salt of *Sylvius*; to which, in order the more effectually to correct the bilious Acrimony, we are to add gentle Absorbents, such as Crabs-eyes, Egg-shells, and Hartshorn, prepared without Fire. But if the Intention is to evacuate these Crudities, the Salts obtained from medicinal Springs, such as those of *Egra*, *Epsom*, and *Sedlitz*, exhibited in a large Dose, or the *Sedlitz Waters* by themselves, eliminate the thickest of them by Stool, whilst tartareous Medicines efficaciously carry off the more subtle salino-sulphureous Sordes by Urine. In Quartan Fevers, the *Magnesia Alba* is, also, possessed of a purgative Quality, since, by absorbing the Acid of the *Primæ Viæ*, it is converted into a bitter Salt, resembling that of *Epsom*.

The second Intention is excellently answered by bitter Substances, which, by their fixed balsamic Sulphur, restore the Balsam of the Bile, obtund acid and saline Humours, and procure a certain mild spirituous Quality to the Juices: Such are the bitter Extracts of Fumitory, Wormwood, *Carduus Benedictus*, red Gentian, Marsh Trefoil, and the lesser Centaury; the Essence or Extract of Rhubarb; and the *Pilulæ Balsamicæ*, prepared according to the Directions of *Becher*, of well-depurated Aloes, bitter Extracts, resinous, balsamic, and temperate Gums; which, besides their laxative, have, also, an attenuating Quality, especially if they are taken alternately with the above-mentioned Salts. This Intention is, also, answered by a due Use of hot and cold medicinal Waters, in Conjunction with

a proper Regimen: But if an inveterate Obstruction of the Viscera, especially of the Pancreas, which, in obstinate Quartans, is highly pernicious, cannot be removed by mild Medicines, more penetrating and active Preparations of the mineral Kind are to be used, such as *Mercurius Dulcis*, the *Diaphoreticus Solaris* prepared in the manner directed under *MERCURIUS*; and the *Antiquartanum* of *Riverius*, which is prepared of Mercury, Antimony, and Gold, by frequently abstracting from them Aqua Regia, and then kindling Spirits of Wine upon them; and, among antimonial Preparations, medicinal Regulus of Antimony; the *Panaceas* of *Glauber* and *Conerdingius*; as, also, my Sulphur of Antimony, corrected and prepared without a Precipitation with an Acid.

The third Intention, which is to allay the spasmodic Strictures of the nervous System, is answered, first, by antispasmodic nervous Liniments, consisting of human Fat, the Oils of Spike, Lavender, Rue, and Sage, together with *Peruvian* Balsam, applied, with brisk Frictions, to the spinal Marrow. Secondly, By Clysters prepared of nervous, carminative, and antispasmodic Herbs, with the Addition of a sufficient Quantity of demulcent Oils. Thirdly, By Baths of sweet Water, which were, by the Antients, principally used, before the Accession of the Paroxysm. And, fourthly, By Epithems and Liniments prepared of spirituous and aromatic Substances, and applied to the epigastric Region under the Horror and Rigor of the Fever.

The fourth and last Intention of Cure is excellently answered, by all bitter Substances, which are, at the same time, possessed of a certain balsamic and astrigent Quality: The most considerable of this Kind are, *Peruvian* Bark, the Barks of *Cascarilla*, *Capers*, *Tamarisks*, and *Cinnamon*; the Shavings of red Sanders, and the Essences extracted from bitter Plants; which, when quickened with some proper chalybeate Liquor, are highly efficacious. But my antifebrile Electuary, directed in the Article *Tertiana Febris*, is, of all others, the most effectual.

In Quartans, great Relief is, also, afforded, by applying to the Wrists some Plaisters; such as that to which *Strobelbergerus* gives the Name of *Emplastrum famigeratissimum*: These Plaisters may be prepared of such Substances as, by their aromatic and balsamic, as well as irritating Principle, add a certain Motion and Stimulus to the Fibres, so that they dislodge the Matter deeply impacted in the nervous Parts, and, on the Day of Intermission, render the Circulation of the Blood quicker.

Besides these Remedies against Quartans, I shall subjoin two others, which I formerly found of singular Efficacy in *Westphalia*: The one is a vinous Infusion, which answers all the Intentions of Cure, and of which a large Draught ought to be drank every Morning. It is prepared thus:

Take of the fibrous Roots of black Hellebore, of Polypody of the Oak, and of Sena-leaves, without the Stalks, each one Ounce; of Wormwood, the lesser Centaury, *Carduus Benedictus*, and Marsh Trefoil, each half a Handful; of the Shavings of Snake-wood, of *Peruvian* Bark, and recent Orange-peel, each three Drams; of the Filings of Steel, and the *Tartarus Tartarizatus*, each half an Ounce: Cut down and bruise all these together, sprinkle them with two Drams of the urinous Spirit of Sal Ammoniac: Mix and infuse in two Quarts of Wine.

The other is the following Powder:

Take of *Peruvian* Bark, three Drams; of medicinal Regulus of Antimony, two Drams; of *Mercurius Dulcis*, (which is not to be triturated with the Powder, on account of the Salts, but only mixed with the Point of a Knife) of the finest Crocus of *Mars*, and Arcanum Duplicatum, each one Dram; and of the Oil of Mint, four Drops: Make up into a Powder, of which half a Dram, or a Dram, may be reduced to the Form of an Electuary, with Rob of Elder, or Julap of Roses, and exhibited every Morning and Evening.

And, certainly, this Powder is of singular Efficacy in a Quartan deeply rooted in the Viscera; but it is only fit for robust Habits, and ought to be accompanied with a due Regimen: For though it sometimes excites a gentle Salivation, which proves uneasy, yet it succeeds so well, as to remove obstinate Quartans.

PRACTICAL CAUTIONS, AND OBSERVATIONS.

Quartan Fevers are so obstinate, that they call for Patience in those who labour under them, and due Expectation in him who undertakes the Cure, especially when they happen in melancholic Constitutions, old Persons, those subject to hypochondriac Disorders, those in whom the Circulation of the Blood

through the meseraic Veins is slow, those whose Viscera are infarcted, or when they happen about the middle of the Autumn; for, in the Cure of these Fevers, the Physician is not to act hastily, or attempt the Relief of the Patient by violent and drastic Medicines, for fear of doing more Harm than Good.

In the Beginning of the Disease, if the Patient is robust, and vigorous, Medicines of a pretty powerful, resolvent; colliquating, and evacuating Quality, are to be used; but when the Disease is of long standing, the Patient tender, and of a delicate Constitution, and a large Quantity of bilious and acrid Recrements are in the Body, the Fever is surprisingly increased by such Medicines, and frequently passes from a simple to a double Quartan, or to a Quotidian: But temperate Substances, rather of the dietetic, than of the pharmaceutic Kind, are to be used in Conjunction with such Things as allay the Spasms of the nervous System.

Every Quartan, however, is not so obstinate as not to yield even to the gentlest Medicines; for I have known many happily cured of this Disorder, only by the Use of a temperate balsamic Elixir, prepared with an aqueous Lixivium of bitter Extracts and Rhubarb, with an Addition of a sufficient Quantity of *Hungarian* Wine: Others have been freed from Quartan Fevers by frequently taking Oil of Tartar per Deliquium, in some proper Liquor, drinking old Rhenish Wine, with or without Bitters, immediately before the Paroxysm, and afterwards using violent Exercise. Some have, also, been cured of Quartans by the daily Use of Baths of sweet Water, and using such a Degree of Exercise as to produce Sweat immediately before the Paroxysm.

But Quartans are most happily and easily cured, when the State of the Weather is favourable, or when the Air is pure, subtle, and rarefied, as it is in the Spring, and serene Summers; for, in such Seasons, long-standing Obstructions of the Viscera are more quickly removed, the Toughness of the Juices more speedily colliquated, and the acrid Sordes more expeditiously eliminated through the open cutaneous Pores, by an equable and constant Perspiration. I have known some who could not possibly be cured of Quartans, till they removed to a more healthy Part, or used another Regimen and Method of Life.

As in all chronical Disorders, so, also, in the Decline of quartan Paroxysms, 'tis expedient to change the Patient's Drink, and exhibit Decoctions prepared of the Roots of *Sarsaparilla* and *Succory*, the Herb *Carduus Benedictus*, Raisins, and Fennel-seeds; and such Decoctions are not only to be drank cold instead of Ale, but, also, warm instead of Tea. In Quartan Fevers 'tis, also, proper to use temperate mineral Waters, such as the *Selteran* Springs; for these, when drank with one half, or a third Part of Wine, produce an highly salutary Effect in diluting the thick Juices, and evacuating the impure Humours by Urine.

We are, also, to take due Care, that the acrid subtle Sordes be continually eliminated by Perspiration. This Effect is to be produced both before and after the Paroxysm, not by actual Sudorifics, but by such Medicines as, by increasing the Tone of the Solids, accelerate the Circulation of the Blood, and by that means promote Sweat. This Intention is excellently answered by violent Exercise, such as Riding, Leaping, or Walking a few Hours before the Paroxysm, by which means I have often known Quartan Fevers removed. Accordingly *Celsus*, in *Lib. 3. Cap. 15.* lays it down as a Maxim, "That, on the Day the Paroxysm is expected, the Patient ought to get out of Bed; use Exercise, and endeavour, if possible, to protract his Exercise till the very Access of the Paroxysm; for, by this means, the Fever is often removed." This Effect I have, also, from numberless Experiments, found to be happily produced by the following Mixture:

Take of the Water of *Carduus Benedictus*, four Ounces; of Treacle-water, half an Ounce; of the Salt of *Carduus Benedictus*, one Dram; of diaphoretic Antimony, half a Dram; of the Spirit of Vitriol, between twenty and thirty Drops; and of the Syrup of *Carduus Benedictus*, two Drams: Mix all together; and, if the *Prime Viæ* are previously cleansed, Half is to be exhibited three or four Hours before, and the other Half immediately after the Paroxysm.

When the Fever is in the Decline, and, the Heat wearing off, the Body becomes spontaneously moist, we are to take great Care, that the Sweat be not interrupted by external Refrigeration, or drinking cold Liquors. If these Measures are not taken, the Fever is not only longer protracted, but, also, Contractions, and cedematous Swellings, of the Feet generally succeed. But 'tis expedient to promote the Sweat by moderate external Heat, and warm diluting Drinks.

Though Venesection is not directly calculated for removing the Causes of Quartans, yet when there is a Suspicion, that the

the Fever is supported by an obstructed Circulation of the Blood through the abdominal Viscera, as in those subject to hysterical and hypochondriac Disorders, and those afflicted with the Hæmorrhoids, or who have a Disposition to that Discharge, a Vein may be opened in the Foot with so great Success, that by one Venesection I have often observed an obstinate Quartan totally removed. As most pregnant Women are generally plethoric, if they are seized with a Quartan, they not only bear, but, also, require Venesection, lest by the intense Motion of the Blood, excited by the febrile Spasms, the Uterus should be stimulated to an Exclusion of the Fœtus before the due time. We are, therefore, carefully to consider the various Stages of Quartans, the Habit and Strength of the Patient, together with the Disposition of the Solids and Fluids, lest, by unseasonable Venesection, the Cure should be render'd more difficult, and the febrile Spasms, during the Paroxysm, increased. It is observable, that the Blood taken from the Veins of Persons labouring under Quartan Fevers is remarkably peccant, and has its Surface covered with a tough, yellow Phlegm; and, according to *Schenckius*, there is, also, a white pituitous Crust of this Kind found in the Veins of Persons who are taken off by Quartans.

Nor in Quartans are Vomits to be used promiscuously, and without Distinction; for when there is a Propensity to vomit, arising from a Collection of crude and viscid Juices in the *Primæ Viæ*, in consequence of excessive Gluttony, it is highly proper, by an Emetic, to evacuate the peccant Matter by the nearest Way, before it enters the Mass of Blood, and affects the nervous System. But it is expedient not to exhibit a Vomit, unless the Viscera are sound, the Stomach and nervous System strong, and the Lungs free from every Disorder. Safe Vomits, and such as are appropriated to this Purpose, are, also, to be used: Of these the best is the Root of Ipecacuanha, which, besides its emetic, has, also, an aromatic and balsamic Quality. And, among Emetics calculated for this Purpose, we are to prefer those prepar'd of Copper, as *Cyprian* and white Vitriol, to antimonial Preparations, because the former, by constricting the bilious and glandular Ducts, not only prevents the farther Afflux of the febrile Matter, but, also, by contracting and stimulating the Fibres, renders them more capable of dislodging the peccant Matter, deeply impacted in the nervous Parts. But antimonial Preparations, and those of Copper, when duly mixed, and, as it were, reduced to a proper Temperament, afford an excellent Medicine, calculated both for cleansing the Stomach, and subduing the Fever.

Though the *Peruvian Bark*, skilfully used, is of singular Efficacy against Quartan Fevers, yet we are not to call in its Assistance, unless the *Primæ Viæ* are duly cleansed, the Plethora removed, and the Viscera sound, and free from Obstructions. It is, also, safer in those bilious Quartans which happen in the Summer, than in such as rage in the Autumn, and are supported by some Disorder of the Viscera, and a tenacious State of the Juices. In this last Case, it is more expedient to use a Decoction of the Bark with Wine, with an Addition of bitter aperient and diaphoretic Substances, such as the Tops of the Lesser Centaury, the Herb *Carduus Benedictus*, the Roots of red Gentian, and Burnet, together with Salt of Tartar.

In Quartan Fevers it is sometimes expedient to heighten the Virtues of the Bark by an Addition of highly subtle Crocus of *Mars*, and a volatile urinous Salt. This Medicine, however, never proves hurtful, when exhibited at proper Seasons, in just Quantities, and duly mixed with diaphoretic and resolvent Substances. See *QUINQUINA*.

In order to diminish, or totally put a Stop to the Paroxysms of Quartans, especially such as happen in the Autumn, are obstinate, seize Persons of languid Habits, or are accompanied with Drowsiness, I have found excellent Effects produced by applying to the Wrists Epithems prepared of acrid stimulating and gently vesicating Substances. The Vulgar use other Substances for this Purpose; but as their Smell is too ungrateful, so Epithems of this Kind are most commodiously prepared of Turpentine, Soot, Sal Ammoniac, bruised Spiders, Pepper, and *Venice Treacle*.

Mineral Waters, especially those of the cold and hot Kinds, in my Opinion, contribute not only to the Prevention, but, also, to the Cure of intermittent Fevers; but we are absolutely to abstain from them immediately before and during the Paroxysm, taking care before the Accession, to have the Water evacuated by proper Emetics, lest the febrile Motions should, by that means be increased. For Drink, temperate Liquors, as we have already observed, are always to be used.

If in a Quartan Fever the Patient is excessively costive, it is expedient to render his Body soluble, rather by Clysters than internal Medicines. The best Ingredients for Clysters of this Kind are, such Substances as, besides their emollient Quality, are, also, parégoric, and allay the Spasms; such as the Tops of Yarrow, the Flowers of common Chamomile, Elder-flowers, the Flowers of the Lime tree, Cumin-seeds, Broth prepared of Veal, the Yolks of Eggs, and a little Sal Gemmæ; some-

times, also, some antifebrile, bitter, nervous, and corroborating Substances, are commodiously mixed with such Clysters; for, in *France*, it has been customary, for some Years past, to cure Quartans by frequently injecting Decoctions of *Peruvian Bark* into the Anus. The same Effect is, also, produced by Clysters of other antifebrile Decoctions, such as those of *Carduus Benedictus*, the Lesser Centaury, Gentian-root, and the Herbs Marjoram, Rosemary, Southern-wood, and Sage. And certainly this Method is very useful in Infants, and such as have Stomachs either naturally weak, or easily subject to Nauseas; only we must observe, that the Body must be rendered soluble by an emollient and saline Clyster, before that of the nervous and corroborating Kind is injected.

The violent Fevers with which Quartans, especially in Persons advanced in Years, are accompanied, are not without great Difficulty mitigated. The principal Relief is, however, to be expected from such Medicines as render the Body soluble, as, also, from bathing the Feet; by which means, the Impetus of the Blood is derived from the Head to the inferior Parts. Among external things, the greatest Relief is afforded by Vinegar of Roses, or that of Rue mixed with Salt and Nitre, poured upon Bread, and applied to the Head.

In order to prevent a Relapse into a Quartan, *Celsus*, in *Lib. 3. Cap. 16.* gives us his Advice in the following manner: "If, says he, a Fever of this Kind is removed, the Patient is for a long time to remember the usual Day of its Accession, and on it carefully to guard against Cold, Heat, Crudities, and Laffitude; for it easily returns, unless the Patient is very careful of himself for some time after his Recovery." Hence, he ought, especially on the Day in which the Paroxysm used to return, to avoid Northerly Winds, a dense, cold, and moist Air, such as that of low-situated, marshy, and subterraneous Parts, taking care at the same time to preserve Perspiration free and uninterrupted. He is to have a peculiar Care of his Regimen, and guard against eating too much, especially of such Aliments as are of difficult Digestion. He is, also, if possible, to preserve a constant Tranquillity of Mind, and avoid Anger and Dread, by which I have frequently known a Quartan brought on.

Then the Stomach is to be corroborated, and the Digestion assisted by stomachic Elixirs, prepared of bitter and aromatic Substances, which are to be long and frequently used, though in small Quantities, lest the Body, already weakened, should be thrown into a preternatural Heat. But in a particular manner we are to take care, that the crude Juices afterwards generated be gently evacuated by Stool; for which Reason the Patient must frequently use the balsamic Pills, or the cinnabarine Pills, or the *Pilulæ de Ammoniaco* of *Quercetan*, with which, if the Fever has been suppressed by the Use of *Peruvian Bark*, we are to join the digestive Salt of *Sylvius*: By these measures, not only Relapses, but, also, other more terrible Disorders, and especially slow Fevers, are seasonably prevented. *Hoffman*.

QUARS. A Gall-stone. *Rulandus*.

QUARTARIUS. The fourth Part of a Sextary, containing nearly a quarter of a Pint.

QUARTATIO. A Separation of Gold from Silver, when mixed together, by means of acid Spirits.

QUARTURA. The same as QUARTATIO.

QUASSATIO. A Concussion.

QUATERNARIUS, or QUATERNIO. The Space of four Days.

QUATRIO. The ASTRAGALUS.

QUEBRICUM is, according to some, Arsenic; according to others, Sulphur.

QUELLEM. Original, or Elementary Earth. *Rulandus*.

QUELLES. An ELIXIR.

QUELMEISEL. The German Name for a Tent made of a Piece of Sponge, Gentian, or any other Root, so as to swell, when introduced into a Wound, or Ulcer, and dilate the Orifice.

QUERA - IBA *Brasiliensibus*. *Marcgrav. & Piso*. The Name of a Tree which grows in *Brasil*. The Bark contused and boiled, is effectual for curing Wounds or Ulcers in the Legs, or other Parts.

QUERCERA. See EPIALOS.

QUERCUS.

The Characters are;

The Leaves are sinuous, and, as it were, lacinated: The Flower is male, amentaceous, and consists of dense Clusters of male Apices, affixed to a thin long Capillament: The Fruit grows at a remote Distance from the Flower, on the same Tree, is furnished with three Tubes, and grows in a Calyx, consisting of small angular Leaves, and becoming at last squamous: This Fruit becomes an Acorn, whose lower Part is contained in the Calyx, and, under an entire coriaceous Shell, incloses a Kernel which cleaves in two.

Boerhaave mentions five Species of *Quercus*; which are;

1. *Quercus*; *latifolia*; *mas*; *quæ brevi pediculo est*. C. B. P. 419. *Platyphyllos, mas*. *Lugd.*

The sweet and honeyish Moisture with which its Leaves are often covered, and which the Bees gather with a great deal of Care, does not come from the Air, as People imagine; it is an extravasated Juice, which is poured out upon these Parts, not only of the Oak, but, also, of the Maple, where it makes a kind of Sugar; of the Ash, and of the Larch-tree, where it produces the Manna: In some Seasons the Leaves of the Lime-trees, in the great Alley of the King's Garden, are covered with it, in such a manner, that they look as if they were varnished: The Washings of these Leaves are sweetish, and loosen the Belly. *Martyn's Tournesfort.*

2. *Quercus*; *latifolia*; *fœmina*. C. B. P. 419. *Platyphyllos, fœmina*. *Lugd.* 2.

3. *Quercus*; *cum longo pediculo*. C. B. P. 420. *Tourn. Inst.* 583. *Boerb. Ind. alt.* 2. 177. *Quercus*. *Offic.* *Quercus vulgaris*. *Ger.* 1156. *Emac.* 1339. *Quercus latifolia*. *Park. Theat.* 1386. *Raii Synop.* 3. 440. *Quercus vulgaris longis Pediculis*. *J. B.* 1. 70. *Raii Hist.* 2. 1335. THE OAK.

This is a Tree which grows plentifully in England, being one of the largest and most common Trees we have, having smooth, shining, green Leaves, sinuated on both Sides. We have two Sorts, one of which, and the most common, bears its Leaves on short Foot-stalks, and its Fruit or Acorns on long; and, on the contrary, the other has the Fruit on short Foot-stalks, and the Leaves on long.

Of the Oak, the Bark, the Buds, the Acorns, and their Cups, are used; as, also, the Galls, which are Excrescences caused by Insects, on the Oaks of the Eastern Countries, of which there are divers Sorts, some perfectly round and smooth; some rougher, with several Protuberances; but all, generally, having a round Hole in them.

All the Parts of the Oak are styptic, binding, and useful in all kinds of Fluxes and Bleedings, either inward or outward: The Bark is frequently used in Gargarisms, for the Relaxation of the Uvula; and for sore Mouths and Throats: It is, also, used in restraining Clysters, and Injections against the Prolapsus Uteri, or Ani. The Acorns, beaten to Powder, are frequently taken, by the Vulgar, for Pains in the Side.

The only official Preparation is the *Aqua Germinum Quercus*. *Miller's Bot. Off.*

4. *Quercus*; *pedem vix superans*. C. B. P. 420. *Robur*. VII. *five Quercus*; *pumila*. *Clus. H.* 19. *Descript.* VI.

5. *Quercus*; *parva*; *five Phagus Græcorum, & Esculus* *Plinii*. C. B. P. 420. *Raii Hist.* 2. 1386. *Tourn. Inst.* 583. *Boerb. Ind. alt.* 2. 177. *Phagus Esculus*. *Offic.* *Phagus five Esculus*. *Park. Theat.* 1386. *Phagus vel Esculus*. *J. B.* 1. 2. 74. ESCULENT, or SWEET OAK.

It grows in Greece and Dalmatia, and the Bark, Leaves, Acorns, and their Cups or Calyces, are in Use, and agree in Virtues with those of the common Oak.

Besides the foregoing Species of *Quercus*, *Dale* mentions the two following; the first is the *Cerrus*, or *Holm Oak*. See *ÆGILOPS*.

The second is the,

- ROBUR*. *Offic.* *Robur tertia Clusii*. *J. B.* 1. 2. 76. *Raii Hist.* 2. 1386. *Robur cum Galla majore rugosa*. *Park. Theat.* 1386. *Quercus Gallam exiguae nucis magnitudine ferens*. C. B. P. 420. *Tourn. Inst.* 583. THE GALL-OAK.

It grows in Pannonia and Istria. The Galls are used in Medicine.

With respect to Galls, there are several Sorts: The first and best is termed the *Aleppo Nut*, or *Galla Spinosa*; the second is white; the third, smooth and round; the fourth, of an irregular Figure; and the fifth, has a kind of Crown. All these Galls are owing to Insects, which first prick the Oak-trees, and then lay their Eggs in the Wound: These Eggs swell with the Excrescence, and first turn to Worms; then to Flies, which, having perforated the Galls, make their Escape. And as some Eggs are unfruitful, and remain in the Gall, they are observed to yield a volatile Salt.

Galls are very astringent, and are by some given inwardly in Dysenteries: They have likewise been recommended in intermitting Fevers; but the Foundation of their febrifugous Quality depends on too few Instances to be relied on. *Geoffroy.*

QUERCUS MARINA. See *FUCUS*.

QUERQUEDULA. The Teal: A Species of wild Duck. It is esteemed good for the Wind Colic, when applied to the Belly. *Lemery des Drogues.*

QUERQUERA. The same as *QUERCERA*.

QUIES. Rest. The Effects of which are abundantly explained, under the Article *FIBRA*.

QUINGOMBO. The Portuguese Name for a Species of *Aleca*, which grows in Brasil. *Raii Hist. Plant.*

QUINQUEFOLIUM.

The Characters are;

The Root is fibrous and perennial: The Leaves grow by more than Threes, at the Top of the Pedicle, round one Centre: The Calyx is monophyllous, not caducous, and, as it were, octophyllous, or decaphyllous, expanded like a Star, and furnished with very numerous Stamina, proceeding from the Compass of the Base of the Ovary: The Flower is roseaceous; pentapetalous, and more rarely tetrapetalous, the Petals standing round the Base of the Ovary: The Ovary is a seminal Head, involved in a Calyx, hemispherical, and has several Eggs, furnished with a long erected Tube.

Boerhaave mentions eleven Sorts of *Quinquefolium*; which are,

1. *Quinquefolium*; *rectum*; *luteum*. C. B. P. 325. *Pentaphyllum, five potius Heptaphyllum, majus, luteum, montanum, flore majore*. M. H. 188.

2. *Quinquefolium*; *majus*; *repens*. C. B. P. 325. *Tourn. Inst.* 297. *Boerb. Ind. alt.* 40. *Pentaphyllum & Quinquefolium*. *Offic.* *Pentaphyllum vulgatissimum*. *Park. Theat.* 398. *Raii Hist.* 1. 611. *Synop.* 3. 255. *Pentaphyllum five Quinquefolium vulgare repens*. *J. B.* 1. 397. *Quinquefolium vulgare*. *Ger.* 836. (*figura transposita*) *Emac.* 987. CINQUEFOIL, or FIVE-FINGERS.

The common Cinquefoil, or five-leaved Grass, has a large spreading, thick, woody Root; covered with a dark-brown Bark; and full of small Fibres, sending forth many slender creeping Stalks, which lie on the Ground, emitting small fibrous Roots from the Joints, by which it easily propagates itself; at every Joint grow the Leaves, five set together upon one long Foot-stalk, which are narrow, veiny, serrated about the Edges, the two outermost being the shortest: Amongst these come forth the Flowers, consisting of five round yellow Leaves, with several Stamina in the Middle, set, also, on long Foot-stalks; and after them small, brown, naked Seed: It grows every-where by Hedges and Way-sides; flowering all Summer. The Leaves and Root are used.

They are restraining and drying, and serviceable against all kinds of Fluxes and Hæmorrhages: The Powder of the Root, given to the Quantity of a Dram, two or three times a Day, is said to cure Agues: The same is, also, accounted good against malignant Distempers, and is an Ingredient in *Venice Treacle*: It is frequently used in Gargles for sore Mouths and ulcerated Gums, and to fasten loose Teeth. *Miller's Bot. Off.*

3. *Quinquefolium*; *quod Pentaphyllum, seu potius Heptaphyllum*; *erectum caule rubro*; *hirsutus*. H. C.

4. *Quinquefolium*; *rectum*; *floribus sublateis*. C. B. P.

5. *Quinquefolium*; *minus*; *flore pallidæ luteo*. T. 297.

6. *Quinquefolium*; *folio argenteo*. C. B. P. 325. *Pentaphyllum rectum, foliis profunde sessilis, subtus argenteis, flore luteo*. J. B. 2. 398.

7. *Quinquefolium*; *minus*; *repens*; *luteum*. C. B. P. 325. *Pentaphyllum*; *parvum, hirsutum*. J. B. 2. 598.

8. *Quinquefolium*; *minus*; *repens*; *luteum*; *flore tetrapetalo*. *Boerb. Ind. alt.* 40. *Tormentilla*. *Offic.* *Ger.* 840. *Emac.* 992. *Raii Hist.* 1. 617. *Synop.* 3. 257. J. B. 2. 598. *Tormentilla vulgaris*. *Park. Theat.* 394. *Tormentilla sylvestris*. C. B. P. 326. *Tourn. Inst.* 298. TORMENTIL.

The Root of Tormentil is pretty thick and large, for the Bigness of the Plant, frequently crooked and knotty, of a reddish Colour in the Inside, with many small Fibres; the Stalks are long, and very slender, and hardly able to support themselves: It has frequently seven, though sometimes only five, long narrow Leaves growing at a Joint; less than Cinquefoil, and serrated only at the Ends: The Flowers are small and yellow, of four Leaves, with a few Stamina in the Middle: The Seed is small, growing naked on the Calyx. It grows in Woods, and in Commons, and flowers in June and July. The Roots are used.

They are very drying and binding; good for Diarrhæas and Dysenteries, especially attended with malignant Fevers; they being, also, accounted alexipharmic: They are serviceable in Hæmorrhages of the Nose, Mouth, or Womb: They fasten loose Teeth; and help the Relaxation of the Uvula. *Miller's Bot. Off.*

9. *Quinquefolium*; *album*; *majus*; *alterum*. C. B. P. 325. *Pentaphyllum album*. J. B. 2. 598.

10. *Quinquefolium*; *foliis ternis*; *præcedenti simile*. H. C.

11. *Quinquefolium*; *quæ Tormentilla*; *reptans*; *alata*; *foliis profundius ferratis*. D. Plot. *Raii Syn.* 142. *Boerb. Ind. alt. Plant. Vol.* 1.

QUINQUE FRAGMENTA PRETIOSA. The Fragments of the precious Stones.

These rare Compositions are hardly prepared any other Way than by Chymistry, which sometimes affords us an Opportunity of employing them in Medicine: But it is sufficient, that we have spoken of each of these Stones in its proper Place; to which we refer the Reader. *Lemery des Drogues.*

 TREE.

It is an Opinion universally received, that every Disease has a Remedy peculiar to itself; and a sick Person can hardly complain to any Man, who will not recommend an infallible Medicine for his Disorder. This Error, which is the genuine Foundation of Quackery, should, if possible, be entirely eradicated out of the Minds of Men; for as the Powers and Effects of Bodies are not in their Natures absolute, so the Qualities of Food and Physic have a Relation to the human Body, on which they operate: Hence Experience teaches us, that the same Medicines may be both prejudicial and serviceable to different Persons labouring under the same Disorder, though administered in the same manner.

Hippocrates long ago inculcated this Doctrine in *Lib. de Art.* 56. "Every one, says he, is not a Judge, what is beneficial and what pernicious; and yet the whole Art of Medicine consists in this Distinction, for those Remedies, which are of Service, are so from the proper Use of them; and those which are of Disservice from the Abuse of them." This Author by no means ascribes to all Medicines, an absolute Power of procuring Health, but only in a certain respect; and that not because they are exhibited in any particular Disorder, but because they are duly and judiciously prescribed, after a thorough Examination into the Patient's Constitution, with the Cause and Nature of the Distemper, having, at the same time, a peculiar regard to the Time, Order, Dose, and Quantity; but when these Cautions are neglected, he declares them noxious. Since, therefore, Medicines are both serviceable and prejudicial, he justly terms Medicine an Art; and pronounces him only a good Physician, who makes this Distinction between the different Effects, and various Operations, of Remedies.

A due Regard to this Doctrine of *Hippocrates* would put an End to many opprobrious Controversies between Men of Learning; whilst some are surprisingly lavish in their Encomiums, and others equally profuse in their Disparagement, of the same Remedy, in the same Disease; whilst they very seldom agree in determining the Power, Effect, and Use, of any Medicine, in this or that Disease. No one can be a Stranger to the different Sentiments, which are entertained of those Medicines, called *heroic*; such as Mercurial Preparations, Antimonial Vomits, Chalybeates, Opiates, drastic purgative Narcotics, and, among surgical Remedies, Vesicatories, Fontanels, Setons, and Venesection: But what is still more surprising, they agree no better in their Opinions of the most simple and diætic Parts of Medicine, such as cold and hot Baths, and the various Cures performed by Milk and Abstinence.

The *Peruvian Bark*, brought into *Europe* about seventy Years ago from *America*, has met with the same Fate: It is wonderful, with what Applause it was at first received; and what Commendations were at first bestowed upon it; as an infallible Remedy against Intermittents: Nor are there wanting, at this Day, some who have it in the highest Esteem. Another Set of Physicians condemn it as unsafe, and even pernicious; and these have still their Followers; and both Parties, in their Writings, appealed to their own Practice: But, for my own Part, I esteem it a good, effectual, and safe Remedy, when properly used, according to the above-mentioned Rule of *Hippocrates*; but hurtful and dangerous, when imprudently or unskillfully given, without any regard to the Constitution of the Patient, the febrile Cause, the Stage of the Disease, and other Circumstances. I have, therefore, made choice of it for the Subject of my present Dissertation, in which I shall first produce the Arguments of the Advocates for the Bark, and then those of their Opponents; next from a rational Account of Fevers, and their Causes; and an Inquiry into the Principles of the Bark, and its manner of operating, I shall shew both its salutary and prejudicial Qualities; and, lastly, answer all Objections.

The *Peruvian Bark*, then, has a great Number of Advocates; for, at its first Appearance in *Europe*, it was known at *Rome*, and sold, by the Jesuits, at an extravagant Price, as a most infallible Febrifuge; and in a little Bill, with Directions for the Use of it, they declared, that this alone, with a preceding Purge, if necessary, would cure even Quartans. *Bartholine*, Cent. 5. Hist. 50. tells us, that Cardinal *de Lugo* had Testimonials of above a thousand Cures performed by this Medicine in the Year 1653, in which simple and double Quartans

greatly raged; and that *Fonseca* had, by Experience, found it not only innocent, but salutary. *Fr. Redi, de Experim. Nat.* a. 143. says, its Effects are miraculous. And *Tozzi, in Comment. in App.* 25. Sect. 2. asserts, that Quartans, which had hitherto been esteemed incurable, are now easily and safely cured by the *Peruvian Bark*.

From *Italy* it was conveyed into *France*, and there several times administered with such Success, that *Tagaultius* gave it, both to the King, and Dauphin, more than once, to good Purpose. About the same time it was received in *England*, with almost universal Applause. For *Willis, de Febr. Cap.* 6. expressly says, that of an hundred Patients, who had taken it, scarce one miscarried. To this one may add, the Testimony of *Mr. Boyle, in Tr. de Philos. Experim.* who assures us, that he had removed Quartans of a Year's Continuance, by a Dose or two of the Bark, to the Quantity of a Dram. But *Digby, in Tr. de Medic. Secret.* most solemnly affirms, that, out of thirty whom he had cured of Quartans, by the Bark, not two relapsed: Adding farther, that a Relapse was rather a Reproach to the Physician, than the Remedy. That great Practitioner *Sydenham, in Tract. de Febr.* has not been wanting in his Encomiums on the Bark, and is very particular in his Description of the proper Method of using it. And that it is still in great Repute in *England*, is certain, from the Writings of *Freind, Lister, and Moreton*, which last in *Tr. de Febr.* says, "The *Peruvian Bark* is, by the unanimous Consent of all modern Physicians, an universal Febrifuge, which entirely, speedily, safely, and successfully cures all intermitting Fevers, at any Season of the Year, at every Age, and in every Temperament; so that it is unnecessary for Physicians to rack their Inventions for the Discovery of any other."

By this Time it had gained great Reputation in most Parts of *Europe*. Among the *Swiss*, *Muraltus* greatly extolled it; and in *M. N. C. Dec.* 21. An. IX. Obs. 2. has given Instances of its Efficacy, both in Tertians and Quartans, upon Young and Old, and concludes with these remarkable Words, "It would require a large Volume, to recount the Cures performed by myself, and others, with the Powder of this Bark." The Writings of *Boerhaave* and *Decker* convince us, that it was, and still is, greatly esteemed in *Holland*. *Bohnius, in Diss. de minus suspecta Februm Fuga*, and *Bergerus, Diss. de Coriis Chinæ ab iniquis Judiciis vindicato*, have, by many solid Arguments, proved the Virtues of it; and that the *Germans* administered it in intermitting Fevers. Nor was it less esteemed by *Waldsemidtius, Dolæus, and Zappus*, who acquired both Fame and Wealth, by an antifebrile Electuary, whose Basis was the Bark: And his Son-in-law *Stroidel* still prescribes it with the same Success.

On the other hand, there have been, and still are, many learned and excellent Physicians, who do not scruple to reproach the Bark with the Title of an uncertain, dangerous, and even pernicious Medicine. Some, relying upon their own Experience, positively affirm, that it is not only attended with violent Relapses, but new and incurable Diseases, as a Cachexy, cedematous Tumors of the Feet, Dropsies, obstinate Costiveness, Oppression of the Præcordia, hypochondriacal and hysterical Affections, slow and hectic Fevers, accompanied with a Loss of Strength and Appetite, Consumptions, and sometimes Convulsions and Epilepsies in Children. Among its most considerable Antagonists is *Baglivi*, who, *Opp. Lib.* 2. says, that a Tertian will not admit of a Febrifuge, till the fifteenth Day, when it ceases spontaneously; that all Remedies before that Time are useless, if not prejudicial; and that those Physicians acted preposterously, who, by Febrifuges, endeavour, as it were, to check a Fever in its Infancy; for within a few Days it either returns more violently, or is succeeded by Asthmæ, Dropsies, slow Fevers, Consumptions, or some other dangerous Distempers.

Among the *Germans*, *Ettmüller, Opp. Tom.* 2. calls it a precarious Remedy, and elsewhere affirms, that it generally produces Costiveness, a Tumor and Hardness of the Abdomen, with tense Pains; and that when these gradually remit, or are irritated by Purgatives, or the Spirit of Sal Ammoniac, the like Fever returns with a more intense Cold. *Palladius*, also, in an Epistle to *Baglivi*, informs us, that the *French* give the Bark successfully in Fevers; but that this Practice would be very ridiculous in *Italy*; nor does he advise it till towards the End, for strengthening the Stomach. For more Instances of the noxious Quality of the Bark, see *Blegny, Zodiac. Gall. Med. Phys. An.* 4. *Mens. August.* Anno 5. *Mens. Januar.* and *M. N. C. Dec.* 3. An. 9. Obs. 109. and Cent. 3. And *Stablius* in *Theoria Med. and Opific. Physico-Med.* as, also, *Juncker, in Conspect. Medic. Theoret. Pract.* every-where oppose and condemn the Use of the Bark in Fevers. And I must confess, that an improper Use of the Bark is very pernicious, and too often attended with dangerous Relapses, or other severe Distempers; and particularly, that a Quartan is followed by

by the Dropsy; and a Tertian, by hypochondriac Affections, in consequence of the preposterous Use of the Bark.

I cannot, however, agree with those who pronounce the Bark absolutely, and always, prejudicial in Fevers; and, for that Reason, endeavour to discredit it, as ill adapted to their Cure; unfriendly to their happy Terminations; and opposite to the salutary Efforts of Nature: For these imagine, that a Fever is nothing but an exactly methodical Effort of Nature, which, by increasing the Motion of the Solids and Fluids, endeavours to discharge out of the Body, through the proper secretory and excretory Ducts, those Causes, which give Birth to the Disorder: For the Accomplishment of this, say they, the Humours must be put in Motion, and the Passages opened; but Astringents, among which is the Jesuit's Bark, incrassate the Fluids, contract and obstruct the small Canals of the excretory Ducts, and, consequently, retain the morbid Matter; which must necessarily produce Relapses, or other dangerous Distempers.

They further suppose, that Nature's principal Design in Intermittents, is, to diminish a Superfluity of Blood, pernicious to Life, by an Increase of internal Heat, resulting from an Acceleration of the Blood's Circulation, and certain Resolution of it into an excrementitious Serum; and at the same time, by a stronger Impulse, to free the Viscera from Disorders, and Obstructions: And, consequently, that these febrile Motions are, as is were, Remedies and Means, by which Diseases are cured, Pains expelled, and those things which threaten Death, eradicated; so that a Suppression of them must be very dangerous. Besides, that it is an hazardous Attempt to disturb and hinder this wise Intention of Nature, in expelling the noxious Humours through the secretory and excretory Ducts, by inducing a contrary Effect from Astringents; which Practice must be attended with Relapses, severe hypochondriacal and hysterical Affections, slow Fevers, Obstructions of the Viscera, Jaundice, Cachexy, Dropsy, Melancholy, and obstinate Costiveness.

But they rely principally upon this, that the Fomes of a Tertian is seated in the Primæ Viæ, or in the Stomach; and especially in the first small Intestines and adjacent Organs; such as the meseraic Vessels and Glands: But as this Fomes is generally a viscid and tenacious Humour, that it is an Instance of the Wisdom of Nature, that in the Beginning of the Disease, the porous and external Parts should be constricted, that, by this means, the Blood may be forced to the internal Parts, and detained there, till a sufficient Quantity of the serous lymphatic Humour transpires through the Coats and Glands of the Viscera into their Cavities, which serves afterwards partly to colliquate and mollify, and partly to discharge the febrile Matter: Hence they conclude, that all Medicines are pernicious which obstruct these salutary Motions, inspissate the viscid febrile Humour in the Primæ Viæ, and by constricting the excretory Ducts suppress all beneficial Secretions and Excretions, as well by Stool as Urine, and the Pores of the Skin. But the Bark is of this astringent Quality, and therefore to be rejected; and such Remedies are only to be used, as assist Nature, dissolve the febrile Matter; and, by decreasing the Redundancy of the Blood, and promoting Secretions of all kinds, free the Body from the peccant Humour; and not such as dangerously repress it, by a Suppression of the febrile Motions.

Thus the Adversaries of the Bark argue; and, at first Sight, they seem to have some Shew of Reason on their Side: But whether this should positively deter all Physicians from the Use of it, is next to be inquired into. Their whole Argument, then, is founded on the Supposition of some internal Agent, which, upon a previous Knowledge, and subsequent rational Intention, produces and directs the vital Motions, among which are the febrile, as well as the Effects of Remedies, to some certain End. But such a Principle is so far from being useful, either in the Theory or Practice of Physic, that it establishes Errors, or induces Confusion, both in explaining physical Subjects, and discovering or applying Remedies.

He who understands this, will soon determine what Judgment to pass upon the febrile Motions excited by this Principle: They esteem these Motions naturally salutary; whereas they are rather destructive; and accuse wise Nature of Imprudence and Madness. For every Smatterer in Physic knows, that this universal Commotion is attended with spasmodic and convulsive Agitations of the external and nervous Parts, and, consequently, of the whole nervous System; not without a violent Injury to the animal Functions, and Danger of Death: So that every one, who dies of an intermitting Fever, expires with these Symptoms. And indeed, if this Agent could at Pleasure direct the vital Motions, it would be more safe, easy, and rational, without this universal pernicious Spasm, and Stricture of the Body, to conduct this copious Motion of the Blood and Humours, gradually to the Seat of the Distemper. And though I own, that Fevers, especially of the intermitting Kind, in

Bodies full of thick and impure Juices, sometimes, by an extraordinary progressive Motion of the Humours, and an Increase of Heat, prove medicinal, and prevent eminent, chronic, and violent Disorders, arising from Obstructions of the Viscera, yet they are not always accompanied with a Redundance of Blood and Humours, Impurity, or an excessive Crassitude of the Blood and Juices, or an Infarction of the Viscera; much less are these the immediate Causes of Intermittents; and, consequently, this so impetuous Motion of the Solids and Fluids, with a Dissolution of the vital Humours, is quite unnecessary.

As to that Part of their Arguments; which is built upon Nature's Design for the Preservation of the Body, to diminish the Redundance of the Blood, by a dissolutive Resolution of it, by the intestine Motion; we absolutely deny a Redundance of Blood and Humours to be the Cause of the Distemper. For, if this was the Case, plethoric Persons would be most subject to Fevers; and all kinds of Fevers removed by seasonable Venesection. Whereas a Consumption of Blood, and its excrementitious Particles, is the Effect and necessary Consequence of the febrile Heat, which is rather an Enemy, than a Friend, to Nature, as it dissipates and destroys the Strength, upon which the Vigour of the vital Motions depends.

Of no greater Validity is that Way of reasoning, which attributes the Cause of Intermittents to the crude, viscid, tenacious Humours, proceeding principally from Indigestion in the Primæ Viæ, and adjacent Organs; for intermitting Fevers very seldom proceed from an irregular Diet, or bad Digestion: But we may rather deduce the Origin of Tertians from a Quantity of acrimonious bilious Humours in these Parts, especially since we find young, choleric, and passionate Persons, liable to them in very hot Seasons; and that their Vomits and Stools are bilious, and their Urine generally high-coloured, from a copious Mixture of sulphureous and bilious Particles. And though I do not approve of Astringents in all kinds of Fevers, yet I cannot allow, that the Bark, judiciously exhibited, has this Effect; but will rather venture to assert, that it promotes Excretions and Perspiration, as I shall shew more at large hereafter.

I shall now propose my own Theory of Intermittents, and their Generation; by which we shall be the better enabled to judge of the proper Methods of Cure, and the Remedies best adapted to remove them. But I must premise, that Experience convinces us, that neither an irregular Diet; nor bad Digestion, gives Rise to them in one or two Persons, but that they rage epidemically, and spring from a preceding, unusual, long-continued, hot, and dry State of the Air, when we carelessly expose ourselves; about Sun-set, to the North Wind; or cool, moist Breezes, from whence we feel a remarkable Cold and Shivering. For this Reason in low marshy Countries; which abound with Ponds, and stagnating Waters; we see the Inhabitants so frequently afflicted with Intermittents at all Seasons; that they seldom live to any great Age; for an Air which is cold, dense, moist, and replete with Insects; must stop Perspiration. Nor does any, especially an intermitting, catarrhus, arthritic, or rheumatic Fever, attack us, till cuticular Excretion has been lessened or suppressed; nor are we, before that, in Danger of a Relapse; and the Continuance and Violence of the Disorder is proportioned to the Interception and Suppression of this salutary Evacuation.

When there is, therefore, a large Collection of noxious Humours, either from the Temperature and preternatural State of the Air; an Irregularity in the Affections of the Mind, or coarse Diet, which ought to be conveyed through the Pores; and the Transpiration, which should rather be increased, for carrying off such a Quantity of active, vapourish, salino-sulphureous Particles, is, by a Stricture of the nervous and excretory Glands of the Skin, greatly impeded, it necessarily follows, that the Motion of the excrementitious Serum must be directed another Way, that is, to the internal Parts. As this, in catarrhus Fevers, happens to the glandulous Parts of the Nose, Fauces, and Bronchia; in those of the rheumatic and arthritic Kind, to the Membranes of the Muscles, and nerveo-glandulous Ligaments of the Limbs; in Diarrhoeas to the Coats of the Intestines; so, in Intermittents, the secretory and depuratory Viscera of the Abdomen, as the Liver, Pancreas, Glands, and glandular Coats of the Stomach and Intestines, are affected. But this malignant Humour here collected, vitiates, corrupts, and contaminates the fermentative, lymphatic, salival, and bilious Juices, destined to Digestion and Chylification; for these, whilst lodged in the Cavity of the Duodenum, by their mutual Fermentation, and Commixture with the Crudities of a bad Digestion, contract, by their Continuance, a worse Disposition, and become very prejudicial to the nervous Parts. These depraved Juices being successively conveyed to the Blood, as well through the Pores as Tubes, when they reach the nervous Membranes, encompassing the Brain

and Spinal Marrow, excite, by their noxious Quality, an universal Spasm in the Vessels and nervous System, which constitutes the Essence of a Fever.

For a Fever is nothing more, than a Disorder or Effect of a preternatural Affection of the nervous System: For all the subsequent Symptoms, as Pains in the Head and Back, particularly about the first Vertebra of the Loins, convulsive Pains of the Joints, Lassitude, Languor, Cold, Rigor, and Horror, sometimes productive of a Concession of the whole Body, Anxiety of the Præcordia, and Difficulty of Breathing, with Inquietude, a contracted, quick, small, unequal Pulse, Vomiting, or an Inclination to it, frequent Thirst in the cold Fit, a very great Costiveness, or even a Flux, in some a Stimulus to make Water, and, as I have often observed in old Men, assisted especially with a Quartan, a Deprivation of the Understanding and Senses, all plainly indicate a violent Disorder of the nervous System. Whilst, therefore, under these Symptoms, by the Stricture of the exterior Parts, the Blood is impelled to the larger Vessels, the Lungs, Head, and Heart, it by its Quantity excites a more violent Pulse, and quicker Systole, in the Muscle of the Heart: Hence the Blood circulates with more Celerity and Strength; the Motion of the Arteries becomes more violent and swift; the Spasms of the Nerves are relaxed by this Increase of Heat, and the Matter which produced them discharged: The Blood is then invited to the Surface of the Body; and the Pores of the Skin, upon this Remission of the Stricture, being opened, a Sweat succeeds.

This seems to me the Origin and Progress of an intermittent Fever; and I shall now endeavour to account for the Return of a Paroxysm, at a particular Distance of Time: This febrile Matter in the Duodenum, composed of vitiated, bilious, lymphatic, and salival Juices, with the Crudities of indigested Food, passes successively to the Blood and nervous System. Then what remains after this Fermentation, if I may so call it, receives fresh Nourishment from the impure Juices flowing out of the Liver, Pancreas, and Glands of the Duodenum: Then, by the extraordinary Increase of Motion in the Paroxysm, the Blood and Serum degenerate into mucid, saline, sulphureous Sordes, which, as they are not entirely dissipated on the intermediate Day, remain within, and increase the Corruption of the lymphatic salival Juices, and of the Bile itself. And give me Leave to make one Observation, which no one, I think, has yet made; which is, that upon the intercalary Day, the Weakness of the Pulse, and the Coldness, rather than Heat of the external Parts, and Skin, sufficiently prove the Transpiration to be incapable of discharging the febrile Matter. And, lastly, it is very probable, that the Tone, Vigour, and Function of this universal, nervous, fibrous, and tubular Emunctory of the Body, the Skin, are very much weakened by so many violent and opposite spasmodic Motions, followed by an excessive Remission; so that the salutary Business of insensible Transpiration, cannot be effectually performed through the whole Course of the Fever, and, of consequence, the Depuration of the Blood and Humours not carried on with proper Vigour: From these Considerations we may reasonably conclude, that the Fomes, which is continually receiving fresh Supplies, may, in a certain Space of Time, be collected into a Quantity sufficient to bring on another Fit.

That the Paroxysms return, sometimes daily; sometimes on the second, third, or fourth Day, and that at different Hours; and sometimes are double, may be attributed to the Difference of the Matter, either on account of its Quantity, and Activity or Inactivity, and the greater or less Afflux of it to the Primæ Viæ; and likewise the different State of the Viscera, especially the Liver, Spleen, and Pancreas. It is very manifest, that anomalous Quotidians, Tertians, and Quartans, were epidemical in Germany last Year, in consequence of the unusual Length of the Heat and Drought in the Summer and Autumn; and that these Fevers must proceed from the various Disposition of the Humours and Viscera, according to the Variety of the Temperaments and Foods of the Patients.

After this explicit Account of the Cause and Nature of intermitting Fevers, we shall inquire into the Preservatives against them: Amongst these the *Peruvian* Bark claims the Preference, whose Qualities, therefore, and Effects, whether beneficial or noxious, demand a most accurate Examination. First, then, it is an Astringent; for its Powder, either by itself, infused with Water, or mixed with highly rectified Spirit of Wine, constricts the Tongue: This is farther confirmed by a chymical Experiment, while a Solution of it with Vitriol, like all other Astringents, grows as black as Ink: Another of its Principles is a Bitter, of an opening Nature, which is universally allowed to be a proper Remedy for Fevers; since almost all Bitters, such as Wormwood, Carduus Benedictus, Fumitory, the lesser Centaury, red Gentian-root, and *Virginia* Snake-root, and Snake-wood, are allowed to be excellent Febrifuges.

The Bark is, also, a Balsamic, which is very agreeable to Nature; but this Quality shews itself, not so much by the Taste and Smell of the Powder, as by a Water drawn from it by Distillation, or when mixed with Spirit of Wine. Another of its Principles is, a fixed Earth, as appears after Solution and Extraction; and this Principle, though hitherto overlooked, is of great Efficacy in correcting, blunting, and involving the Acrimony of the febrile Matter; particularly of the bilious Kind, in the same manner as earthy Substances, Shells, Mother of Pearl, Sealed Earth, and Coral, operate in removing Fevers. This Simple, therefore, according to *Galen's* Manner of speaking, acts by the Whole of its Substance; and it has, besides, many other Advantages, which are seldom or never found in any other Medicine; for which Reason they are greatly mistaken, who confine the Power of this Remedy over Fevers to Astringency alone.

From this Theory and Pathology of Fevers, and these Qualities of the Remedy, we may soon learn the proper Use of the Bark, in intermitting Fevers, and how to give it to Advantage. We have already proved the material Cause of Intermittents to be, a large Collection of vitiated Bile, and salival Juices, mixt with indigested Aliments, and lodged in the Primæ Viæ, particularly in that winding Intestine the Duodenum; from whence successively passing, in certain Quantities, into the internal Parts, and nervous System, it occasions these spasmodic febrile Motions. Our Intention, therefore, in the Cure should be, to correct and blunt this peccant Matter, procure its Elimination, and prevent its further Discharge from the Glands, and biliary Ducts; and, in my Opinion, if the Bark does not entirely, it will yet, in a great measure, answer these Intentions.

We grant, indeed, that this Febrifuge is not so effectual, when the Primæ Viæ are overcharged with peccant Sordes, especially of the viscid and tenacious Kind; but rather does Harm, by inspissating and rendering them more immovable; and, at the same time, by its astringent Quality, rendering the Patient costive; by which means the febrile Matter is not only retained, but the tensile Pains and Anxieties about the Præcordia are increased, as we have often seen in those, who have been long afflicted with a Quartan, especially old Persons and Children, when they have taken great Quantities of the Bark. In this Case, therefore, it is safer and better to reject this Remedy, or at least, not to use it till such others have been exhibited, as conduce to attenuate, incide, and evacuate by Stool, the thick, viscid, and tenacious Humours. For these Intentions, among Salts, we give the Preference to depurated Sal Ammoniac, the digestive Salt of *Sylvius*, vitriolated Tartar, the Arcanum Duplicatum, *Glauber's* Salt, and *Epsom* Salt. Salts, also, drawn from medicinal Waters, are very efficacious in removing chronic Fevers, such as the *Sedlitz* and *Egran*; half an Ounce, or an Ounce of which, dissolved in a sufficient Quantity of Water, and exhibited as often as the Circumstances of the Patient require, will cleanse the Intestines from the peccant and viscid Sordes. The Power, also, of Bitters is very great, in inciding, deterging, and evacuating the mucid, tenacious, and acid Juices; among the best of these we may reckon the Extracts of the lesser Centaury, red Gentian, and Carduus Benedictus, Wormwood, Rhubarb, and Aloes previously corrected and qualified, which, dissolved in a lixivial aqueous Menstruum, and given in Wine or Brandy, on the intercalary Day, are very serviceable. After these, the Bark, with other Remedies assisting its Operation, not only greatly prevents an excessive Afflux of the peccant Humours to the Primæ Viæ, but, also, promotes and facilitates Perspiration.

In like manner, when the Crudities arising from indigested and corrupted Aliments, with the vitiated Bile and salival Juice, nourish a Fever, Reason and Experience convince us, that we ought to purge the Primæ Viæ of these acid, bilious, and corrupted Humours, before we use specific Febrifuges and Corroboratives. For this Purpose, gentle Emetics are proper, or such Medicines as evacuate both upwards and downwards; but we must avoid all strong drastic Purges, and violent Emetics; for these being injurious to the Stomach and nervous Parts, weaken the Patient, and rather increase than diminish the preternatural Commotions. For this Purpose I would recommend an Ounce or two of Manna, with a Grain or two of emetic Tartar, gently dissolved in a sufficient Quantity of Spring-water; which Medicine operates efficaciously enough, both upwards and downwards; and, as I am assured from long Experience, answers the End proposed. After these Measures are duly taken, the Bark may be exhibited with the greater Success.

On the contrary, there are many Species of Fevers, such as the bilious Summer Quartans and Tertians, those of the double and continual Kind, accompanied with severe and cruel Symptoms, which proceed from an imtemperate, sharp, hot, and volatile Bile, generally after a long-continued, hot, and dry Season.

Season. In these Cases, after a few Fits, the Bark, especially in Powder, mixed with absorbent and nitrous Medicines, will be of Service in fixing, correcting, and blunting this Matter, and preventing too copious an Afflux of it to the Intestines: Thus have I known great Advantages produced by plentiful bilious Stools, especially in bilious choleric Constitutions; for the Fever has soon after left them.

As what I have already said, is supported by Experience, so I can, upon the same Foundation, assert, that the Bark supports and promotes Perspiration; which, if not the principal, is certainly a very material Step towards the Cure of intermitting Fevers. For when this salutary Evacuation, as I before observed, is suppressed, and the Sordes, which should be discharged by it, are convey'd to the internal Parts, it gives the first Rise to these Fevers, which bear a Proportion to the Quantity of bilious Sordes retained in the Blood and Humours. Then these Sordes, on account of the inconsiderable Excretion upon the intervening Day, being collected in a greater Quantity, produce a Return of the Fit. Relapses, also, proceed from a Retention of the febrile Matter, which generally happens, when the Patient, too soon after Recovery, exposes himself to a cold humid Air, near stagnating Waters, in low Places, or in vaulted Churches, or to the North Winds. It must, likewise, be attributed to the greater Freedom of cuticular Excretion in the Summer, that Summer Tertians and Quartans are more easily cured, than those of the autumnal Kind; and that Quartans, which have continued all the Autumn, Winter, and Spring, go off spontaneously about the Summer Solstice, without any Medicines. And this will account for some Instances, produced by Authors of undoubted Credit, where obstinate Fevers have been cured by bare Exercise, as Running, Leaping, Riding, or by hot Baths, and drinking Wine till the Pores were opened.

So great is the Use and Necessity of Perspiration in the Cure of Fevers, that it is incumbent on us to shew, that the Bark is endued with a Power to promote it. For its astringent Quality seems adapted to produce a contrary Effect; and it is commonly thought, that it obstructs the Pores, and prevents Perspiration. But we do not ascribe an absolute and positive astringent Quality to the Bark, but rather esteem it a Corroborative, in consequence of its bitter and balsamic Principles.

For though aluminous and vitriolic Substances, Snake-root, and the Roots of Tormentil and Bistort, are very astringent, yet they prove efficacious in intermitting Fevers, if they are seasonably, and after a proper Regimen, exhibited, especially drinking a warm Decoction, or Infusion, after them, and using proper Exercise. But the Power, Nature, and Virtue of Corroboratives are far different; since these act not so much by their terrestrial and astringent, as by their balsamic and bitter Quality, upon the weakened Solids of the Body, by procuring to them Strength, Tone, Vigour, and a motive Faculty, that thus the Motion of all the vital Fluids, which principally depends upon that of the Solids, may be rendered quicker, and more expeditious, through the whole Habit; which always produces a greater Excretion of Matter, by insensible Transpiration; so that Corroboratives are much safer than Astringents. And, indeed, among the Simples of a corroborative and sub-astringent Quality, those are best and most efficacious in curing obstinate and inveterate Disorders, which have somewhat of a balsamic Virtue. Hence Decoctions of the vulnerary Herbs, such as Strawberries, Sanicle, Baum, Agrimony, Scabious, Horehound, Lung-wort, Liver-wort, Spleen-wort, Scolopendrum, Money-wort, Plantain, Yarrow, the Flowers of Daisies, and St. John's-wort, and Tree Lung-wort, have an universal and surprising Effect, not only in the Cure of Wounds, but, also, of inveterate and almost incurable Diseases, such as the Cachexy, Consumption, Scurvy, Jaundice, Spitting of Blood, and sometimes a Quartan, by depurating the Blood, opening the obstructed Viscera, and promoting the languid Excretions; they do not, however, act immediately upon the Fluids, by correcting their Disorders; but rather upon the Solids, by restoring their Tone and Vigour. Nor are we now unacquainted with the Power of Cascarella, which is hotter and less balsamic than the Peruvian Bark, in stopping excessive, and even dysenteric Fluxes; and, when properly applied, is of Service in intermitting, and, likewise, slow Fevers, which proceed from a Fault of the Stomach, or a Weakness of the Digestion.

The Peruvian Bark, then, is so remarkably salutary, that by strengthening the Tone of the Solids, it promotes the Circulation of the Blood; the various Excretions, and particularly, insensible Perspiration. Hence we learn from Experience, that by the Use of it the Strength is restored, Vigour of Body and Mind recovered, lost Appetite revived, with an absolute Cessation of the febrile Paroxysms. Other celebrated Physicians have observed the same remarkable Effects produced by it: Thus Lister, Bobmius, Sydenham, Decker, Bergerus, Jones, Merton, and D'Aquin, unanimously declare, that the Bark in an extraordinary manner corroborates the Stomach, quickens the

Appetite, increases the languid Heat of the Body, restores the Strength, and not only promotes Perspiration, but, likewise, Urine, and sometimes renders the Body soluble, especially if it be fresh. And, at last, they judiciously add, that all who have found this Effect from the Bark in Fevers, have continued free from the Disorder, and been afflicted with no Symptom or Inconvenience arising from it. But we must take notice, that these salutary Operations are not derived from the increased cuticular Excretion alone. For I have not only often observed, that, after a plentiful and continual Sweat on the intercalary Days, the Fit has nevertheless returned, without any Increase of Strength or Appetite; but am, likewise, convinced from Experience, that strong Sudorifics are not proper and conducive to stop febrile Paroxysms. For there is a great Difference between Sweat, which often proceeds from a Want of Strength, and decayed Tone of the Skin; and an augmented Perspiration resulting from a brisker and quicker Circulation of the Blood through the whole Body: This latter may be distinguished by the Vigour and Equality of the Pulse. And these Effects are not so much produced by Sudorifics, which excite an hot intestine Motion in the Blood, as by those Medicines which restore and corroborate the Tone of the Solids, Heart, and Vessels; among the Number of which Remedies, we may justly reckon the Peruvian Bark.

Nor am I of Opinion, that this Remedy alone does, at all Times and Seasons, by corroborating the Solids, increase the Circulation of the Blood, and Perspiration, in those who labour under Intermittents; but it is very necessary, that the Body should be duly predisposed, the Passages and Tubes of the Excretories open, and not obstructed by Spasms, the Humours thin and fluid, not thick, viscid, and immoveable, and the Virtues of the Remedy entire, and neither blunted nor weakened by the peccant Humours of the *Prima Via*. For the Effect of our Bark is the same as that of well-prepared Chalybeates, which, also, by corroborating the Tone of the Solids, and thus promoting an universal Circulation of the Blood and Humours, are of very great Efficacy in curing inveterate and obstinate Diseases: They do not, however, always produce these happy Effects, but only when the Fluids and Solids are duly disposed to promote the various Excretions. Since, therefore, Chalybeates, by strengthening the Solids, promote Perspiration, the Reason is evident, why chalybeated Flowers of Sal Ammoniac, as, also, those prepared with Blood-stone, duly exhibited either in Powder, or reduced to an Essence with Spirit of Wine, subtile Crocus Martis, and rusty Filings of Steel reduced to a Powder, and properly exhibited, have the same Effect as the Bark, in stopping and even removing febrile Motions; but on the contrary, prove highly prejudicial, when indiscriminately prescribed, without any regard to Time, or the Habit, Constitution, and peculiar Circumstances, of the Patient.

Hence it may possibly seem specious to urge, that, perhaps, it would be safer, and more reputable for a Physician, not only in the Cure of various Diseases, but, also, of Intermittents in particular, to abstain entirely from the Use of such Medicines, as require so exact a Circumspection, to prevent them from being mischievous; and rather commit the principal Business of the Cure to Nature, administering these only, which correct the Intemperance of the Humours, and render them sufficiently moveable and fluid. But this Practice is not always safe and beneficial to the Patient; for Experience teaches us, that Intermittents are sometimes so obstinate and stubborn, that tho' an exact Regimen has been observed, and safe and select Remedies used, which not only correct and dilute, but, also, gently evacuate, and after the Paroxysm excite a Diaphoresis, they yet continue for several Months, and sometimes a whole Year, and longer, emaciate the Body; and entirely exhaust the Strength. Besides, tho' the Violence of the Fever is in the mean time abated by these Medicines, yet on account of the great Weakness brought on by its long Continuance, and which, according to Celsus, happens in all Diseases, by any slight Error in Diet, or Regimen, gentle febrile inconsiderable Paroxysms easily return, or other Diseases, such as a Cachexy, and slow Fevers, are produced, especially if the Patient eats liberally; so that, even the Enemies of the Bark, and Baglivi himself, are forced to own, that in the End, when the Fever has for a long time preyed upon the Strength, the Bark may be used to strengthen the Stomach, and the whole Body. And certainly there are many, and those considerable Disorders, especially such as arise from a Redundance and Impurity of the Juices, which might be successfully cured without Physic, by Abstinence and Hunger alone; but as many are unwilling to undergo such a Degree of Mortification, recourse must be had to Venesection, which is far less safe than Abstinence. Care, must, therefore be taken to avoid dangerous and prejudicial Measures.

Another Argument brought by many learned Physicians against the Bark is, that its astringent and corroborating Qualities suspend the febrile Commotions and Paroxysms, but do

not remove the material Cause of the Fever, which afterwards induces Relapses, or other more terrible Diseases. But we have already proved, that the *Peruvian Bark* is of such a Nature, as, when exhibited duly, in a proper Order, and in Conjunction with other suitable Remedies, to remove the Cause of the Fever, by promoting Perspiration, and restoring the due Tone of the Solids. Besides, there are Cases, where it is expedient to check and remove, for a time, morbid, and even febrile Commotions, leaving the Cause to be afterwards subdued. For sometimes the Fits are so violent, for Instance, in a continual and double Tertian, that the Strength being consumed by Watching, and long-continued excessive Heat, the Patient becomes incapable of supporting the Disease any longer. Here then it is very serviceable, and indeed necessary to suspend these dangerous Commotions for a time, that Remedies (both of the correcting and evacuating Kind) may be afterwards more efficaciously used to remove the Cause of the Fever, because the Medicines would either do no Service, or be prejudicial, during such a violent Paroxysm of the Fever, and such a Perturbation of the Economy of the natural Motions and Functions.

But there is another Argument against the Use of the Bark, which seems to carry greater Weight with it, and which is, that many Persons, as Experience evinces, who have been afflicted with Fevers, have by this Medicine been hurried into dangerous and incurable Diseases, such as slow and hectic Fevers, Cachexies, an Ascites, and Tympanites; in Men, hypochondriac, and in Women, hysteric Disorders, and in Children, Convulsions, and Epilepsies. But, though it cannot be denied, that these dangerous Disorders frequently follow Intermittents, yet the Cause of this is not evident, and therefore deserves an accurate Examination. It must be observed then, that before the Fever the Humours and Viscera are generally disposed to those Diseases, which may, also, in some measure, be produced by an improper Regimen, Diet, and manner of living, great Perturbations of Mind, and perhaps, also, by an unseasonable and imprudent Administration of the Bark, either with regard to the Quantity, or the Time of its Exhibition; so that the Person who considers this State and Condition of things, cannot assert, that a proper Use of the Bark is the sole Cause of these bad Effects, nor even suspect it, as faithless and prejudicial.

Besides, it is sufficiently evident, that the most efficacious Remedies, such as Venesection, Emetics, Purgatives, Opiates, Mercurials, Chalybeates, Preparations of Gold and Antimony, the volatile Salts of Animals, Laconic Baths, and spirituous Medicines, if used without Judgment, are equally pernicious and fatal. But surely no one can hence infer, that they are of no Use in Medicine, and ought to be entirely rejected; but he must rather argue thus: These noble Remedies are capable of producing bad as well as good Effects; and, therefore, should be properly used. But this Reasoning is still more applicable to the Use of the Bark, which is not to be classed among the above-mentioned Medicines, which are of an highly active Nature, because they contain a certain Principle, a small Quantity of which, produces sudden and great Alterations in the Body; but the Bark acts otherwise, and whoever would see the Effects of it, must take successively a large Quantity, even some Ounces of it; and we may reasonably conclude, that the Bark is not unfriendly to Nature, because it may be very successfully given in Diseases, where the Strength is decayed, and the nervous System affected; and for this Reason it is very serviceable in strengthening the Tone of the Stomach, Intestines, and nervous Parts, not only in Fevers, but, also, as Experience evinces, in Fluxes, Vomiting, Dysenteries, hypochondriac, and hysteric Disorders, and gouty Pains.

'Tis almost universally allowed, that, when the Fever is almost overcome by the Assistance of Nature, the Bark may be successfully used to suppress habitual febrile Commotions; but that it may be safely administered in the Beginning, after the first or second Fit, is principally denied by those who think Nature prudently makes use of a Fever, as a Remedy to remove the Causes, which endanger Life, being persuaded, that the wise and salutary Design of Nature is, by this means, disturbed. But Experience, the best Master in the Medicinal Art, whose Sanction is superior to all Arguments, plainly evinces, that this Fear is unnecessary. I have known several Instances of Persons, who, being seized with an epidemic Tertian, attended with dangerous Symptoms, have been happily cured by the following Method: After the third or fourth Fit, having taken an efficacious Medicine, which purged both upwards and downwards, they took the following Day, an antifebrile Electuary of the Bark, in proper Quantities, Order, and Time. By this means, after two or three Paroxysms, they were never sensible of another Attack, but perfectly restored to Health, especially when, after the Bark, they used strengthening, stomachic Medicines, and Exercise, to promote Perspiration. And I can positively affirm from frequent Observation, that a Fever is op-

posed with more Difficulty, and requires greater Caution, when it has continued for several Weeks or Months, than when the Assault is recent; because, the longer the Continuance of the Fever, the greater Quantity of Sordes arises from the Dissolution of the Blood by the hot intestine Motion; and this larger Quantity of Sordes is, therefore, corrected and evacuated, with the greater Difficulty.

Of the same Opinion are several eminent Physicians, among whom we shall only mention *Bohnius*, who in a particular Dissertation *de Fuga Februm minus suspecta*, has confirmed this Doctrine by many important Reasons; and *Bergerus*, who, in his Dissertation *de Chinchina ab iniquis Judiciis Vindicata*, very justly speaks in the following manner: "I cannot approve of *Sydenham's* mistaken Caution in ordering, that the Bark should not be too soon given, before the Fever has in some Degree wasted itself by its own Force, lest the Patient's Life should be brought into Danger, if we should suddenly check the Motion of the Blood, cleansing itself by the utmost Efforts of a Fermentation." *Padus*, *Donzellius*, *Lifter*, *Morton*, *Jones*, and principally *Bohnius*, with more Reason teach us, "That after the Use of Evacuants, if necessary, and especially of Emetics, at the Beginning, and before the Fever has taken Root, and weakened the Juices, Viscera, and Strength of the Body, its Force is successfully lessened by the Use of the Bark. Here there is no Fear either of Relapses, or of more Disorders, which *Baglivius* ascribes to the Use of the Bark; whereas he ought rather to have ascribed these Disorders to a preposterous Cure of the Fever, and the Impurity of the Body, because both Reason convinces, and Experience demonstrates, that, by a proper Use of this salutary Medicine, both the Cause of those Disorders, and of the Fever itself, are removed; so that *Bohnius* declares, that in almost infinite Numbers, to whom he gave the Bark at the Beginning, and whom he cured, none were sensible of any ill Consequence from it.

Lastly, in order to establish and confirm the proper, secure, and efficacious Use of this Medicine in the Cure of Fevers, we shall subjoin some necessary Cautions and Admonition, the due Observation of which, will prevent any one from doing Mischief with the Bark.

The Bark, then, should not be given, till the *Prima Via* are cleansed from that Collection of peccant Humours, with which they abound; and this is best performed by detergent Salts, either alone in due Quantity, or mixed with a proper Laxative, or Emetic. Nor should the Bark be prescribed, especially in a considerable Quantity, if the Viscera of the Abdomen are obstructed or infarcted with Blood and Humours, before these Obstructions are opened, and the Infarction removed; which Intention is best answered by drinking mineral Waters, by neutral and bitter Salts, obtained from hot and cold medicinal Springs, by Preparations of Rhubarb mixed with Salt of Tartar, or the *Terra foliata Tartari*, by Broths boiled with aperient Roots and Herbs, and by proper Motion and Exercise of the Body.

Nor is the Cure of an Intermittent to be undertaken by the Bark in a manifestly plethoric, cacochymic, cachectic, and hypochondriac Patient, or when the critical Evacuations of Blood are suppressed; but it is far better by seasonable Venesections, by temperate balsamic Elixirs, by the *Pilula Balsamica Polychrestæ*, and the Interposition of bitter neutral Salts, to remove Obstructions, and employ the febrile Commotions, which ought never to be suddenly checked, as Medicines adapted to remove these Disorders.

Greater Caution is necessary, if the Patients to whom this Febrifuge is to be given, have their Strength and Blood exhausted; if they are obnoxious to exorbitant Passions; if they are old; and if the Fevers themselves approach to a continual hectic, or a slow Fever; if there is an excessive Costiveness; if the Urine is limpid, and without any Sediment; if the Hypochondria are tumid, and an autumnal, or winter Fever, has already been long protracted; for, in such Cases, it is more expedient to moderate the febrile Commotions, if there are any, by gently evacuating and corroborating Medicines, till at last, as it frequently happens, the Fits spontaneously cease, either by a Change of Place, a more exact Regimen, and Method of Living, or a wholesome, light, serene, and warm Air.

Since it is of great Importance to the proper and salutary Use of the Bark, in what Form, Dose, Season, and under what Regimen, it is exhibited; we must observe the following Cautions: 1. As to the Form, we ought above all to choose a pure, solid, well-tasted Bark, without any musty, vapid Smell. This, being reduced to a very fine Powder, is most commodiously given in Substance, without any Addition, in any proper Vehicle. But, if any one abhors the Powder, it may be made up into an Electuary with Water and Sugar, and then swallowed. I can positively affirm, that I have found the Bark, given in this plain Method, better, and more effectual, than when mixt with many

many other Ingredients, and reduced into a Variety of Forms. When there is a manifest Weakness of the Stomach, accompanied with a Loathing of the Powder, it may be infused either in Water or Wine, edulcorated at Pleasure, prepared with a little Cinnamon to render it palatable, and which may be drank either warm or cold. Besides, if the Fever is of the bilious Kind, attended with great Heat, it is better to give the Powder mixt with a fourth Part of purified Nitre. But when, from a Suspicion of an Obstruction and Infarction of the Viscera by viscid and crude Humours, its too strong Astringency is to be dreaded, whether it is given in a solid or a liquid Form, lixivial Salts must be added, especially those of the alkaline Kind, which powerfully correct and subdue the astringent Quality of the Bark. For answering this Intention, a most secure corroborating and antifebrile Liquor may be soon prepared, by boiling an Ounce of the Bark with two Drams of Salt of Tartar, in a Pint of Water diluted with Wine. I have, also, used the following Electuary with very great Success:

Take of the Rob of Elder, one Ounce; of *Peruvian Bark*, six Drams; of the Extract of common Chamomile-flowers, of depurated Nitre, and of diaphoretic Antimony, each one Dram and an half; and of the Julap of Roses, a sufficient Quantity.

2. As to the Dose of this Specific, it is never to be given in an excessive Quantity, such as a Dram or more at a time; but it will be more adviseable to give, at different times, one or two Scruples only on the intercalary Day, after the Fit, every three Hours, drinking after it a sufficient Quantity of Water, Decoction, Broth, or Beer. It may, also, be exhibited with the Aliments. But Motion and Exercise are very great Assistants to the Operation of this Medicine, as they promote Perspiration, which is very conducive to the removing a Fever, and preventing a dangerous Stricture of the Solids, or a Coagulation of the Humours.

3. As for the Time, we ought to persist in this Method of Cure, at least for a Week: Then the Fever being gone, and the Appetite returning, a Dose should be taken once every Day, and after that every other Day.

There are still further Cautions to be observed in the Use of the Bark in intermitting Fevers: For,

1. During the Use of this Medicine, if the Patient is costive, his Body must be rendered soluble, only by an emollient and gently stimulating Clyster; but not by Purgatives, for fear of a Relapse, because, by the Use of these, Perspiration is obstructed, and the Afflux of the excrementitious Humours recalled to the Intestines. But afterwards Manna with Cream of Tartar may be used, as, also, my balsamic Pills, or those of *Stahl*, or *Becher*, with some aperient Salt, given at proper Intervals, during the Intermission, and towards the End, of the Disorder, in such a manner, however, that after the Use of these Laxatives, a Dose of the Electuary may be again given.

2. When the Fever is gone, the Body should be kept in a free Perspiration; for which Reason, cold Air, North Winds, and all external Cold, together with moist and low Places, are to be avoided; and bitter stomachic and corroborating Elixirs, such as my balsamic Elixir, must be used; which being taken in the Morning, or at Noon, not only contribute greatly to strengthen the Stomach, but, also, to promote Perspiration.

I must now briefly mention the Fate this Dissertation has met with. There was published at *Frankfort upon the Oder*, a Dissertation, directly opposite to ours, wherein the well-known Author, out of a Spirit of Contradiction, very positively asserts, and supports the Assertion with idle trifling Arguments, that the *Peruvian Bark*, though used with the utmost Caution, is a faithless, dangerous, and noxious Medicine. I thought it not worth my while avowedly to oppose this Writer, because the Judicious and Skilful in the Healing Art will soon discover the Weakness of his Argumentation: For the sake, however, of young Physicians, who are easily confounded by a Diversity of Opinions; I have been induced to make some Remarks on that Performance.

The whole Weight of the Reasoning in this Dissertation is founded on the famous *Stahlian Hypothesis*, which is, that the rational Soul produces these febrile Commotions for a salutary End, in order to eradicate the Cause of the Fever out of the Body; and that they are, therefore, by no means to be suppressed, especially by Astringents; among which the Bark is certainly to be classed. But, as I had in this Dissertation previously overthrown this Opinion, I am the more surprised, that the Author should, upon a bare precarious Hypothesis, totally deny, and utterly reject, the Truth of Facts, vouched by the Authority of the most celebrated Physicians of all Nations in *Europe*, and which palpably evince, that the *Peruvian Bark* may be successfully and safely used in chronical Fevers,

which can be cured with no other Remedy. For it is a very unphilosophical Procedure, to judge of Experience, and measure the salutary Use of a Medicine, by imaginary Hypotheses, and the pageant Force of abstract Reasonings, since we should rather inquire first into the Truth of a Fact, and then examine the Reasons, and by these means establish the Hypothesis. Let this great Author, therefore, as it is incumbent on him, demonstrate, that the Bark, even cautiously and circumspectly given, has, without Distinction, and at all times, been detrimental in Fevers. As for my own Experience, in above fifty-five Years Practice in different Places, and particularly in *Westphalia*, where the Inhabitants are plethoric, I dare confidently affirm, that neither incurable Diseases, nor Relapses, have occurred to me, from giving the Bark prudently, and not in too great a Quantity, especially, if it was exhibited under a proper Regimen; so that I have rather observed the evident and secure Effects of it. I have myself been three times afflicted with a very obstinate intermitting Fever; and, after a fruitless Application of all other Remedies, was perfectly recovered by a proper Use of the Bark alone; whereas the Cures of intermitting Fevers, undertaken by other Physicians without the *Peruvian Bark*, or that of *Cascarilla*, have more than enough convinced me, that the Patients have not only been racked for a long time, but often hurried into violent chronical Distempers; and, what is very surprising, these very Contemners of the Bark have at last been obliged to have recourse to it, as their only remaining Refuge.

But, in order to shew from Reason, whether, as is falsely asserted, the Bark, even properly used, by its astringent Quality, depresses the febrile Commotions, without removing the Cause of the Fever, it will be necessary to examine very closely into the Manner of its operating. The Bark, then, contains fixed, terrestrial, astringent, and bitter Particles, by which it exerts its antifebrile Virtue. But who in his Senses does not perceive, that in these Principles of the Bark there is a natural Remedy, if properly used, to infringe the subtle caustic Acrimony of the Bile in the *Prima Via*, from whence epidemic Tertians principally arise, before it is convey'd to the Mass of Blood, or from thence to the Nerves, and throws the whole nervous System into violent spasmodic Contractions? Further, since every one allows a strengthening Principle in the Bark, which binds up the relaxed Parts, and corroborates those that have lost their Tone, it is not to be wonder'd at, that from the Increase of Perspiration, especially on the intercalary Day, the remaining Sordes, which afford Matter for a new Paroxysm, should be entirely evacuated, and the whole Impetus of the Fever, by this means, destroy'd.

Now we readily grant, that this Medicine will prove very detrimental, and even bring on worse Diseases, if improperly administered, without any regard to an accurate History of the Distemper, the Constitution of the internal Parts, the Cause of the Fever, and other morbid Dispositions and Circumstances, as the Time, Order, and Dose, in which the Medicine is exhibited. But, since it is unreasonable to argue in the manner I have already mentioned, it necessarily follows, that the Bark, when properly applied, is beneficial, and, when improperly, pernicious; for, if the Bark, given in large and too frequently repeated Doses, finds Obstructions of the small Vessels in the Viscera, and a Redundance of viscid Humours in a Body disordered through the dull and languid State of the moving Fibres, in this Case, by its astringent and incrassating Quality, it may increase the Distemper, and excite violent chronical Diseases.

Thus much I thought proper to say at present, to convince every one, that the Bark is not so dangerous and terrible a Remedy in Fevers, and other Distempers, as some imagine, but safe, efficacious, and innocent, especially in the Hands of one, who administers it with Judgment and Reason; and that the bad Effects of it do not proceed from the Medicine itself, but should be deservedly attributed to the improper Use of it, or the Errors of the Patient, or a Neglect of removing the peccant Reliques. However, I would advise those, who are not complete Masters of the Healing Art, to refrain wholly from all heroic Medicines, and even the Bark itself, lest they should do more Injury than Good. *Hoffman*.

Mr. *Rusworth*, a Surgeon, in *Northampton*, sent a printed Letter to the Master and Governors of the Surgeons Hall in *London*, dated *October 18. 1731*. in which he gives the following Account of his using the Bark in Mortifications.

In the Year 1715, I was sent for to a Man who had a Mortification on the Foot, from an internal Cause. The Fever was very high, attended with an irregular Pulse, as is usual in that Case. I made deep Incisions in the mortified Part to the Bone, and scarified all around as far as there was any Inflammation, and used the common Applications; upon which the Fever abated, the Pulse became not only calm, but, also, regular; and in a few Days I had a Digestion at the Edges: I was obliged to leave it

it to the Care of an Apothecary; but in a short time I was sent for again, the Fever being returned, and the Part mortified higher: I used the same Method as before, with the same Success; but all the former Symptoms returned the third time; but, upon repeating the same Method again, ceased. I thought it to no Purpose to take off the Leg, having too often found Returns after it, the Fault being in the Blood and Juices. But Providence now first directed me to order the Bark in this Case (while there was a Remission of the Fever); it answered beyond what I expected, the Fever no more returned; the Leg was taken off; and I saw the Person well and lusty many Years afterwards; and I have since several times had the Experience of the good Effects of it in the like Cases, which has been no small Satisfaction to me.

Mr. Rushworth reprinted this Letter, adding another to Serjeant Amyand, dated August 5. 1732. in which he says, I beg Leave just to mention, that leaving off the Bark too soon, a Patient of mine had a Return of the Mortification, in about five Days time; but, scarifying, and repeating it, I presently had the good Effects of it again, and she is now perfectly recovered; and though she had a very ill Habit of Body before, is now much better than she had been for several Years, and her Looks shew it to all that knew her before, though she is fifty Years of Age. In Page 35. of the same Pamphlet, he says, It is necessary, that I intimate to all Surgeons what I have mentioned to our Company, that I would not be misunderstood by my printed Letter, as if the Bark would answer in Mortifications from all internal Causes; for in some it is not proper, as Surgeons may easily suggest to themselves.

In the same Pamphlet is a Letter from Serjeant Amyand, dated July 29. 1732. giving Mr. Rushworth the following Account of his Success in exhibiting the Bark in Mortifications.

I am now to acknowledge yours of the 17th Instant, and to acquaint you, that from your Example, I have given the Bark in all Mortifications with such Success, as has encouraged the Gentlemen you mention, to administer it. I have now under my Cure a Gentleman of Seventy-eight, who owes his Life to that Medicine. His Case was at first a Gangrene after a Phlegmon; the usual Means seemed to have removed the Danger; but the Fever continuing without Remission or Intermission, a Sphacelus soon appeared, of which nothing stopped the Progress, till the Bark was used; and in twenty-four Hours, or less, the Separation began, with a laudable Pus. The same thing happened to a few, whose Sphacelus had got Ground for three Weeks, in spite of all Means, where several Surgeons were concerned.

I have now used it in seven Cases, the Circumstances in each being different; and yet, in all, the Bark has taken Effect; even within these few Days, to Mr. Delenor, who kept the Bagnio in St. James's-street, in whom a Mortification happened after several Punctures in dropsical Legs. The Bark stopped the Progress in less than twenty-four Hours, and the Sloughs began to separate; but the Patient having a Jaundice, and being spent with Evacuations, it revived, and came to the other Leg; of which though he died, yet the Power of the Bark was so plain, that from this and the other Cases, I think it is evident, that we may be as sure of getting the better of, or at least of stopping a Mortification from an internal Cause by the Bark, as conquering an Ague thereby. I am, &c. Claud Amyand.

Mr. Rushworth gave the Bark in the Remission of the Fever, Mr. Amyand, in the Height of a Fever, yet it had the same Effect; which shews the Difference between these Sorts of Fevers and Agues; in which last it is known to every body, that the Bark does Harm, if given in the Fit. Mr. Rushworth says, the Bark will not answer in all internal Mortifications: Serjeant Amyand asserts from Experience, that it will answer in all internal Mortifications. Mr. Rushworth discovered this extraordinary Effect of the Bark in the Year 1715. and communicated it, as he says, to several Physicians and Surgeons; yet we never heard any thing of it, till it was lately brought into Practice by Serjeant Amyand. Neither Serjeant Amyand, nor Mr. Rushworth, have given any Account of the Dose they gave of the Bark, how often they repeated it, or how long they continued it.

Mr. John Douglas gives the following Case, by way of Instance, of the Effects of the Peruvian Bark in Mortifications.

April 22. 1732. I was sent for about fifteen Miles out of Town, to visit a Gentleman a little turn'd of Fifty, where I met Dr. Newington, of Greenwich, and Mr. Wade, Surgeon and Apothecary, of Bromley. Upon Examination, I found the Back of his Right Foot mortified near the middle Toes, about the Breadth of a Shilling, the Small of the same Leg being pretty much tumefied, and pitted a little in some Places; his Pulse quick, and his Tongue dry. Upon Inquiry, whether he had received any Bruise, Wrench, or Wound, he answered,

Not, as he remembered; but some Persons about him talked of a strait Shoe, which he had complained of some time before, which there was no Stress to be laid on: Therefore, we were all of Opinion, that it proceeded from an internal Cause. The Dressings being prepared, I began to scarify on the mortify'd Part, and cut to the Bones without giving him any Pain. I then continued the Incisions through the Skin all over the Back of the Foot, which was a little tumefied, without his discovering the least Sense of Feeling; which did not a little surprize me, the Skin looking perfectly fair: I then went on all over the fore Part of the Small of his Leg, whence we had a considerable Discharge of a Sort of a bloody Water, but there was still no Sensation: Therefore, I proceeded as high as the Gartering below the Knee, when he began to complain a little, and pure Blood followed the Knife. His Limb was then well stuped with a strong Fomentation, and the Wounds dressed with Pledgets armed with Digestive, and dipped in hot Oil of Turpentine; over them was applied a Poultice made of Oatmeal, stale Beer, and London Treacle.

He was then carried to Bed, and the Doctor wrote thus:

Take of Raleigh's Confection, half a Dram; compound Powder of Crabs-claws, and the Root of Virginian Snake-weed, half a Scruple; the Confection of Alkermes, a sufficient Quantity to make the Whole into a Bolus; to be taken every fourth Hour, drinking after it four Spoonfuls of the following Julap.

Take of the Waters of Milk, black Cherries, and Treacle, each three Ounces; of the Syrup of Saffron, six Drams: Make them into a Julap.

Let him drink plentifully of Whey, and alterative Treacle-water.

As soon as we withdrew into another Room, the Company asked me, What I thought of the Gentleman's Case? I told them, I thought he was in very great Danger, not only as it proceeded from an internal Cause, but because it had spread so far in so little time.

April 23. Serjeant Dickens, and Mr. Cheselden, having been sent for, came down this Morning; and, after they had seen and examined the Patient, they told him, that every thing had been done for him which was proper; that the Progress of his Disease appeared to be stopped, and that he had nothing to do but to go on in the same Method.

The 24th, his Pulse was much the same as before, and the Mortification did not seem to spread.

Dr. Newington wrote as follows:

Take of Raleigh's Confection, and Lapis Contrayerva, each a Scruple; Syrup of Saffron, enough to make them into Bolus; to be taken every fifth Hour, drinking after it four Spoonfuls of the Julap above prescribed:

April 25. his Fever was high, his Tongue dry, and the Mortification began to spread a little. I scarified it deep, and dressed warm.

On the 26th, I could not perceive, that the Mortification had made any further Progress.

The Doctor wrote thus:

Take of the common Decoction for Clysters, eight Ounces; Oil of Chamomile, and Syrup of Violets, each two Ounces: Inject this Clyster in the Evening.

Take of the compound Powder of Crabs-claws, a Scruple; English Saffron, and Raleigh's Confection, each half a Scruple; Syrup of Cloves, enough to make them into a Bolus; to be taken every sixth Hour, drinking after it four Spoonfuls of the following Julap.

Take of alexiterial Milk-water, and Mint-water, each four Ounces; of Treacle-water, three Ounces. Syrup of Saffron, six Drams: Make them into a Julap.

The 27th, his Fever increased, and the Mortification spread across the Toes, towards the Ball of the Foot, which I scarified deep, and dressed as before.

On the 28th. the Mortification still got Ground; therefore I had recourse to the actual Cautery, with which I burned, where-ever it was corrupted.

Next Day I found no Benefit from the actual Cautery; for the Mortification increased; so that I told those about him, I had no Hopes of his Life. They immediately replied, What! Would not taking off his Limb save him? No, I said, I did not think it would; but advised to send for the two Gentlemen they had consulted before.

QUI

On the 30th, in the Morning, Dr. Newington, Serjeant *Dickins*, Mr. *Chefelden*, Mr. *Wade*, and myself, met in his Chamber; and found his Fever very high, and his Tongue excessively dry, his Visage wild, a great Drought upon him, very restless, the Mortification spread as far as the *Tendo Achillis*; and he complained, also, of an Hardness and Pain in one Side of his Belly. After withdrawing, we were all of Opinion, that taking off his Limb would be of no Use; and that, in all Probability, he could not live twenty-four Hours longer.

Upon this, Serjeant *Dickins* advised the Trial of the Bark, which he said had been highly recommended to him by Serjeant *Amyand*, in such Cases. Mr. *Chefelden* was of Opinion, that it would do no Harm; but added, that he had never heard of its being serviceable in such Complaints; nor did he believe that this, or any other Medicine, would succeed, in the present Case. Since it was the extreme Remedy, I was for having it given as soon as possible. That Evening it was given, in the following manner:

Take of the finest Powder of *Peruvian Bark*, half a Dram;
Confection of *Alkermes*, enough to make them into a Bolus: To be taken every fourth Hour.

May 1. I returned about Noon, and found a surprising Alteration to the better: His Pulse was calm, his Tongue moister, the Wildness of his Countenance gone, and he said he had rested much better than any other Night, from the Beginning of his Disorder. When I opened his Leg, I found the Mortification had made no further Progress; he had then taken but four or five Doses of the Bark.

Next Day he was still better, and we had a small Discharge from the Sore: He had five or six small Stools, but we stopped the Purging, by adding three Drops of liquid Laudanum to each Bolus of the Bark.

On the 3d I found two large Abscesses formed, one on each Ankle: The innermost being biggest, I opened it first, and had about four or five Ounces of good Pus; then I opened the other, and found near the same Quantity of Matter: I could now thrust my fore Finger, with Ease, through, from the internal to the external Wound, between the *Tendo Achillis*, and the Bones of the Tarsus, notwithstanding the outermost Tumor subsided but very little after opening the innermost.

Thus the Violence of the Fever being taken off by the Bark, Nature was enabled to form these Abscesses, which was an infallible Sign that the Progress of the Mortification was stopp'd. We then order'd the Bark should be given only every six Hours.

Next Day I found his Pulse higher, his Tongue a little dry, and the Discharge rather less than the Day before; therefore we ordered the Bark to be given every four Hours, and a Glas of Madera Wine after it.

On the 5th I found his Pulse regular, the Digestion plentiful and laudable, his Countenance serene, with other favourable Symptoms; but the next Day I found him very uneasy, and his Pulse quicker; and, upon Inquiry, I found this Alteration proceeded from his Mind being ruffled by his Lawyer, about his Will.

On the 7th I found the Symptoms favourable; on the 8th his four little Toes being entirely mortified, I cut them off; and, next Day, I cut off his great Toe, and desired him to eat and drink more freely.

On the 14th every Symptom continued favourable, the Discharge from the Wounds was plentiful and laudable, a total Separation was now made between the living and the dead Parts, and the Sloughs were hanging, like Tatters.

On the 18th he had two large Stools in the Morning, and a great Discharge from his Wounds, which I thought weakened him; therefore we ordered a Mixture, with *Confectio Fracastorii*, to be taken, in case he had any more Stools; and, also, to add liquid Laudanum to his Boluses of the Bark.

On the 20th I laid open a large Sinus above the inner Ankle. On the 24th Mr. *Wade* and I agreed to give him the Bark every six Hours only.

On the 28th they shewed me an oedematous Tumor on the Back of his other Foot, upon which, we ordered him to take no more Bark, and drink a little more freely of Wine. He had now taken the Bark every four Hours for twenty-three Days, and every six Hours for five Days, in all, about ten Ounces.

Next Day I ordered his Left Foot to be washed well with hot Water, Bran, and Soap, every Morning, to get off the Dirt, and scaly Foulness, which obstructed Perspiration: We, also, ordered him some bitter Draughts, to be taken three times a Day.

On the 30th I found the oedematous Swelling of the Left Foot lessened; and I designed to have purged him, but that he had two or three natural Stools: Next Day I found him hearty, and the Wound in good Order; therefore I took off the Bone of the *Metatarsus*.

QUI

June 2. an old Gentleman, who came to visit him, took a great deal of Pains to prejudice him against our Proceedings. On the 3d I found an Impostumation about the fore and middle Part of his Leg; but I was obliged to bring Serjeant *Dickens*, next Day, to persuade him to suffer it to be opened, with which he did not comply without Reluctancy. I made an Incision about two Inches long, and had a Discharge of three or four Ounces of Matter. On the 5th I carried him some Spaw-water, to drink with his Wine.

On the 7th I cut off another of the metatarsal Bones; and, on the 9th, I cut into the Joint of one of the metatarsal Bones, to hasten its Separation. On the 15th I cut into the Sloughs in the Foot, and let out a great deal of viscid Matter; and then snipp'd off all the loose Rags of Sloughs; upon which, I discovered a large Fungus, which had thrust forth under the Sloughs, from the tarsal Bones.

On the 16th I cut off the Remainder of the metatarsal Bones, and sprinkled the Fungus with red Precipitate. On the 19th I perceived the Tibia bare about the middle; a large Sinus, and a considerable Discharge: The Sinus I laid open on the 21st, and on the 22d I laid open a small Sinus on the Back of his Foot. There was a large Discharge from his Wounds, which weakened him, and lessened his Appetite. The next Day the Discharge was very fetid, and in too large a Quantity; and, on the 24th, it seemed rather to increase, and his Strength to decrease: Nevertheless, I laid open two more Sinuses. On the 25th the Discharge still increased; however, I laid open one more Sinus.

The Ulcer now reach'd from the Origin of the Soleus, just below the Knee, all along the Inside of the Tibia, as far as the Heel, being in some Places very broad, and in others very deep; all the Bones of the Toes and Metatarsus were gone, and all those of the Tarsus carious. I now suspected that the Tibia was carious further than we perceived it, which might be the Cause of that great and constant Discharge; and I thought that he could not bear so large a Drain long, and that it was better to have his Limb off, before it was too late: But, on the 27th, I was much pleased, to find the Discharge considerably lessened, and could discover no more Sinuses: We, therefore, agreed to proceed as before, only to dress twice a Day, for some time.

On the 28th I found the Ulcer in good Order, and the Discharge lessened.

July 1. we ordered an Infusion of the Bark to be taken twice or thrice a Day. On the 8th he was carried out into his Garden, for the first time, in his three-wheel'd Coach, for the Benefit of the Air. On the 12th I took off the *Os Cuboides*, and the three small Bones of the Tarsus. On the 16th I separated the *Os Naviculare*, and left only the *Astragalus* and *Os Calcis*.

August 5. I cut off, with a Knife, that large Fungus which sprung from the *Os Calcis*, and had plagued him so long, and then applied the Actual Cautery to stop the Blood, and consume the Roots of the Fungus. Before this, I had tried red Precipitate, Roman Vitriol, Butter of Antimony, and even the Potential Cautery, several times, one after another, but could not destroy it.

On the 29th, Part of the *Os Calcis* came away.

Sept. 4. I took away the *Astragalus* whole, and the Remainder of the *Os Calcis*, as I thought: When these two Bones came out, they left a Hollow big enough to receive a Duck's Egg; the back Part was form'd by a horny sort of Excrecence, which seemed to spring from the *Tendo Achillis*, the fore Part of it, by the Remainder of the Flesh which made the Back of the Foot, and the upper Part by the hollow End of the Tibia: A good deal of Blood follow'd these Bones, therefore I cramm'd this Hollow full of Lint, and roll'd it up tight.

On the 6th I cut off this large horny Excrecence (which made a Half-Moon round the End of the Tibia) with a Knife; there was no Appearance of any Bone in it, yet my Knife stopp'd, when about half way through, which surpris'd me a little, because I concluded the *Os Calcis* was entirely gone, yet there was a pretty large Piece of it in the middle of the Fungus. I, therefore, cut a little higher towards the *Tendo Achillis*, and it separated, with Ease, all round. It bled very fresh, so I ty'd one Vessel, which spurted out, and stopp'd the rest with the Actual Cautery, which, at the same time, consumed the Roots of the Excrecence. It was very remarkable, that the End of the Tibia was not carious, notwithstanding these foul Bones had remained there so long.

On the 13th I found all the Sloughs separated, the End of the Tibia covered with a fine grainy Flesh, the Lips thin, and the Discharge moderate and laudable.

By Nov. 8. the long Ulcer, which reached from his Knee to his Heel, was perfectly cicatrized; and though all the Bones of his Foot were taken, yet the Ulcer, on the End of the Tibia, was not above the Breadth of a Shilling, and, otherwise, very favourable.

favourable. I then ordered a wooden Leg to be made for him, to clap his Knee on, and walk about for Exercise, until this little Ulcer should be cicatrized.

Mr. Samuel Lewis, aged Seventy-six Years, of a pale Complexion, and choleric Constitution, a lusty, and, seemingly, a very healthy Man, having but little Sickness from his Youth, shewed me an Inflammation of his Left Leg, extending from an Issue he had below his Knee, down to his Ankle, and all round his Leg, partaking of an Erysipelas and Oedema. I threw out the Pea from his Issue, and endeavoured, by discutient Fomentations, Embrocations, and Cataplasms, with Bleeding, and lenient Purges, to mitigate the Inflammation, but to no Purpose; for I found it tending, very fast, to a Gangrene: His Leg, from an intense red, turned livid black; Blisters arose, &c. I would have scarified it, but was not permitted.

On the thirteenth Day the Tumor was sunk, his Leg black and dry, his Pulse quick, with frequent Intermissions; his Countenance wild, his Tongue hard, parched, and dry: He would not permit the necessary Incisions to be made. With the Consent of Dr. Anthony Weaver, a Gentleman of great Charity, Humanity, and Learning, I prepared eight of the following Draughts:

Take of the Powder of the best *Peruvian Bark*, half a Dram; of the Water of Black Cherries, one Ounce and a half; and of the Syrup of Saffron, half an Ounce: Mix, for a Draught.

One of these Draughts I gave him about Noon, and order'd, that he should continue to take one every four Hours.

On the fourteenth Day, about Ten in the Morning, by which time he had taken three Drams of the Bark, I found his Tongue moist, his Countenance not so wild; and, examining his Leg, found it impostumated, from a little below the superior Tubercle of the Tibia, down to the Small of his Leg; a little above which I saw a small Aperture, with a little Matter oozing from it. I told him, he stood a very fair Chance for his Life, if he would submit to the suitable Means. With his Allowance, I immediately entered the Probe-point of my Scissars at the Aperture, and cut upwards, as far as it was hollow; then turned them, and cut downwards, as far as the Cavity ran, and discharged between three and four Ounces of a well-digested Pus; and, after fomenting very well with a Decoction of the warm Plants in a strong Lixivium of Wood-ashes, Sal Ammoniac, and camphorated Spirits of Wine (which I had used from the Time I suspected it would mortify), I dressed the Incision with equal Parts of Basilicon and *Linimentum Arcaei*, spread upon a Doffil dipped in hot Oil of Turpentine, with a Cataplasma of Oatmeal, Flowers of Centaury, and Chamomile, of each equal Parts, with the Fomentation and Oil of Chamomile over all. He found an agreeable Warmth about his Leg, after the Dressings were applied.

On the fifteenth, I found him very cheerful, and discovered a large Sinus betwixt the Soleus and *Gastrocnemius internus*; I laid it open, and discharged about the same Quantity of well-digested Matter as Yesterday: There was a very large Slough in the former Incision, which I cut off, and dressed as before.

The sixteenth he had been very restless all Night, his Pulse irregular, his Tongue rough and dry, with Flushings in his Cheeks. Inquiring if he had taken his Draughts regularly, I was told he had not, through the Attendant's Drowsiness: After reprimanding them for that Neglect, and cautioning him about it for the future, I opened his Leg, and found the Discharge large, a fungous Flesh rising in the first Incision, which I sprinkled with red Precipitate, and dressed as before; and, by reason he had not a Stool since the fourteenth, I ordered him a common Clyster, which brought away some harden'd Excrements: At Night, his Heat and Flushings were not so great, and his Tongue was moister.

The eighteenth, being wearied of his Draughts, I ordered thus:

Take of the Powder of the best *Peruvian Bark*, half an Ounce; and of the Confection of Alkermes, one Ounce: Mix together, and divide into eight Boluses; one of which is to be taken every fourth Hour, drinking after it three Spoonfuls of the following Julap:

Take of Milk-water, and Black Cherry-water, each four Ounces; of Rue-water, half an Ounce; of the epidemical Water, two Ounces; of the Tincture of Saffron, prepared with the Aqua Theriacalis, one Ounce; of the Confection of Alkermes, two Ounces; and of the Syrup of Cloves, two Ounces: Mix all together.

I observed Matter lodged in the *Gastrocnemius internus*, almost to the Back of the Leg; I opened it in the most depending Part, but had not the Discharge expected.

On the twenty-first Day, Compresses and Bandages were applied, to unite that Cavity, and prevent the Matter from lodging in it.

On the twenty-second, a Sinus, running towards the Small of his Leg, opened.

On the twenty-third, he complained of a Pain in his Side, and had a restless Night: I dressed the Ulcers only with dry Lint; the Cavity above-mentioned inclined to unite.

On the twenty-fourth he was very much dejected, but I could not apprehend the Reason of it; every thing appeared in good Order.

On the twenty-fifth he shew'd me a Swelling in his Groin, with great Hardness and Inflammation reaching down: the Inside of his Left Thigh, extending to a pretty large and insensible Tumor a little above his Knee, which he found gradually to increase since the fifteenth Instant, but did not speak of it before, lest he should (as he expressed it) be cut there. I applied an emollient Plaster over it, and was apprehensive he would have a very large Abscess, which would exhaust him: There was very little Discharge from his Leg.

Till the thirtieth Day his Fever increased, with an irregular Pulse, great Drought, and a Dryness of the Tongue, notwithstanding he continued the Use of the Draught or Bolus, as before; very little Discharge from his Leg, the Ulcer appearing livid. I fomented well, and applied the warm Digestive, as above. The Swelling in his Groin very much increased; the Inflammation decreasing, I felt Matter to fluctuate, but deep; the Tumor not very painful. Not having a Stool for several Days past, I gave him a lenient Purge, by which he had a very large Stool of black and very fetid Excrements.

On the thirty-first, the hard insensible Tumor above his Knee was of a livid Colour, and that in his Groin rising towards a Point near the Inguen, inclining to the Inside.

On the first and second of February, instead of Matter, there was a Discharge of clotted Blood from his Leg: I dressed with the warm Digestive.

On the third, the Pus was laudable, the Tumor in his Groin considerably raised; he took a lenient Purge, which gave him one Stool, not having had one since the thirtieth of last Month.

The eleventh; to this Day his Fever continued, but not in any Degree, and his Pulse was irregular; a white Pustule appeared on the most prominent Part of the large Tumor in the Inguen, which I cut, and then entering the Point of my Probe-scissars, cut about an Inch in Length near his Groin: Well-digested Matter gushed out, as from a Cock, and in as full a Stream, sometimes streak'd with Blood: I took from thence, at least, three Pounds. His Leg begins to cicatrize.

On the twelfth, a large Discharge about the Bed, from the last Incision, and a large Quantity of Matter that fell below the Orifice, yet in the Cavity on the Inside of the Thigh. I applied a Caustic on the lowest Part, and discharged from thence about half a Pound; I, also, open'd that Tumor near his Knee, and discharged an Ounce of well-digested Pus.

On the nineteenth I opened another Sinus on the Inside of his Leg, and discharged thence only several Clots of Blood. From this time the Discharge from his Thigh gradually lessen'd; that very large Sinus united, by means of Compress and Bandage; his Fever left him; and he did not use his Medicine since the Fourteenth Instant; in which Time, in Draughts and Boluses, he had taken between ten and twelve Ounces of the Bark, which, being continued so long, and regularly, I believe assisted Nature to expel her Enemy in that very large Abscess in his Thigh, which, otherwise, might, notwithstanding the Mortification was stopp'd in his Leg, have seiz'd it again, or have fallen upon some more noble Part, and occasioned his Death; after which, I made him a Decoction of the most agreeable Bitters, by which means, he recover'd a good Appetite, and, in a short time, was able, with a little Assistance, to walk down Stairs, and any-where else in the House, with a Staff only; and, on the twenty-fifth of March, he walked to my House to be dressed, which is near a Quarter of a Mile; and, about a Week afterwards, went to his Work as usual, (which is mending Shoes) his Leg giving him very little Disturbance. In the Day it swells considerably; but, when he rises, in the Morning, is of its natural Size; for which I order'd a laced Stocking. His Thigh is strong, and firmly cicatrized; as, also, is his Leg; and the Man enjoys good Health, and is every Way as fit for his Work as he was before his Illness.

A Surgeon of Glasgow, of a very bad scorbutic Habit of Body, about forty Years of Age, had a little Pimple on the middle of the Under-lip, which his Barber cut the Top from, in shaving him, on Saturday the ninth of February: the following Evening, upon going out to the cold Air, the Pimple swelled, and turned hard, with an Inflammation all round it, which increased the Monday following: He applied an antiphlogistic Fomentation, with Spirit of Wine camphorated. Notwithstanding the frequent Use of these for four or five Days following,

following, and his being twice blooded, the Inflammation, Hardness, and Swelling, increased considerably, extending itself to the Angles of his Mouth, and some way along the Cheeks, and all round the Chin, with great Pain, and with vast Disorder through his whole Body.

On Friday the fifteenth, at Eleven at Night, a small black Spot, about the Bigness of a Herring-scale, appeared (not where the Wound was, but) on the middle of the red Part of the Lip, which spread so fast, that, by Eleven next Forenoon, it cover'd near one half of his Lip, that then began to stand out much; when a Consultation, of almost all the Physicians and Surgeons in Town, was called, who advised the Continuation of the Fomentation and Spirits, as before, and a Decoction of the Woods. For two or three Hours the Mortification continued to spread, till it had covered almost his whole Lip, reaching inwards, and downwards, to the Gums, the Hardness and Swelling of the neighbouring Parts increasing. Upon this, he was advised to try the Powder of the *Cortex Peruvianus*, half a Dram for a Dose. He took the first Dose betwixt Three and Four o'Clock Afternoon, and his Lip was dressed at Ten at Night, when the Mortification did not appear to be increasing, at least the Increase was very inconsiderable: He then took another Dose of the Bark. Towards the Morning of the seventeenth his Lip was again fomented, and he took a third Dose of the Bark: At Ten of the Forenoon I dressed it, and found the Mortification had made no further Progress since last Night: At Night I dressed it again; and then, for the first time, observed something like an Appearance of Suppuration at the Place where the Wound, or, rather, Pimple, was; but none at all on the mortified Part. That Night he took another Dose of the Bark, and continued to take two Doses, one in the Morning, and another in the Evening, for two Weeks.

The Fomentation and Spirits being applied twice a Day, and a little Emulsion given him for Drink, without any other Medicine than the Bark, the Suppuration succeeded well in the mortified Parts on the third Day after he began to take that Medicine; upon which, proper Digestives, and other Dressings, were applied. The Sloughs cast off very well; the Hardness and Swelling went off; and, in twelve or fifteen Days, the Lip healed up, though with a considerable Contraction, by the great Loss of Substance.

In very cold Air he still feels a Pain in his Lip. This, I am apt to believe, does not so much proceed from the Callus, as from his Lip pressing upon the fore Teeth, which are very rough and loose; and which it does, more especially, when he attempts to speak, by the Lip being so much contracted.

I have read this Account to the Patient, and had his Approbation of my Relation of the Facts, which my Attendance on him all the Time of this Disorder gave me sufficient Opportunity to observe.

Mr. Monro, Professor of Anatomy in the University of Edinburgh, gives the following Remarks upon the *Peruvian Bark*.

After the good Effects of the Bark, in Gangrenes, were known, I had Occasion to use it several Times, in that Disease, with Success; and sometimes, by Necessity or Choice, gave it in an Injection by the Anus, rather than by the Mouth, as I had, also, formerly done in Agues: The Quantities given in Clysters were larger, but the Effects were the same. One Cure of a Gangrene, made, I think, by the Bark in Clysters, seems to me so remarkable, that I must tell the History of it.

A young Gentleman, very healthy, in Appearance, had strained his Left Hand, but had no Uneasiness in it for ten or twelve Days; at the End of which, he was suddenly seized with a very sharp Pain near the *Os Pifforme* of the Wrist; and, soon after, the Teguments on the anterior Part of the metacarpal Bone of the little Finger swell'd: He neglected to ask Advice for two Days; then some Student, who saw it, observing a Mortification begun, scarified the Skin, fomented the Part, and applied some digesting Ointment with Oil of Turpentine, which Dressings were continued, also, the third Day.

On the fourth Day, when I saw him first, the Teguments covering the short Muscles of the little Finger were all mortified, his Pulse was so low, that, with Difficulty, I could feel it, and it was so quick, that I could not number the Beats of it. He had a general Tremor over all his Body; the *Subsultus Tendinum* was very frequent; he had a constant Anxiety, Restlessness, and Delirium; his Tongue was parched and dry; and whatever Food or Drink he swallowed, was vomited before it almost got down to his Stomach. The gangrened Parts were again scarified and fomented, their Edges were dressed with warm Basilicon, to which a small Proportion of Oil of Turpentine was added, and a Poultice of *Venice Treacle* was put over all. Soon after, his great Guts were emptied by a laxative Clyster, and, as soon as the Operation of this was done, five Ounces of warm Milk, and a Dram of the Powder of the *Peruvian Bark*, were injected, which he retained: Four Hours

after, the Milk and Bark were repeated; and two more such Injections were given, in the Night-time.

Next Morning he had no Raving, Tremor, Subsultus, or Vomiting; and his Pulse was stronger and slower: The Hand was dressed, as the preceding Day, and the Injection with the Bark was repeated; in the Afternoon it was changed, at the Patient's Desire, for a Bolus of half a Dram of the Bark, which was repeated every four or five Hours. The Fever ceased, the gangrened Parts began to separate next Day, and, the Bark being continued several Days, the Cure went on without any further Accident, except that he was put to a good deal of Pain, one Day, by an Application of ill-prepared *Aqua Phagedenica*. This I mention, to have an Opportunity of warning the younger Surgeons not to make Use of that Medicine, unless when the Lime-water is strong enough to make the Solution of the corrosive Sublimate Mercury to turn turbid, and to precipitate in Form of a very fine red Powder: For if the Lime-water is effete, and remains clear after the Sublimate is mixed with it, instead of a very mild Medicine, they are to expect all the Effects of unaltered corrosive Mercury.

In all the Gangrenes where the Bark was given with Success, I observed, that it brought on a mild Suppuration, which I saw became worse when the Use of the Bark was interrupted, and then turned of a good Kind, when the Bark was again given: This made me join in Opinion with others, that it would, also, be of good Service in several Sores where the Suppuration was faulty: Experience proved we judged right; so that the Bark became a common, and a beneficial Medicine, in this Town, for such Sores.

This Effect of the Bark, in procuring a kindly mild Suppuration, led me to imagine, it might be serviceable in the Small-Pox of a bad Kind, where either a right Suppuration did not come into the Pustules, or the Petechiæ shewed a Disposition to a Gangrene; and I had the Pleasure to see the Effects I expected from it in several variolous Patients, to whom I gave the Bark: The empty Vesicles filled with Matter, watery Sanies changed into thick white Pus; Petechiæ became gradually more pale-coloured, and, at last, disappeared; the blackening of the Pox began sooner than was expected. I no sooner had the good Effects of the Bark in the Small Pox ascertained by Trials, than I spoke of it to other Gentlemen in Practice here, some of whom had reasoned in the same way I had done, and had been giving it to their Patients with Success; since which, I have had Thanks from some of my Friends in the Country, to whom I recommended this Practice.

I gave, at first, the Decoction, and then the Extract of the Bark; afterwards, I forsook those weaker Preparations for the fine Powder, which was mixed with some mild rich Syrup, and an aromatic distill'd Water, both which may be varied, as the Patient prefers one sort of Taste to another. In this Form, from ten to forty Grains were ordered to be swallowed every four or five Hours.

But as several Children could not be prevailed on to take it by the Mouth, in any Form I could contrive, and, through fear of having this Medicine given, would taste neither Food nor Drink, there was a Necessity of using the other Form of Clysters: Previous to giving the Bark this way, the great Guts were unloaded by a laxative Injection; and then from half a Dram to two Drams of the Jesuit's Powder was injected, with a small Quantity of warm Milk, to which some Diacordium, or Syrup of Poppies, was added, if the Clysters were retained too short a time: These Injections were repeated Morning and Evening, or oftener.

I have hitherto only given the Bark in the Small Pox, after the Eruption, and continued it till the Blackening was completed; but am persuaded, from the Effects I saw of it, in mitigating the Secondary Fever, that if it is given during the eruptive Fever, it might be of Use in determining the Small Pox to be of a favourable Kind.

I hope what I have said will not be understood as if I recommended the Bark as an infallible universal Remedy in those Diseases, and the only one that needs to be employed in them: So far from meaning any such thing, I assure you, I have seen it fail, more than once, in both Gangrenes and Small Pox; and, in general, I know no Medicine which is not capable of doing Hurt to Patients, under some particular Circumstances of the very Disease for which it is given with the most Success. Thus, in the Small Pox, when the Lungs are violently inflamed, I would not consent to give the Bark: I have seen Patients, in this Condition, almost suffocated, after a small Dose of it: They would, also, in my Opinion, do very ill, who would trust entirely to the Bark, neglecting the other Medicines which have been used, to Advantage, in the different Circumstances of this Disease. The Bark would not, surely, moderate a very high, full, hard Pulse, with high Breathing, and inflamed Brain, in either eruptive or secondary Fever of the Small Pox, as Blood-letting would do. The Bark could not clear

clear the Stomach and Bronchia of viscid Phlegm, as an Emetic would; it would not, singly, calm the general Spasm, or relax the Skin, to make way for the Eruption, as when assisted by a tepid Bath: Nor would it raise a sinking Pulse, or discharge a Load of viscid Humours, as the Stimulus of a Blister, and the Suppuration after it, will frequently do. In short, I pretend to recommend it no further than as an excellent Assistant to Nature in what the Antients called the Concoction and Maturation of the morbid Matter, the Effects of which appear in moderating the Fever, and bringing a kindly mild Suppuration; which are, indeed, grand Articles, in the Cure of Gangrenes, Ulcers, and Small Pox. *Medical Essays.*

Mr. Ranby, in a late Treatise, recommends the *Peruvian Bark*, in some Cases where its Use is not, I believe, commonly known, as follows:

The Method I have prescrib'd to myself, in penning this small Treatise, leads me in this Place to speak of the Bark; a Medicine which no human Eloquence can deck with Panegyric proportionable to its Virtues; of such incomparable Benefit it is to Mankind!

I have for a long time indulged myself in the frequent Use of this noble Drug, in respect of large Sores of every Kind; and have often experienced, that, in those painful Circumstances, it would procure Rest, if given in large Doses, when even Opium had been taken, without any manner of Effect.

Though I am aware, that a very ingenious Surgeon recommends the Bark (see *Philos. Transf.* N^o 426.) against Hæmorrhages, in external Wounds in general; yet the prescribing it in gun-shot Wounds, in the manner I introduced it last Campaign, is a Practice, as I conceive, no-where left us on Record; and this I did with extraordinary Success, of which I shall give some few of the many Examples that have occurred to me in Practice.

In all large Wounds, especially those made by a Cannon-ball, there is constantly a great Laceration of the Membranes, and Parts endued with an exquisite Sensation; and these are ever attended with an excruciating Pain, and a Discharge of a gleety Matter, which, if not restrain'd, proves often of the last Consequence. In this unhappy State, the Bark (given in Doses of a Drachm each, and repeated every three Hours, or oftener, if the Stomach will bear it) with surprising Efficacy repairs the Breach made in the Constitution by this terrible Havock. Elixir of Vitriol, taken three times a Day, in a Glass of Water, I find to be of singular Benefit, and to prove a very good Assistant to the Virtues of the Bark; and, if the Body be costive, to each Dose of the Bark I add four or five Grains of Rhubarb, till that Inconveniency is remedied. Should the Bark run off by more than four or five successive Stools, I take care to check this Effect of it, by ordering two or three Drops of Laudanum, or two Spoonfuls of a Diascordium Mixture, along with it, every time it is given.

Where the Sore discharges a considerable Quantity of gleety Matter, is flabby, looks pale, and glossy, (which Appearances are ever consequent to a Loss of Substance) the Bark continually relieves the Pain, that is predominant in this Case, thickens the Matter, lessens its Quantity, and quite changes the Complexion of the Wound. And though the Patient has a dry Tongue, great Heat, a quick, low Pulse, and a Head hardly clear; yet, even in this Situation, I have known it to do Miracles. Nor (I freely own, when the Necessity for it is evident from Symptoms) have I, in administering it, the least Attention to the Quickness of the Pulse; and in Wounds where, upon every Dressing, the Arteries have started, and, of course, subjected the Patient to no little Hazard, I have frequently remark'd the Bark to procure the most unaccountably good Effects.

However, I would not be understood to insinuate, that the Bark will stop the Bleeding of any considerable Artery; nevertheless, though this efficacious Property is not to be expected from it, the vitiated Texture and State of the Blood (which, from too great a Degree of Fluidity, forces thus its Way thro' the arterial Passages) will be alter'd more effectually from the Exhibition of it, than from any thing I know in the whole *Materia Medica*: From whence, I think, is plainly pointed out to us, the Basis we are to erect our future Superstructure upon. The Bark, on these Occasions, I constantly advise, together with Opiates, more or less, in proportion to the Urgency of the supervening Symptoms.

As to the Efficacy of the Bark in amputated Limbs, Mr. Ranby gives the following Case: It is very common, in scorbutic Constitutions, for a Sore, the first eight or ten Days after taking off the Limb, to promise all imaginable Success; from which time it frequently begins to gleet prodigiously, looks pale, glossy, and flabby; and this Gleet, if not check'd, in a little while runs the Patient out of the World. In Exigencies of this Kind, the Bark hardly ever fails to procure Relief,

and works an apparent Change in a very short Space of Time, sometimes in twelve Hours. This I can attest for absolute Truth, in regard of a very worthy Gentleman, about fifty Miles from London, who broke his Leg by a Fall from his Horse. I took it off the second Day from the Accident, and, after the first Dressing, resigned him to the Care of his neighbouring Surgeons, not, in the least, afterwards suspecting but that every thing was succeeding agreeably to our Wishes: But the Scene was soon reversed; for, about sixteen Days after, I receiv'd a Letter from the Gentleman who had the Management of him, intimating, that a small Artery, near the Skin, bled very freely, on their removing the Dressings. In Answer, I advis'd a Vein to be open'd in the Arm, and the Bark to be taken instantly. But, as the Symptom of the arterial Opening ceas'd, and the Patient was without any Sign of a Fever, the Advice of seeking Resource from the Bark was postpon'd. The Seven-and-twentieth Day, another Surgeon, eminent in the Profession, and myself, were hurried out of Town to his Assistance: On our Arrival, we found him very much emaciated, a great Gleet incessantly ousing from the Stump, which, on the Removal of the Dressings, bled, from every Pore, like Water press'd from a Sponge. We immediately gave him the Bark, and repeated it every two Hours. The next Morning, the Discharge was considerably lessen'd, nor did there appear the least Footsteps of Bleeding. If he accidentally, at any time, neglected taking it only for a Day, or even lessen'd the Doses, the Wound inevitably pointed out the Omission, by the Alteration of its Complexion. He persisted in the Method of taking the Bark every two or three Hours, till he came to Town, when it was thought proper to give him a larger Respite. He now enjoys a perfect State of Health, and has done so ever since the Stump was heal'd; but, ere this was accomplish'd, he took near nine Pounds of the Bark. *Ranby.*

This Bark is brought from Peru, and there are three Kinds of it. The first is of a bitter, resinous Taste, and not so red as the common sort; the second, less than the first, is cover'd with a Moss; the third is the finest, and imported in small Pieces.

The *Peruvian Bark* is uneven, and thick, its Colour resembling that of Cinnamon, Coffee, or Rust of Iron. It is of a bitter Taste, and has no Smell but what comes from the Wood. The Name *Kina* is taken from the Count of Cinchon, who was Viceroy of Peru when the Medicine was discover'd. The Tree, to which it belongs, is not, as yet, sufficiently known: It is said to have Leaves like the Plum-tree, and flowers like the Orange-tree. *Herman* says, it is a high large Tree, like the Lime-tree; and that it bears Berries. It grows in the inland Part of Peru, on the Mountains near Loxa, or Loja, in the Province of Quito. The Spaniards say, that the Use of its Bark was discover'd in the following Manner:

Near the Town of Loxa was a Lake surrounded by *Quinquina* Trees, before the Spaniards settled in that Country: These Trees being, by an Earthquake, or some other Accident, thrown into the Lake, communicated a bitter Taste to the Water; so that the Inhabitants, who used to drink it, were obliged to leave it off: However, an Indian, who had a violent Fever upon him, and, consequently, a great Drought, finding no other Water, was forced to drink of this, by which he was perfectly cur'd of his Fever. He related this Adventure to some of his Friends, who, having made the same Experiment, were likewise cur'd: Upon this, they set themselves to discover what had given this febrifugous Quality to the Water of the Lake, and found, in the first Place, that a great Number of Trees had fallen into it; and, Secondly, that, after a certain time, these Trees, being rotted in the Water, it lost its bitter Taste, and, at the same time, its Virtue: Whence they concluded, that this Virtue was owing to the Trees. Afterwards, they tried all the Parts of them infus'd in Water; and thus discover'd, that their whole Virtue resided in the Bark. The Spaniards having conquer'd their Country, this invaluable Medicine was kept a great Secret; and they oblig'd themselves, by Oath, never to discover it to their Conquerors; hoping, thereby, to see them all perish by the epidemical Fevers that then reign'd in the Country. The Secret was inviolably kept, till the Year 1640, when a Spanish Soldier, quarter'd in an Indian's House, who had got into the good Graces of his Landlord, was seiz'd with a severe Ague. The Indian, touch'd with Compassion, and fearing, perhaps, that he should have a worse Guest, if this Soldier happen'd to die, brought him the Bark, which having taken, he was soon perfectly cur'd. The Soldier, surpris'd at such an unexpected good Effect of an unknown Remedy, made use of all his Address to discover the Tree to which this Bark belong'd, and, at length, succeeded. For some time he contented himself with curing his Fellow-soldiers, but never told them by what means; but the Vicequeen, Wife of the Count de Cinchon, then Viceroy of Peru, being

being seiz'd with an intermitting Fever, which had so far baffled the Skill of her Physicians, that her Life was despair'd of, and this Report having reach'd as far as *Loxa*; the Soldier, who was Master of the Secret, told his commanding Officer, that if he would allow him to go to *Lima*, he would cure the Vice-queen. The Officer, having inform'd himself of the Cures he had perform'd in that Country, readily gave him not only Leave to go, but, also, Letters of Recommendation, and proper Certificates. Being arriv'd at *Lima*, he was admitted to make Trial of his Medicine, on this Condition, that he was to take as much himself as he gave to his Patient. This he easily agreed to; and, having succeeded, in a very little time he was amply rewarded, and then prevail'd on to discover the Secret, which the *Spaniards* made use of from that time forward, with so great Success, that the Physicians were astonish'd, and half-starv'd. In 1649. Father *de Lugo*, a Jesuit, then Procurator General of his Bark to *Rome*, and the Society began to bring it into Reputation in *Europe*, by which they got a great deal of Money, in a short time. They sold it for more than the Weight in Gold, and, to disguise it the better, never parted with it but in Powder. From that time it was call'd the *Jesuits Powder*, because these Fathers were the sole Masters of it, and had brought it into Use. Two Drams were at that time thought sufficient for the Cure of any intermitting Fever, because they never gave it till after many other Medicines had been made Trial of. The Physicians were divided in their Opinions about it, some looking on it as a divine Medicine, whilst others believ'd it dangerous, and even fatal, in many Cases. Many Treatises were written, some for it, others against it; but the *English* Physicians, having, at length, made several Experiments with it, that might be depended on, it came to be greatly in Vogue in *England*; and the famous *Morton* wrote his *Pyretologia* in its Defence. In 1679. a Person, nam'd *Tabor*, who, to make himself more considerable, changed his Name to *Talbot*, came into *France*; where, having cur'd the Dauphin of a stubborn quartan Ague, by this Medicine, it gain'd a great Reputation, and the King purchas'd his Secret, and made it public. It was then term'd the *English Remedy*, and consisted of an Infusion of the Bark in Wine. There was a little Treatise publish'd at that time, with this Title, *The English Remedy for Fevers*.

The Bark is an infallible Remedy for all intermitting Fevers, if the following Circumstances be observ'd:

1. The Patient ought to lose some Blood, and to be purg'd before he takes the Bark; and, if he is of a dry Habit of Body, he ought to be kept, for some time, to a liquid Diet; because, before the depuratory Fermentation is begun, the Fluids ought to be well diluted.

2. The Bark made use of ought to be compact, or solid, of a redish Colour, like Cinnamon, of a faint Smell, a little musty, bitter and astringent to the Taste, and not kept too long.

3. It ought to be given in large Doses: For Instance, a Dram of powder'd Bark may be taken at a Time, in a Glass of White-wine, or Water, and repeated every three Hours, till the Time of the Return, or Paroxysm, be over. It may, likewise, be given in Infusion, or Decoction; an Ounce boil'd in a Quart of Water, till reduced to a Pint, being drank, by large Draughts, in the Interval between two Fits.

4. It ought to be continued for a long time after the Fever has ceas'd; gradually diminishing the Dose, and the Frequency of repeating it. This is a sure way to prevent a Return.

This Remedy appears sometimes to fail, that is, the Fever returns, after a certain Quantity of it has been taken; but this is never owing to want of Efficacy in the Bark, but from Ignorance of the true Method of taking it. Thus, if the Body is not sufficiently prepar'd, it can't act as it ought, because of the Obstructions it meets with in the *Primæ Viæ*, and in the Blood-vessels. If the Bark be bad, nothing is to be expected from it; and if the Dose be too small, or not continu'd for a sufficient time, it only deadens the Fever for a time, but does not radically destroy it. It is, therefore, a groundless Prejudice, that the Bark fixes Agues, or that the Use of it is ever attended with bad Consequences, especially in the Stomach, as many pretend. The Patient is seldom thoroughly cur'd without some kind of Crisis, especially by Stool, or Urine: This latter is the best, and the Physician may be assur'd, that his Patient is safe, if he makes a greater Quantity of Urine than usual. The Bark has, likewise, been given in Clysters, with Success; but then the Quantity, usually taken by the Mouth, ought to be tripled.

This admirable Specific is, likewise, a good Alterative, and, consequently, proper in an infinite Number of Cases where there is no Fever; for it strengthens the Stomach, excites the Appetite, &c.

This Medicine is not hurtful to weak Lungs, as some imagine, Experience having often shewn the contrary; and it

has often prov'd very successful in Catarrhs, and other Kinds of Fluxions, even when accompanied with Spitting of Blood, as in the Case of the late *Maréchal Tallard*. But in these Cases other pectoral Medicines are to be join'd with the Bark.

Some join with the Bark, given in Fevers, dried Arum-root, Sal Ammoniac, Cinnamon, &c. Sal Ammoniac is the most proper Way of any, being mix'd in the Quantity of half a Dram to two Drams of Bark. *Geoffroy*.

QUINTA ESSENTIA. See ESSENTIA.

CHYMICAL LIQUID QUINTESSENCES.

Put any distill'd aromatic, or essential Oil, into a clean dry Glass, and pour to it twelve times its Quantity of pure Alcohol, distill'd from Alkali, so as to contain not the least Water: Shake them together, and the Oil will disappear, and intimately mix with the Alcohol, so as to form one simple and transparent Liquor; but no Water must be contained, otherwise the Experiment will fail.

Alcohol, therefore, and essential Oil, are of such a Nature, as intimately to mix and unite together, provided they are both perfectly freed from Water; for, if only the Glass were moist, or the Breath interposed, it would hinder the Effect: And, when the Solution is perfect, and the two Liquors are thoroughly mixed together, the Addition of Water turns them white, or opaque, while the Water unites with the Alcohol, and separates the Oil.

If the Alcohol, saturated with the Oil, be carefully distilled, in a close Vessel, with a gentle Fire, and several times cohobated, the Oil will thus gradually be made so volatile, as, in great measure, to rise along with the Alcohol: Whence Oils are rendered more moveable, and more subtle, and are exalted to the highest Degree of Penetrability, like that of Spirit, tho' still retaining their native Virtues. But if, with a Fire of only Ninety Degrees, a Mixture of Alcohol and these Oils be distill'd, the Alcohol will rise by itself, or only carry with it the presiding Spirit from the Oil, leaving the oily Part behind; and if, with great Care and Caution, the thinner Part be several times separated from the thicker, by repeated gentle Cohobations, the Alcohol will, at length, be so impregnated with these Spirits, as to appear almost pure Spirit itself, leaving a gross exhausted Oil behind.

REMARKS.

The antient Chymists conceived, that Fire, Air, Water, and Earth, contributed to the Composition of Bodies, with the Addition of a fifth thing, which, made of the four common Elements, enriched the Whole, by its own particular and inseparable Virtue, whereon the Colour, Odour, Taste, and Virtue, of each Body, principally depends: Therefore, they supposed, that each particular thing, consisting of four Essences, had a fifth Essence added to it, which was extremely small in Quantity, yet of very powerful Efficacy, so that, when separated, and added to another Substance, it animated the Spirits thereof: Upon which Subject *Isaac Hollandus*, and *Paracelsus*, ought to be read. There is scarce any known Method more proper than the present, for preparing Quintessences. Thus, if a single Drop of Quintessence, so made, with Oil of Cinnamon, be mixed, and drank with a Glass of *Spanish* Wine, it instantly gives a grateful Briskness to the flagging Spirits, and therefore proves an admirable Remedy in Faintings, Suffocation, and want of Spirits. Nor do we know, that the Art of Chymistry can go farther, in obtaining the Virtues of Vegetables. If a Drop of such a Mixture, of Alcohol and Oil, be let fall into the Water, it presently turns milky; which shews when Oils are adulterated with Alcohol. Hence, also, we understand the Power of Alcohol, which principally acts upon the Spirits and Oils of Plants, by mixing and fixing them intimately with itself, and thus making a Compound, which afterwards seems to act with an uniform Virtue. And though these Oils exist under very different Forms in Vegetables, yet they may still be united with Alcohol, provided there be no Water in either: And we find, that the native Spirit always adheres to this oily Matter, under whatever Form it appears. All these Preparations have a great Affinity with Fire; for such Quintessences, being taken, heat the Body, and, if the Quantity be large, scorch and burn it; when externally applied, they produce all the Effects of a sharp Inflammation, even up to a Gangrene itself.

DRY QUINTESSENCES.

Take Alcohol, wherein an aromatic Oil is dissolved; pour it upon ten times its Weight of dry Loaf Sugar, reduced to a fine Powder: Grind them together exactly, for a long time, in a glass Mortar, that they may unite; put the Mixture into a China Vessel, set it in a glass Body, kept on all Sides moderately warm, that thus the remaining Spirit, which moistens the Matter, may gently exhale, and, by means of a Still-head, be collected in the Form of a liquid Quintessence: And thus the

Sugar will remain dry in the China Vessel, yet impregnated with the Quintessence. Let it now immediately be put into a glass Vessel, close stopp'd, and preserv'd, under the Title of a dry Quintessence. By a Dram of the finest Wheat-flour, five Drams of Loaf-sugar, and grinding them dry in a glass Mortar, then adding a Dram of the liquid Quintessence, and proceeding as before, an elegant dry Quintessence will be obtain'd.

By taking a Dram of the liquid Quintessence, and half a Dram of the essential Extract of Saffron, and three Drams of fine Sugar, and as much fine Wheat-flour, and proceeding as before, nearly the same Kind of Preparation will be obtained, but more compounded.

As any of these Kinds of Oil may be dissolved in Alcohol, and so brought into an uniform Liquor, though consisting of various Sorts, and thus employed to the same Uses, it appears, that these noble Compositions may be made by various Mixtures, at the Discretion of the Artist. Hence there are infinite Ways of varying these Forms, each whereof may, for Excellence, vie with the rest.

REMARKS.

Here we see to what a Length Chymistry may reach, in affording Forms of Medicines, of great Efficacy, in little Compass: For if a Scruple of the dry Quintessence be mixed with an Ounce of *Spanish Wine*, we have, hence, a little Draught, containing the utmost Virtue that can be obtain'd from Aromatics. If, therefore, a prudent Physician shall justly know the Necessity and Use of such a Remedy, he may hence derive it from Chymistry for his Purpose. These Preparations have this Convenience, that they may long be preserved perfect for Use, and may be safely and commodiously carried in Voyages, Journeys, and Camps, where furnished Shops are not at hand. Here, again, we have the Bounds of chymical Perfection. *Boerhaave's Chymistry.*

QUINTANA. An Ague, the Paroxysm of which returns every fifth Day.

QUINTI ANTIDOTUM. The Name of an Antidote, describ'd by *Oribasius, Collect. Medicinal.*

QUINUA. See **AMARANTHUS.**

QUIRAPANGA. The Name of a small white Bird found in *Brasil*, remarkable for nothing but the Shrillness of its Voice, which may be heard half a League. *Lemery des Drogues.*

QUISQUILA. The COTURNIX.

QUISQUILIUM. A Grain of *Chermes.*

QUITY. See **ARBOR SAPONARIA.**

QUIYA. See **CAPSICUM.**

QUOCOLOS. The Name of a Stone found in *Tuscany*, as hard as a Flint, somewhat transparent, and, in some measure, resembling Marble. In the Fire it loses its Transparency, and becomes less ponderous, and white; and a strong Fire readily converts it into Glass. It has no medicinal Virtues, but is used at some Glass-houses.

QUOTIDIANA FEBRIS. A Quotidian Fever.

Among the intermittent Fevers, those of the quartan and tertian Kinds happen more frequently than the quotidian, which seizes and terminates every Day, with a subsequent Intermission, for the Space of some Hours.

The Accession of this Fever happens early in the Morning, about four or five a Clock; and is accompanied with Cold and Horror, though without any Rigor. During the Paroxysm, there is a Cardialgia, accompanied with a Nausea: Some are afflicted with Head-achs, others with Deliriums, and most with a Vomiting, or Purging, or both: This State is succeeded by a Heat rather slow than excessive, whilst the Thirst is less intense than before; the Pulse, also, though before irregular, and weak, becomes more frequent, and not so hard, but considerably softer: Nor is the Urine high-colour'd, but rather crude, turbid, and of a Citron-colour. Many Patients, labouring under Quotidians, have an unsurmountable Propensity to Sleep; at last, a gentle Sweat appears on the Body; and after ten, or, perhaps, more Hours, the Paroxysm is removed, leaves the Body languid and heavy, and returns next Day at a stated Hour.

This is generally the manner in which a genuine intermitting Quotidian seizes, and proceeds; but such Quotidians as do not preserve this Type, but have their Accession either about Noon, or about the Evening, or at uncertain Periods, are call'd spurious, erratic, or anomalous Quotidians.

This irregular Species of Quotidian is frequently observ'd to be epidemical, especially during a long-protracted, irregular, and insalutary Constitution of the Weather. After the long-continued Heat in the Years 1727 and 1728, I observ'd, that, according to the Diversity of Constitutions, not only Diarrhoeas and Dysenteries, but, also, intermittent Fevers of various Kinds, especially Quotidians, were produced.

But as we are treating of an intermittent Quotidian, we shall not confound it with that of the continual Kind, which,

also, has its Accession early in the Morning, with a cold Fit; but the Heat and Languor, the Quickness and Weakness of the Pulse, the want of Appetite, and, sometimes, a colliquative Sweat, remain all the rest of the time. If this Species of Quotidian is long protracted, it generally proves mortal; since the Patients, after their Strength is exhausted, die under the cold Fit.

Nor is a genuine intermittent Quotidian to be confounded with a catarrhus Quotidian; since the latter, when of a benign Nature, seizes the Patient, towards the Evening, with a Kind of gentle Refrigeration, goes off in the Morning, and is sufficiently distinguishable, by the catarrhus Defluxions with which it is accompanied. A catarrhus Quotidian, on the contrary, when of the malignant Kind, is easily known, from the remarkable Loss of Strength, and the Watching; nor does it totally intermit, but remit.

The genuine intermittent Quotidian, also, differs from other intermittent Fevers; for when a simple Tertian becomes double, the Paroxysm seizes every Day: But the Times of Accession do not alternately correspond to each other; neither are their Causes, and the Methods of Cure to be taken, the same.

If, from a Quartan, the Fit becomes quotidian, it is called a triple Quartan, and the Paroxysm does not every Day return at one stated Hour, but, every fourth Day, has the same stated Period of Accession: In these, also, the Methods of Cure are different, because they proceed from different Causes.

A genuine intermittent Quotidian, also, differs from a slow Fever, because the latter seizes after Meals, and towards the Evening, without Horror, but is accompanied with Heat in the Palms of the Hands, and Soles of the Feet: It is, also, more violent in the Night, than in the Day-time; is accompanied with Sweat, and remits in the Morning, though it does not totally intermit.

Now as the proximate Cause of every Fever is a Disorder of the nervous System, so it is certain, that the formal Cause of a Quotidian consists in a spasmodic Agitation of the nervous Parts, and the Vessels: But this preternatural febrile Commotion is brought on by a Matter quite foreign to the natural and mild Quality of the vital Humours conveyed to the Blood; though, at the same time, incapable of being mixed with it.

For the *Primæ Viæ*, the Stomach, *Duodenum*, and the largest Part of the *Jejunum*, which is furnished with Valves, are the Seats in which the peccant Matter, which, in some of its Qualities, resembles Leaven, is lodg'd; from thence it is convey'd through the lacteal Vessels to the Blood and Humours, whence, being carried to the delicate and sensible internal Parts, it agitates and stimulates them to a preternatural and extraordinary Motion: And that, during a quotidian Fever, the *Primæ Viæ* abound with various Kinds of peccant, corrupted, viscid, acid, and bilious Juices, is certain, from several Circumstances: For a Quotidian is generally accompanied with Eructations, a Nausea, a Desire of Vomiting, want of Appetite, a Cardialgia, and Inflation of the Thorax, an Uneasiness of the *Præcordia*, and Oppression of the Breast; and, sometimes, a tensive, pungent, and biting Pain, reaching to the Back: A disagreeable, fetid, and, sometimes, a bitterish, or a somewhat sweetish and nauseous, and sometimes a plainly noxious Taste, is perceiv'd in the Mouth; and, at last, the Fever is frequently terminated by a spontaneous Purging; but an artificial Cure is most happily effected by Emetics and Purgatives, in Conjunction with Stomachics.

But because this Fever is often protracted for many Months, it is justly to be suspected, that the Disorder is deeply rooted in the Recesses of the lower Belly; for the secretory Organs, the Glands, and glandular Coats of the Intestines, being too much relaxed, instead of a subtil, lymphatic, and salival Juice, discharge a large Quantity of an impure and serous Humour. The other Viscera, also, subservient to the Depuration of the Blood, such as the Liver, Spleen, and Pancreas, in consequence of their impaired Strength, and the languid Circulation of the Blood through them, send less pure, lymphatic, and bilious Juices, into the Organs of Digestion: Hence the Solution of the Aliments, and the Elaboration of the Chyle, are disturb'd, and many serous and corrupted Crudities generated and accumulated in the *Primæ Viæ*, which assuming a worse Quality, by their Continuance there, and being conveyed to the Blood, excite the febrile Commotion, as we have already observed.

The greater Frequency of the Paroxysms in Quotidians, than in other Intermittents, is, in my Opinion, owing to a greater Weakness of the *Primæ Viæ*; for such a remarkable Weakness greatly favours the Generation of Crudities, and is the Cause why they more quickly flow, and are collected there; as, also, why they are sooner conveyed to the Mass of Blood, and Membranes of the spinal Marrow.

Hence it is, that all Things which tend to bring on a Flaccidity of the Viscera, or generate crude and impure Juices, lay a Foundation for quotidian Fevers, which are principally incident

to those of languid Constitutions, those addicted to Idleness, those who use crude Aliments, live irregularly, drink too much Malt Liquors, indulge themselves in Grief and Care, and whose Stomachs are weakened by the Shocks of previous Diseases, or by Hemorrhages. It is more frequent in Winter, the Autumn, and cloudy Weather, than at other Seasons; old Persons are more subject to it than others, Women more than Men, Persons of pituitous, phlegmatic, and sanguineous Constitutions, more than those of bilious and melancholic Habits. A Quotidian is, also, quickly generated, by other Intermittents, especially when the Patient uses improper Aliments, is frequently ruffled by the Sallies of Passion, has the Strength of his Stomach impair'd by strong Purgatives and Emetics, uses anodyne, hot, and spirituous Substances, or, neglecting to have his *Primæ Viæ* cleansed, preposterously uses Astringents and Specifics.

An intense genuine Quotidian, arising from a want of due Tone in the Viscera, is generally long protracted, and creates a great deal of Trouble to the Physician; but erratic and epidemical Quotidians, which depend only on a peccant State of the Juices, are more easily cured.

Quotidians which have a total Intermission of the Paroxysm, are less dangerous than others; but those which incline to the Nature of the continual Kind, and which, after the Paroxysm, leave the Strength languid, the Pulse weak and frequent, and the Body, as it were, dissolved into Sweat, are protracted for some Months; these so weaken the Patient, that he is generally taken off by them.

Quotidians succeeding other Intermittents, especially of the quartan Kind, are highly obstinate, and dangerous. Thus *Celsus*, in *Lib. 3. Cap. 15.* tells us, that a *Quartan* seldom proves mortal; but, if it degenerates into a Quotidian, the Patient is in a bad Situation: For this Circumstance indicates, that there is a great Disorder of the Viscera; and, in this Case, the Fever generally bears an Affinity to those of the continual Kind.

When, in the Beginning of the Paroxysm, bilious and pituitous Vomiting and Stools are evacuated, it is a good Sign, unless the Strength is already unhappily exhausted, by the Length of the Disease: A gentle Eruption of Sweat, also, in the Decline of the Paroxysm, and a copious Discharge of Urine with a Sediment, after the Fit, diminish the Violence of the subsequent Paroxysms, and prognosticate a happy Termination of the Fever.

On the contrary, when there is no Excretion, the Fever is long protracted, and the Viscera acquire such a Disorder, as to bring on Cachexies, slow and hectic Fevers, Consumptions, and, in those disposed to it, a Phthisis.

The same Misfortunes, also, readily happen, when Astringents, and specific Febrifuges, are preposterously used; and if, by hot, sudorific, and spirituous alexipharmic Essences, the acrid Recrements are forced from the *Primæ Viæ* into the Blood, the Quotidian soon passes into a continual Fever, accompanied with a perpetual Sweat, and a Loss of Strength.

In Patients who die of Quotidians, the cold Fit is highly intense, lasting, and accompanied with a Rigor, a Loss of Strength, and a Perturbation of Mind: They generally have two Fits of this Kind, succeeded by Heat; but, under the third Fit, the Pulse is weak, and unequal, and the Cold terminates in a mortal Rigor.

THE GENERAL METHOD OF CURE.

Since the Causes of an intermittent Quotidian are a Collection of ferous and viscid Crudities in the *Primæ Viæ*, a flaccid State of the Viscera and Glands, and an obstructed Circulation of the Blood through the Vessels of the lower Belly; so the only Intentions of Cure must be,

1. To prepare, and, by proper Emunctories, evacuate the impure and peccant Juices from the *Primæ Viæ*.
2. To corroborate the Viscera, whose Tone is impaired; and, by that means, prevent the farther Generation of Crudities. And,
3. To restore the free Circulation of the Blood through the abdominal Viscera and Intestines, which are the Organs destin'd for the Digestion of the Aliments, and the Elaboration of the Chyle.

The first of these Intentions is excellently answered, by inciding and abstergent Substances, and neutral Salts; the most efficacious of which are depurated Sal Ammoniac, the digestive Salt of *Sylvius* prepared of the Caput Mortuum of urinous Spirit of Sal Ammoniac, vitriolated Tartar, the *Arcanum duplicatum*, Epsom Salt, *Sedlitz* Salt, and antimoniated Nitre: Such Substances, also, answer this End, as abound with an acrid aromatic Salt; such as the Roots of Cuckowpint, *Calamus aromaticus*, white Burnet, true Costus, and Zedoary; together with *Winter's* Bark, Ginger, and white Pepper; which, when reduced to a Powder, and mixed with the above-mentioned Salts, with the Addition of a Drop or two of some carminative Oil, make an excellent antifebrile Medicine.

For answering the first, as well as the second Intentions, that is, gently to evacuate the Sordes by Stool, and, at the same time, to corroborate the Tone of the Stomach and Intestines, and restore their disturbed Motion to a due State, the most efficacious Medicines are, the balsamic Pills of *Becher*, those of *Stahl*, and those directed by myself; as, also, the *Pilula Aloephangina*, the *Pilula de Succino Cratonis*, and the *Pilula Solanandri*, especially if exhibited in Conjunction with the above-mentioned Salts.

But, for restoring Strength to the abdominal Viscera, and to prevent an Afflux of impure Juices to the Organs of Digestion, the most efficacious Medicines are, bitter Elixirs, mixed with Chalybeates, such as my temperate balsamic Elixir, prepared without Spirit of Wine, with an alkaline Liquor, or Essence of *Cascarilla*, mixed with Essence of Ginger; or stomachic Elixirs, such as my Elixir, or that of *Michaeli*, with the Addition of a few Drops of a chalybeated Tincture, prepared of the chalybeated Flowers of *Sal Ammoniac*, with rectified Spirit of Orange-peel.

By these, also, the Circulation of the Blood through the abdominal Vessels, and the Organs of Digestion, is excellently promoted: However, if the Quotidian is obstinate, and supported by an irregular Regimen, the most efficacious Medicines are, medicinal Waters, especially those of the hot and cold Kinds; such as the *Caroline* and *Egran* Springs, drank warm; which, used with a proper Regimen, and an Intermixture of bitter, balsamic, and anticachectic Medicines, dilute the viscid Sordes, evacuate them by Stool and Urine, together with the ferous Recrements, remove Infarctions, and restore the free Circulation of the Blood.

But the particular Method of using these is to be varied, according to Temperaments, Ages, the Seasons of the Year, the Constitution of the Patient, the State of the *Primæ Viæ*, the Sex of the Patient, and the Cause of the Disease; to each of which Circumstances, both the Dose of the Medicines, and the manner of their Exhibition, are to be accommodated. It is, however, to be observed, in general, that, on the Hours free from the Paroxysm, saline Powders are to be exhibited, with inciding Liquors; and, on the third or fourth Day, the Body is to be rendered soluble, by proper Pills, but in such a manner, as that their Operation may be over before the Paroxysm begins; and the Sweat, about to make an Eruption in the Decline of the Paroxysm, is to be promoted, by Rest, and drinking warm Liquors; after which, we are to subjoin corroborative, bitter, chalybeate, and antifebrile Medicines.

PRACTICAL CAUTIONS, AND OBSERVATIONS.

Quotidian intermittent Fevers are to be treated with great Circumspection, lest they should degenerate into other chronic and dangerous Diseases. The Patient is, in a particular manner, to abstain from astringent and paregoric Medicines, large Quantities of precipitating earthy Substances, and all drastic, purgative, sudorific, and emetic Medicines.

It, also, contributes greatly not only to promote the Cure, but, also, to prevent the Return of a quotidian Fever, to avoid all Commotions of Mind, especially Sorrow, and long-protracted Anxiety; and to guard against insalutary Aliments, the Use of Wine, and Refrigeration, especially of the Abdomen.

As Nature often happily terminates Quotidians by a critical Flux, so her Indications are to be followed; and the Physician is to act in Concert with her salutary Efforts: For which Reason, the Patient is not to be reduced to a sudorific Regimen, nor are Sweats to be forced by Medicines: But we ought, rather, to endeavour, that the peccant Matter, and the *Primæ Viæ*, should be prepared and disposed for a Flux; which End is excellently obtained, when, a few Hours before the Paroxysm, a gentle Laxative, such as the *Pulvis Cornachini*, or the *Pilula Balsamica*, is exhibited with some of the above-mention'd Salts.

Because Quotidians are accompanied with a Vomiting, which proves beneficial to the Patient, this should be promoted by proper Doses of well-chosen Medicines, exhibited seasonably. Hence it is sometimes absolutely proper, by means of Emetics, to excite a Vomiting before the Paroxysm. I remember, in legitimate Quotidians, which used to have their Accession about Five in the Morning, I have often, towards the Evening before the Crudities were conveyed from the Organs of Digestion to the Blood, exhibited a gentle Vomit, consisting of fifteen Grains of *Ipecacuanha*, and half that Quantity of the *Pulvis Cornachini*: By this means, a Vomiting was happily excited; and sometimes a Purgine, and the Fever, becoming considerably milder, was afterwards easily removed, by other Medicines.

If a Quotidian lasts for a Month, or longer, and seems, as it were, to degenerate into a slow Fever, we may commodiously exhibit one Grain of emetic Tartar, dissolved in some proper Liquor; by which means, I have known an incredible Quantity of stagnant bilious Juices thrown up, and the Patient greatly relieved.

When

When Quotidians are accompanied with a Loathing of Food, a pressory Pain, or Inflation of the Stomach, we are to apply to the epigastric Region small Bags, either dry, or boiled in Wine, consisting of the Herbs Mint, Wormwood, and Rosemary; the Flowers of Spike and Roman Chamomile, Cloves, and Nutmegs: These Bags, when applied after the Paroxysm, are highly beneficial, by effectually promoting Perspiration and Sweat.

In Quotidians of the legitimate Kind, we are to deal very cautiously with Febrifuges; but, in epidemic and erratic Quotidians, besides the above-mentioned Medicines, we may, also, safely exhibit antifebrile Specifics, and that Electuary, the Basis of which is *Peruvian Bark*, and that of *Cascarilla*; since, by this means, a Solubility of the Body, and copious Stools, have

been procured, without any Uneasiness to the Patient: But, in quotidian Fevers, the Bark of *Cascarilla* is justly preferable to the *Peruvian Bark*, because the former is more corroborative, and astringent, than the latter.

Venesection is rarely proper in Quotidians which are already accompanied with a Weakness, especially of the Stomach, and generally complicated with something of a cachectic Nature: But if there is a considerable Plethora, especially arising from a Suppression of the Menses, or Hæmorrhoids, and if the Urine is tinged, or the Patient accustomed to drink Wine, a Vein is to be opened in the very Beginning of the Disorder, lest the Fever should be increased, and, according to the Observation of Physicians, slow, hectic, and apoplectic Fevers brought on. *Hoffman.*

R. In Prescriptions, imports *Recipe*, Take.

RABDOIDES SUTURA. The Sagittal Suture.

RABEOIA. The Roots of the *Flammula Major*. *Rulandus*.

RABIEL, or ROHEL. Dragons Blood. *Rulandus*.

RABIES. See HYDROPHOBIA.

RABIRA. Tin. *Rulandus*.

RACEMUS. A Bunch of Grapes; or of Ivy-Berries; or of any other Fruit which grows in Clusters.

RACHAMMELCA. A new Term coined by *Doleus* from the Hebrew Word רחם *Rechm*, signifying the Uterus, and מלך *Melech*, a King. By this Word he intended to express what they call the active Principle, or the *Plastic Spirit of the Uterus*.

RACHI, or RACHO. Mercury. *Rulandus*.

RACHITÆ, or RACHLÆL. The Muscles belonging to the Back. *Blancard*.

RACHITIS.

This Disorder, generally known by the Name of *Rickets*, is a kind of partial Tabes, and consists in an unequal Nutrition, by which some Parts are deprived of their due Nourishment, and waste away, whilst others receiving more than enough, are preternaturally increased with an Incurvation of the Bones and Spine of the Back.

This is a new Species of Disorder; for it only made its first Appearance in England about the Middle of the Seventeenth Century; and was afterwards spread through all the Northern Parts of Europe. It principally discovers itself by these Signs: The Disorder appearing about the ninth Month of the Child's Age, or later, the Proportion of various Parts of the Body gradually becomes irregular; the Skin lax, the Abdomen large, and, as it were, turgid with Flatulences. The Muscles are consumed by an Atrophy, whilst the Joints of the Arms, Hands, Knees and Feet, become protuberant. The Bones are also render'd incapable of sustaining the Body, and the Spine of the Back is frequently enervated. Hence the Patient is hardly able to walk, and often intirely incapable of moving. Then the jugular and carotid Arteries become tumid, the Head large, and frequently nodding, in consequence of the weak and flaccid State of the Neck. The Genius is for the most part more acute than is usual at that Age. The Chest is narrow, and, as it were, compressed on the Sides; the Sternum acuminate, and the Extremities of the Ribs full of Knots. As the Disorder increases, it is accompanied with a slow Fever, a Cough, a Difficulty of Breathing, and other Symptoms which generally continue till the Patient dies. But 'tis carefully to be observed, that there are certain Degrees and Periods of Duration in the *Rickets*, which don't produce the same Symptoms in all Patients; but in some, those of a violent, and in others, those of a mild Kind.

In dissecting those who die of the *Rickets*, sometimes one, and sometimes another of the Viscera is found corrupted; for in some, the Liver is preternaturally large, scirrhus, and adhering to the Diaphragm, whilst the Mesentery and Pancreas are obstructed, and full of indurated Glands. In others, the Lungs adhere either to the Pleura or Back, and are either livid or full of Vomicas. In others, the Pericardium is full of Water. Most Authors, among whom are the celebrated *Glisson*, *Bonetus*, and *Heister*, unanimously agree, that in Patients who die of the *Rickets*, the Beginning of the Spinal Marrow is preternaturally hard and obstructed; the Space between the Dura and the Pia Mater full of Water; the Brain excessively large, and the carotid and jugular Veins smaller than their correspondent Arteries.

Induced by Experience and the Authority of these Authors, we shall, as the Cause of the *Rickets*, assign the intercepted Ingress of the nervous Fluid into the spinal Marrow, either in consequence of its Obstruction or Compression. Hence the Nutrition of those Parts which receive Nerves from the spinal Marrow, such as the Arms and Legs, must necessarily be destroyed; whilst, on the contrary, those are preternaturally nourished, whose Vessels are pervious, and receive too large a Quantity of nutritive Juice; as is observable in the Heads of *rickety* Patients, which, in consequence of the intercepted Influx of the nutritive Lymph into the spinal Marrow, receive too much Nourishment; which not only renders them preternaturally large, but also their Faces ruddy and well-coloured. Nor is the Brightness of their Genius to be otherwise accounted for, than from the Soundness of the Brain and Cerebellum, which duly discharge their respective Offices. For which reason, the Parts to which Nerves are distributed from the Brain, are generally in a good Condition.

'Tis also obvious why the Bones are incurvated and deformed with Knots about their Epiphyses; for because the Muscles and their Ligaments, by which the Bones are joined, are not in this Disorder duly nourished, whilst the Nourishment is copiously conveyed through the Arteries to the Bones, it generally happens that the Extremities of the Bones, which in Children are of a soft Texture, are, in consequence of the small Resistance, distended and elevated into Tubercles. And since during this Nutrition, the Bones perpetually increase, and the Muscles become smaller and shorter, the Elongation and Extension of them is easily retarded by the Muscles which adhere to them. Hence an Incurvation of the Bones happens; and so much the more easily, because at this Age they are highly soft and flexible. Nor is the Distortion of the Spine of the Back owing to any other Cause, than the Flaccidity and the Destruction of the natural Tone of the bony Processes, Cartilages, Ligaments, and Muscles, connecting the Vertebrae of the Back; and during this Flaccidity, these Parts, upon inclining the Body, recede too far from each other, and are too much distended to be again restored to their natural Situation.

The immediate Cause of the *Rickets* is a viscid Tenacity of the Juices, which being separated from the inspissated Blood, are deposited on the spinal Marrow; and, by compressing or obstructing its Pores, hinder the due Influx of the subtiler nervous Fluid into it; so that it cannot be farther distributed through the Nerves.

Among the remote Causes of the *Rickets* produced by an improper Regimen, we may reckon all those Circumstances which bring on an Atrophy; for 'tis certain, from Experience, that whatever disturbs Digestion, and generates a thick viscid Chyle, unfit for Nutrition, has a Tendency to bring on the *Rickets*.

But nothing more effectually contributes to the Production of this Disorder, than an Air which is cold, cloudy, and impregnated with various hurtful Exhalations; since such an Atmosphere, partly by debilitating the Tone of the Skin, retains the pituitous Sordes in the Body; and partly by relaxing the Lungs, hinders the intimate Mixture of the Blood in them, and prevents its due Distribution through the whole Body. A memorable Instance of this is found in London, which, in consequence of the prodigious Quantity of Exhalations, and the Particles of the Smoke, arising from fossile Coal, is found very fit, not only for producing, but also for supporting the *Rickets*. Nor is it surprising why, from the same Cause, this Disorder is most frequent in maritime and marshy Places, as also in the Spring and Autumn: And why in Towns situated by large Rivers, incommoded with a moist Atmosphere, clouded with saline effluvia, or the sulphureous Smoke of fossile Coal, so many Children are subject to the *Rickets*.

Nor shall I hesitate to affirm, that the Stagnation of the Humours in the spinal Marrow, is greatly promoted by the foolish Custom of Nurses, who, for whole Days, carry Children in their Arms, wrapt up in a Cloak; and not only, for a long time, keep the Spine of the Back in an incurvated Posture, but also bend the Legs unequally. Hence crooked Backs and Legs are not only produced, but a favourable Foundation laid for the *Rickets*. The like also happens, when Infants, by a Blow or Fall, have the Spine of their Back distorted; for which reason gibbous Children easily become subject to the *Rickets*.

Nor is it to be doubted, that previous Diseases dispose not only to a Consumption, but also to the *Rickets*. But among all Diseases, none so effectually contribute to the Production of this Disorder, as those which, by bringing on a Deposition of Humours on the spinal Marrow, suspend and prevent the free Ingress and Egress of the nervous Fluid to, and from it. Thus, in Practice, we often find the *Rickets* arising from this Cause, after an ill-managed Small-Pox; as also after the Repulsion of the Itch, the Crusta Lactea, or a scald Head.

As for the Prognostics of this Disease; if it is violent, and lasts till the fifth Year of the Patient's Age, or longer, it is not to be cured without Difficulty; generally renders the Body languid and deformed; and unless, as Youth advances, when the whole Body undergoes a great Change, it is totally removed, it becomes incurable during the whole of the Patient's Life. Nor is it to be cured with less Difficulty, when it is hereditary, or appears in the first Month after the Birth of the Infant. When the *Rickets* are succeeded by a Phthisis, accompanied with an hectic Fever; by a Dropsy, an Asthma, or a Diarrhæa; only faint Hopes of the Patient's Recovery are to be entertained. But the *Rickets* which arise from a Fault of the Regimen or Air, which are succeeded by the Small-Pox, Itch, or other Efflorescences of the Skin, and are not accompanied with a great Incurvation of the Bones, and an Inability to Motion, are more easily cured.

When viscid, tough and pituitous Humours deposited on the spinal Marrow, are the Cause of the *Rickets*, the first Intention of Cure is to resolve the Viscidity of the Juices, remove Obstructions, and by that means promote a free Circulation of the Humours through all the Body. For this purpose, in order to remove the Fountain of the Disorder lodged in the *Primæ Viæ*, we are, above all things, to use gentle Laxatives; not neglecting, if it is necessary, and the Constitution of the Child admits, the Use of mild Emetics, consisting of a few Grains of the Root of *Ipecacuanna*, exhibited with Sugar and Cinamon-Water, prepared without Wine, or reduced to the Form of an Electuary, with some proper Syrup; for by these means the viscid Sordes, collected in the Stomach and Intestines, are not only excellently eliminated, but also by the Stimulus of such Medicines, a due Resolution of the Humours, and an Opening of the obstructed Vessels, are successfully obtained: Only such stimulating Medicines are not to be exhibited to Patients whose Strength is exhausted, who labour under any Disorder of the Mesentery, or a violent Obstruction of the Viscera; since, in such Cases, it is more expedient to exhibit Medicines of the deobstruent kind.

To the Medicines already recommended, we may also, now and then, add those of a gently resolvent kind, as Diaphoretics generally are; such as the Tincture of Tartar, the acrid Tincture of Antimony, and Preparations of Cinnabar; which in the *Rickets* are preferable to Mercurials, and highly beneficial in eliminating the serous Impurities, partly by Perspiration, and partly by Urine; especially if they are exhibited in such Infusions as dilute and purify the Blood.

But in particular, for removing the Obstruction of the spinal Marrow, and restoring the Influx of the nervous Fluid into it, various Authors recommend Frictions of the Spine of the Back, Arms and Legs, with warm Linen-Cloths; as also Fumigations of Frankincense, Amber, Mastich, and Olibanum. But I can, from Experience, recommend as the most effectual Remedy, Baths of sweet Water, boiled with Nervous Herbs, such as Marjoram, Lavander, Mother of Thyme, Rosemary, Chamomile and Baum. In such Baths, the Patient is to be frequently immersed, and have the Spine of the Back and Joints rubbed and anointed with the following Nervous Ointment.

Take of human Fat, and expressed Oil of Nutmegs, each half an Ounce; of Peruvian Balsam one Dram; and of the Oils of Rue, Lavander and Cloves, each thirty Drops.

By these means I have often seen many Patients afflicted with the *Rickets*, not only surprisingly relieved, but also totally recovered.

But these Measures are carefully to be accompanied with a proper Regimen; for the Patient is by no means to use stultulent viscid Aliments, or such as are of difficult Digestion: But he may frequently use weak Broths, prepared of Fowls or Veal, with the aperient Roots of Asparagus, Fennel, Succory, Smallage, Celeri, Parsley, and River-Crabs bruised. Then, in order to corroborate his Stomach, temperate stomatic Elixirs, such as the Visceral Elixir, are to be mixed with his Aliments. His Drink is to be thin, and during the Time he is suckled, the Milk should be good and sufficiently thin; adding, at the same time, proper Exercise suited to his Age; such as Gestation, that his languid Body may be only gently exercised. If he is coisive, his Body is to be render'd soluble by a Laxative, or a Glyster. If the Disorder is either brought on, or supported by a bad State of Health in the Nurse, the same Medicines are to be exhibited in larger Doses to her.

For an Incurvation of the Spine, and Members variously distorted, we must also recommend Swathing, and the Use of proper Stays, provided due Care is taken to do no Injury by them; since often, by these means, the Infant is thrown into another more dangerous Disorder. *Frederic Hoffman.*

Children are never born with the *Rickets*; for this Disorder is rarely incident to them before they are nine Months old, and hardly ever seizes them after they are two Years of Age, but frequently happens in the intermediate Space between these two Periods.

This Disease is most incident and fatal to Children whose Parents are of a lax and weak Constitution; who are addicted to Idleness and Effeminacy; who live luxuriously, or use pinguious Aliments, Dishes prepared with Sugar, a small Quantity of Bread, sweet Wines, and large Quantities of warm Water; who are exhausted by chronical Disorders, Venery, Age, a Tabes, especially of the Venereal Kind, and repeated Gonorrhæas; for such Persons propagate a weak and languid Offspring.

When the Nurse labours under such Misfortunes, the *Rickets* are more quickly brought on, and increased in the Child.

Especially if the Disorder is treated with a cold and moist Regimen, and the Infant fed with aqueous and mucous Substances, crude Summer-Fruits, Fish, farinacious unleavened Bread; if the Infant has long laboured under an autumnal intermittent Fever, a chronical or acute Disorder; if he has had the Itch, an Herpes, or Ulcers, suppressed, or ill-cured; if he is enervated by Baths, Fomentations, Liniments, Ointments, or moist Vapours; if he remains constantly without Motion in a perforated Chair, with the inferior Parts of his Body naked.

This Disorder, when beginning, is known in those who cannot walk, first, from the Age; secondly, from the preceding Causes; thirdly, from the Brothers or Sisters of the Infant being seized with the like Disorders. Fourthly, from a flaccid Swelling of the Head and Face. Fifthly, from the lax State of the Skin. Sixthly, from the Swelling of the Abdomen. Seventhly, from the Leanness of the other Parts, especially of the Muscles. Eighthly, from the Protuberance of the Epiphyses at the Joints of the Radius, Ulna, Humerus, Knee, Tibia and Fibula. Ninthly, from the Largeness of the Jugular Arteries and Veins, whilst the others decrease.

But in Children who have begun to walk, the approaching *Rickets* are known, first, from the before-enumerated Signs; secondly, from a slow infirm Manner of Walking, a falling forwards, and an Instability which terminates in a perpetual Desire of Sitting, which soon degenerates into a State of constant Decubiture, and at last an Inability of moving any of the Joints; the Neck in the mean time becoming flexible, and the Head nodding: And, thirdly, from the preternatural Ripeness and Force of the Genius; the genuine Exercise of the Senses, the Appetite and Digestion remaining almost sound and uninjured.

When the *Rickets* are of a longer Standing, the Patient's Head is preternaturally large, and its Sutures gaping; the Thorax at the Sides is compressed to the Sternum, which rises in a kind of sharp Arch; the Extremities of the Ribs are full of Knots; the Abdomen protuberant, and the Teeth carious and black; which Symptoms gradually increasing, frequently thro' the whole of the Patient's Life, produce the like terrible Disorders, especially a Spina Ventosa, and a Caries of the Bones.

During the whole Course of the *Rickets*, a slow Fever preys upon the Body, till the Patient dies; and then in the Carcase all the Fibres, Membranes, Vessels and Viscera are found soft and flaccid, while the Humours are colliquated and mucous.

Hence the immediate Cause of the *Rickets* is, a languid, mucous Cold and vapid Cacoehymy, perhaps complicated with a latent Venereal Taint, and accompanied with a lax and flaccid State of the solid Parts.

The Cure of the *Rickets* is most effectually produced by light, easily-digested, dry, lean Aliments, season'd with mild Aromatics, and frequently exhibited, tho' in a small Quantity; by drinking a small Quantity of generous Liquors, especially of Ale, tho' not old, but long boil'd and thick; by a dry and somewhat hot Air; by wearing very dry, and warm Clothes, especially such as are made of Wool; by lying upon Couches prepared of aromatic, corroborating, and drying Herbs, laid upon Boards, in the upper Rooms of the House; by Gestation, Concussion, Oscillation, Riding in a Chariot in rough Roads; by much dry and warm Friction, especially of the Abdomen and Spine, performed with Clothes, impregnated with the Smoke of Aromatic Substances; sometimes by the repeated Application of Cantharides, by gentle Emetics, frequently tho' prudently repeated; by Purgatives, and then by corroborating Medicines, exhibited for some Days successively; and lastly, by the long-continued Use of corroborating, drying, antiscorbutic Medicines, and such as rouse the Spirits. Hence we understand the Uses of Immersion in cold Water, for the Cure of this Disorder, which, however, is not to be put into Practice, till the Viscera of the Abdomen are, in some measure, eased of the Load of Humours which oppress them. Hence, also, the proper Use of Liniments may be understood, which ought to be of the nervous Kind, and applied to the Abdomen, and Spine of the Back; but not to the prominent Parts of the affected Bones.

The best Aliments for Children labouring under the *Rickets* are:

1. Well fermented Bread and Biscuit, mixed with a small Quantity of Saffron, Nutmeg, Cardammons, Cinnamon, Seeds of Celeri; and other grateful and corroborating Aromatics.
2. Lean Pigeons, Fowls, Rabbits, Mutton, Kid and Veal, gently roasted, cut small and mixed with Biscuit, Salt, and a little Parsley, Thyme, and Nutmeg.
3. Millet and Barley, boil'd with Water and Raisins; and then seasoned with a little Wine and mild Aromatics.

The most proper Drinks for Persons labouring under the *Rickets* are,

Ripe, red and astringent French Wines, an Ounce of which is to be exhibited three or four Times a Day.

Half an Ounce of Hippocratic Wine, exhibited at the same Time.

Brunswick Mum, *British* Ale, and that Species of *Dutch* Ale, which is sold at twelve Florins.

With these Malt Liquors, in the Summer Time, may be mixed an equal Quantity of medicated Chalybeate Water, but rather of the Spaw Waters.

Take of the following recent Leaves dried in a Shade, *viz.* of the Male Fern, three Pounds; of Marjoram, Baum, and Mint, each two Handfuls: And of the following recent Flowers, also, dried in a Shade, *viz.* of Melilot, sweet Trefoil, Elder, and Roses, each two Ounces. Reduce to a fine Powder. Mix with double the Quantity of Barley-Chaff; and put all into Bags for Couches, on which the Patients are to lie; these are to be carefully preserved from Moisture, and frequently dried.

Take of Benzoin, Mastick, Olibanum, Amber and Frankincense, each one Ounce; reduce to a Powder; of which throw a little upon live Coals, and the Steam arising from it is to be received in Clothes, for rubbing the Parts.

Take of the Roots of Ipecacuana, one Scruple; of white French Wine, one Ounce; and of Sugar, two Drams; infuse for a whole Night; and when depurated, exhibit in the Morning. Let this be repeated every fourth Day for five Times.

Take of the best Rhubarb, half an Ounce; of Citrine Myrobalans, without the Kernels, three Drams; and of the Troches of Agaric, two Scruples. Infuse in four Pints of cold strong Beer, for twenty-four Hours; and let the Patient use this for common Drink for a Month: But if it should prove too purgative, it may be diluted with an equal, or, if necessary, a greater Quantity of other Ale.

The corroborative, drying, exciting and antiscorbutic Herbs proper for curing the *Rickets*, are, Agrimony, Betony, the Bark of Caper Roots, Spleen-wort, Succory, Dorder, Sanicle, Endive, Male Fern, Liver-wort, Harts Tongue, Baum, Myrobalans, Osmund Royal, Polypody of the Oak, the Leaves and Acorns of the Oak, Rhubarb, the Leaves and Root of the Bramble, white Maiden Hair, Scabious, the Bark, Flowers and Leaves of the Tamarisk, Trichomanes, and Male Speedwell.

Of these medicated Ales, Wines, and Infusions, may be prepared and exhibited with great Success; as also Conerves, and other Things of a like Nature, thus:

Take of Agrimony, Spleen-wort, Fern-Root, Harts Tongue, the Root of Polypody, and white Maiden Hair, each two Ounces. Having cut these small, mixed them, and put them in a Linnen Cloth, infuse them in twelve Pints of cold Ale, to be used for common Drink.

Or,

Take of the Leaves and Flowers of Betony, three Ounces; of the Barks of the Roots of Capers, Tamarisks, and wild Bramble, and of Trichomanes, each two Ounces; and of Filings of Steel, half an Ounce. Infuse in eight Pints of cold White Wine, of which one Ounce is to be exhibited thrice a Day.

Take of *Boyle's Ens Veneris*, two Grains; which are to be exhibited every Evening in Canary Wine for three Weeks.

Take of the Filings of Steel, one Ounce; of the strongest distill'd Vinegar, ten Ounces; and of Sugar, three Ounces. Boil all together gently for twenty-six Hours in a tall Phial; and let the Liquor, when filtrated, be kept in a close Vessel. Six Drops of it are to be exhibited every Morning and Evening in a little Spanish Wine.

Boerhaav. Aph. & Mat. Med.

RACRI, RAAN, or RANAC. Sal Ammoniac. *Rulandus.*

RADLEUS, or RADIALIS. *Winslow* takes Notice of three Muscles under this Name; the first is the *Radialis Internus*, otherwise called *Flexor Carpi Radialis*. See FLEXOR.

The second is the *Ulnaris Externus*, or *Extensor Carpi Radialis*. This Muscle *Winslow* divides into two. In many Subjects, says he, we find these two Muscles entirely distinct from one End to the other, and they may be named *Radialis Externus primus* & *Radialis Externus secundus*, regard being had to the Insertion of their Tendons. Sometimes the two fleshy Portions adhere closely together, appearing to make but one Body, but the Tendons are always distinct and separate.

The first is inserted above, in the *Christa* of the external Condyle of the *Os Humeri*, below the Insertion of the *Supinator Longus*. The second is inserted in the same Condyle,

below the Insertion of the first; and in the neighbouring articular Ligament. From thence the two fleshy Bodies run down very close together; and having reached the Middle of the Outside of the Radius, each of them terminates in a long Tendon.

The *Radialis Externus*, together with the *Radialis Internus*, turns the inner Edge of the Hand directly toward the *Styloide Apophysis* of the Radius.

With the *Ulnaris Externus* it inverts the Hand, turning the Convex Side of the Metacarpus toward the lower Extremity of the Bones of the Fore-arm. It likewise moves the second Row of the Carpus on the first, and thereby increases the transverse Fold on the Convex Side of the Carpus. This Motion also encreases the Angle, which the Back of the Hand naturally makes with the Outside of the Fore-arm; and therefore, according to the common Language, it would be more properly term'd a Flexion outward, than an Extension.

This Muscle acting alone, draws obliquely, and toward the external Angle of the Radius, that Portion of the Hand, which answers to the first Metacarpal Bone, and to the Index; but not without some Difficulty.

Each of the two *Radiales Externi* may act separately, and, consequently, have distinct Uses; since their Tendons having passed the Annular Ligament, are inserted at some Distance from each other; and thereby one of them seems to be fitted to co-operate with the *Radialis Internus*, the other with the *Ulnaris Externus*; and they both serve conjointly to keep the Hand in its true natural Situation. *Winslow.*

RADIATED FLOWERS. See FLOS RADIATUS, under the Article BOTANY.

RADICALIS. Radical. This, when join'd with *Humor*, seems to imply much the same as innate.

RADICISECA. A Servant of the ancient Physicians, employ'd in gathering, and cutting Roots and Herbs, and preparing them for Medicinal Uses.

RADICULA. A Name for the *Raphanus*: According to *Blancard*, the Romans call'd the *Lychnis*, *Sylvestris*, *quæ Saponaria*, *vulgo* by this Name.

RADIUS, in Anatomy, is the Name of a Bone in the Fore-Arm. See BRACHIUM.

RADIX ALBA, in *Hippocrates*, is the Root of the *Dracunculus*, as explained by *Galen*, in his *Exegesis*.

RADIX BEZOARDICA, a Name for the CONTRAYERVA.

RADIX CARLO SANCTO.

This Root is found in temperate Soils, in *Mechoacan*, a Province of *America*. Its Bark is easily separated from it, is of an aromatic Smell, and of a bitter and somewhat acrid Taste. The Root itself consists of very slender Fibrils, which are easily separated from each other. The Bark is accounted sudorific, and corroborates the Stomach and Gums. If chew'd it procures an agreeable Breath. It is good for Scurvies, Catarrhs, Epilepsies, hastening Deliveries, and removing Hernias, and the Small Pox, if taken either in Powder or in the Form of a Decoction. The *Spaniards* have called it by the Name of *St. Charles*, on account of its uncommon Virtues. *Lemery des Drogues.*

RADIX CAVA. A Name for the *Moschatellina Foliis Fumariæ bulbosæ*; *de qua Cordus.*

RADIX CHINA. See CHINA.

RADIX DULCIS. A Name for the *Glycyrrhiza*, *capite echinato.*

RADIX IDÆA. A Name for the *Ruscus*; *Angustifolius*; *Fructu folio imnascente.*

RADIX RINZANGO. *Sive Bengalensis.* Supplem. 396.

This came in Use but very lately, for I find no mention of it in any Pharmacopœa, or Catalogue of Plants. As to its Virtues, it is recommended by *Dr. Tancred Robinson*, as a very potent Cephalic.

RADIX SIMAROUBA, Offic. *Sima Ruba*, Geoff. Tract. 297. Ind. Med. 90.

This is the Root of a *West India* Plant, which produces the *Cayan* Wood, remarkable for being very light. The Root and Bark are said to be excellent Astringents, proper in all Sorts of Loosenesses, and especially in Dysenteries. The Dose of the Root is an Ounce cut in small Pieces; and of the Bark two Ounces; boil'd in three Pints of Water to a Pint. This Decoction the Patient uses for his common Drink, till he is cured. *Geoffrey.*

RADIX URSINA. A Name for the MEUM.

The five Opening Roots are, those of Apium, Asparagus, Fennel, Parsley, and Butchers Broom: These are by some Authors called the greater Opening Roots, to distinguish them from the lesser, which are those of Caper, Eryngo, Dogs Grass, Rest Harrow, and Maddar.

RADIX SANCTÆ HELENÆ. *Cyperus Americanus.* *Hernand.*

This is a pretty long Root, full of Knots, black without, white within, and of an aromatic Taste, almost like that of Galangals. It is brought dry from the Port of *St. Helena*;

in the Province of *Florida* in *America*, where it grows. This Root is good against Pains of the Stomach, and is of an highly aperient Nature. It is recommended against the Nephritic, Colic, and a Difficulty of discharging the Urine. It is, by some, bruised and applied to weak Parts, in order to strengthen them. *Lemery Traité des Drogues.*

RABULA. A Raspatory.

RAIA. Offic. Salv. de Aquat. 149. Schonef. Ichth. 57. Mer. Pin. 185. Bellon. de Aquat. 80. *Raia Clavata*, Aldrov. de Pisc. 450. Rondel. de Pisc. I. 353. Gefn. de Aquat. 795. Charlt. Pisc. 11. Raii Ichth. 74. Ejusd. Synop. Pisc. 26. **THE THORNBAC.**

This is a Sea-Fish, of which the Flesh, Liver, and Gall, are used in Medicine. The Flesh is analeptic, and is said to increase Venereal Vigour. The Gall is recommended against Dimness of Sight, and Exulcerations of the Eye; and is a Remedy for the Itch.

Pliny recommends the Gall for Disorders of the internal Ear, *Lib. 32. Cap. 7.* See **BATIS.**

The Thornback is a Sea-Fish well known, of which there are several Species. Some have their Backs almost all over diversified with white Points like Stars; others have none but on the Tail; another Kind taken at *Marseilles* is greatly esteemed.

This Fish is of a blackish Colour, multiplies fast, feeds upon small Fishes, and lives in muddy Places near the Shore. It affords nourishing, solid and durable Food; because the viscous Juices it contains adhere to the Vesicles of the Fibres, and make it hard of Digestion. It is subject to cause Wind, and produce heavy and gross Humours, especially if eaten before it is kept some Time. It contains much Oil and volatile Salt. It agrees at all Times with young, bilious and sanguine People, who have good Stomachs. In some Places it is dried and will keep long, but it does not thus yield good Food. *Lemery of Foods.*

RAIZ-D'EMPOSE. A Name for the *Mathonica Malabarorum.*

RALLUS. The Name of a River-Fowl, a Sort of Moor-Hen, frequent in *Italy*, and other Places. The Fat is esteem'd resolute, emollient, and Anodyne. *Lemery des Drogues.*

RAMAG. *Athes. Rulandus.*

RAMALIS VENA. The *Vena Portæ.* *Theophilus de exalta Retrimentorum Vescæ Cognitione. C. 2.*

RAMED. Rhubarb. *Rulandus.*

RAMENA-POU-MARAM. The Name of a very large and tall Tree, which grows in *Malabar*; to which I find no Medicinal Virtues ascribed.

RAMENTUM. A Strigment, or small Corpufcle, abraded or scrap'd from any Body.

RAMEX. The same as **HERNIA.**

RAMIGRI. Colophony. *Rulandus.*

RAMUS. The Branch of a Tree; or Ramification of a Vessel in the Body.

RANA. Offic. Mer. Pin. 169. Bellon. de Aquat. 54. Schonef. Ichth. 59. Rondel. de Aquat. 2. 218. Charlt. Exer. 27. Aldrov. de Quad. Ovip. 89. *Rana Aquatica* Schrod. 5. 331. Jonf. de Quad. 130. Schw. Rept. 155. Raii Synop. A. 247. *Rana aquatica & innoxia*, Gefn. de Quad. Ovip. 46. **THE COMMON FROG.**

Frogs are of different Sizes and Colours, according to the Places where they are bred. Sea-Frogs are monstrous, and not used for Food. Land-Frogs, called in *Latin* *Rana Sylvestres*, nearly resemble Water-frogs, only they are smaller, and not eat; but Water-frogs are much used.

The Water-Frog is an amphibious Animal; but keeps most in the Water, as in Rivers, Marshes, Ponds and Fountains. It feeds upon Flies, Worms, Leaches, Snails, Insects, and Herbs which grow in the Water; sometimes also they devour their own Species, for small Frogs are often found in the Mouths and Bellies of large ones. They swim fast, and instead of walking, leap along.

In some Places they are much used for Food; tho' *Galen* so little regarded them, that he does not once mention them. Those bred in Ponds and Marshes are not so wholesome as those bred in Rivers, which abound with Phlegm, volatile Salt, and oily and balsamic Principles, which are proper for allaying sharp Humours of the Breast, are a little nourishing, and of an opening and dissolving Nature. From their Viscosity, however, they are hard of Digestion, and breed gross Humours; and some Authors assure us, that the two frequent Use of them makes People look sickly, and causes a Fever.

They agree at all Times with those who are of young and bilious Constitutions, have good Stomachs, and are accustomed to Exercise; but old and phlegmatic Persons ought to abstain from them, or use them moderately.

Their Spawn is much used in Physic, is cooling and moisten-

ing, and proper for qualifying sharp Humours: The Water distilled from it has the same Virtues. This Spawn is a viscous Matter, transparent, cold, glewy, and full of small Eggs. *Lemery of Foods.*

Emplastrum de Spermate Ranarum.
Plaster of Frog-Spawn.

Take of Frogs-Spawn, Oil of Frogs-Spawn, and Cerufs, reduced to a fine Powder, each two Pounds; of white Vitriol and crude Alum, each an Ounce and an half; boil all together to the Consistence of a Plaster: Then add of white Wax three Ounces; of Mastich and Frankincense, each half an Ounce; and of Camphire three Drams. Make into a Plaster.

The Frogs-Spawn must be newly gathered, and mixed in a Balon with the Oil of Frogs-Spawn, the Cerufs, the Vitriol, and the Alum reduced to Powder. This Mixture must be boiled by a moderate Fire, to the Consistence of a Plaster; then the white Wax must be melted in it; and when it is almost cold, incorporate with it the Mastich and Incense reduced to a fine Powder; and last of all add the Camphire, dissolved in about half an Ounce in the Oil of Frogs-Spawn. This Plaster is to be made up in Lumps for its better Preservation.

It is proper for Wounds, accompanied with Inflammation; it deterges, corrects the Acrimony of the Humours, and dries. It is used in Wounds of the Eyes.

The Vitriol and Alum are not ordinarily mixed with this Plaster, till about the End of the Boiling: But as only the Phlegm can be extracted from these Mineral Salts by such a Boiling, it is no matter whether they are put in soon or late. *Lemery Pharmacop.*

RANA VIRIDIS. Offic. Aldrov. de Quad. Ovip. 622. *Rana nostra viridis*, Ind. Med. 96. *Rana aquatica viridis*, Schw. Rept. 158. *Ranunculus viridis*, Schrod. 5. 305. Jonf. Quad. 133. *Ranunculus viridis, sive Dryopetes*, Gefn. de Quad. Ovip. 60. *Agedula*, Isidor. **THE TREE-FROG.**

The whole Frog, and its Blood, are used in Medicine. The Animal agrees in Virtues with the common Frog, and its Ashes sprinkled on Wounds are said most effectually to restrain their Bleeding. The Blood is recommended as of peculiar Efficacy in a Piltre. *Dale from Schröder.*

RANCIDITAS. Rancidity; that sort of disagreeable Corruption which fat and oily Substances contract by Age and Heat.

RANCULA. An erratic Pain in a Wound, attended with Pain and Pulsation. *Johannes Anglicus.*

RANDIA.

The Characters are;

It hath a Flower consisting of one Leaf, whose lower Part is tubulous, but the upper Part is expanded, and for the most part divided into five Segments. The Flower is succeeded by an oval Fruit, having but one Cell, which is filled with flat cartilaginous Seeds surrounded by a Pulp.

Miller mentions but one Species of this Plant.

Randia frutescens, spinis bijugis, foliis subrotundis, floribus albis. *Houft.* Shrubby *Randia*, with Spines growing two at a Joint, roundish Leaves and white Flowers. This Plant is figured and described by Sir *Hans Sloan* in his History of *Jamaica*, under the Title of *Lycium forte, foliis subrotundis integris, spinis & foliis ex adverso sitis.* Vol. I. p. 40.

This Shrub grows plentifully about *La Vera Cruz*, whence the Seeds were sent by the late Dr. *William Houston*, who gave this Name to it in Honour of Mr. *Isaac Rand*, a curious Botanist.

This Shrub rises to the Height of ten or twelve Feet in the Country of its Growth, and divides into a great Number of Branches, which are always produced by Pairs opposite, as are also the Leaves and Spines. The Flowers are small, and of a white Colour, which are succeeded by hard oval-shaped Fruit, about the Size of a large *Spanish Nut*, which is full of flat Seeds, inclosed in a soft blackish Pulp. The Leaves continue green throughout the Year. *Miller's Dictionary.*

RANGIFER. Offic. Jonf. de Quad. 64. Charlt. Exer. 12. *Cervus Rangifer*, Raii Synop. A. 88. *Tarandus*, Aldrov. de Quad. Bisul. 859. *Tarandus, sive Rangifer*, Gefn. de Quad. 840. *Tarandus*, Agric. Eliot. **THE RAIN-DEER.**

It is an Inhabitant of *Lapland*, and its Horns and Hoofs are of use in spasmodic Affections.

RANINÆ VENÆ. The large Veins under the Tongue.

RANULA. A Disorder of the Tongue, or rather a Tumour under the Tongue. See **LINGUA.**

RANUNCULO AFFINIS. A Name for the *Hydrocotyle, Zeylanica, Asari folio.*

RANUNCULOIDES. A Name for the *Hepatica; trifolia; caerulea flore.*

RANUNCULUS.

The Characters are;

The Perianthium is generally pentaphyllous, sometimes hexaphyllous, and commonly caducous. The Flower is rosaceous, generally pentapetalous, or hexapetalous, and furnished with numerous Stamina. The Fruit is round or oblong, and contained in Capsules, each of which is furnished with an incurvated Tube, which varies according to the Species. The Plant, in other Respects, resembles the *Chelidonium Minus*.

Boerhaave mentions sixty-nine Species of *Ranunculus*, none of which have any particular medicinal Virtues ascribed to them at present, that I know of, except the 1st, 2d, 3d, 6th, 11th, 13th, 16th, 61st, 62d, 63d, and 68th.

1. *Ranunculus pratensis*; erectus; acris. *C. B. P.* 178. *Raii Hist.* 1. 583. *Synop.* 3. 248. *Boerh. Ind. A.* 30. *Tourn. Inst.* 289. *Ranunculus acris*, Offic. *Ranunculus rectus non repens*, flore simpliciter luteo, *J. B.* 3. 416. *Ranunculus pratensis*, erectus, acris, vulgaris, *Park. Theat.* 329. *Ranunculus sur-rectus cauliculis*, *Ger.* 804. *Emac.* 951. UPRIGHT MEADOW CROWFOOT.

It grows in Meadows and Pastures, and the Herb is used. This Species of *Ranunculus* is of a caustic Quality, and if the recent Herb bruised be applied to the Skin, it excites a Pain and Inflammation. The Roots are in Request among the Rustic Sort of People, and Soldiers, for the Cure of intermittent Fevers.

2. *Ranunculus*; pratensis; erectus; acris; in folii medio maculatus. *C. B. P.*

3. *Ranunculus*; pratensis; erectus; dulcis. *C. B. P. M.* H. 2. 439.

6. *Ranunculus*; pratensis; repens; hirsutus. *C. B. P.* 179. *Tourn. Inst.* 289. *Boerh. Ind. A.* 31. *Ranunculus*, Offic. *Ranunculus pratensis*, repens, *Park. Theat.* 329. *Raii Hist.* 1. 581. *Synop.* 3. 247. *Ranunculus pratensis etiamque hortensis*, *Ger.* 804. *Emac.* 951. *Ranunculus repens flore luteo simpliciter*, *J. B.* 3. 419. CROWFOOT.

This has a small creeping fibrous Root, from which arise several hairy Leaves, cut into three Segments, each of which is divided into as many more, and are frequently spotted with white Spots on their upper Side. The Stalks grow not so upright as those of the *Ranunculus Pratensis*, radice verticilli modo rotunda, having longer and narrower Leaves, and not so divided; bearing on their Tops, round, five-leav'd, shining, yellow Flowers, with several yellow Stamina in the Middle. When the Flowers are fallen, the Head enlarges into a round Cluster of sharp-corner'd flattish Seed. This Species sends out Flagellæ from the Roots, by which it propagates itself. It grows frequently in moist Meadows, and by River-sides, and flowers in May. *Miller's Bot. Off.*

This Species is quite harmless, and is often boiled with other Greens in the Month of April. *Dale.*

11. *Ranunculus*; montanus; aconiti folio; albus; flore minore. *C. B. P.* 182. *Aconitum Ranunculoides*, flore albo simpliciter. *M. H.* 2. 450.

13. *Ranunculus*; pratensis; radice verticilli modo rotunda. *C. B. P.* 179. *Tourn. Inst.* 289. *Boerh. Ind. A.* 31. *Ranunculus bulbosus*, Offic. *Ger.* 806. *Emac.* 953. *Park. Theat.* 329. *Raii Hist.* 1. 581. *Synop.* 3. 247. *Ranunculus tuberosus major*, *J. B.* 3. 417. BULBOSE CROWFOOT.

This is the most common, and with this our Fields about Town are covered in the Spring. It may be known from the rest by its round white tuberous Root, having several Fibres at the Bottom. Its Leaves grow on longer Foot-Stalks; but it is cut into three Sections, like the *Ranunculus pratensis*, repens, hirsutus. It grows more erect, and the Calyx of the Flower turns back, and remains till the Leaves drop; whereas, in the creeping Sort, the Calyces fall off as soon as the Flowers are opened. It flowers in May, and is too frequent in our Fields and Meadows, being by the Vulgar called Butter-Flowers; they believing that the Butter receives its yellow Colour from these Flowers; whereas the Cows will meddle with none of the Crow-feet when green, by reason of their hot caustic Taste. *Miller's Bot. Off.*

The Root of this Plant is so acrid, that it may be used for Caustics and Blisters, but principally upon the Joints of those Parts which are infested with the Gout. They bruise this *Ranunculus*, and apply it to the Corns of the Feet, after they have been well softened in warm Water, and cut to the Quick. *Martyn's Tournefort.*

The Root is of admirable Efficacy in eroding, consuming, and drying hard Tumours; but loses its Virtue when dried.

16. *Ranunculus*; palustris; Apii folio; lævis. *C. B. P.* 180. *Boerh. Ind. A.* 31. *Tourn. Inst.* 291. *Ranunculus palustris*, Offic. *Ger.* 814. *Raii Synop.* 3. 249. *Ranunculus palustris retundi folius*, *Ger.* *Emac.* 962. *Raii Hist.* 1. 585. *Ranunculus palustris sive minimo*, *J. B.* 3. 858. *Ranunculus*

palustris Sardonicus, *Lævis*. *Park. Theat.* 1215. ROUND-LEAV'D WATER CROWFOOT.

It delights in watery Places, and flowers in June and July.

This *Ranunculus*, *Dale* supposes the fourth Species of *Dioscorides*, who writes that the Leaves and tender Stalks being applied as a Cataplasm, are exulcerating and escharotic, not without Pain. Hence they cure scabrous Nails, remove the Psores, and obliterate the Marks of such as are stigmatized. The Application hereof cures also the Myrmeciae, Acrochordones, and Alopecia, and that in a short time. A Decoction of the same is good to foment Chilblains. The Root dried and triturated, excites Sneezing, when applied to the Nostrils, and worn as an Amulet, eases the Tooth-ach, but it breaks the Teeth. *Dioscorides*, *Lib. II. Cap.* 206.

61. *Ranunculus*; gramineo folio; flore caudato; feminibus in capitulum spicatum congestis. See MYOSUROS.

62. *Ranunculus*; longifolius; palustris major. *C. B. P.* 180. *Boerh. Ind. A.* 34. *Tourn. Inst.* 292. *Ranunculus flammæus*, Offic. *Ranunculus flammæus major*, *Ger.* 814. *Emac.* 961. *Raii Hist.* 1. 587. *Synop.* 3. 250. *Ranunculus palustris flammæus major*, *Park. Theat.* 1215. *Ranunculus folio longo maximus*, *Lingua Plinii*. *J. B.* 3. 365. GREAT SPEAR-WORT.

It grows in marshy Ditches, and flowers in June; its Virtues are the same with those of the *Ranunculus palustris*.

63. *Ranunculus*; longifolius; palustris; minor. *C. B. P.* 180. *Tourn. Inst.* 292. *Boerh. Ind. A.* 34. *Flammula*, Offic. *Ranunculus flammæus minor*, *Ger.* 814. *Emac.* 961. *Raii Hist.* 1. 587. *Synop.* 3. 250. *Ranunculus palustris flammæus minor sive angustifolius*, *Park. Theat.* 1214. *Ranunculus longifolius aliis flammula*, *J. B.* 3. 864. SPEAR-WORT.

It is found frequently growing in watery Meadows, and oozy Places, and flowers in June. The Herb, which is of Use in Medicine, agrees with the other Species in its caustic Quality. Its Leaves are sometimes even or entire, and sometimes serrated; in which latter Respect, it is called *Ranunculus flammæus serratus* by *Gerard* and *Parkinson*; and *Palustris serratus* by *C. Bauhine*.

68. *Ranunculus*; folio Cyclaminis; radice Asphodeli; major. *Tourn. Inst.* 285. *Boerh. Ind. A.* 35. *Thora*, Offic. *Thora Valdensis*, *Ger.* *Emac.* 966. *Raii Hist.* 1. 591. *Thora folio Cyclaminis*, *J. B.* 3. 650. *Aconitum Pardalianches alterum*, seu *Thora minor*, *C. B. P.* 184. *Aconitum Pardalianches*, seu *Thora minor*. *Park. Theat.* 317. *Thora montis Baldi*, sive *Sabaudica*, *Ger.* *Aconitum Pardalianches primum*, seu *Thora major*, *C. B. Pardalianches*, seu *Thora major*, *Park.* LEOPARD-BANE.

It grows on the Mountains of Switzerland, and the Herb is endued with a caustic Quality.

The Virtues of this Plant are either of the laudable and salutary, or of the hurtful and pernicious Kind. The first, second, sixth, thirteenth, and sixteenth Species are principally kept in the Shops. Its Roots and small Bulbs, bruised and applied to the Skin, excite Pain, Redness, Inflammation, a Gangrene, and an acrimonious State of the Humours: For this Reason they are of an escharotic, caustic Quality, and cure Diseases in which the nervous System is to be roused and shaken; such as Pains of the Bones, Epilepsies, Convulsions, Spasms, hysteric Passions, fixed Pains of the Periosteum, Gouts, old Ulcers, and ischiadic Pains. They exulcerate and burn into Crust the Skin and Panniculus adiposus; and if they are left in open Wounds, they excite Fistulas. It is also customary among Soldiers and common People, to gather, wash, and bruise the Roots of the first, second, and third Species; and apply them to the Soles of the Feet, or between the Fingers, by which Means they successfully cure intermitting Fevers; but if they are too acrid, they burn the Skin.

This Herb is, by many, called *Scelerata Herba*, because with its Roots and Bulbs the Beggars raise unseemly Ulcers on their Children, in order to excite the greater Compassion. The Herb put up the Nostrils excites a violent Sneezing. Warts are eradicated by rubbing them with this Plant; and the Ancients applied the Leaves of the *Ranunculus* for the Cure of a Leprosy. This Plant is poisonous when used internally, but externally it cures the Itch in Children.

It is by some called *Apium Risus*; hence *Giulandinus*, that skilful Botanist, thought that it was the *Apiastrum* of *Pliny*, which *Dioscorides* calls *Sardonis*. This is so acrimonious, that if it is applied to the Tongue, it immediately inflames it, and produces a Gangrene in it.

It is also called *Herba Strumea*, because it resolves and dissolves scrophulous and strumous Swellings; *Pes Corvini*, because the Leaves of some Species of it resemble Crows Feet; and *Ranunculus*, from *Rana*, because it grows in moist Places. *Hist. Plant. Ascript.* *Boerh.*

Besides the foregoing Species of *Ranunculus*, *Dale* mentions the following:

Ranunculus montanus, Offic. *Ranunculus montanus maximus albus*, Park. Theat. 334. *Ranunculus montanus Aconiti folio albus flore majore*, C. B. P. 182. Tourn. Inst. 290. *Ranunculus Aconiti folio*, Ger. Emac. 954. *Ranunculus flore albo Alpinus major*, J. B. 3. 861. Raii Hist. 1. 589. MOUNTAIN CROWFOOT WITH A WHITE FLOWER.

It grows on woody Hills, and flowers in May and June; and agrees in Virtues with the other Species of *Ranunculus*.

RAPA.

The Characters are;

The Pod ends in a fungous kind of Horn, and the Root is carnosous and tuberous.

Boerhaave mentions nine Species of *Rapa*, which are;

1. *Rapa*; *fativa*; *rotunda*; *radice candida*. C. B. P. 89. Raii Hist. 1. 800. Synop. 3. 294. Tourn. Inst. 228. *Boerb. Ind. A. 2. 12.* *Rapa*, Offic. *Rapum hortense*, Park. Parad. 508. *Rapum majus*, Ger. 177. Emac. 232. *Rapum sativum rotundum*, J. B. 2. 838. TURNEPS.

This is a Root so well known, that it would be needless to say more than that it is round, and somewhat flat, of a white Colour, but somewhat reddish on the Outside. The Leaves are large, rough, and very much cut in, being round and broad at the End, and lying on the Ground. In the Spring it sends forth branched Stalks, clothed with smaller, but smooth and undivided Leaves, and long Spikes of four-leaved bright yellow Flowers; which are succeeded by long, slender Pods, containing round black Seed. It is sown in the Fields and Gardens, and flowers in April.

Turneps are much eaten with all Sorts of Flesh, in the Winter Season especially, and are a wholesome and nourishing Root, tho' somewhat windy; and are more used in the Kitchen than in the Apothecaries Shops. Some commend a Syrup made with Slices of Turneps and brown Sugar-candy, Stratum super Stratum, baked in an Oven, as a good Pectoral, and helpful for Coughs and Consumptions. *Miller's Bot. Off.*

Turneps are sown in a moist Soil with Cabbage, and are much used for Food. They are of two Kinds, Male and Female, which differ little from one another; only the Male is usually round, about the Bigness of a Child's Head, and much extended in Breadth; the Female is oblong, and most esteemed. Such as are tender, plump, of a good Taste, and grow in a fat and moist Soil, are the best. They sometimes grow to a prodigious Bigness. *Pliny* and *Tragus* say, they had seen some of the Males that weighed forty Pounds; and *Amatus* reports that he had seen some that weighed above fifty and sixty Pounds. Some of the Females have been known to have weighed thirty.

They contain much Oil, and a little essential Salt; and are very nourishing, softening, and provoke Urine, having an oily balsamic Juice, proper to correct the sharp Salts of the Humours, and to recruit the solid Parts. The Decoction of them, strained and sweetened with Sugar, is used to allay the sharp Humours of the Breast, and remove Hoarseness, and must be taken just before going to Bed.

They are hard of Digestion, windy, and sometimes cause Obstructions; because their Substance being very compact and close, they continue a long Time in the Stomach before they are wasted, ferment there, and easily stop in the small Channels or Pipes through which they pass. They agree at all times with young bilious Persons, and those whose Humours are sharp and thin, provided, however, they have a good Stomach. The Seed is reckoned good against Poison, and to kill the Worms. *Lemery of Foods.*

2. *Rapa*; *fativa*; *rotunda*; *radice obsoletè nigricante*. C. B. P. 90.

3. *Rapa*; *fativa*; *rotunda*; *radice suprà Terram viridi*.

4. *Rapa*; *fativa*; *rotunda*; *radice foris & intus flavescente*. C. B. P. 90.

5. *Rapa*; *fativa*; *rotunda*; *radice foris & intus pallide lutescente*.

6. *Rapa*; *radice compressa, candida*.

7. *Rapa*; *radice oblonga*; seu *femina*. C. B. P. 90.

8. *Rapa*; *radice oblonga*; seu *femina*; *radice obsoletè nigra*.

9. *Rapa*; *radice oblonga*; seu *femina*; *major*. *Boerb. Ind. Alt. Plant.*

This Plant agrees in Virtues with the *Raphanus*; the Cortex, or Bark, of the Root has an acrimonious Taste; but the Juice of the interior medullary Substance has a Honey-like Savour. The Root boiled and decorticated is an excellent Antiscorbutic, and is thought to have a demulcent Virtue. The expressed Juice of the Root, taken in a good State of Maturity, and before it bears Seed, being boiled and clarified, with an Addition of Honey, making a third Part of the whole, is an incomparable Medicine for Ulcers in the Mouth, and to deterge Aphthæ; and being drank, is an excellent Remedy for an inveterate Cough. The Seed, heated and pressed, yields

an Oil of Use on all Occasions. The Bulb roasted under the Embers, is an Anodyne in Inflammations of the Ears. The same boiled in Butter, and made into a Cataplasm, is very good to mollify Tumors. *Nicander* writes, that the *Rapa* is a very proper Ingredient in alexipharmic and theriacal Compositions; it serves also for Food and Sauce. *Galen* says, that it is a very good Aliment, but flatulent: It loses, however, its Flatulency in boiling or roasting; but as it is always deprived of its Cortex, it must still retain some Flatulency. The following Remarks on *Rapa* are worth Observation: The lesser the Bulb, and the more sandy the Soil in which it grows, the more acrimonious is its Taste; the Rind of the Bulb is always bitter, which is a Proof that the Plant is antiscorbutic. The Juice is highly commended by modern Physicians. They press the whole Body of the Bulb into a Flour, and so express the Juice, which is acrimonious; then with an Addition of Honey they make of it a Gargarism, which is a good Remedy in the Quinsey, and a Peripneumony. The eighth Species becomes the more acrimonious for being pierced by Worms, because the aqueous Juice is evacuated by the Wounds. That there is a considerable Flatulency in crude Turneps, is demonstrated by Mr. Boyle, who found, that by putting them with their Rinds pared off in an exhausted Receiver, and suffering them to continue therein for four and twenty Hours, they had in that Space of Time generated five Atmospheres; that is, rendered the Air within the Receiver of five Times the Weight of that without it. The same Experiment will hold good of Radishes; whence it appears, that there is in these Plants an antiscorbutic and very deterfivè Quality. *Hist. Plant. Ascript. Boerhaave.*

Besides the foregoing Species of *Rapa*, Dale mentions the following:

Rapa Sylvestris, Offic. C. B. P. 90. Raii Hist. 1. 800. *Rapum Sylvestre*, Ger. 179. Emac. 233. *Rapum sylvestre non bulbosum*, Park. Theat. 861. *Rapum sylvestre Matthioli*, J. B. 2. 841. WILD TURNEP.

It grows in Fields, and flowers in the Summer. The Root, as *Dioscorides* says, is an Ingredient in *Smegmata*, or deterfivè Medicines, composed of the Flour of Lupines, Wheat, Darnel, or Vetches, for clearing the Skin of the Face, and of the Body. *Dioscorides*, L. 2. C. 135.

RAPAX. A Name for Amber.

RAPHANINUM OLEUM. Oil drawn from the Seeds of the Radish. *Dioscorides* recommends it for cutaneous Disorders. L. 1. C. 45.

RAPHANISTRUM.

The Characters are;

The Pod is full of Joints, like a fasciated or filleted Column, and full of roundish Seeds, inclosed in each Joint.

Boerhaave mentions three Species of *Raphanistrum*, which are;

1. *Raphanistrum*; *segetum*; *flore luteo, vel pallido*. T. 230. *Rapistrum, flore luteo, siliqua glabra articulata*. Raii Hist. 805.

2. *Raphanistrum*; *arvense*; *flore albo*. T. 230. *Rapistrum, flore albo Erucæ foliis*. Lob. Ic. 199. *Lampfana*. Cæsalp. 355.

3. *Raphanistrum*; *flore albo striato*; *siliquâ articulata, striata, minore*. See ARMORACIA. *Boerb. Ind. Alt. Plant.*

It is called *Raphanistrum* from *Raphanus*, because its Root resembles that of the *Raphanus minor*. Its Virtues are the same with those of the *Raphanus*. *Hist. Plant. Ascript. Boerhaave.*

Raphanistrum is also a Name for several Sorts of *Rapistrum*, which see.

Raphanistrum dispernum. A Name for the *Erucago*; *segetum*.

Raphanistrum, monospermum. A Name for the *Myagrum monospermum*; *latifolium*.

RAPHANUS.

The Characters are;

The Pod is like a Horn, thick, spongy, divided by a thin Membrane into two Capsules, or Cells, containing round Seeds.

Boerhaave mentions five Species of *Raphanus*, which are;

1. *Raphanus*; *major*; *orbicularis*; *vel rotundus*. C. B. P. 96.

2. *Raphanus*; *major*; *orbicularis*; *floribus candidis*. C. B. P. 96.

3. *Raphanus*; *niger*; *major*; *rotundus*. M. H. 3. 265.

4. *Raphanus*; *minor*; *oblongus*. C. B. P. 96. Tourn. Inst. 229. *Boerb. Ind. A. 2. 11.* *Raphanus hortensis, Radicula*, Offic. *Raphanus*, J. B. 2. 846. *Raphanus sativus*, Ger. 183. Emac. 287. Raii Hist. 804. Synop. 3. 296. *Raphanus vulgaris*, Park. Theat. 861. Parad. 507. RADISH.

This Root is very well known to every one, to be long, single, and white; and covered with a thin reddish Skin on the

the upper Part; the Leaves are large, rough and hairy, pretty much cut in on the Edges; the Stalks grow to three or four Foot high, much branched, having several four-leaved white Flowers, with a reddish Spot on each Leaf; which are succeeded by pretty large, light, spongy Seed-vessels, including oval, reddish, brown Seed, as big again as Rape Seed. It is planted in Gardens, and flowers in May.

Radishes are opening, attenuating, and antiscorbutic, and are much eaten in the Spring; but afford little Nourishment, and are very windy. They provoke Urine, and are good for the Stone and Gravel. They are but seldom used in the Shops. *Miller's Bot. Off.*

The Parts useful in Medicine are the Root and Seed, which are principally employed in wasting and expelling the Stone; in provoking Urine and the Menfes; and in opening Obstructions of the Liver and Spleen. *Dale.*

The *Raphanus* has the Virtues of the *Cochlearia*; the Root is efculent, expels Phlegm from the Intestines, and is a Carminative. The Flowers, Leaves, Seeds and Roots are antiscorbutic; for which Reason they are much in request, and are proper for phlegmatic Constitutions. The expressed Juice of the Roots and Seeds, taken in the Morning with Honey, is a very wholesome Medicine, especially if a Draught of Whey be taken afterwards; for it cleanses the Stomach, Kidneys, and Lungs, and is good against an inveterate Cough and Hoarseness, proceeding from Phlegm; but it is not proper in a Cough proceeding from an Inflammation, nor for those who spit Blood. The Leaves are used among other Greens. The Root contains much of an aqueous and acrimonious Substance; and the drier it is, the more acrid it becomes; but its Acrimony is lost in boiling. Its Aquosity renders it flatulent, on which Account it is said not to be good in hypochondriacal Disorders: The daily Use of the Root, however, is of sufficient Efficacy to cure a great Dropsy in the Beginning; and it is of excellent Service in the Scurvy. It is also aperitive, inciding, and good for the Stone, the nephritic Colic, a Retention of Urine and the Menfes, and in the Jaundice. The Seeds are opening; but taken inwardly by themselves, they excite a Nausea. *Hist. Plant. Ascript. Boerhaave.*

5. *Raphanus*; major; oblongus. *Boerb. Ind. Alt. Plant.*
Raphanus aquaticus. A Name for the *Sisymbrium*; *aquaticum*; *Raphani folio*; *siliqua brevior*; and for the *Sisymbrium*; *aquaticum*; *foliis in profundas laciniis divisis*; *siliqua breviori*.

Raphanus rusticus. A Name for the *Cochlearia*; *folio cubitali*.

RAPHE. A Suture.

RAPISTRUM.

The Characters are;

The Shell is almost globular, and consists of one Capsule, which generally contains no more than one Seed.

Boerhaave mentions six Species of *Rapistrum*, which are;

1. *Rapistrum*; *Oriente*; *Acanthi folio*. *T. Cor. 14.*
2. *Rapistrum*; *monospermum*. *T. 210. C. B. P. 45. Prodr. 37. J. B. 845. Raphanistrum, monospermum, capsulis striatis, tenuibus, oblongiusculis*. *M. H. 2. 267.*
3. *Rapistrum*; *maximum*; *rotundifolium*; *monospermum*. *Corn. 147. Raphanistrum monospermum, maximum, rotundifolium; capsula rotunda, glabra*. *M. H. 2. 265.*
4. *Rapistrum*; *arvense*; *folio auriculato, acuto*. *T. 211. Myagro similis, siliqua rotunda*. *C. B. P. 109. Prodr. 52. Raphanistrum, siliqua minore, rotunda, rugosa, aspera*. *M. H. 2. 267.*
5. *Rapistrum*; *Oriente*; *folio Raphani*; *capsulis rugosis*. *Nissle.*
6. *Rapistrum*; *Oriente*; *Dentis Leonis folio*; *flore albo*. *T. Cor. 14. Boerb. Ind. Alt. Plant.*

It is called *Rapistrum* from *Rapa*, because its Leaves resemble those of the *Rapa*. All the Species are antiscorbutic, and have an acrimonious Taste, mix'd with a Savour of Garlick, whence they contain something of a heating Quality; however, they are not much commended, and are but of little Use in Medicine. *Hist. Plant. Ascript. Boerb.*

Rapistrum, is also a Name for the *Sinapi*; *arvense*; *præcox*; *semine nigro*. And for the *Sinapi*; *arvense*; *præcox*; *semine nigro*; *foliis integris*.

Rapistrum flore albo. A Name for the *Raphanistrum*; *arvense*; *flore albo*.

Rapistrum flore luteo. A Name for the *Raphanistrum*; *setum*; *flore luteo, vel pallido*.

Rapistrum Italicum. A Name for the *Erysimum*; *angusti folium*; *majus*.

RAPUM. See RAPA.

RAPUNCULUS.

The Characters are;

It has all the Appearance of the *Campanula*, except in that the Flower is monopetalous, quinquefid, stellated, and furnished with a corniculated Pistil.

Boerhaave mentions two Species of *Rapunculus*; the first of which has its Flowers collected into a Head, and is known by the Name,

Rapunculus; *Scabiosæ capitulo*. *C. B. P. 92. Scabiosa, globularis; quam ovinam vocant*. *J. B. 3. 25. 12. Rapuntium montanum, capitatum, leptophyllum*. *Col. 1. 227.*

The second Species, which is distinguished by having its Flowers disposed in the Figure of an Umbella, is called,

Rapunculus; *valerianoides*; *cæruleus*; *umbellatus*. *Flor. 2. 113. Cervicaria, valerianoides, cærulea*. *C. B. P. 95. Trachelium, umbelliferum, cæruleum*. *Ponæ. Valerianthemum*. *Hoffman. Delic. Boerb. Ind. Alt. Plant.*

It is called *Rapunculus*, because its Root resembles that of the *Rapum*. But I find no Virtues ascribed to it.

Rapunculus is also a Name for several Sorts of *CAMPANULA*.

RAPUNTIIUM.

The Characters are;

In Leaves, Fruit, and outward Appearance, it resembles the *Campanula*. The Flower is monopetalous, divided into Parts, shaped like a Tongue, and inclosed in a Sheath.

Boerhaave mentions four Species of *Rapuntium*, which are;

1. *Rapuntium*; *maximum*; *coccineus*; *spicato flore*. *Col. in Rech.*
2. *Rapuntium*; *Americanum*; *flore dilute cæruleo*. *A. R. P. 105. Rapunculus, Galeatus, Virginianus, flore violaceo, majore*. *M. H. 2. 466.*
3. *Rapuntium*; *Americanum*; *Virgæ aureæ foliis*; *parvo flore cæruleo*. *T. 163.*
4. *Rapuntium*; *Africanum*; *minus*; *angustifolium*; *flore violaceo*. *T. 163. Campanula, minor, Africana, erini facie, flore violaceo, cauliculis procumbentibus*. *H. L. Boerb. Ind. Alt. Plant.*

This Plant is not received in Medicine. The first Species serves to feed Sheep, and bears a very beautiful Flower, which, for Colour and Lustre, surpasses all others; for which reason it is called *Flos cardinalis*, the Cardinal Flower. *Hist. Plant. ascript. Boerhaave.*

RAREFACIENTIA. Medicines which rarify the Blood.

RASA. The same as RESINA.

RASA, or RASTIS. Tin.

RASAKETI, RUSATAGI, or RUSANGI. Burnt Copper. *Rulandus.*

RASCATIO. Excreation, or Hawking.

RASCETA, or RASETTA. The Wrist; or Ankle. The Word is Arabick.

RASILIS ÆRUGO. See ÆRUGO.

RASORIUM. A Raspatory, or Lenticular. See Table 28. Fig. 3, 4, and 5.

RASPATORIUM. The same as RASORIUM.

RASTETA. The same as RASCETA. *Paracelsus.*

RASTOL, or RASOES. Copper. *Rulandus.*

RASTUL. Salt. *Rulandus.*

RASURA. A Shaving; or Rasping. It is also used to express a kind of Corrosion by acrid Humours. *Rasura*; are Shavings, or Rasplings.

RATIONIS OS. The OS SINCIPITIS. *Blancard.*
RATIS. *Marcellus Empiricus* informs us, that this is the French Name for the *Filicula*, (Polypody) which frequently grows on the Beech.

RAUCEDO. Hoarseness.

RAVED. Rhubarb.

RAXACH. Gum Ammoniac.

REALGAR. *Realgar*, or *Lisagallum*, of the Shops; *Σαδάραχ* of the Greeks; *Realgar*, *Lesgal*; and *Zarnich Abmer*, of the Arabians; called by us Red Orpiment; is an arsenical Juice of the same Nature with Orpiment, differing from it only in Colour. It is of two Kinds, native and factitious: The native *Realgar* is dug out of the same Mines with Orpiment, resembling Cinnabar in Colour, and smelling like Sulphur and Garlick when burnt, and made up in solid brittle Glebes. The factitious Kind is made of Orpiment, melted and boiled for some time in subliming Vessels, by which the yellow Flowers are raised to the upper Part of the Vessels, and the Mass remaining at the Bottom, being condensed by Cold, becomes of a red Colour, like Cinnabar, and is called *Realgar*; which, if it be exposed to the free Air for a long Time, becomes covered with a saline Efflorescence. This *Realgar* is not to be confounded with the factitious red Arsenic.

Realgar is brought from China, in different Figures; some of which resemble the Figures of little Men, called Pagods; and I am of opinion that it is not cut into these Figures, but cast in Moulds.

Realgar is no less poisonous than Orpiment. According to *Dioscorides*, *Sandaracha* has a septic and corroding Virtue; but it is wonderful that he should recommend the Use of it, not only in Fumigations for Coughs of long standing, but also

also taken inwardly, mixed with Resin for Asthmas; with Honey for a Hoarseness, or a spitting up of a purulent Matter. Even *Hippocrates*, in a Suffocation of the Uterus, accompanied with a Cough, orders the Weight of an Obolus, or about twelve Grains of Sandarach, mixed with the same Quantity of unprepared Sulphur, and three or four blanch'd Almonds, to be taken in sweet or perfumed Wine. The *Indians* commonly drink Wine or Water out of arsenical Cups, for various Diseases, as a sovereign Remedy; though among us, this Practice has been found to be attended with very bad Consequences. It must be owned, therefore, that the Bodies of Men in hot Countries are different from ours. As insensible Perspiration is there more copious, their solid Fibres are drier, and more unfit for Motion; and, for that reason, require more strongly irritating and stimulating Medicines, to make these Fibres contract as they ought. Likewise, as the Fluids in their Bodies are thicker and more viscid than in ours, by the Evaporation of the more fluid Parts of them, they cannot be attenuated but by strong and very acid Medicines; and therefore what is a certain Poison to us, is to them an efficacious Remedy; as the cathartic Medicines which we use, have hardly any Effect on them, except they be given in three times the common Quantity, as has been often observed by Physicians. In our Climate, therefore, we ought to abstain from the inward Use of these Medicines, however prepared, corrected or mitigated; because they still retain some Part of their deleterious Qualities, and prove fatal to Persons whose Viscera are tender. Neither is the external Use of them altogether safe; for *Fernelius* relates, that by applying a large Quantity of Arsenic to a cancer'd Breast, the Patient was carried off in six Days. About three Hours after the Medicine was applied, she was seized with a Shivering, Vomiting, Pain in her Head, and frequent Fainting. Her Pulse was weak, and as the Symptoms increased by Degrees, she began to be cold in the Extremities of her Body, and then her Face and other Parts swelling beyond Measure, she soon died. From this Observation, *Fernelius* takes occasion to caution Physicians against the external Use of arsenical Medicines, except in small Quantities, and to Parts at a great Distance from the Heart and Brain; though, in the Opinion of many very great Physicians, they are thought to be very powerful and efficacious Remedies in cachectic, phagedænic, and carcinomatous Ulcers.

The Correction of *Realgar*, first proposed by *Helmont*, and afterwards published by *Dallicot*, first Physician to the Duke of *Lorraine*, which has been found successful in many Cases, is this:

Put any Quantity of *Realgar*, finely powdered, into a Glass Matrafs, and pour upon it as much of a strong Lixivium of Tartar and Nitre, as will swim four Fingers Breadth above the *Realgar*. Digest them in a Sand-heat for twenty-four Hours, shaking the Matrafs very often. Then pouring off, and preserving the Tincture, pour new Lixivium upon the Powder, and repeat the whole Operation, till almost all the *Realgar* is dissolved, some indissoluble metallic Parts only remaining. Afterwards mix all the Tinctures together, pass them through Cap-Paper, and pour, at several times, as much Vinegar of Lead to the strained Liquor, as will precipitate all that can be separated from it. Then pouring off the clear Liquor from the precipitate by Inclination, let the Powder be washed with warm Water till it become almost insipid; and when it is well dried, burn a sufficient Quantity of rectified Spirit of Wine upon it; and then calcine it with the Tincture of Opium extracted with Spirit of Wine. This Powder, so prepared, is a gentle Escharotic, of great Service in cancerous Swellings. *Geoffroy*.

REBIS. A Word in *Paracelsus*, importing the Excrements of the Belly. It is also a Name for his celebrated Medicine, called *Azoth*.

REBISOLA. A secret Medicine prepared of Urine, for the Jaundice. *Rulandus*.

REBOLEA. Mummy. *Rulandus*.

REBONA. Burnt Dung. Mummy. *Rulandus*.

REBUS. The ultimate Matter of all Things.

RECEPTACULUM. A Receptacle. In Chymistry, a Receiver. In Anatomy, the *Receptaculum Chyli*, or Receptacle of the Chyle, is the Part to which the Lacteals convey the Chyle, in order to be transmitted to the Blood.

RECEPTARIUM MEDICUM. Physicians who collect or write vast Loads of Prescriptions, to the great Detriment of their Patients, are thus called by way of Reproach.

RECEPTUM. A barbarous Word, importing a Prescription.

RECESSUS. This Word is sometimes used to express an Abscess, or Apostemation.

RECHA. Marble. *Rulandus*.

RECIDIVA. A Relapse. After a Disease is once cured, the Patient often suffers a Relapse; a Disposition to which may

be known by the following Signs: If, after the Disease has left the Patient, a Weakness still remains; if there be no Appetite, nor Digestion, but much Nauseating, accompanied with stidorous or acid Eructations: With equal Certainty is a Relapse portended, if the forementioned Indications be attended with a fetid Breath, a vehement Thirst, and much Watching; if the Præcordia, and Parts adjacent, are tumified; and if the Face be inflated, especially towards the upper Eye-lid. All these forementioned Symptoms indicate a Return of the Disorder with the greater Certainty, in proportion as they appear more evidently at those Times, in which there is usually an Exacerbation of the Disease.

The Kind, or Nature of the Distemper will also furnish something material for predicting a Relapse. Those Fevers which are attended with an Inflammation, are very subject to return upon the Patient; for though the Fever goes off, it leaves behind it something of a Heat and Aëstuation in the Viscera. Of the same Disposition are the Epilepsy, Dimness, the Hernicrania, an obstinate Pain of the Head, a Catarrh, Asthma, Pains in the Kidneys, the Colic, Gout, and other Disorders of that Nature. The Season most favourable to Relapses is the Autumn; and every Relapse is the less dangerous for being occasioned only by bad Diet, and not from some corrupt Reliques of the former Disease. The sooner a Disorder returns, and the more impaired the Strength of the Patient, the worse is the Relapse; and whatever Disease ceases all on a sudden, and for no manifest Reason, seldom fails to return. *Lonnius, Med. Obs.*

RECIPE. A Word always used in the Beginning of Prescriptions, importing, Take. It is generally wrote R, or ʒ.

RECIPIENS. In Chymistry is a Receiver. In Pathology, *Recipiens* is the Recipient, or Subject which receives a Disease.

RECIPROCATIO. The same as ANTAPODOSIS.

RECLUSIO. The same as ANASTOMOSIS.

RECOCTA. A Sort of Cheese made of Whey or Butter-milk. *Castellus*.

RECOLATIO. A repeated Percolation, or Straining.

RECORDATIO. The same as ANAMNESIS.

RECORPORATIO. See METASYNCRISIS.

RECREATIO. The same as ANALEPSIS.

RECREMENTUM. A Recrement. It is much the same as Excrement; except that with respect to Metals, their *Scoriæ* are called Recrements.

RECRUESCENTIA. This is used by some Authors to express a Relapse.

RECTIFICATIO. Rectification; that is, a Depuration, or Exaltation of the Substances produced by Distillations, by repeating the Distillation a sufficient Number of Times.

RECTUM INTESTINUM. See COELIA.

RECTUS. This is a Name for several Muscles. Thus there is the *Rectus Abdominis*. See ABDOMEN. There are several Muscles which assist in moving the Head, that are called *Recti*.

RECTUS MAJOR.

This is a small, flat, short Muscle, broad at the upper Part, and narrow at the lower; and though it is called *Rectus*, it is situated obliquely between the Occiput and second Vertebra of the Neck.

It is fixed below to one Branch of the bifurcated Spine of the second Vertebra of the Neck, at a Tuberosity, which is often found at the upper Part of that Branch. Thence it ascends a little obliquely outward, and is inserted in the posterior Part of the inferior transverse Line of the Os Occipitis, at a small Distance from the Christa, being a little covered by the Obliquus superior.

RECTUS MINOR.

This Muscle is like the former, and it has also a small Insertion below, in the posterior Eminence of the first Vertebra. From thence it ascends laterally, and is inserted immediately under the posterior Part of the inferior transverse Line of the Os Occipitis, in a superficial Fossula, on one Side of the Crista Occipitalis.

The *Recti majores* and *minores postici*, and *Obliqui Superiores*, turn the Head a little Backward, on the first Vertebra of the Neck; and they can neither act otherwise nor separately; the *Recti Majores* contribute most to this Motion; and the *Minores* seem likewise to hinder the articular Membranes from being pinched between the Bones in great Motions.

RECTUS ANTICUS LONGUS.

This Muscle is in some Measure of a pyramidal Figure, lying along the anterior and lateral Parts of the Vertebrae of the Neck, all the Way up to the Basis Cranii.

It is fixed to the anterior Parts of the transverse Apophyses of the third, fourth, fifth and sixth Vertebrae in a digitated Manner. From thence it runs up obliquely inward towards the

the lateral Parts of the Bodies of the Vertebrae, passes on the Foreside of the first and second, without being inserted in them; and approaching gradually towards the same Muscle on the other Side, it is inserted near it, in the Forepart of the lower Side of the Apophysis Basilaris, or great Apophysis of the Os Occipitis.

RECTUS ANTICUS BREVIS.

This is a small flat Muscle, about the Breadth of one Finger, situated laterally on the anterior Part of the Body of the first Vertebra. It is fixed below to the Basis or Root of the transverse Apophysis of that Vertebra, near the anterior Eminence.

From thence it runs obliquely upward and inward to a transverse Impression in the lower Side of the Apophysis Basilaris of the Occipital Bone, immediately before the Condyle on the same Side, being covered by the *Rectus Anticus Longus*.

The *Recti Majores* and *Minores Antici*, and the two *Transversales Antici* move the Head forward on the first Vertebra; and the *Recti Minores* and *Transversales Breves*, likewise defend the Capsular Ligaments. *Winslow's Anatomy*.

RECURSIO. The same as **PALINDROMIA**. Or the Return of a Paroxysm, or Fit.

RECUTITI. The same as **APELLÆ**.

REDIVIVUS. Reviv'd. This, in Chemistry, is frequently apply'd to Metals, which, after having been disguised, and concealed in a Form foreign to their respective Natures, are reviv'd, and restor'd to that which is natural to them.

REDUC. or **REDUX.** A Flux, or Powder, by which calcin'd Metals, or Minerals, are reduced to a Reguline Form. *Rulandus*.

METHODS OF PREPARING FLUXES.

We took four Ounces of red Lead, an Ounce of white Sand in Powder; and two Ounces of dry decrepitated Salt, and mixed them all well together in a Mortar; then putting the Mixture into a clean Hessian Crucible, fitted with a Cover, we fused the Matter in a Wind Furnace for a Quarter of an Hour; when taking it out, and letting it cool, we afterwards broke the Crucible, and found the Salt at Top, and a pure Glass of Lead at the Bottom. This Glass we carefully separated, and kept a-part as a powerful Flux.

The Salt is of no other Use in this Operation, than to serve as a Flux to the Sand, and make it more readily unite with the Red-Lead; so as to form a Glass without any great Violence of Fire, or the Necessity of being long detained therein. So that by this Means a Glass of Lead may be readily prepared for the Purpose of artificial Gems, or other Uses.

This Glass of Lead is a Flux extremely useful in the Business of Assaying; and when kept long in Fusion, passes thro' the Pores of any common Crucible, almost like Water thro' a Sieve; so as, upon the Test, readily to vitrify, or carry off all Sorts of Metalline and Mineral Matter, except Gold and Silver: On which Property, therefore, the Art of Cupelling depends.

Fluxes seem reducible to two general Kinds; the Vitreous and the Saline. By the Vitreous we understand all those which either have of themselves, or readily assume a glassy Form in the Fire; among the Principle whereof we reckon the Glass of Lead, the Glass of Antimony, and Borax.

By the Saline Kind of Fluxes, we understand all those that are composed of Salts, whether Tartar, Nitre, fixed Alkali, or the like. Among the principal of this Kind, we reckon the black Flux, Sandiver, Kelp and the like. The vitreous Kind seem more immediately destined to act upon the stony or vitrescible Matter, wherewith stubborn Ores are frequently mixed; and the Saline Kind, to act more immediately upon the Ore itself, for the due Exclusion or Separation of the Metal.

The more kindly Ores require no Flux to make them run thin, or to afford all the Metal they contain. And sometimes Ores are so kindly as to contain their own Fluxes within themselves. Thus we have met with Copper Ores, which being barely ground to Powder, and melted, without any Addition, in a common Wind-furnace, have yielded as much, or even more pure Metal at the first Operation, than we could obtain from them by Means of the usual Fluxes. Whence we see that artificial Fluxes are not always necessary; or that the principal Use of them is for the stubborn and less tractable Ores. These are sometimes so exceedingly hard to fuse, and reduce to a metalline Form, that it requires the utmost Power of Art to treat them advantageously in the larger Way of Business, where no considerable Expence can usually be allowed for Fluxes. On this Account it is, that many Mines remain unwrought, as being intractable, without great Charges. Whence the Improvement of the Business of Fluxes, so as to render them cheap and effectual, might greatly contribute to the Improvement of Metallurgy.

We would, therefore, recommend to farther Enquiry what Matter it is, in the more soft and tractable Ores, which renders them so fusible, and easy to part from their Metal. Certain

Experiments we have made with this View seem to shew, that in Copper Ores it is a Kind of bituminous Substance, capable of melting by a strong Heat into a soft black Kind of Glass.

Some of the most powerful and cheap simple Fluxes hitherto known, are dried Wine-Lees, dried Cow-dung and Horse-dung, dried River-mud, Fuller's Earth, Iron Filings, common Salt Glass, Kelp, or Pot-ash, Sandiver and the like, which may be used in the larger Works; as Nitre, Tartar, Borax, Sal-ammoniac, Mercury-sublimate, and the like, may in the smaller, or for the making of Assays.

As for compound Fluxes, they are numerous, almost every Operator having his favourite Flux. And certainly some Fluxes are better adapted than others to certain Ores. But perhaps a few general Ones might be fixed upon, which should serve instead of all those hitherto commonly known and used. We will here recommend three, which are powerful, almost general, and not expensive.

1. Take of Nitre, prepared by long boiling it in Lime-Water, of Sea Salt, melted in the Fire, Sandiver and dry Wine-Lees, each one Part; Glass of Lead three Parts; and powder'd Glass, eight Parts; mix them all well together. This Flux added in an equal Weight, will fuse a very stubborn Ore.

2. For a still stronger, Take equal Parts of white Tartar, common Salt and Nitre, prepared as above; calcine them to a white Powder, and mix therewith its own Weight of Glass of Lead; and of this Flux add two Parts to one of the stubbornest Ore.

3. For a powerful Saline Flux, Take of the strongest Soap-boilers Lees four Pounds, white Tartar and common Salt, melted in the Fire, each one Pound; boil them together with five Gallons of human Urine, to a dry Salt. This Flux is particularly proper where Sulphur and Cobalt abound, and render the Ore very refractory.

But the great Secret in making and adapting of Fluxes, is not only to separate the Metal already ripened in the Ore, but even to mature and ripen the crude immature Part of the Ore in the Fire. Something of this Kind we apprehend may be effected; as having Reason to believe, that certain Fluxes will obtain a larger Yield of Metal from certain Ores, than other Fluxes in common Use, though esteemed of the best, and though they are perhaps of the dearest Kind. Thus clean Iron Filings will often do more than Borax. But as the Scales and Crocus, or Rust of Iron, have been commonly used, instead of pure and perfect Iron itself, for a Flux, few Operators appear acquainted with the Excellence of perfect Iron, employed for this Purpose: And many Advantages are now commonly reaped by a prudent mixing of one Ore with another of the same Denomination, and with the Slags or Recrements of Metals, in the Way of a Flux. *Shaw's Chemical Lectures*.

REDUCTIO, Reduction, in Chymistry, or Resuscitation; is the Restoration of a Metal, previously disguised under the Form of a Calx, or Powder, or dissolved in a Fluid, to the Form of a Metal.

REDUPLICATION. The same as **ANADIPLOSIS**.

REDUVIA. A Whitlow; or a painful Crack at the Root of the Nails.

REFE. A Thread doubled and twisted. It is the same as **ACIA**.

REFECTIO. The same as **ANALEPSIS**. *Fabricius ab Aquapendente*.

REFICIENTIA. The same as **ANALEPTICA**.

REFINATIO. Refination; that is, Depuration; a Term used with respect to Metals, and Sugar.

REFRIGERATIO. The same as **CATAPSYXIS**.

REFRIGERATORIUM. A Refrigeratory. This is a Vessel filled with Water, thro' which the Worm passes in Distillations. The Use is to condense the Vapours, as they pass thro' the Worm. *Vigani* takes Notice of another Sort of Refrigeratory, *Medull. Chym.* Tab. 2. Fig. 5. f. which consists of a Vessel filled with common Salt.

REGENERATIO. The same as **PALINGENESIA**.

REGIMEN. The Regulation of Diet; with a View of preserving, or restoring Health. See **DIÆTA**. *Regimen* in Chymistry, is the Regulation of Fires.

REGINA. The same as **BASILIS**.

REGINA PRATI. A Name for the **ULMARIA**, Meadow-Sweet.

REGIO. A Region. In Anatomy this is applied to many Parts of the Body. Thus the Parts adjacent to the Navel are denominated the Umbilical Region; and the Parts about the *Hypochondria*, the Region of the Hypochondria, or Hypochondriacal Region.

REGIONALIS MORBUS. An Endemial Disease.

REGISTRES. Registers, in Chymical Furnaces, are Air Vents, by opening or closing of which the Operator regulates the Fire at Pleasure: For when they are opened, the Heat of the Fire increases; when closed, it abates.

REGIUS MORBUS. This Name is, by different Authors, apply'd to several Distempers; but *Ceius*, the Standard for Medicinal *Latin*, means by this the Jaundice. Other Authors call the King's Evil, and others the Epilepsy, by this Name.

In Chymistry the *Aqua Regia* is a corrosive Water, which dissolves Gold. See *AQUA*. And in Pharmacy *Regius* is a pompous Epithet, apply'd to many Medicines.

REGNUM. A Kingdom. The *Materia Medica* is divided into three Kingdoms; the Animal, Vegetable and Mineral.

REGULUS. The Metalline Part of Minerals, which remains in the Bottom of a Crucible, after the Separation of the *Scoriae*, is called *Regulus*, or *Rex*.

REGULUS, is the Wren.

REJECTIO. A Casting up of any Thing preternaturally by the Mouth, either by way of Expectoration or Vomit.

REL, or **REBUS.** Sour Milk. *Rulandus*.

RELAXANTIA. Relaxing Medicines.

RELAXATIO. Relaxation. See *FIBRA*.

RELOLLÆUM. A Term used by *Paracelsus*, and his Followers, which it is not easy to affix any Meaning to. *Hellmont*, in his Treatise intitled *Natura contrariorum nescia*, defines it an efficient Quality, not proceeding from the Ferments and Seeds of Things. *Rebilla*, says he, are of two Sorts; one in *Corpore proprio*, the other in *alieno*. Amongst the *Relollæa propria* some are separable, as Cold from Water and Air; others inseparable, as Heat from the Light of the Sun, a Candle, or Fire. The *Relollæum alienum* perishes, if not supported; and is, therefore, called transient; of this Sort is Heat in Water.

REMINISCENTIA. The same as *ANAMNESIS*.

REMISSIO. A Remission of a Distemper is, when it is mitigated considerably, but does not entirely cease; for when it does, it is then called an Intermission.

REMORA. Offic. Aldrov. de Pisc. 335. Bellon. de Aquat. 405. Charlt. de Pisc. 6. Jonst. de Pisc. 7. Raii Synop. Pisc. 71. *Iperuquiba* & *Piraquiba Brasiliensibus*, Marcg. 180. Raii Ichth. 119. *Echenei seu Remora*, Imperat. 684. **THE SUCKING-FISH.**

It is taken in the main Sea. As to its Virtues, it restrains Venery, prevents Abortion, and retains the Fetus till Maturity.

RENALE EMPLASTRUM. The Name of a Plaster described by *Ætius*, Tetrabib. 3. Sermon. 3. C. 3.

RENCHUS. The Name of a Fish found in *Bavaria*, celebrated for being a delicious and good Aliment.

RENES. The Kidneys. These are by *Oribasius*, *Ætius*, and *Paulus Aegineta*, represented to be of difficult Digestion.

The Kidneys are two pretty solid, glandular Bodies, situated in the posterior Part of the Cavity of the Abdomen; on each Side of the Lumbar Vertebrae, between the last false Ribs, and *Ossa Ilium*. The Right Kidney lies under the great Lobe of the Liver, and is consequently lower than the Left, which lies under the Spleen.

The Figure of the Kidneys resembles that of a large Bean; their Circumference being convex on one Side, and concave on the other. The concave Side is turned to the Vertebrae, and the convex Side the opposite Way. Their Length answers to the Distance between the last false Rib and *Ossa Ilium*; they are about half as broad as long, and half as thick as broad.

In each Kidney we observe a Fore and Back-side; an upper and lower Extremity; a great and small Curvature, and a Convexity and Concavity.

The Back-side is broader than the Fore-side, and the upper Extremity is a little broader and more incurvated than the lower. The Depression in the small Curvature is oblong and uneven, resembling a Sinus, surrounded by several Tubercles; and as it is turned a little toward the Fore-side, this Side is something narrower than the other.

The narrowing Aorta and inferior Vena Cava, lie between the Kidneys, pretty close to the Bodies of the Vertebrae, and to each other; the Artery being on the Left Hand, and the Vein on the Right. Each of these large Vessels sends out transversely towards each Side, commonly one capital Branch, which goes to the Kidney, and enters the Sinus and Depression thereof, by several Ramifications.

These Vessels were by the Ancients termed the emulgent Arteries and Veins, but I chuse rather to call them the Renal Veins and Arteries. Sometimes there are more than one of each Kind, which is oftenest found in the Arteries; sometimes on one Side only, and sometimes on both.

The Artery and Vein are not of an equal Length, and the Difference depends on the Situation of the Aorta and Vena Cava; for the Left Renal Artery is shorter than the Right, because the Aorta lies nearest the Left Kidney; and the Left Renal Vein is longer than the Right, because the Vena Cava lies furthest from the Left Kidney.

These Vessels are likewise disposed in such a manner, as that the Veins lie more anteriorly than the Arteries; because the Aorta lies close to the Spina Dorsi; whereas the Vena Cava, which perforates the Diaphragm at some Distance from the Vertebrae, does not join them, till after it has given off the Renal Veins.

Each Renal Artery is surrounded by a nervous Net-work, called *Plexus Renalis*, which furnishes a great Number of Filaments to the Kidneys, that come partly from the semilunar Ganglions of the two great sympathetic Nerves, and partly from the *Plexus Hepaticus* and *Splenicus*. This Renal Plexus sends likewise some Filaments round the Renal Veins.

The Kidneys are surrounded by a very loose, membranous and cellular Covering, called *Membrana Adiposa*, because in fat Persons the Cells of this Substance are filled with Fat. This was for a long time mistaken for a Duplication of the Peritonæum, the true membranous Lamina of which covers only the Fore-side of the Kidneys; and consequently they lie without the Peritonæum; because the Portion of that Membrane that covers them cannot be looked upon as an entire Coat; so that the only common Coat they have, is the cellular Substance, which likewise invests the Renal Arteries and Veins in Form of a Vagina.

The proper Coat or Membrane of the Kidneys is composed of two Laminæ; between which there is likewise a very fine cellular Substance, which may be made sensible by blowing through a Pipe between the two Laminæ.

The external Lamina is very thin, and adheres closely to the internal Lamina, by means of the cellular Substance. The internal Lamina penetrates every where by numerous Elongations, into the Substance of the Kidney, from which it cannot be separated without Tearing.

The Surface of the external Lamina is very smooth, polished, and shining, and it renders the whole Surface of the Kidney very even and uniform in Adults. In Children, this convex Surface is in a manner divided into several Lobes or Tubercles, almost as in Oxen and Calves; and in grown Persons we sometimes observe the same Inequalities.

The Blood-Vessels having entered the Kidneys, are ramified every way; and these Ramifications send out other capillary Branches, which go all the Way to the Surface, where they appear like irregular Stars, and furnish the proper Membrane of the Kidneys. Sometimes these two Ramifications penetrate to the *Membrana Adiposa*, and communicate there with the Adipose Veins and Arteries.

The proper Membrane having surrounded the Kidney, all the way to the Sinus, joins the Vessels at that Place, and accompanies all their Ramifications through the Body of the Kidney, in form of a Vagina or Capula; and likewise contributes, in part, to form the Pelvis and Calyces, or Infundibula.

We sometimes observe a considerable Vessel to go in or come out from the convex Surface of the Kidney; but this is not common; and in that Case, there is a Depression by which the proper Membrane enters, and communicates with that Portion which goes in by the Sinus.

The Tunica Adiposa, or common Coat, which likewise invests the great Vessels to their Entry into the Kidneys, does not seem to accompany them any farther; but terminates at the Sinus, in the Interstices between the Ramifications.

We may distinguish three Kinds of Substances in the Kidney; an exterior Substance, which is thick, granulated, and in a manner cortical; a middle Substance, which is medullary and radiated, called *Striata*, *Sulcata*, or *Tubularis*, because it seems to be made up of radiated Tubes; and an inner Substance, which is only a Continuation of the second, and terminates on the Inside by Papillæ; for which reason I have given it the Name of *Papillaris*.

These three Substances may be seen distinctly in a Kidney cut into two equal Parts through the great Curvature. The cortical Substance may be observed round the whole Circumference; and by the Microscope we perceive it to be of a spongy, granulated, and waving Texture; all its Parts adhering together in a radiated Manner. Its Colour is a bright whitish Grey.

By fine anatomical Injections and in Inflammations, we discover an Infinity of small capillary Vessels, which run in various Directions, between and round the different Portions of this Substance; and by the Help of a Microscope, we likewise see great Numbers of small red Corpuscles more or less round, and disposed almost like Bunches of Currants. These small Corpuscles are, perhaps, only the Extremities of the cut Vessels, filled either with Blood, or with a coloured Injection.

The other two Substances, that is, the medullary or striated and papillary, are really but one and the same Mass, of a more reddish Colour, the convex Side of which rises at several Places into narrow Tubercles, lodged in the same Number of Cavities or Depressions. The radiated Striae are afterwards continued to the

the papillary Portion; and the Papillæ form, in some measure, so many Centers of these Radii, opposite to the Tubercles.

The medullary Substance is likewise distinguished from the cortical, by the arterial and venal Arches, which send capillary Ramifications on all Hands; and its Colour is more or less red.

The Papillæ, which are only a Continuation of the medullary Substance, as has been said, are often a little paler than that Substance. They are ten or twelve in Number, very distinct from each other, resembling the same Number of Cones, with very broad Bases and obtuse Apices.

At the Point of each Papilla we see, even without a Microscope, in a small Depression, several very small Holes, through which little Drops may be perceived to run when the Papillæ are compressed. These are little Drops of Urine, which being filtered, partly in the cortical, and partly in the medullary or tubular Substance, do afterwards pass through the Substance of the Papillæ, and are discharged by these Orifices.

Each Papilla lies in a kind of membranous Calyx or Infundibulum, which opens into a common Cavity, called the Pelvis. This Pelvis is membranous, being of the same Structure with the Calyces of which it is a Continuation; and its Cavity in Man is not uniform, but distinguished into three Portions, each of which contains a certain Number of Infundibula, or Calyces, together with the Papillæ which lie therein; and sometimes we find two or three Papillæ in the same Infundibulum.

At the Place where these Infundibula surround the Bases of the Papillæ, they send Productions into the medullary or radiated Substance of the Kidney, which accompany the Blood Vessels, and serve for Capsules or Vaginae to all the vascular Arches, both arterial and venal, and to their different Ramifications, quite through the cortical Substance; and as far as the Surface of the Kidney.

URETERS. After the Infundibula have contracted in a conical Form round the Apices of the Papillæ, each of them forms a small short Tube or Gullet, which uniting at different Distances along the Bottom of the Sinus of the Kidney, form three large Tubes, which go out from the Sinus, in an oblique Direction from above downwards, and immediately afterwards unite into one Trunk.

This Trunk becomes a very long Canal, called the Ureter. In Men the three Tubes supply the Place of what is called the Pelvis in Brutes, and might more properly be called the Roots and Branches of the Ureters than the Pelvis; which Name would agree best to the Trunk, as being larger than the rest of the Ureter. The Ureters are commonly two in Number, one for each Kidney; but sometimes there are more than two.

The Situation of the Trunk, and of the Roots and Branches of each Ureter, with respect to the renal Artery and Vein, is in the following Manner; the Artery is in the upper Part of the Sinus, and partly before the Vein. The Vein is about the Middle, and between the Artery and Ureter. The Ureter is in the lower Part, a little behind the Vein, and it is partly surrounded by one Branch of the Artery.

This Disposition appears plainer near the anterior than near the posterior Side of the Kidney, because this last is broader than the former; and we likewise see there the three Branches of the Ureter, of which the uppermost is the longest, and the lowest is the shortest, because of their oblique Direction downward.

From this Description we see that in the human Kidney there is no other common or uniform Pelvis, but the Trunk or Head of the Ureter, and the three great Branches. To have a true Idea of their Disposition, we must imagine, that the Ureter enters the Kidney by the lower Part of the oblong Sinus; that it increases gradually in Breadth as it advances, and that it is divided into three Branches, before it enters the Substance of the Kidney.

One of these Branches may be reckoned a direct Continuation of the Ureter, and it is longer than the rest; being extended from the lower to the upper Part of the Sinus, and it may be found without much Preparation. The other two Branches are shorter, and cannot be well discovered without an artificial Separation. The Angles between these Branches at their Bases, or at the Head of the Ureter, are not pointed as those of other Ramifications; but formed by a round Incurvation, which is generally surrounded by Fat.

These first Branches of the Ureters produce other small Branches at the Bottom of the Sinus, which are disposed in Pairs. These small collateral Branches extend in Breadth, and form the Infundibula or Calyces, in which the Papillæ are lodged; the great Circumference of which produces, in the Substance of the Kidney, the different Vaginae of the vascular Arches, and of their Ramifications. The internal Lamina of the Kidney is continued round these Vaginae; and the exter-

nal Lamina is expanded round the first Branches, round the Trunk, and round all the rest of the Ureter.

If the Trunk of the Ureter be split on that Side which is next the Vertebrae, and this Section be continued to the Extremity of the superior Branch; we may observe, immediately above the Trunk, two Holes lying near each other, which are the Orifices of the small collateral Branches, and Gullets of the Infundibula. A little above these Holes, there are other two very much like them; and so on all the Way to the Extremity of the superior Branch, which terminates likewise by these Gullets of the Infundibula. And in each of these Gullets we may observe, at least, the Apex of one Papilla.

A Section begun on the Convex Surface of the Kidney, and carried from thence to the Trunk of the Ureter, discovers the Extent of the Papillæ very plainly, and likewise the Infundibula, their Gullets, &c.

The Ureters run down obliquely, and with a very small Degree of Inflexion, from the Kidneys on the lateral Parts of the inner or anterior Side of the Os sacrum, and passing between the Rectum and Bladder, they terminate in the last of these Viscera.

They are composed of three proper Coats; the first of which, that surrounds the rest, is of a whitish Colour, and of a very compact filamentary Texture, being stretched with Difficulty, and appearing like a filamentary Substance degenerated. The next Coat is of a reddish Colour, stronger than the first, and made up of different Strata of Fibres, which intersect each other; but it is very hard to determine whether they are muscular or simply membranous.

The innermost Coat is in some Measure Ligamentary, and lined by a very fine Membrane, which covers a very delicate reticular Texture of Vessels. It is slightly granulated like shorn Velvet; and moistened all over by a mucilaginous Liquor. It has several longitudinal Rugæ, which are intersected by a great Number of small transverse Rugæ.

Besides these proper Coats, the Ureters are invested by the cellular Substance of the Peritonæum, the membranous Lamina of which covers likewise about two thirds of their Circumference, sometimes more sometimes less, but never surrounds them entirely. So that when they are examined in their natural Situation, they appear like Ropes lying behind the Peritonæum, and jutting out more or less towards the Cavity of the Abdomen, together with that Portion of the Peritonæum, which covers them.

All that has been said about the Structure of the Ureters, Pelvis, Arches, Striæ, Fossilæ, and Holes at the Apex of the Papillæ, appears most distinctly, when these Parts are examined in clear Water.

GLANDULÆ RENALES, VULGO CAPSULÆ ATRABILIARIÆ. Immediately above each Kidney lies a glandular Body, called by the Ancients *Capsula Atrabiliaris*; by others *Capsula Renalis*; *Renes Succenturiati*, and *Glandulæ Renales*; and they might be properly enough termed *Glandulæ supra Renales*. They are situated on the upper Extremity of each Kidney, a little obliquely; that is, more toward the inner Edge and Sinus of the Kidney, than toward the outer convex Edge.

Each Gland is an oblong Body with three Sides, three Edges and two Points, like an irregular Crescent with its great or Convex Edge, sharp, and the small concave Edge, broad. Its Length is about two Thirds of the greatest Breadth of the Kidney; and the Breadth of its middle Portion is about one third of its Extent between the two Extremities, sometimes more sometimes less. Its Colour is a dark yellow.

It has one anterior, one posterior, and one lower Side, which last may be termed the Basis; and it has one upper, and two lower Edges, whereof one is anterior, the other posterior. The upper Edge may be called the Crista, and the two lower Edges, the Labia. One of its Extremities is internal, or turned inward toward the Sinus of the Kidney; the other is external, or turned outward toward the gibbous Part of the Kidney. The Figure of this glandular Body may also be compared to that of a single Cock's Comb, or to the Top of an Helmet.

The Surface of these Glands is uneven; the Foreside is the broadest, and the lowest Side or Basis the narrowest. Along the Middle of the anterior Side, a Ridge runs from the Edge of the inner Extremity, a little above the Basis, to the Joint of the other Extremity, and divides this Side into two equal Parts, like the Middle Rib of the Leaf of a Tree, and on the lower Side under the Basis, there is a kind of Raphe or Suture.

The Blood-Vessels of these Glands come from the Renal and Diaphragmatical Veins and Arteries, and also from the Aorta and Vena Cava, and from the Celiac Artery. These Vessels are termed the Capsular Arteries and Veins; and as they enter the Glands, they seem to be invested by a Vagina. They are not always derived from the same Sources, neither is their Number the same in all Subjects; and there is commonly a pretty large Vein, which runs along the Ridge. The Nerves

on each Side are furnished by the neighbouring femilunar Ganglion, and by the Renal Plexus, which depends on it.

In the Inside of these Capsulæ, there is a narrow triangular Cavity, the Surface of which is full of short strong Villi of a yellowish Colour; but in Children it is reddish, and of a dark brown in aged People. The Sides of this Cavity are connected by a great Number of Filaments; and they appear to be wholly glandular, that is, to be filled with very fine small folliculous Corpuscles. Along the Top of the Gland, these Sides touch each other immediately.

In Opening this Cavity, we find a granulated or follicular Substance, which fills it almost entirely; and the Blood-Vessels are distributed on this Substance, as well as on the Sides of the Cavity. If the Section be begun at the great Extremity of the Capsula, and be continued through the upper Edge; and if the lateral Portions be afterwards separated, the glandular Body appears like a kind of Crista, raised from the Middle of the Bottom of the Cavity.

This glandular Body or Nucleus, adheres more closely to the Bottom or Basis of the Cavity, than to the two Sides, especially near the great Extremity; but yet it may be separated both from the Basis and Sides, being connected to them by a great Number of small Filaments. It adheres least to the Basis near the small Extremity.

The Capsular Vein, which comes ordinarily from the Renal Vein, is much larger than the Arteries; and it communicates with the Inside of the Capsula, much in the same manner as the Splenic Vein with the Cells of the Spleen; for it may be inflated by blowing into any Part of the Capsular Cavity, and the Air also passes into the Renal Vein.

This Cavity contains an unctuous viscid Liquor, of a yellowish red Colour, which, with Age, changes gradually into a yellowish purple, a dark yellow, and a black yellow; and sometimes it is perfectly black; but even then, if it be spread thin on a large Surface, it appears yellow. I have sometimes found it not only reddish, but mixed with real Blood.

The Uses of these Renal Glands have not as yet been discovered; and all that we know about the Liquor contained in them, is, that it resembles the Bile. They are very large in the Fœtus, and diminish in Adults. These two Phænomena deserve our Attention.

They lie sometimes directly on the Top of the Kidneys, but I never found them on the gibbous Part. The Gland on the Right-Side is partly connected to the Diaphragm, under and very near the Adhesion of the great Lobe of the Liver to that Muscle. That on the Left-Side adheres to the Diaphragm below the Spleen; and both these Connexions are confined to the contiguous Portions of the inferior Muscle of the Diaphragm. They are involved together with the Kidneys, in the Membrana Adiposa; of which a very thin Portion insinuates itself between the Kidneys and Glands, and also between them and the Diaphragm; so that they adhere to both by the Intervention of the cellular Substance, which, in some Subjects, contains a Stratum of Fat.

The Venal Ridge already mentioned, sinks so deep into the Fore-side in some Subjects, that the upper Part of this Side appears to be separated from the lower; but this is seen most distinctly when the Capsula is examined in clear Water.

When the Capsular Vein is opened lengthwise with the Point of a Lancet, we discover in it a great many small Holes, many of which are only the Orifices of the Branches of the Vein; others are simple Holes; and it is, perhaps, through these that the Air passes into the Gland, as already mentioned.

On the outer Surface of these Capsulæ, we observe a very thin distinct Coat, separate from the cellular Substance that surrounds them. Sometimes this Coat is raised by an uneven Stratum of Fat, which makes it appear granulated; and for the same reason, the Capsulæ are of a pale Colour, like a *Corpus Adiposum*.

The Liquor contained in them appears sometimes in the Fœtus, and, in young Children, of a bluish Colour, inclined to red.

To be able to discover the Uses of these Capsulæ, we must not only attend to the two Circumstances already mentioned, but also to their external Conformation, which is commonly more regular in the Fœtus, and in Children, than in Adults and in old People. We must also consider the Consistence and Solidity of their Substance, which is greater before Birth, and in Childhood, than in an advanced, or Old-Age; in which they are often very flaccid, and very much decayed: And this, perhaps, may be the Reason why the Figures given of these Glands, taken out of their Membrana Adiposa, are so very irregular and different from what I have demonstrated for above twenty Years past.

Valsalva endeavours to prove, the *Renes Succenturiati*, or *Glandule Renales*, to be Organs of Generation, or assistant to them; and gives the following Reasons for his Opinion: He observes the seminary Vessels of several Fowls to come from

these Capsulæ, before they are sent from the Testicles. In the Viper and Water Tortoise, he remarks such membranous Connexions between the *Renes Succenturiati* and the Testicles, as make it probable that some Excretions are sent through the Capsulæ to the Testicles. He affirms his having seen Vessels that were neither nervous, sanguiferous nor lymphatic, going from the human Capsulæ to the Testes. His Observations are much the same as to Females. To these he subjoins the Consent and Sympathy observed by Physicians between the Loins and the natural or genital Parts. To confirm all, he relates the following Experiment: He cut away one Testicle, and extirpated the Kidney of the opposite Side of a Whelp. The Wounds healed, but the Creature was of a very lax Habit, and was so far from attempting Coition with Bitches, that he did not seem fond of them when they were proud.

Valsalva had endeavoured to secure the Honour of this Discovery to himself, by entering a publick Protest, that no other should claim it: Mr. *Ranby* suspected that the Duct, which the *Italian Literary Journals* mentioned as the principal Part of this Discovery, was no other than an Artery sent off from that of the Capsula on each Side, to the Testicles of Men, and Ovaria of Women. *Edinburgh Medical Essays*, Vol. II. p. 372.

THE URINARY BLADDER.

The Bladder is a kind of membranous and fleshy Pouch or Bottle, capable of Dilatation and Contraction, situated in the lower Part of the Abdomen, immediately behind the Symphysis of the Ossa Pubis, and opposite to the Beginning of the Intestinum Rectum. The Figure of it is nearly that of a short Oval. It is broader on the Fore and Back-sides, than on the lateral Parts; rounder above than below, when empty, and broader below than above, when full.

It is divided into the Body, Neck and Bottom, into an anterior, posterior, and two lateral Parts. The upper Part is termed the Fundus or Bottom, and the Neck is a Portion of the lower Part, which is contracted like the Gullet of some Vessels.

The Bladder is made up of several Coats, almost like the Stomach. That Part of the external Coat which covers the upper, posterior and lateral Sides of the Bladder, is the true Lamina or Membrane of the Peritoneum; and the rest of it is surrounded by a cellular Substance, by the Intervention of which, the Peritonæum is connected to the Muscular Coat.

The proper Coats are three in Number, one muscular, one nervous, and one villous, which is the innermost. The Muscular Coat is composed of several Strata of fleshy Fibres; the outermost of which are mostly longitudinal; the next to these are more inclined toward each hand; and the innermost, more and more oblique; and they become at length almost transverse. All these Fibres intersect each other in various manners, and they are connected together by a fine cellular Substance, and may be separated by inflating that Substance.

The nervous Coat is nearly of the same Structure with the Nervous Coat of the Stomach.

The internal Coat is something granulated and glandular, and a mucilaginous Serum is continually discharged through it, which moistens the inner Surface of the Bladder, and defends it against the Acrimony of the Urine. It appears sometimes altogether uneven on the Inner-side, being full of Eminences and irregular Rugæ when empty, and in its natural State of Contraction. These Inequalities disappear when the Bladder is full, or when it is artificially distended by Air, or by injecting any Liquid.

At the Top of the Bladder, above the Symphysis of the Ossa Pubis, we observe a ligamentary Rope, which runs up between the Peritonæum and the Linea Alba of the Abdomen, all the Way to the Navel, diminishing gradually in Thickness, as it ascends. This Rope had a particular Use in the Fœtus. It is sufficient to add, that it is in part originally a Production of the inner Coats of the Bladder, which Production is termed *Urachus*.

This Rope is composed also of two other ligamentary Elongations, which are the Extremities of the umbilical Arteries. These Arteries come from the Hypogastricæ, run up by the Sides of the Bladder, and remain hollow and filled with Blood, even in Adults, as high as the Middle of the Bladder, through all which Space they also send off Ramifications. Afterwards they lose their Cavity, and become ligamentary as they ascend. At the upper Part of the Bladder, they approach each other, and, joining the *Urachus*, form that Rope, which may be termed the superior Ligament of the Bladder.

The external Fibres of the muscular Coat are more numerous than the internal; and the most longitudinal anterior Fibres form a kind of Incurvation round the *Urachus*, at the Top of the Bladder, much like that of one of the fleshy Portions, which surround the superior Orifice of the Stomach, and lower Extremity of the Oesophagus. This Incurvation passes behind the *Urachus*.

The Portion of the Peritonæum, which covers the posterior

rior Convex Side of the Bladder, forms a very prominent transverse Fold, when the Bladder is contracted, which disappears when the Bladder is extended. This Fold furrounds the posterior Half of the Bladder, and its two Extremities are elongated toward each Side; by which Elongations a kind of lateral Ligaments of the Body of the Bladder is formed, which are more considerable in Children than in Adults.

The lower Part of the Bladder, which deserves the Name of Fundus much better than the upper Part, is perforated by three Openings, one anterior and two posterior. The anterior Opening is formed by an Elongation of all the proper Coats, in Form of a Gullet, turned much in the same Manner with the inner Orifice of the Rostrum of the Head of an Alembic. This Elongation is called the Neck of the Bladder.

The other two Openings, in the true Bottom of the Bladder, are formed by the Ureters, which, in their Course downward, run behind the Spermatic Vessels, and then behind the lower Part of the Bladder, approaching each other. Each Ureter lies between the umbilical Artery and Vas Deferens of the same Side, the Artery lying on the Outside of the Ureter, and the Vas Deferens on the Inside.

Afterwards they get between the Vasa Deferentia, and the Bladder, crossing these Canals; and then at about a Finger's Breadth from each other, they begin to pierce the Coats of the Bladder. They run a little Way between the muscular and nervous Coats, and open into the Bladder obliquely, something nearer each other, than when they first entered its Coats.

The Orifices of the Ureters in the Bladder are something oval, and narrower than the Cavity of the Ureters immediately above them. The Edge of these Orifices is very thin, and seems to be formed merely by the Union of the internal Coat of the Bladder, with that of the Ureters.

The Arteries of the Bladder are furnished by the *Hypogastrica* or *Iliaca interna*, being Branches of the *Arteria Sciatica*, *Epigastrica* and *Umbilicalis* on each Side. The Veins come from those of the same Names with the Arteries.

The Nerves of the Bladder come from the *Crurales*, and also from the *Sympathetici Maximi*, by Means of their Communication with the *Crurales*. It has also some Nerves from the *Plexus Mesentericus inferior*.

Besides the Ligaments already mentioned, there are also two small ones, by which the anterior Part of the true Bottom of the Bladder is connected to the *Ossa Pubis*. *Winslow's Anatomy*.

As the Kidneys, especially that on the Right Side, are by their Situation and Connection capable of being greatly assisted in their Excretory Office, by the Motion of the adjacent Parts; and as they are defended by the Membrane of the circumambient Peritonæum, and wrapt up in a kind of dry Fat; so they almost constantly receive the superincumbent Glands into their superior Part, which inclines somewhat to a Concave, and which is hardly ever of the same Form and Bulk in different Men. Then receiving one or more considerable Ramifications from the Aorta Descendens; acquiring, also, another Membrane, and four or five large Ramifications, they from these receive many other smaller Ramifications, from which winding Vessels, so small as to escape the Sight, are distributed through all the Parts of the Kidneys. The small Ramifications of these minute Arteries, in their vermicular Course, being mutually united in some Parts, and again separated, form as it were Conglomerations, from which seem to arise not only the small returning Veins, but also the minute lateral Ducts, which are almost pellucid, and which receive the Urine separated from the small Arteries, convey it from them; and when, after uniting, they have formed many polygonous pyramidal Bodies, they at last generally terminate in twelve membranaceous Bodies, called *Papillæ*, in which many Orifices of the renal Ducts open obliquely every where, both externally and internally.

There are also found in the Substance of the Kidneys, small round hollow Bodies, every where covered with minute Vessels, furnished with Veins and Nerves, and reaching to the urinary Ducts. This is confirmed by the Kidneys of Hedgehogs, Tortoises, and Diseases in the Kidneys, as also the Sight of the Kidneys in a Fœtus. For this Reason the Urine seems here to be secreted, by a double Apparatus, a curious and laborious one of the glandular Kind, and one more simple, which receives its Name from *Ruych*, a Circumstance by no means repugnant to the usual Methods of Nature in other Parts; as in the Liver for Instance. But *Ruych*, after the most strict and exact Scrutiny, thinks that these were not really Glands, but only Intorions of small Arteries.

The other Part of the renal Artery is necessarily employed in supplying Life and Heat to the Substance of the Kidneys; and from the Blood, conveyed by this Part of the Artery, seems to arise that large Quantity of Lymph, which returning from the Kidneys, and being of the laudable and not of

the excrementitious kind, mixes with the Chyle, circulates with the Blood, and does not taste like Urine. Hence, also, there will, without Doubt, arise proper corresponding Veins.

For the small Veins arising from the minute Roots of the renal Arteries being collected, become larger, are united like Arteries in their Division; and at last join Trunks whose Number is uncertain. These convey in various Manners to the Vena Cava the remaining Blood.

The Renal Papillæ drop out the Urine convey'd into the urinary Ducts into the large Cavity, form'd by the expanded Membrane of the Pelvis, which is furnished with a soft Fat. Hence being collected, retarded and mix'd, it is forced into the Ureters, which are formed by an Angustulation of the Pelvis, and which convey it to the Bladder.

For from the Circumference of the Papillæ arise about eleven or twelve Canals, which receive, and convey the Liquor discharged from them into three large Ramifications, which, when collected into one, form a large Pelvis, which terminates in one membranous, thick and strong Duct, furnish'd with Arteries, Veins, Nerves, lymphatic Vessels, moving Fibres, and mucilaginous Lacunæ, fit for lubricating its Sides. This Duct is called the Ureter, which running first strait downwards, and soon after bending all along under the Lamina of the Peritonæum; and being in various Places of an unequal Breadth, is at last inserted in the posterior Part of the Bladder, about two Finger Breadths from its inferior Neck, and about the same Distance from each other. Then perforating the exterior Coat, and running, about a Fingers Breadth, between it and the anterior Coat; and running down obliquely, it penetrates into the Cavity of the Bladder. Then its Fibres being lengthened, and running downwards, it forms a round and long Body, by which the Bladder, when full, is hindered from returning the Urine to the Ureters; which, when the Bladder is expanded, are drawn downwards, and clos'd up by this Body, and convey the renal Urine safe to the Bladder: And this Structure hinders the Urine from rising again into the Ureters, however the Bladder should be compressed.

All these Observations are confirm'd by microscopical Discoveries, Injections, Ligatures, and comparative Anatomy, in Hedge-Hogs, Dormice, Tortoises, Bears, Oxen, Birds, human Fœtuses, the Dissection of Patients subject to Disorders of the Reins, and monstrous and preternatural Kidneys.

Hence we may understand, that the mechanical Secretion of the Urine is made by the Force of the Heart and stronger Arteries, by which the aqueous Part of the Blood is forced into numberless Flexures, Gyration, Resistences, opposite Motions, Concussions, and Commixtions; and at last its more fluid Part is secreted, propell'd, collected and expell'd through Ducts, only somewhat narrower than these Blood-Vessels.

There is, therefore, no Occasion for accounting for the Secretion of the Urine by Attraction, Emulsion, or other Powers of a like Nature.

Neither is there any Necessity for a Fermentation, in order to account for this; since, in this Affair, neither the Place, the Cause, the Time, the Matter, the Mixture, nor the Effects of a Fermentation are to be observed.

Nor for the same Reasons are we to suppose a fusing and precipitating Power in the Parts subservient to this Secretion.

'Tis sufficiently obvious, that all the Humours, which are less thick than the Urine, will be discharged this Way, provided they are only applied to these Vessels. Hence we understand, that there is a Cause which hinders them from flowing here; or if they do that, sudden and great Weakness must be produced. The Renes Succenturiati always lying on the superior Parts of the Kidneys; but being separated from them by the interposed Fat, contiguous to the Diaphragm, united by Blood-Vessels, pressed between the Diaphragm and the Kidneys, furnished with Arteries, wanting peculiar Emisfaries, in Fabric resembling the Spleen, and subject to the same Things, and pouring almost all their Blood through their Veins into the emulgent Veins, perhaps here performs this Office, the venous renal Blood being, by a saline Solvent, depriv'd of its most liquid Part, after the Secretion of the Urine, as the splenic Blood does to the Blood of the Vena Portæ; or perhaps these are subservient to other Uses. But this Theory is in all Probability just.

So that a continual and uninterrupted Secretion of the Urine is the primary Cause of the Soundness of the Kidneys and Ureters, as also the Cause why they are neither obstructed nor concreted by their own Collapsion or Pressure. *Barb. Institut.*

PROCESSES UPON URINE.

Urine is neither acid, nor alkaline, but fetid.

Take the Urine of a Man in Health, made twelve Hours after Eating or Drinking, which must therefore have remained

so long in the Body, and have circulated almost the same time therein, and have been mixed with nearly all the Juices in all the Vessels, by means of the vital Powers. It is therefore an aqueous Lixivium, that has washed away, and brought off with it, whatever would dissolve in Water, and run thro' the fine urinary Vessels of the Kidneys; particularly it contains the spirituous, saline, and saponaceous Matters of the Blood; and when thus long retained and digested, it acquires the true Nature of the Body, as being wrought upon by the vital Powers for twelve Hours successively; at which time the Milk has lost its own Nature in the Body, and now begins to be converted into the Serum of the Blood. And for this Reason, such Urine should be chose as is well concocted, and discharged at twelve Hours Distance from Feeding, the thinner and more crude being come away before. Such Urine, therefore, may always be collected without the Body, and yet retain and perfectly exhibit the Nature of the animal Juices, and their Principles. This Urine is not acid, because it neither tastes nor smells sour, nor gives a red Colour by mixing with these Juices, that turn red with Acid: And, lastly, because, if heated and mixed with Oil of Tartar per Deliquium, it affords not the least Sign of Effervescence. And if another Part thereof be heated and mixed with the alkaline Spirit of Sal Ammoniac, it manifests no Sign of Effervescence; besides, what seems stranger, the Urine of a Man who drank a large Quantity of Rhenish Wine, which is considerably four, and also of four Beer, used much Vinegar in his Sauce, and eat largely of Fruit, did not afford the least Signs of Acid, upon any Experiment, twelve Hours after Eating. So likewise the Urine discharged by young Female Persons of weak Constitutions, that use little more than acid Vegetables for their Meat and Milk for their Drink, manifests no Acid twelve Hours after Meals; the natural Powers, therefore, have in this time conquered that Tendency which the Vegetables had to Acidity, or else the Acid that was in them. *Helmont*, therefore, justly said, that Acids were Enemies to the Veins; but his Followers hence unjustly forbid the Use of Acids in Diet and Medicine, as if they were poisonous; supposing them prejudicial to the first Passages. These Experiments will be allowed by Chymists; but it may, perhaps, move them to hear, that there is no manner of Alkali contained in this Urine, and yet the thing is certain; for if, to separate Particles of this heated Urine, there be successively poured Vinegar, Lemon-Juice, Spirit of Nitre, Spirit of Salt, and Oil of Vitriol, no Effervescence ensues; but these Acids, mixed with warm Urine, discharged at the Distance of twelve Hours after Eating, unite therewith, as Water unites with Water, without Bubbles and without Hissing. Such Urine, also, does not turn the Juices of Herbs to a green Colour, as alkaline Salts do.

R E M A R K S.

Hence we may collect, that the Powers of the Body change Acids, so that they remain no longer the same, and prevent Things disposed to Acidity from becoming acid; and that, in Health, alkaline Salts are never produced, but only such as are neutral. This I have observed in the Urine of Persons in high Fevers, and inflammatory Diseases, where the vital Actions being increased, rendered the Urine flame-colour'd, fetid, sharp, and little in Quantity; for even such Urine, examined by the Methods above-mentioned, gave new Signs of its being alkaline; whence I was led to consider, whether, in a perfect Stoppage of Urine, where this Liquor is long detained, heated and agitated in the Body, it would not become alkaline. And it happened, that an eminent Person in Years, falling into this Distemper, which proved fatal to him, had no Discharge of Urine for five Days, but, on the sixth, suddenly made a few Ounces, which was red, turbid, and fetid; but he had hence no Relief, and made not a Drop afterwards; but died. This Urine I directly carried home with me, and presently examined by the known chymical Methods, none of which shew'd it to be alkaline; whence I understood, that Urine could not become alkaline in the Space of a hundred and twenty Hours, tho' agitated by the Heat of the Body, and the Action of Circulation. For in the Patient above-mentioned, the Bladder contained no Urine; and I have never found any of the Humours in Health to be alkaline, though they may become so from other Causes. Nor did I ever find them alkaline in the most putrid Diseases, whether acute or chronic. I remember once, an aged Corn-Merchant had a large Stone in his Bladder, but being not a fit Subject to be cut for it, his Urine would often, when he was in exquisite Torture, smell alkaline; and as he had frequent Stoppages, a skilful Surgeon was obliged often to put back the Stone from the Neck of the Bladder, with a Catheter, towards the Bottom; but being once absent, the Patient continued in Pain, without making Water for several Hours; but the Operator returning, and performing his usual Office, the Urine came out so sharp, alkaline and putrified, and with such a peculiar

Stench of digested Urine, that the Surgeon inadvertently drawing the Vapour thereof into his Lungs, was thereby disordered for some Days. Whence I conceive, not having any Opportunity of examining this Urine, because it was spilt, that, being attracted into the Pores of the Spongy Stone, and lodging therein, it was thus digested by the Heat, and so, perhaps, acquired a true alkaline Acrimony. However this be, it is certain, that the Urine contains no native alkaline Salt, and, consequently, no other Humour of the Body; because the Urine contains more Salts than any other animal Liquor; and because the Salts of the Urine are more acrimonious, and easier rendered alkaline, than of any other Liquor in the Body. Whence those Artists are greatly deceived, who so loudly cry out against the natural, volatile, oily, alkaline Salts in the Body. This is an Error introduced into Medicine by an imprudent Cultivation of Chemistry, which the more prudent Cultivation thereof must correct. The fetid Smell of Urine in Health is, therefore, entirely owing to the attenuating, putrid, and volatilized Oil, which is inseparable from it; and not to a volatile, alkaline Salt. Its bitter, nauseous, and saline Taste, proceeds from the compound Salt of the Urine, and from the Oil; as also, from the Sea-Salt which Urine generally contains.

FRESH URINE, DISTILLED IN A VERY CLOSE VESSEL, AFFORDS A FETID, NAUSEOUS WATER, NEITHER ALCALINE, ACID, SALINE, NOR VINOUS.

Take well-concocted human Urine, discharged in Health, and distil it in a Glass-Body, with a gentle Fire of a hundred and fifty Degrees, uniformly kept up, till only a twentieth Part remains behind. There will come over a limpid Water; the Urine in the mean time gradually changes from its natural Straw-Colour to Red; and the more of this pellucid Water comes over, the deeper that red Colour appears; and at length the Remainder becomes almost of black Red, very thick, turbid, opaque, frothy, and tenacious. The first limpid Part has a particular nauseous Smell, but not that of a volatile Alkali; but what seems strange, though it be often distilled over again, yet it always retains this nauseous Odour, and even though it should long stand in the open Air. This corrupt Odour, therefore, is inseparable, and intimately mixed with the Liquor, so as not to be destroyed even by the Addition of an Acid. It seems to resemble nothing more than that disagreeable Exhalation, which arises from Wounds in the Abdomen, or the Carcass of a Man fresh opened after a violent Death. The nauseous Taste of that Water, though somewhat putrid, is not alkaline, or any way saline, howsoever it be distilled. Again, in Distillation thereof, there appear no Veins upon the Glass Still-head, as in the Distillation of vinous Spirits; and if the Water that first comes over, be a second time distilled, neither thus will the least Quantity of any such Spirit appear; and though ever so carefully rectified, it has, so often as I have examined it, never took Flame, but always quenched Fire. Even the Urine of such Men as are great Drinkers of strong Liquors, such as Wines and distilled Spirits, never affords any thing inflammable. When this first distilled Liquor of the Urine is mixed with Acids, it never gives any Signs of Effervescence, nor changes Juices green, as Alkalies always do; nor considerably precipitates the Solutions made with Acids; and by no manner of Rectification will it afford a manifest Salt, nor ever change Acids into a compound neutral Salt. Consequently it is no alkaline Liquor; nor does it manifest the least Signs of Acidity upon any kind of Experiments; as the Addition of fixed and volatile Alkalies, the various Juices that turn red with Acids, and the like. Whence we seem to have proved our Point.

R E M A R K S.

We may learn many momentous Particulars in Medicine, from this slight Experiment. Thus, 1. We see the lightest, thinnest, and most volatile Part of the healthy Juices is nearly elementary Water, excepting that there is inseparably joined therewith that other equally light, thin, volatile, fetid and seemingly corrupted Matter, not proceeding from a saline Principle, but rather from an oily one, and yet no ways vinous or inflammable. 2. Hence there is no Fermentation in the Juices, nor no Production of inflammable Spirit, which is easily separated from Water; whereas this fetid Part can by no Means be separated from its Water. 3. Consequently, there is no inflammable Spirit in the vital Juices of the Body. 4. Oil, by the vital Powers of the Body, is rendered much more volatile, than any Salt in the Body, contrary to what is generally believed. This peculiar, fetid, oily Matter is scarce otherwise found, than in the Matter of Perspiration, the Sweat, and the Vapour which naturally resides in the Cavities of the Body. Vinous Spirits, when drank, do not go to the urinary

urinary Passages; and may, therefore, rise to the Head, disturb the Brain, the common Sensory, and the Origin of the Nerves; and hence (perhaps) they so wonderfully affect the Actions of the Cerebrum and Cerebellum. Hence (perhaps) it is, that they so easily exhale from the Body, possibly at the Surface of the Skin. Our present Process also shews, that there is no volatile Salt in the Body, capable of rising with this Degree of Heat, whatever Chymists or Physicians may think to the contrary; and that there is no volatile Alkali, whether simple or oily, nor any volatile Acid in the Body; so that the modern Physic must be greatly corrected in these Particulars. The fetid Smell of the Urine always increases and decreases, as the vital Powers increase and decrease, in an healthy Body; and the more the Body is exercised by Labour and Motion, the more this fetid Smell is always increased, and *vice versa*. If any Thing in the animal Juices is to be called Spirit, on Account of its Acrimony, Volatility, Lightness and penetrating Virtue, it is neither vinous nor saline, but really arises from an Oil corrupted, or turned to such a Putrefaction as the Putrefaction of Vegetables.

THE REMAINS OF THE RECENT URINE, AFTER THE PRECEDING PROCESS, ARE NEITHER ACID, NOR ALKALINE, NOR TRULY SAPONACEOUS, BUT SALINE AND FETID.

If the gross Remainder, after the preceding Distillation, be mix'd with any kind of Acid or Alkali, it affords no Sign of Effervescence, so as to appear either acid or alkaline; nor can it be manifested by any other Experiment. It is indeed highly sharp, of a very saline Taste, and a little bitterish, but not alkaline; nor has it an alkaline Odour, but smells fetid almost as before. If used by Fullers and Wool-Scourers, it neither cleanses nor deterges, and therefore has no saponaceous Virtue, which it excellently acquires by putrefying. In this whole Inspissation there appears no Signs either of Chyle or Milk. Nor have I, with the utmost Attention, ever discovered the least of that Coagulation, which the Lymph and Serum of the Blood always run into by Heat. However treated, it manifests nothing of a cheesy Nature; but constantly the more it is inspissated by the Fire, the sharper and deeper-coloured it becomes; and thus, by various Degrees, it increases and changes in Colour, Thickness and Acrimony, the longer the Inspissation is continued, so as to run through all that Diversity usually observed in the Urine, under acute and chronical Distempers, as a *Bellini* has excellently observed. In acute Diseases, the hotter the Fever, and the more it dissipates the moist Parts, the redder, the sharper, and the thicker the Urine becomes.

REMARKS.

There is therefore naturally no fixed or volatile Alkali in an healthy Body, nor any fixed or volatile Acid in the natural Juices, whilst they remain sound; but this Salt is of a particular Nature, which we shall hereafter examine; and much less volatile than Water, as not rising even with a boiling Heat. It is surprising that no nutrimental Matter should ever be contained in this Urine; for there is no Chyle, Milk, Curd, Serum, or Lymph therein, which coagulate by Fire; but Physicians justly acknowledge these as the original Matter of Nutrition. Nothing nutrimental, therefore, is discharged from the Body along with the Urine. Thus all the Parts of the Chyle, Milk, Blood, or the Humours thence prepared, that become sharp, corrupted, subtle, unfit for Nutrition, and hurtful to the Body, having performed their Office, are at length separated by the Vital Powers, and, by means of the Kidneys, discharged from the Body. Urine, therefore, exhibits the Humours highly changed by the Powers of the Body, even so far as never afterwards to prove healthful thereto; and therefore the small Quantity, the Sharpness, Colour and Thickness of the Urine, afford many just Informations to the Physician, as indicating the Necessity of Water, demonstrating the Condition and State of the Humours, the Remedies required in Diseases, and what Things are principally destructive to the Body, by dissolving the Texture of the Blood, and how pernicious a great Fluidity is.

RECENT URINE, INSPISSATED TO A FORTIETH PART, AND DISTILLED WITH SAND, AFFORDS AN ALKALINE SPIRIT, AN ALKALINE, VOLATILE SALT, A VERY FETID OIL, AND SALINE FÆCES.

If the Distillation of the Urine be continued, till of forty Pounds there remains but one; or if the like recent Urine be suffered to exhale in a low, capacious, cylindrical open Vessel, with an almost boiling Heat, till only a fortieth Part remains, there will be found at the Bottom a gross, thick, blackish, sharp Matter, which being mixed with thrice its Weight of clean Sand, and then distilled in a Retort, in a Sand-heat, by gentle Degrees at first, and often examining the Liquors that come over, by removing the Receiver, a lim-

pid Water will first rise, as in the preceding Process; and when the Matter begins to be almost dry, another limpid Liquor will come over, of a sharp, fiery alkaline Nature. Continue the Operation so long as this rises, and keep it separate, then closely lute on a Receiver, and urge the Matter by Degrees of Fire, upon which white Clouds will long continue to rise, and unctuous Veins appear, whilst a somewhat oily, yellow Liquor, together with a white, solid and alkaline Salt will rise. At last, with the utmost Violence of Fire, there comes over a yellow or gold-coloured Oil, and when this ceases, a saline, feculent Matter remains at the Bottom. The first Water is scarce alkaline, sharp, saline, or any Way oily, but like the Water of the preceding Process; the second Liquor has a sharp and manifest saline Odour, it proves pungent and fiery upon the Tongue, and has a perfect alkaline Taste; it makes a violent Effervescence with all Acids, and when saturated with any Acid, concretes therewith into a compound, neutral, half volatile Salt, like Sal Ammoniac, but of a determinate Nature, according to that of the Acid. This Salt therefore is truly alkaline and volatile, like that produced from the Putrefaction of Vegetables. All this appears more in the third unctuous Liquor, which is much more intensely alkaline, tho' oily; and hence is usually called alkaline Spirit, as consisting of Water, Salt and Oil, mixed together. The whole Salt is always alkaline, but rendered very ungrateful by the fetid Oil adhering thereto. The Oil which comes over at the same time, and afterwards is highly fetid, and infects every Thing with its Odour, so as to be intolerable, and not only retains the Smell of Urine, but is somewhat stercoraceous. The remaining Fæces being calcined in an open Fire, and elixated with Water, afford a true Sea-salt, if the Person has used that Salt in his Food.

REMARKS.

Hence it appears that the Salt of Urine, tho' not alkaline of itself, may be rendered so by a certain Degree of Heat, and that this urinous Salt is not ammoniacal, because Sal Ammoniac, tho' volatile with a certain Degree of Heat, yet when sublimed thereby, never becomes alkaline, but remains compounded, how often soever it is sublimed; whereas the Salt of Urine, tho' likewise of a half fixed Nature, and becoming volatile with a certain Degree of Heat, at the same time also becomes alkaline, and no longer retains the Nature of a compound Salt. It therefore approaches to the Nature of alkaline Salt, and Sal Ammoniac, tho' itself be neither of them. Hence also we see that the Salt, saline Spirit, and first Oil, are almost equally volatile in a sound State; and that this unctuous Spirit consists of Water, Oil, and Salt, into which it may be commodiously resolved. And hence also we understand, how by the natural Powers, the mild, white, indolent, inodorous, and unctuous Matter of the Aliment, Chyle, Milk, Fat, and Marrow, may turn into another that is sharp, yellow, inflammatory, thin and fetid; whence also the fetid Smell of the Urine usually proceeds. Again, we hence learn, that there is no fixed Alkali in the animal Juices; for I never could find a Grain thereof in the largest Quantity of the Urine thus treated. And lastly, that Sea-Salt may enter the Blood, mix therewith, thence pass into the urinary Vessels, and yet remain unchanged, so as to act through most of the Vessels of the Body, without suffering an Alteration by their Re-action. All which Particulars being considered, our present Experiment, which is owing to *Hellmont*, will be found of infinite Use in Medicine.

RECENT INSPISSATED URINE, DISTILLED WITH FIXED ALKALI.

Fresh Urine being inspissated as before, pour thereon an equal Quantity of the Oil of Tartar *per deliquium*, or the Solution of Pot-ashes, and there will instantly arise a sharp, alkaline, volatile Vapour, such as usually proceeds from well-putrefied Urine, when it grows warm. If the Mixture be now immediately distilled in a Glass Alembic, with a gentle Fire, there comes over a limpid Liquor, running in Veins, which proves sharp, highly alkaline, and more volatile than Water, and in every respect resembling true and strong Alkali. And when instead of the Oil of Tartar, the dry Salt of Tartar is used, a dry alkaline Salt often rises first in this Distillation. And when the former alkaline Liquor is again distilled in a tall Body, with a gentle Fire, the Part that first rises is saline, white and alkaline; the Oil remains at the Bottom, along with the fixed Alkali added, as if it was more fixed thereby. Lastly, when all is become dry, if the Fire be strongly kept up, there likewise comes over a fetid, yellow Oil after the Salt.

REMARKS.

This Experiment shews the Nature of the animal urinous Salts to be such, that a fixed alkaline Salt can instantly change them, like the violent Action of the Fire in the preceding Process. And hence we learn that fixed alkaline Salts being mixed

mixed with the Juices of the Body, will presently render them sharp, alkaline, extremely moveable, and more volatile than the Water and Spirit of the Body, communicate a fiery corrosive Nature to the Spirits, and immediately give them a Tendency to Putrefaction. If the Salt and Saline Spirit thus produced be several times distilled over again with a gentle Fire, they at length become as purely alkaline as those prepared from Hartshorn, or other costly Substances: When mixed with Acids, they make a violent Effervescence, especially if shaken together, and by this Means, are so mortified and changed as to lose their Sharpness, and all their alkaline or fiery Nature, being thus also so fixed, as not to prove volatile with the Heat of an healthy Body. They lose the proper Virtue of acting like volatile Alkalies, especially that of almost mortally dissolving and attenuating the Juices of the Body. And what is more to our Purpose, Physicians may hence understand the surprizingly changeable Nature of the Salts of the Body; how variously they may alter from their native Disposition; and the proper Effects of each Alteration; and also learn the Remedies and Degree of Correction which each requires: All which were known to the Ancients from Experience. Thus in Fevers, attended with an increased Heat and Motion, *Hippocrates* allowed only of Things tending to an acid Nature, or actually acid, to be used as Food, Drink, or Medicines; and hence we see, that fixed Alkalies are destructive in the Body, as often as attended with Heat, Motion, a fetid Smell, a Flame-Colour, or small Quantity of the Urine, or the Juices are too much dissolved; so that in such Cases to exhibit these Salts is highly dangerous, especially in the Plague.

RECENT URINE, ESPECIALLY WHEN INSPISSATED, AFFORDS A FIERY SPIRIT THAT IS NOT ALCALINE, UPON THE ADDITION OF QUICK-LIME.

If Quick-Lime be thrown into recent Urine, there instantly exhales a spontaneous Vapour, which strikes the Nostrils with an extremely pungent and fiery Sensation; and if it be now directly and gently distilled in very close Vessels, it affords a limpid Water, of an intolerable fiery Odour, like the former, but much more sharp and volatile. And if, when the Urine is first inspissated to a fourth Part, an equal Quantity of Quick-Lime be mixed with the Remainder, the Odour is much stronger, and the Spirit obtained by Distillation, not to be equalled by any other for its sharp, fiery, subtle, and volatile Nature. After all this Spirit is separated by Distillation, and the remaining Mass afterwards treated by the same Operation, it will never afford a solid Salt, as in the preceding Process; but always a very fluid saline Liquor; and whatever Acid is mixed therewith, it causes no Effervescence, tho' the fiery Virtue and Volatility are greatly diminished thereby. There is Caution required in this Process; for as soon as the Quick-Lime touches the Urine, or the inspissated Matter thereof, it excites a great Ebullition, and a violent Heat, and at the same Instant the most sharp and volatile Spirit hitherto known arises; and, being agitated with the violent Heat, it is put into a furious Motion, so that being inadvertently received into the Lungs, it may instantly prove highly dangerous, and occasion an instantaneous Inflammation in the tender Vessels of the Lungs, and directly communicate it to the Blood circulating through them. For if this Spirit be held to the external warm Skin, it immediately makes the Part gangrenate and mortify; but perhaps the whole Thickness, between the circulating Blood in the Lungs, and the Air contained in the Vesicles thereof, is not the thousandth Part of an Inch; but this urinous Spirit, prepared with Quick-Lime, suddenly exhales its sharp Part in the open Air, and leaves a Water behind.

REMARKS.

Hence we may learn the Action of Quick-Lime upon the saline urinous Juices of the Body; for when assisted by Heat, and the vital Motion, it presently generates these fiery Spirits, that prove destructive to the tender pappy Mass of the Brain and Nerves; and the hotter, or the more agitated the Body, or the more it is affected with inflammatory Disorders, the more destructive the Use hereof. But when the Body abounds with Acid, Water or Phlegm, the prudent Application thereof may be sometimes of Service. We must also consider, that the Lixivium of Quick-Lime has a great Force in correcting, and extricating the muriatic, fixed Salts in the Blood, and fitting them to be easily discharged; whence it becomes an extraordinary Remedy in that Kind of Scurvy, which principally proceeds from the above-mentioned Causes; but in that Kind which proceeds from Putrefaction, and consists in a sharp Oil and Salt, it proves highly prejudicial. Whence, perhaps, we may, in some Measure reconcile the Experiments of some eminent Physicians in *France*, which shew the Lixi-

vium of Quick-Lime to be pernicious in that Country; whereas in *Germany* it appears a very advantageous Medicine. But all this holds truer of the Quick-Lime prepared from Stone than of that from Shells. The Particulars hence arising seem to be these. 1. The violent Corrosion which happens in a live Body, upon the Application of Quick-Lime, proceeds more from those fiery saline Spirits, which the Lime produces from the Salt, than from the sharpness of the Lime itself. 2. Hence it may be of Use in Diseases proceeding from acid, aqueous, austere, viscid, mucous, and phlegmy Causes, where Motion and Stimulation are wanting. 3. On the contrary, it proves hurtful in acute Distempers, proceeding from alkaline, bilious, saline, putrid, acrimonious, and heating Causes, where the Body is dry and strongly agitated by Motion. 4. The mild Salts of the Body may instantaneously become extremely sharp and poisonous, by the bare Admixture of a Thing not sharp itself. 5. That an exceeding sharp Matter may be produced from healthy Juices, which is neither a Salt, Spirit, nor Oil; for this Liquor cannot, by any Art that I know of, be made to appear in the solid Form of a Salt, and can be only obtained invisible by Means of Water. 6. These Spirits therefore that do not appear to be alkaline, by any Experiments made with Acids, are much sharper than any Alkali; so that there is not any known Thing that yields a sharper and more odorous Vapour. Whence also it appears, how suddenly a very different Taste and Smell may arise from the Salt of the Body, which is almost inodorous.

THE NATIVE SALT OF URINE.

Take very fresh Urine, discharged twelve Hours after eating by a Man in Health, and immediately, by a gentle Fire of two hundred Degrees, evaporate it in a clean Vessel, till it acquires the Consistence of Cream. Then strain the Liquor hot through a Flannel Bag, that the viscid Oils may be somewhat kept back and separated, which the more exactly it is done, the better. Set a large Quantity of this inspissated Liquor, in a tall, cylindrical, glass Vessel, tied over with Paper in a cool Place, for a Year; during which Time, a saline, solid, hard, brown, and somewhat transparent Mass will concrete to the Bottom thereof; and a thick, black, unctuous Liquor float above it, as separated and excluded from the Salt. Pour off the Liquor, and putting the saline Mass into another Vessel, add very cold Water thereto, and shake it a little therein, to cleanse it from its oily Foulness, which is easily done, because the Matter does not readily dissolve in cold Water. Let this saline Mass be preserved under the Title of the native Salt of Urine. If this Salt be dissolved in Water, and several Times strained, till the Solution becomes limpid, and then exhaled to a Pellicle in a clean Glass, and set to rest in a cool Place, it shoots into saline Glebes, of its own peculiar Kind, very different from any other Salt, tho' somewhat resembling the Crystals of Sugar, in Figure and Hardness. They are not fetid or alkaline, but extremely volatile; and this is the purified Salt of Urine.

REMARKS.

This Experiment excellently shews Physicians the Nature of those Salts, which in an healthy Body are very sharp, and greatly inclining to an alkaline Nature, yet not really alkaline; and therefore require to be quickly discharged by the vital Powers, to which they however owe their Origin. And hence Physicians may know, that the other Salts contained in the other Juices, are much less sharp or alkaline. These Salts are generated in the human Body alone, from the Meat, Drink, and Sea-Salt taken in and changed. There is Sea-Salt contained herein, but not alone. It is a saponaceous Salt, but not very unctuous. It is highly diuretic, if drank diluted with Water, and sudorific with a proper Regimen. It has such extraordinary Effects upon Metals, that some have thence promised themselves Wonders. All the fat Matter, which remains upon straining, and cleansing the inspissated Urine, is, when dried by a gentle Fire, excellent for the producing of Phosphorus; for which End it may be preserved. The Experiment also shews, that the Salt remaining in the Urine, thus inspissated, will not putrify or grow alkaline, so as to become volatile and easily fly off, tho' they are otherwise so easily changed. It should be considered what Share this Salt has in producing the Stone of the Bladder or Kidneys.

URINE, BY DIGESTION, TURNS ALCALINE, AND CHANGES ITS COLOUR, TASTE, ODOUR, AND VIRTUES.

If such Urine as was described in the first Process, be kept in an open Vessel of Glass, Earth, Wood, or Metal, in an Air of thirty three Degrees of Warmth, it begins to smell fetid, putrefy, and change its Straw Colour for a dusky brown,

brown, depositing gross Fæces, and thus in a few Days acquiring an alkaline lixivious Nature, and at the same time striking a stony Crust on all the Sides of the Vessel. The hotter the Air is, the stronger, and quicker the Change of the Urine is made; whence in the Summer-time, especially when the Weather is hot, all this happens in a greater Degree. To discover how far this changeable Nature would reach, I filled a Bottle with natural recent Urine, and corking it close, set it in a moderately warm Place; and after three Months, I found it changed in this close Vessel, as is described in the preceding Case. And herein the Change principally consists; the recent Urine of a Man in Health is of a straw Colour, it daily proceeds through successive Changes, till at length it ends in a deep brown; and the more it is putrified, the darker the Colour. And the same Thing is observable in the Urine of Persons under a Fever; the State of the Juices being learnt from the Colour of the Water. Recent Urine smells ungrateful, though not alkaline; but digested Urine has a manifestly fetid, volatile, alkaline Odour, very different from the other. Recent Urine is of a bitter, saline Taste; but digested Urine putrid, sharp, alkaline, and perfectly lixivious. Recent Urine affords no Signs of containing an Alkali; but digested Urine makes an Ebullition, and a violent Effervescence, upon mixing with any Acid, and in every other Trial, manifests a true alkaline Nature. Recent Urine has no saponaceous scouring Virtue; but digested putrified Urine is used by Scourers and Dyers, as a sharp Lie, that cleanses foul Wool, Silk, and the like, after the manner of fix'd Alkalies: And as these Changes happen, with a small Degree of Heat in a close Vessel, which every one may be easily satisfied of by Trial, it is in vain for Chemists to deny this Property in Urine.

REMARKS.

We are here to consider, that there is separated from the Body, by the urinary Passages, a Water containing Salts and Oils, approaching to a State of Putrefaction; nor do we find in all the Body, another Fluid that is so easily changed by such a Digestion in close Vessels. Urine, therefore, which is destin'd for Excretion, cleanses the Blood from these noxious, putrid Substances; and, therefore, if retain'd through any Distemper, it produces mortal Effects, as being soon rendered sharper by the Heat of the Body, and thence presently intolerable to the finer Vessels, and dissolving to the Humours by a pernicious Relaxation. And as it thus easily and suddenly acquires these new Properties in a close Vessel, with a moderate Heat, we are shewn that the Body neither produces Vinegar, nor inflammable Spirit from what it takes in, and consequently does not act by Fermentation, but introduces the true Change of a putrified Substance, and therefore in its Effect, approaches nearer to the Nature of the Putrefaction of Vegetables; for if bare Stagnation can occasion this Change of the Urine, how greatly must it be disposed to a true Putrefaction? And hence we see how great Necessity there is of Water, Acids, and saline Matters in those Persons who live in hot Climates, and accustom themselves to daily Labour and Exercise; for by Meats, Drinks, and Sauces of this Kind, too great a Tendency to Putrefaction is prevented. Hence also the daily Necessity of a mild, somewhat acid, and a new Chyle, for sheathing the Acrimony produced in the Blood. Hence also it appears, that in twenty-four Hours the necessary Utility and Service of this new Chyle vanishes; and that fresh Assistance is likewise required from the same Means. In burning Fevers, therefore, tart, acid, and mild Aliments, like Chyle, are extremely necessary; great Abstinence being in these Cases highly prejudicial. Hence it is that Barley Pofians, with Vinegar and Honey, are here so serviceable, as *Hippocrates* prudently inculcates, in his incomparable Book concerning the Diet in acute Diseases. The Physician also, upon examining the Urine, by means of these Experiments, may learn many useful Particulars, with regard to the Change of the Oil and Salt thereof; and perceive that a true Stone may be generated from the Urine of a Man in Health, even by Rest, and while the Urine putrifies, or grows alkaline; and therefore that Attenuation, Alkalies and Putrefaction, do not prevent the Origin of the Stone, since it may be generated and not dissolved even in putrified Urine. Hence, therefore, as Tartar is generated in the best Wine, so is the Stone generated, and not dissolved, in the Urine elaborated by the vital Powers: Therefore, volatile alkaline Salts are in vain given to prevent the Generation of the Stone. The following Experiment I have seen with Horror. Upon filling a clean Glass Bottle with the recent Urine of a healthy Person, and setting it by for some time, then pouring out the putrified Liquor for Distillation, there was a stony Crust all round the Inside of the Glass. Without washing this off, I filled it with fresh Urine, set it by as before, and afterwards emptied it. And by repeating this several Times, I at length found the whole

Surface of the Glass crufted over with the Matter of the Stone. This Production of a stony Matter seems very destructive, though necessary to the Body. It may perhaps seem strange, why the Body should not therefore putrify by its own vital Heat and Motion, since it so soon putrifies the wholesomest Juices; and since dead Carcases, exposed in Air heated to eighty Degrees, in a few Hours putrify, resolve away, and fly into Air, leaving only the Bones behind: But Chemistry supplies us with this Answer, that such a Putrefaction is prevented by the Meat, Drink, Sauces, Air, and sometimes the Medicines used, which resist Putrefaction; otherwise, in burning Fevers, the whole Structure of the Body would presently be dissolved by Putrefaction.

DIGESTED URINE AFFORDS BY DISTILLATION AN ALCALINE SPIRIT, A FETID OIL, A VOLATILE, ALCALINE SALT, PHOSPHORUS AND SEA-SALTS.

Take Urine digested according to the foregoing Process, distil it, with a gentle Fire, in a low Glass Body; there first arise Veins of Liquor running in the Form of unctuous Spirits. The Receiver being changed, and the Fire a little encreased, there follow dewy Drops, resembling Water; and this Water may be accurately separated till the Matter remains almost dry, which again being urged by Degrees, and at length by a strong Fire, will afford a yellow and very fetid Oil, along with something saline; black Fæces will remain behind, which, when burnt in an open Fire, become a white Calx, that with Water resolves into Sea-salt, and a fixed, insipid, subtile Earth. The first Water is fetid, sharp, fiery, perfectly alkaline, and makes a violent Effervescence with Acids. If this be distilled in a tall Vessel, by a gentle Fire, it affords a white, solid, truly alkaline Salt; and leaves a Water of an ungrateful Smell and Taste behind. When the Water that came over second is long distilled in a tall Vessel, with a gentle Fire, it affords somewhat of the former Spirit; which being carefully separated, and the remaining Water distilled in a clean Vessel, it affords a Liquor which *Helmont* recommends, in his Treatise on the Stone, for an admirable Lithontriptic. There here appears no fixed Alkaline Salt, but a true Sea-salt, if the Person used much thereof; but when I desire to obtain a large Quantity of the Salt, I usually proceed thus.

I put a hundred Weight of Urine into a large low Vessel that widens upwards, and inspissate by boiling, with Care to prevent the unctuous Matter from boiling over; and being left, till the whole acquires the Consistence of Honey, I put a large Quantity of this into an open cylindrical Glass, and expose it for some Months in a warm Room, so that it may be well putrefied. I afterwards put the Glass into an Iron Pot, to the Mouth whereof a large earthen Still-head may be commodiously fitted, and closely luted; the Head has a long Pipe, to which I apply a capacious Receiver, then raise the Fire by Degrees, upon which an incredible Quantity of a white alkaline Salt arises, next a yellow Oil that fouls the former Salt, and with it another Salt somewhat more fixed. I urge the Fire till the Pot begins to grow red hot, at which Time the Oil and the last Salt come over. Then suffering the Iron Pot to cool a little, while the fixed Matter continues sufficiently hot, I take away the Receiver, and put up all that was raised into Glass Bottles, and stop them close. This afterwards resolves into Spirit, Salt, and Oil, as the former. If what now remains at the Bottom be mixed with twice or thrice its Weight of Wood-Coal, and then put into little coated Retorts, and urged with the utmost Violence of Fire for sixteen Hours, into Receivers filled with Water, and so placed as to bury the Necks of the Retorts under Water, little blue Masses of Matter will at length come over, and fall to the Bottom of the Receivers, whence they are collected, so as to be gathered together under Water, in a small Vessel; which being set over the Fire, so as to be very hot, the Matter of the Phosphorus melts without dissolving in the hot Water, and runs into one Mass, like melted Wax; and may be afterwards preserved for twenty Years, or more, under Water, without losing its Virtue. But if another Part be taken of the Mass, as it remains in the Pot, and calcined in an open Fire to a white Calx, this Calx, when put into Water, communicates a saline Matter thereto; and which, when reduced, proves to be true Sea-salt, that remained thus unchanged through all the Digestions of the Body, and even after such a long continued Putrefaction and Distillation. That it is a true Sea-salt, appears manifest from the Taste, but more particularly, because, when mixed with *Aqua fortis*, it dissolves Gold; so that there is no fixed alkaline Salt found even in this Urine; but whatever it contains of saline, is either of the volatile Kind, or Sea-salt.

R E M A R K S.

This is the true Analysis of Urine after Putrefaction, where it affords all the same Matters as that which is distilled fresh, though with a less Heat and in an inverted Order. Putrefaction renders the Salts more volatile than Water, and makes those alkaline which were not alkaline before; it renders the Oil sharper, more fetid, and more volatile, yet produces no inflammable Spirit, no fix'd or volatile Acid, nor any fix'd Alkali. Yet these two Salts appear differently volatile; the first whereof easily rises and separates almost pure; the other with more Difficulty, slower, and mixed with a copious Oil, not easily to be separated from it, and requires a large, and in part the strongest Fire to raise it. I once urged the prepared Fæces of Urine, with the most violent Fire for the making of Phosphorus, and was surprized to find how long this saline Matter continued to come over, after having so long suffered the Violence of a former Fire; but this Salt was strangely dense, yellow, fetid, and fix'd to the Sides of the Retort. All Acids, therefore, are here changed into a neutral, saline Substance, by the vital Powers; yet this neutral Salt becomes truly alkaline by Putrefaction, and more volatile than any hitherto known, even than Alcohol itself. This Putrefaction volatilizes all the saline Matters of Animals and Vegetables, but can neither convert Sea-salt into an Alkali, or render it volatile. Some eminent Chemists have said, that an Acid might, by the Force of Fire, be drawn from the Fæces of Urine, remaining after its Distillation: And I have found this true, where common Salt was largely used by the Person, and not changed, as was above observed, but remaining plentifully in the Fæces: For being thus mixed in a large Proportion of Earth, the extreme Violence of the Fire drives over the Acid of the Salt, which has thus been hastily taken for the Acid of the natural Juices: Yet it must be acknowledg'd that Phosphorus spontaneously resolves into an Acid by the Air, not greatly differing from the Oil, or acid Spirits of Vitriol or Sulphur; whence it makes a kind of Compound Body with Quicksilver. But whence this Acid should proceed I am at a Loss to know, as also of what Nature it is. Certainly it suits neither with Animals or Vegetables; perhaps, Alum might be added in the Preparation; for thus it may be obtained to Advantage; and the acid Spirit of Alum is very like that of Vitriol. On the other hand, it has appeared by Experiments, that Fowls feeding upon Vegetables inclined to Acidity, and drinking nothing but Water, while they were cooped up, and being afterwards calcined with an open Fire, together with all their Excrement, afforded Fæces that contained nothing either of acid, or of an alkaline Nature. If a Spirit highly saturated with volatile, alkaline Salt be highly rectified, it becomes limpid; but if afterwards long kept, it changes brown, and generally deposits something terrestrial to the Bottom and Sides of the Vessel. Let it be examin'd whether this is not that volatile Earth, which rises with the first Spirit of putrefied Urine, that tarnishes the Glass so as not to be got off again but by the other subsequent Spirit, which, though scarcely saline, spontaneously dissolves it; of which *Helmont* treats so largely in his noble Book of the Stone. This deserves to be thought of and tried, as being an easy Thing that has its Use. Certainly Alkalies rather generate the Stone; but if the second Liquor, which is not alkaline, dissolves the Stone, then Urine will contain both the Matter of the Stone and its Solvent. Sea-salt, therefore, does not generate the Stone, but rather resolves it, as hindering by its Saltiness, the Tendency of the Humours to an alkaline Nature and Putrefaction. Whence *Helmont* conceives, that Vinegar, Sea salt, and Sulphur, were the great antipeffential Remedies of *Hippocrates*, being used along with fumigated Wine; whence the Adepts declare, that Nature has lodged absolute Perfection in Salt. It does not however commodiously dissolve the Stone formed in the Urine, or the Concretions of the Gout.

Dr. *Langrish*, in his modern Theory and Practice of Physic, says, That the Kidneys are Organs designed by Nature to through out of the Body a recrementitious Liquor, which in Health is straw-coloured, or of a pale Yellow, and contains little or no Sediment, or feculent Matter; being in effect a Lixivium, in which a Portion of the animal Salts and Oil is dissolved and washed away. If, therefore, (as we have Reason to believe) the secretory Ducts of the Kidneys are more than ordinarily contracted, in an acute Fever, either by the sharp, acrid Salts and Oil stimulating them as they pass along, or else by the general Tension of the Vessels at that Time; or if the Union or Attraction between the serous and globular Parts of the Blood is so strong as not to be separated in the Renal Tubuli, we have a manifest Reason for the small Quantity of Urine.

Another Cause, indeed, may be the Velocity of the Fluids; for a strong and swift Circulation is an Hindrance to all Secretions, by reason they are perform'd by lateral Branches going off at or near Right Angles; and consequently a swift Circulation along or parallel to the Axis, carries along with it what should be laterally secreted.

As to the Colour of the Urine, that depends upon the Quantity of oily and sulphureous Particles wherewith it is impregnated; it being well known, that Oil or Sulphur is the Cause of all Colours in Liquors; since neither pure Salt, pure Water, nor pure Earth, can communicate any Colour at all. Add to this, that Oil gives the deeper Colour, the more it is attenuated and exalted by Heat and Motion. And again, when the increased Heat of the Body hath exalted the most fluid, aqueous Particles of the Blood, the Urine may become higher coloured, or intensely red, by the Proximity of the sulphureous Particles.

Hence we sometimes meet with Urine, so saturated with oily, saline, and terrene Particles, as to be a perfect Lixivium; and at other times, the Salts and Oil are not determined to the Bladder along with the Urine; that is, when the Fibres of the Kidneys are over and above contracted, or the Salts and Oil are not attenuated and divided enough, to suit the Orifices of the secretory Ducts, the Urine is as limpid and clear as common Water. The former of these argues an inflammatory Disposition of some of the inner Viscera; and the latter threatens Deliria, and Convulsions.

The rank fetid Smell, which often attends the Urine of Persons in ardent Fevers, proceeds from the Salts being volatilized and rendered alkaline, and the Oil tending towards Putrefaction; all which is repugnant to the natural State of the Fluids.

Towards the Crises of Fevers, when the saline, sulphureous, and terrene Particles, are attenuated and ground fine enough to pass through the Renal Tubuli, the Urine is loaded with Contents, and lets fall a thick Hypostasis, or turbid Sediment, after it has stood for some time. Since, therefore, the Urine, by its several Contents and Appearances, furnishes us with Signs as well diagnostic as prognostic, it ought to be inspected every Day, in order to deduce our curative Indications, or to make our medicinal Prediction with greater Certainty; either from the Cloud at the Top, the Eneoræma suspended as it were the Middle, or the Hypostasis or Sedimentum subsided to the Bottom: The last of which is the best Indication of a kindly and regular Concoction.

Thus by daily inspecting the Urine, we are taught the State and Progress of the Disease; and thereby enabled not only to make our Prediction, but we are, also, greatly directed thereby in our medicinal Practice. *Hippocrates* laid great Stress upon his Observations on the Urine. And our Countryman *Willis* is so sanguine as to tell us, that the Acidulæ or Spaw Waters do not more certainly shew the Nature of the hidden Mine, through which they are strained, than Urines give Testification of the divers Sorts of Dyscrasies of our Bodies and their Habitudes.

If, therefore, a bare Inspection of Urine is of such Advantage towards investigating the Nature, State, Progress, and Cure of Diseases; most certainly the natural History of it, or a more curious Search into the Contents of the Urine, in every Period of the Disease, will be of more moment in discovering the several Dyscrasies of the Blood, and in indicating the Method of Cure, than what we can meet with in the Urinal only. For this Reason, I thought it worth while to make the following Experiments, that by an exact Analysis we might see the different Contents of the Urine, and the various Proportions of its Principles.

A CHYMICAL ANALYSIS OF THE URINE, BOTH IN HEALTH AND IN ACUTE FEVERS.

EXPERIMENT I.

I took all the Urine that was made in the Space of twenty-four Hours, by a Man, thirty-five Years of Age, in perfect Health, and of a regular Life. I weighed out two Pound, and distilled it; by which means I gained

	Ounc.	Dr.	Gr.
1. Lymph	30	7	2
2. Volatile Salt		2	18
3. Oil			32
4. Cap. Mort. before Calcination		3	17
5. Cap. Mort. after Calcination		1	43
6. Fixed Salt			32

The greatest Part of the Lymph was pellucid, insipid, and inodorous, and exhibited no Signs of an Acid or an Alkali; but the latter Part was very strong and offensive, and fermented violently with Oil of Vitriol, made a white Precipitate with

with Solution of Sublimate, and turned Syrup of Violets green.

When the volatile Salt first began to rise, it shot all over the Glas-head and Recipient into most beautiful Crystals; some of which resembled fine Boughs or Feathers; while others radiating from a Point or Centre, formed Stars or Roses of various Sizes.

When the volatile Salt was mixed with an acid, a stinking Vapour arose, which smelt like a nasty Corner where People have made Water for a long time.

I repeated this Experiment three Times, but as there was no material Alteration either in the Quantity or Quality of any of the Principles, it would be encroaching on the Patience of the Reader to insert those Processes.

EXPERIMENT II.

A young Lad, ten Years old, being seized with an acute Fever, attended with a Phrenzy, Subultuses, and many other dangerous Symptoms, it continued till the eighth Day; on which moderate Sweats broke forth, and the Urine let fall a vast Hypostasis.

All the Urine which was made on the eighth and ninth Days, being saved by my Order, it amounted exactly to two Pounds; which being committed to the Still, it afforded,

	Ounc.	Dr.	Gr.
1. Lymph	30	2	
2. Volatile Salt		5	46
3. Oil		1	23
4. Cap. Mort. before Calcination		5	4
5. Cap. Mort. after Calcination		1	56
6. Fixed Salt			44

Hence we may not only observe a great Difference between the Contents of healthy Urine, and that made at the Crisis of a Fever; but we plainly see the Reason of the vast Advantages which generally accrue when the Urine is loaded with Contents, and lets fall a thick and turbid Sediment. For we have good Reason to believe, from this Experiment, that the greatest Part of the Hypostasis consisted of saline and sulphureous Particles, which, while in the Blood, irritated the Vessels, and increased the Fever.

The Lymph also seemed to be much stronger in this than in the former Experiment; and as it contained more volatile Salt and Oil, it fermented more violently, and smelt stronger when mixed with Oil of Vitriol.

EXPERIMENT III.

A young Woman, seventeen Years of Age, lay ill of an ardent Fever, and from the tenth to the fifteenth Day, the Urine came away involuntary; so that none could be saved, except about a Spoonful of limpid clear Water on the twelfth Day, at which time she was raving, gather'd up the Bed-Clothes, caught at imaginary Flies, and the like. On the thirteenth and fourteenth she lay comatose. The fifteenth she raved again, had strong Subultuses, and a black parched Tongue. On this and the next Day, we saved eight Ounces of Urine, which was something deeper coloured than a Citron, smelt strong, and had a very thin bright Cloud swimming in the middle. This Urine being distilled, we procured,

	Ounc.	Dr.	Gr.
1. Lymph	7	5	
2. Volatile Salt			40
3. Oil			32
4. Cap. Mort. before Calcination		1	6
5. Cap. Mort. after Calcination			21
6. Fixed Salt			4

EXPERIMENT IV.

The dreadful Symptoms which attended this poor young Woman on the fifteenth and sixteenth Days, were something alleviated on the seventeenth, by a gentle breathing Sweat; but the Remission was very short, a Rigor succeeded, and the Fever seemed to return with greater Violence than ever. All that Night she raved much. The next Day, the eighteenth, I found her delirious, with frequent Catchings of the Tendons, and her Pulse so extremely quick as scarce to be counted.

Nine Ounces of Urine being saved on the seventeenth and eighteenth Days, I distilled eight Ounces of it, and obtained,

	Ounc.	Dr.	Gr.
1. Lymph	7	4	45
2. Volatile Salt			48
3. Oil			34
4. Caput Mort. before Calcination		1	10
5. Caput Mort. after Calcination			23
6. Fixed Salt			3

It may be proper to observe, that about four Ounces of this Urine, which was made during the little Remission of the Fever, was highly red at first; afterwards it grew thick and cloudy, and the next Morning it had a laudable Hypostasis subsided to the Bottom. The other Part was much the same with that of the former Process.

Having one Ounce of Urine to spare, and it smelling exceedingly rancid and strong, though the Glasses were very clean in which it was contained, I thought it worth while to try if I could possibly discover any alkaline Property in this Urine, before the Fire had any share in it; and accordingly I divided it into four Parts; to the first I let fall some Solution of Sublimate, which made no Alteration in it; to the second I dropt in some Solution of Alum, which also lay very quiet; to the third I added Oil of Vitriol, which manifestly gathered together, and collected the grosser, thicker Contents of the Urine (which, by shaking the Bottle before we weighed out what was distilled, were equally scattered all over, so as to render it of an even turbid Colour) into little Rags, and left the Interstices clear. With the fourth I mixed Oil of Tartar, which immediately dispersed the Thickness or Muddiness, and rendered it clear, and almost of a Straw-colour.

Hence it is evident, that though the Urine was not alkaline enough to raise a visible Fermentation with Acids; yet as the saline and oleaginous Particles were undoubtedly attracted and collected together by Oil of Vitriol, and repelled and dispersed by Oil of Tartar, we may reasonably conclude, that the prodigious Heat of the Body had exalted the Animal Salts and Oil to an alcalic State. For this was the most intense Fever I ever met with; and as the Heat had been continued many Days, I am persuaded it might be the Cause of these Phenomena.

EXPERIMENT V.

On the 19th Day of this young Woman's Illness, we had a Remission for four Hours; during which Time she came to her Senses, drank plentifully; her Tendons were quiet, her Pulse regular, in comparison to what they had been; and by the Assistance of a Clyster we procured two Stools. In the Evening the Rigor returned, though not with so much Vehemence as on the 17th. The Fever, Delirium, Subultus Tendinum, &c. soon succeeded; so that the Night was passed with great Inquietude. On the 20th in the Morning, she had two Hours Sleep, which greatly refreshed her, and slackened the Pulse both in its Hardness and Velocity. She now began to spit a good deal of frothy Matter; her Skin felt smoother and softer than it had done before; and the Urine on both these Days was loaded with Contents, and let fall a very thick Hypostasis. Eight Ounces of this Urine afforded,

	Ounc.	Dr.	Gr.
1. Lymph	7	3	32
2. Volatile Salt		1	38
3. Oil			53
4. Cap. Mort. before Calcination		1	12
5. Cap. Mort. after Calcination			26
6. Fixed Salt			5 ¹ / ₂

Having mentioned in the former Experiment, that Oil of Vitriol plainly collected, and Oil of Tartar as manifestly dispersed the turbid Parts of the Urine, I was induced to try it again with some of this Urine before Distillation; because it seemed to be more impregnated with volatile Salts and Oil; and consequently it might exhibit the Phenomena more plainly. Accordingly I dropt a few Drops of Oil of Vitriol into an Ounce of it; from whence a fine white Froth arose to the Top of the Mixture, while the grosser Contents run together, and after some time subsided to the Bottom. The Ferment, indeed, was but weak; however, it was enough to discover, to any unprejudiced Person, an alkaline Matter in the Urine. I must confess, indeed, I have repeated this Experiment a great many times on the Urine of other Persons in ardent Fevers, and never could observe the same Appearances; but, as I said before, since all the Vessels which received this Urine were very clean, and since the Heat was most extreme, as well as of very long Continuance, I am positively sure the Phenomena proceeded from an alkaline Disposition in the Urine.

EXPERIMENT VI.

On the twentieth Night this young Woman slept well. The next Morning I found her greatly refreshed, though not free from the Fever. All that Day, and the next, she continued mending; she spit much, had little breathing Sweats, and a Multitude of Contents in the Urine. All the Urine she made on the 21st and 22d Days, being mixed together, and shook, in order to disperse the Contents equally, I distilled eight Ounces, and obtained,

1. Lymph

	Ounc.	Dr.	Gr.
1. Lymph	—	—	—
2. Volatile Salt	—	—	—
3. Oil	—	—	—
4. Cap. Mort. before Calcination	—	—	—
5. Cap. Mort. after Calcination	—	—	—
6. Fixed Salt	—	—	—

The critical Evacuations by Sweat, Urine, and Spit, continuing on the 23d and 24th Days, my Patient was past all Danger; she slept quietly, and only complained of great Lassitude and Faintness: But as the Urine on these two Days continued to be very turbid and thick, I was invited to pursue my Enquiry, and from eight Ounces procured,

	Ounc.	Dr.	Gr.
1. Lymph	—	—	—
2. Volatile Salt	—	—	—
3. Oil	—	—	—
4. Cap. Mort. before Calcination	—	—	—
5. Cap. Mort. after Calcination	—	—	—
6. Fixed Salt	—	—	—

The Oil and latter Part of the Phlegm, or Spirit, which came over in this Process, being left in the Recipient all Night, I found next Morning several large and beautiful Crystals shot from them, some of which were as large, and much resembled the Crystal Stones used for Mourning Rings.

From these five last Experiments we may plainly observe, that the Urine became more and more impregnated with saline and sulphureous Parts, in Proportion to the Abatement of the bad Symptoms; till at the Crisis it contained more than double the Quantity it did at first. Hence the several Organs of the Body were vastly relieved, their Tension was abated, the Blood grew polite and smooth, and the Cohesion between the several Orders of Blood Globules became less and less, by a constant Diminution of the Quantity of strongly attracting, acrid, irritating, saline and sulphureous Particles.

EXPERIMENT VIII.

A young Man on the sixth Day of an acute Fever, made exceeding limpid, clear, and pale Urine, which was soon followed with a Phrenzy, Subsultus Tendinum, and other dangerous Symptoms. From eight Ounces of this Urine I obtained

	Ounc.	Dr.	Gr.
1. Lymph	—	—	—
2. Volatile Salt	—	—	—
3. Oil	—	—	—
4. Cap. Mort. before Calcination	—	—	—
5. Cap. Mort. after Calcination	—	—	—
6. Fixed Salt	—	—	—

It is an old Observation, founded on Experience, that if the Urine changes suddenly from a deeper Colour to a crude Paleness, without a Sediment, towards the Height of a Fever, it is the Fore-runner of some fatal Metastasis, as of Deliria, Convulsions, and the like. And here, in this Experiment, we have plain Demonstration of the Cause of it; because the animal Salts or Oils are not determined to the Bladder, along with the Urine, but are accumulated in the Blood and Lymph, and generate Obstructions.

EXPERIMENT IX.

On the tenth Day the Urine of this young Man grew exceedingly turbid, with an even white Hypostasis at the Bottom, and all the bad Symptoms vanished. Eight Ounces of this Urine afforded,

	Ounc.	Dr.	Gr.
1. Lymph	—	—	—
2. Volatile Salt	—	—	—
3. Oil	—	—	—
4. Cap. Mort. before Calcination	—	—	—
5. Cap. Mort. after Calcination	—	—	—
6. Fixed Salt	—	—	—

Here again we have manifest Proof of what vast Advantage it is to the animal Oeconomy, to have the Salts and Oils properly attenuated, diluted, and drained off from the Blood, by the secreting Tubuli of the Kidneys.

Thus, in the most natural Way of analysing the Urine, without Fermentation or Putrefaction, or without the Addition of any suspicious Analyser, we have separated the several constitutive Parts of Urine; whereby we have evidently demonstrated, that the Urine in Fevers abounds more with saline and sulphureous Particles than it does in Health; and especially towards the Crisis, when the Salts and Oils are sufficiently attenuated, ground, and comminuted, it is loaded with a Multitude of Contents, which gives great Relief to

the Sick: But when it is pellucid, pale and clear, and continues so for some Time, it is a very dangerous Phenomenon, and requires the utmost Skill and Diligence to remove it. I shall only add, that the fixed Salt in all these Experiments, appeared, by the strictest Trials with Oil of Vitriol, and a Solution of Silver, to be Sea-Salt.

RENOVATIO. Renovation, in Chemistry, is defined, the Restoration of a mineral Body to a perfect State, from one which is imperfect. It is also used, with respect to the Body, in the same Sense.

RENUANS MUSCULUS. A Name for the *Rectus Anticus Brevis*.

RENUNCIATIO. Renunciation; that is the Report of a Physician or Surgeon to a Magistrate upon an Inquest, with respect to the Event of a Wound, or Poison, or relative to contagious Distempers.

REPANDATIO. The same as **LORDOSIS**.

REPELLENTIA. Repellent Medicines. See **INFLAMMATIO**.

REPERCUTIENTIA. The same as **REPELLENTIA**.

REPLETIO. Repletion, Satiety, or a *Plethora*.

REPOSITIO. The Reduction of a luxated, or fractured Limb.

REPRIMENTIA. Remedies which repel by their Astringency.

REPULSORIA. The same as **REPELLENTIA**.

REPURGATIO. The same as **ANACATHARSIS**.

RES NATURALES. The Naturals.

In every Person, says *Boerhaave*, however disordered, Life, the Cause of Life, and its Effects, remain in some Degree. These, says he, are called the Naturals, or Things according to Nature, and sometimes simply Nature.

RES NON NATURALES. See **CAUSA**.

RES PRÆTER NATURAM. Diseases, their Causes, and Symptoms, or Effects, are thus called by the Writers of Institutes.

RESEDA.

The Characters are;

The Leaves are pinnated; it hath a polypetalous anomalous Flower, composed of several dissimilar Petals, out of whose Cup arises the Pointal, which afterwards becomes a membranaceous Fruit, for the most Part three or four corner'd, oblong, and as it were cylindraceous, pregnant with roundish Seeds.

Boerhaave mentions six Species of this Plant; which are;

1. *Reseda*; maxima. *C. B. P.* 100.

2. *Reseda*; alba. *J. B.* 3. 467.

3. *Reseda*; vulgaris. *C. B. P.* 100. *Raii Hist.* 2. 1053. *Synop.* 3. 366. *Tourn. Inst.* 423. *Boerb. Ind. A.* 251. *Reseda*, *Offic. Reseda Plinii*, *Ger.* 226. *Emac.* 277. *Reseda lutea*, *J. B.* 3. 467. *Reseda minor seu vulgaris*, *Park. Theat.* 823. **BASE ROCKET.**

It grows in chalky Soils, and flowers in June and July. The Herb is said to mitigate Pains, and discuss Inflammations.

4. *Reseda*; minor; vulgaris. *Tourn. Inst.* 423. *Boerb. Ind. A.* 251. *Phyteuma*, *Offic. J. B.* 3. 386. *Raii Hist.* 2. 1054. *Reseda affinis Phyteuma dista*, *C. B. P.* 100. *Reseda affinis Phyteuma Monspeliensium dista*, *Park. Theat.* 822. *Valeriana septima*, *Ger.* 918. *Emac.* 1076. **SMALL BASE ROCKET.**

This grows about Montpellier, and flowers in the Summer. The Herb is said to increase Venereal Inclinations.

5. *Reseda*; minor; alba; foliis dentatis. *Barr. Ic.* 588.

6. *Reseda*; minor; folio inferiori parum, superiori magis inciso; perennis. *Boerb. Ind. Alt. Plant. Vol. I.*

RESINA. Resin. See **CATHARTICA**.

Resins consist of Oil and Acid, and accordingly are artificially produced by mixing Spirit of Vitriol with Spirit of Wine, or of Turpentine. They are either solid or liquid, but these differ from one another only in the Proportion of Earth that enters their Composition. *Geoffroy*.

METHOD OF PREPARING RESINS.

Let the Tinctures prepared with Alcohol from fat resinous Vegetables, be first well clarified by standing, then distilled in a Glass Body, with a gentle Fire, till only one Fourth remains behind: The Alcohol thus drawn off, is to be kept for the same Use again. Then pour the thickened Tincture into a low Glass, with the Mouth wide enough to admit the Hand; and let this Vessel contain twelve Times the Quantity of fair Water, in Proportion to the thickened Tincture. The Mixture thus will instantly grow thick, white, and soon exhibit yellow Curds, which, fallen to the Bottom, constitute a gross viscous, unctuous, and somewhat transparent Matter; then set the Glass in a Sand Furnace, and draw off the remaining Alcohol by means of an Alembic, continuing the Operation

Operations so long as the Veins in the Head shew any Spirit to rise, and add this Spirit to the former. At the Bottom there will remain the Water, with the abovemention'd Matter below it. This Matter liquifies in hot Weather, but grows hard in the Cold. The Water being thrown away, tho' it still retains some Odour or Taste, tho' but little Virtue, let the resinous Matter collect and unite into a Mass at the Bottom. It will first be flexible, soft, and, when touch'd, stick incommodiously to the Fingers; but when washed for some Time in several Waters, it begins to cool and harden, and when dried, appears a hard, brittle, transparent Body, that will run with Heat, dissolve in Oil and Alcohol, but not in Water, and burn in the Fire like Oil. This Matter is called by the Chymists Rosin; and requires to be kept in a cool dry Place, and in a close dry Vessel.

This Rosin may be thus prepared from almost any oily, ponderous, dry and resinous Parts of Vegetables. Nature often produces the like from Vegetables, but no where more perfect than in the Camphire Tree, which yields a pure, white, transparent, highly odorous, volatile Rosin, tho' hard to grind: And next to this is Benjamin, which is also a pure volatile Rosin, copiously afforded by the Tree. But when pure Alcohol acts upon resinous Plants, whilst yet green and juicy, the Water abounding in these Juices mixes with the Alcohol, and dilutes it; whence it acts like common rectified Spirit, or rectified Spirit of Wine, in Proportion as the Plant contained more or less Water; and thus its Action becomes different.

R E M A R K S.

This Experiment, which is considerably general, shews the Nature of Rosin, which in the Plant seems to be a pure thin Oil. And hence Chymists are taught under what various physical Forms Oils may subsist, in respect of Heat and Cold; for the Rosin, which in a certain Degree of Cold is hard and brittle, soon resolves by Heat into a pure fluid Oil. Some have supposed that Rosins are generated, whenever any strong Acid is mixed with a clear Oil, upon observing that the strong and fiery Spirits of Nitre and Vitriol turn with Oils into a pitchy Mass, which, when farther perfected by the Fire, becomes a true Rosin; and therefore that the Sulphur thus produced is a true Rosin of the Earth. But there is Room to doubt whether the Coagulation of the Oil proceeds from the Acid, because by the natural Conversion of Balsams into Rosins, the Acid is always more separated from the Balsam, the more the Balsam, which was first liquid, grows thick and hard; and at last there is less Acid found in the Rosin, than in the more fluid Mass; and even the Rosins, which are thus said to be produced by a Mixture of Acid and Oil, yet always differ from those prepared by Nature, or by the Means of Alcohol. These Rosins soon dissolve in Alcohol, but Sulphur never.

The Rosins, thus prepared, manifest their oily Nature by being totally inflammable, and seem to contain their former prefiging Spirit; for the Smell, Taste, and particular Virtue of the Subject are always found in the Rosin, though this is to be understood only so far as they remained in the oily Part of the Plant. Hence these Virtues are long retained and preserved for Years, in the viscous Substance of the Rosin; whereas they would otherwise be soon lost in the Plant itself. And hence it often happens, that the Rosins taken in the Body pass through it undivided, by reason of their Tenacity, and without having their Spirits extricated to perform their proper Actions, as not meeting with the Bile, or other saponaceous Fluid, to dissolve and open them; and this is frequently regretted by Physicians, while they direct these Rosins in Form of Pills, which may pass the Body without being dissolved, and without producing the desired Effect. These Rosins, also, generally have a manifest, sharp, caustic, inflammatory, violent Virtue; so that if they stick to the Tongue, or the Jaws, they prove very troublesome by their Acrimony; and this Effect they often have upon the Stomach and Intestines, and thus they may prove mischievous, by stimulating and inflaming. And thus the Rosins of Coloquintida, Euphorbium, Hellebore, Jalap, Scammony, and the like, sometimes occasion violent and dangerous Purgings, that cannot easily be stopt. In order to prevent both these ill Effects, it has been found proper to grind them in a Glass Mortar, for a considerable Time, with an equal Quantity of dry Sugar; so as thus to prepare a fine Powder, which being afterwards mixed and taken in any Syrup, never passes the Stomach undissolved, nor sticks in the Folds of the Intestines, but proves an excellent and expeditious Kind of Purgative. So likewise, if mixed with a little Yolk of Egg, this will dissolve their Tenacity, and promote and increase their Efficacy; and when thus treated, these Rosins will also prove purgative, which are obtained from Simples not purgative themselves, as we see in the Rosin of Guaiacum.

Some of the greatest Artists have observed, that the proper distilled aromatic Oils, abounding with their own Spirits, grow resinous, as often as they are deprived thereof. And this is certainly found in some Oils; for if pure Oil of Cinnamon be dissolved in Alcohol, and the Alcohol be with a gentle Fire drawn over from it by Distillation, it carries over the Spirit with it, and leaves the Oil behind deprived thereof and resinous. But as the purging Virtues of certain Plants partly reside in that resinous Matter, which Alcohol extracts, and partly in another active Part of the Plant, which dissolves in Water, as appears in Jalap; the Remainder of such a Plant, after the pure Alcohol has extracted all the Resin, will afford another Part by being boiled in Water. And if this Decoction be strained, inspissated with a gentle Fire to the Consistence of an Extract, and afterwards mixed along with the Resin dissolved in the Yolk of an Egg, there will thus be obtained an excellent Composition, containing almost the whole medicinal Virtue in a little Compass.

RESINA JALAPIL. See JALAPA.

RESINA SCAMMONIL. See SCAMMONIUM.

RESINATUM VINUM. Wine impregnated with Resin of the Pitch-Tree. It is mentioned by Celsus, L. 2. C. 24. as good for the Stomach. Dioscorides, L. 2. C. 43. informs us it was generally made in Galatia, where the Wines were subject to grow sower, without this Precaution, because the Climate was too cold to ripen the Grapes.

RESINOCERUM. A Mixture of Resin and Wax.

RESOLVENTIA. Resolvent Medicines. See FIBRA and INFLAMMATIO.

RESOLUTIO. Resolution. See FIBRA and INFLAMMATIO.

RESOLUTIVUS. Resolutive, a modern Epithet for that Species of Fermentation, which tends to the Resolution of Bodies. *Castellus* from *Stabl*.

RESONITUS. A Contraffiture. See CAPUT.

RESORBENTIA. The same as ABSORBENTIA.

RESPIRATIO. Respiration. See PULMONES.

What Respiration is, and why it is uninterruptedly carried on without the Concurrence of the Mind, will appear from what follows. Tho' no Action seems to be more frequent than Respiration, yet it is not to be understood without considerable Difficulty, not only because it is partly vital and partly voluntary; but also because an incredible Number of Organs are subservient to it; for which Reason its Nature is carefully to be investigated, which is most commodiously done by considering the Phenomena with which it is accompanied, and the Organs employed in carrying it on.

The Lungs suspended in the Air, which every where acts upon them, and equally presses them, always collapse, contract themselves into a smaller Space, and become much less than when they remained in the entire Thorax, as is sufficiently evinced by Anatomy: This is principally perform'd by the contractile Force of the muscular Fibres, which connect the squamous Segments of the Bronchia.

If the Lungs thus contracted are filled with Air, forcibly blown through the Glottis, they are so distended as in Bulk not only to equal that which they had in the entire Thorax, but even much to exceed it, as is sufficiently certain from Experience.

The same Thing happens, if when an Access for the Air thro' the Glottis, is left to the Lungs, the Air externally acting on the Lungs is either removed, or its Pressure diminish'd. This may be demonstrated by Experiments made in the Air-Pump.

Hence 'tis obvious, that the Lungs by their proper Force have always a Tendency to become less in all their Parts, than they are when placed in the entire Thorax. For this reason 'tis certain, that they are in a continual State of Distraction, so long as a Person is alive, so that they must collapse, and be diminished, whilst the whole of the Animal remains in a Vacuum, obtain'd by an Exhaustion of the Air in an Air-Pump.

For there is nothing similar to a circumambient Air between the external Membrane of the Lungs, and all the internal Surface of the Pleura, in a sound Person; nothing therefore externally compresses the Lungs, except the Diaphragm. There is, however, always an internal Air contained in them, and freely conveyed to them through the Glottis. Hence the Lungs are always somewhat more distended by the internal Air, than they are compress'd by the external Air, the Access of which is hindered by the Diaphragm, which is so connected with the Ribs and Vertebrae, that the Air cannot enter the Thorax in such a manner as would be requisite for an Equilibrium.

The Truth of this Doctrine, which in accounting for Respiration is of the last Importance, is evidently demonstrated by Anatomy; by the Production and Growth not only of the Fœtus in the Uterus, but also of Infants brought into the World;

World; by the Inflation of the Lungs, by Wounds penetrating into the Cavity of the Thorax, occasioning a Collapse of the Lungs, hindering their Dilatation, and inflicted sometimes on one and sometimes on another Side of the Thorax; but most of all by the celebrated Experiment of Mr. *Hook* upon live Dogs.

Since, therefore, in Inspiration, a greater Quantity of Air enters the Lungs through the Glottis, it will extend the Lungs more, and overcome their natural Force; so that in this Action the Lungs are passive, but how far they are active is only to be discover'd from certain Phenomena.

In vital Inspiration then, especially considered in a sleeping Person, first, the Ribs, especially the nine superior ones, articulated at the Vertebrae, and by Cartilages join'd to the Sternum, with their arched Part rise so to the Clavicles, that this Motion is principally observ'd in the Middle of the Arch. Whilst three or, perhaps, four of the inferior Ribs are turned downwards, backwards, and obliquely outwards; but in such a Manner that the seventh, eighth, ninth and tenth Ribs are by their cartilaginous Segments, as it were, drawn inwards. Secondly, the whole Abdomen, to the very End of Inspiration, is gradually rendered more tumid, and press'd outwards. Thirdly, at the same Time the Cavity of the Thorax is enlarged, as is obvious by measuring with a Cord, by viewing it with the Eye, and especially by a mechanical Consideration of the Figure, Situation, Connection, and Articulation of the Ribs here placed, according to the Rules of most perfect and consummate Art, as *Borelli* has excellently demonstrated.

But during this Action the Diaphragm is drawn downwards from the convex and sinuous Situation it was in before, and assumes a plainer Figure, as is obvious from dissecting live Animals, and from large abdominal Wounds inflicted on Man. But that this Change of Figure in the Diaphragm depends upon the Contraction of its muscular Fabric, is sufficiently obvious from an anatomical Consideration of it.

Since, therefore, in Inspiration no other Things happen, its Cause must be determined by these; namely, the above-describ'd Motions of the Ribs and Diaphragm: For which Reason, we must enquire into the Causes which produce these Motions.

The ten superior Ribs, being bonny, arched, incurvated, and more depressed and flat in the Middle than in their rising Extremities, are by two Apophyses fortified with a Cartilage, articulated, first, into the cartilaginous Pit of the Vertebrae, imprinted laterally and backwards on the united Bodies, or only in the Body of the first Vertebra; secondly, in the cartilaginous Sinus imprinted on the transverse Process of the Vertebrae. The seven superior Ribs are join'd to the Sternum, by the Interposition of an arch'd, cartilaginous, and pretty elastic Segment; which in the first Rib forms an acute Angle upwards, in the second Rib an Angle almost right; and in the other five Ribs an obtuse Angle with the Sternum. So that the Angle here form'd by the Cartilages of the Ribs, with the Sternum, is the more obtuse the more inferior the Rib is; or that Segment ascending enters the lateral Cavities of the Sternum so that the more superior the Rib is, the smaller the Angle of this Insertion is from the Concourse of the superior Part of the Sternum. But the sixth, seventh and eighth Ribs join their cartilaginous Arches, not only in their uniting Extremities, which reach to the lowest Part of the Sternum, but they also coalesce by mixing broad cartilaginous Processes with each other. The two and sometimes the three inferior Ribs being only furnish'd with one posterior Apophysis, are only articulated to one Sinus in the Body of its own particular Vertebra; and their Cartilages being almost only tendinous, they do not touch the Sternum, but are inserted in the Diaphragm and Cartilages of the next Ribs. So that they seem to be subservient to directing, equally sustaining, and performing the Motions of the Diaphragm, backwards and downwards.

The external intercostal Muscles, arising from the inferior Margin of the superior Rib, descend obliquely forward, and are inserted in the superior Margin of the Rib next to it below, through all the bonny Circumference, between all the Ribs both true and spurious. But the internal intercostal Muscles, arising from the inferior Margin of the superior Rib at a Distance from the Sides of the Spine of the Thorax, and descending obliquely backwards, intersect the former, and are inserted in the superior Margin of the next Rib below, thro' all the bonny Circumference.

But the subclavian Muscle arises fleshy from half the inferior Part of the Clavicle, where the Spine is joined to the Scapula, and going on in a forward Direction, is inserted in the superior Margin of the first Rib near the Sternum.

If, therefore, all these Muscles are contracted at once, then the first Rib is sufficiently fixed by its own Articulation, whilst, by the Force of the Subclavian, the nine following Ribs are elevated and turn'd outwards, especially in the Middles of

their Arches, yet so as to remain in an equable Parallellism, and depress the cartilaginous Segments. Thus the Cavity of the Thorax is remarkably increased.

The Diaphragm already described, when contracted, becomes plain, greatly dilates the Thorax, contracts the Abdomen, draws the anterior Cartilages of the spurious Ribs inwards towards the Vertebrae, draws the two inferior spurious Ribs downwards, and distends and overcomes the Force of the abdominal Muscles.

And these Muscles alone seem to perform vital Inspiration; the intercostal Muscles receiving Nerves from the dorsal Nerves, and the Diaphragm from the vertebral, diaphragmatic, and intercostal Nerves.

When, therefore, the Cavity of the Thorax is increased between the Pleura and Surface of the Lungs, nothing presses the Lungs; so that the Air which enters them through the Glottis, inflates them till they again are, or rather remain, contiguous to the Pleura and Diaphragm; and by this means produces all the Effects already mentioned.

Whilst the Parts remain in this Situation, the Air acts upon the Lungs with a Force equal to that with which the Thorax resists; so that the Lungs will remain in a State of Rest. Hence less Blood will pass through them, and a smaller Quantity of it be forc'd into the Left Ventricle of the Heart, and consequently less Blood will be convey'd to the Cerebellum and its Nerves. The arterial Blood will also act less on the intercostal Muscles and Diaphragm; so that the Causes dilating the Thorax are weaken'd. Hence the Elasticity of the cartilaginous Segments again depresses the Ribs, in which Work they are also assisted by the muscular Fibres, arising from the Side of the Sternum within the Thorax, and inserted into the bonny Extremities and Cartilages of the true Ribs. At the same Time the distracted Fibres of the Peritonaeum and abdominal Muscles restore themselves. Hence the compressed Viscera thrust the relaxed Diaphragm upwards into the Thorax, which is by this Means contracted, and the Air expelled from the Lungs. By this Means Expiration and the Actions already mentioned are perform'd. But in a particular manner, by these two Actions the Blood is not only carried through the Lungs, but its Motion accelerated.

At the same Time the Blood being again accelerated, begins to flow more strongly and copiously to the Cerebellum and Muscles, so that the Causes contracting the intercostal Muscles and Diaphragm are renew'd, Inspiration is restor'd, and thus the genuine, present, and effectual Cause of this alternate vital Motion is assign'd.

But besides these Causes of Respiration, there are also others subservient to the Will, and applied to the Ribs for the violent Dilatation of the Breast, and its Contraction. Tho' the former are subservient to the other Functions, yet they also concur to this, since they are naturally form'd for it; for first, the first Scalenus arising fleshy from the anterior Part of the transverse Process of the second, third and fourth Vertebrae of the Neck, and descending obliquely forwards, is by its Tendon inserted in the first Rib. Then the other Scalenus, arising fleshy from the lateral Part of the transverse Process of the second, third and fourth Vertebrae of the Neck, and descending tendinous above the first, is inserted in the second or third Rib. Then the third Scalenus arising fleshy from the anterior lateral Part of the transverse Process of the second, third, fourth, fifth and sixth Vertebrae of the Neck, is inserted for the most Part into the first Rib; for by means of these Muscles the three superior Ribs are elevated, sustained and supported, left the Action of the intercostal and other Muscles should be determin'd downwards in strong Inspiration. Nor is it any Objection, that by their Action the Neck is bended or turn'd about; because if they act at the same Time, and if the Neck is fixed by its erecting Muscles, which are the Spinalis Colli, the Transversalis Colli, the Interspinalis Colli, the Longissimus Dorsi, and the Semispinatus, acting at the same Time, and fixing the Neck; the Action of the Scalenus necessarily elevates the Ribs. But in very violent Respiration, 'tis certain that many such Things concur. Fourthly, the Serratus Anticus Minor arising fleshy from the Caracoid Process, descending obliquely forwards, becoming larger, and then smaller, is inserted fleshy in the anterior bonny Parts of the second, third, fourth, and fifth Ribs. Fifthly, the Serratus Anticus Major arising fleshy, large, and thick from the Basis of the Scapula, and descending obliquely forwards, is, as it were, by notch'd fleshy Portions, inserted into the eight superior Ribs; the two, three, four, or five inferior of which are indented with similar Portions of the Obliquus Exterior Abdominalis. For if the Muscles of the Scapula, the Trapezius, the Rhomboides, and the Levator, fix the Scapula immoveable upwards and backwards; then the Action of both the Serrati strongly elevates the Ribs from the second to the eighth, which we observe to happen in the strongest Inspiration. Sixthly, in the posterior Part, the Serratus Posterior

Superior, arising tendinous from the Spines of the two inferior Vertebrae of the Neck, and the three Superior of the Thorax, is by fleshy Denticulations inserted into the Curvature of the second, third and fourth Ribs, which it raises upwards. Seventhly, Respiration is also assisted by the Serratus Pecticus Inferior, which arising from the Spines of the lumbar Vertebrae, and sometimes from some of the thoracic Vertebrae, is with digitated Fibres inserted almost in the Middle Arch of the ninth, tenth, eleventh, and the Extremity of the twelfth Rib; for this Muscle, by the Descent of its Fibres, almost from the horizontal ascendant Muscle, and by drawing these last Ribs outwards, downwards and backwards, enlarges the Thorax, and prevents its Contraction by an Approach of these Ribs, in consequence of the Contraction of the Fibres of the Diaphragm.

But if the Action of the Musculus Obliquus exterior, and of the Musculus Rectus acting in Concert, depressing the Ribs, contracting the Thorax, and resisting the Serratus Inferior Anticus, as is obvious from their Connection, concurs with the Action of the Sacro-lumbaris, which is a highly compound Muscle, hardly capable of being distinctly describ'd. It consists of a Series of muscular fleshy Fibres, arising from the transverse Processes of the Lumbar Vertebrae, and their Spines, and such as ascend upwards, and are there join'd to the fleshy Musculi accessorii, which proceed from the Ribs: This Action, I say, strongly assists a violent Expiration, the Abdomen being at the same Time contracted by Means of the Musculus Transversus.

In Women the Sternum is more compress'd, the Clavicles more straight, the Thorax narrower, and its anterior Part flatter, and the Superior cartilaginous Segments sooner become bony, than the inferior. Hence in Inspiration their Sternum is turn'd upwards and obliquely outwards, and the whole Thorax as it were rises. Hence also they respire most freely whilst their Abdomen is tumid.

'Tis certain that those Muscles which are subservient to Respiration, and at the same Time under the Influence of the Will, are far larger and stronger than those which necessarily perform vital Respiration. Hence it is, that the Force of the former is capable of augmenting, diminishing, and of totally stopping both Inspiration and Expiration.

Hence we may conceive, that there are not two Moments in the Life of Man immediately succeeding each other, in which the Pulmonary Vessels retain the same Figure, Largeness and Action.

As also, that here some Muscles have what we may call an Antagonism without an Antagonist Muscle.

Hence also we understand the Antagonism between the Action of the Fluid which moves the Muscles, and the Resistance of the simple Elasticity in the Solids.

That in order to alternate Motions in Parts to act reciprocally, it is not necessary to suppose alternate Actions of the Humours, since it is sufficient that they act in either.

The Will is capable of stopping the Force and Cause of Respiration, tho' not of directly stopping the Force of the Heart; so that the Cause of Motion in the Heart, is stronger and more constant, and its Action more frequent: There is, however, a kind of Consent between the Pulsations of the Heart, and the Number of Respirations; tho' it is hard to account for such a Consent.

Hence we perceive the Necessity of reiterated Pulsations of the Heart, in order to the Repetition of Respiration. But how long these may stop, without destroying Life, is hard to determine.

Hence also we understand, why in an asthmatic Paroxysm, a Peripneumony, a Difficulty of Breathing, and in the Agonies of Death, Respiration is performed by the vital Muscles, whilst those under the Direction of the Will greatly contribute to it: So that the Neck, Scapulæ, Breast, inferior Ribs and Back, are evidently moved.

Why in perfect Health, when the Body is at Rest, and the Person awake, Respiration is so slow and still, that it is hardly perceptible, and at the same time the Circulation of the Humours brisk.

Why in Coughing and Sighing, the Respiration being accelerated, the Motion of the Blood through all the Vessels is increased.

Why the first Action of Respiration is Inspiration, and the last Expiration.

Why when in Diseases the Respiration ceases long, the venous Sinuses, the Auricles, and the Heart itself, palpitate.

And why it is, that an Air which is highly heavy, light, moist, dry, hot, or cold, compressed or rarified; as also that which being pent up in a small Space, is not soon renewed, is absolutely unfit for performing Respiration, and continuing Life. *Boerhaave Institus.*

OF PROGNOSTICS FROM A GOOD AND BAD RESPIRATION.

That a free and regular Respiration, according to Nature, is always of great Moment towards predicting the Recovery of the Patient, is, I believe, universally acknowledged. *Hippocrates*, in his Book of *Prognostics*, tells us, "That a Facility of Respiration has a great Influence towards a Recovery in all acute Diseases, which come to a Crisis in forty Days." And he had very good Grounds for so pronouncing, when, as *Galen* says in his Commentary on the Place, "A good Respiration shews that the Thorax, Heart, Lungs, Diaphragm, Pleura, and, in short, all the Parts contributing to Respiration, are in a sound State; for it is impossible for any of the Organs subservient to Respiration to be injured, and the Patient at the same time to breathe in a free and natural manner." And therefore the same Author, *Lib. I. de Cris.* among other Signs, justly reckons a good Respiration. But that we may with Certainty prognosticate a good Event, there are two other Signs to be also regarded, which are, a strong Pulse, and a right Disposition of the Sick, with respect to such Things as are offered for his Sustenance; for these three Signs observed at the same time, that is to say, a just and natural Respiration, a right Disposition of the Patient with regard to Meat and Drink, and a Pulse sufficiently strong, are Indications of great Importance toward prognosticating a good Issue to the Disease, as *Galen* in 3 *Epid.* observes; and they have frequently proved salutary Indications in those who have been regarded as dying Persons. A due Respiration, therefore, in all acute Diseases, is good, and the contrary bad, as it indicates an Indisposition of some Organ belonging to Respiration. This last Sign, however, is of itself no sufficient Indication of a fatal Event, but only in Conjunction with other mortal Prognostics; in which Circumstance, it is a most fatal Indication, when attended with an Abhorrence of Food, a very dry and parched Tongue, and yet no Thirst, Excrements of the worst kind, and a very weak and low Pulse; and the Physician may, in such a Case, confidently predict the Death of the Patient. A bad Respiration then is always a bad Sign, though it be not always mortal in acute Diseases; but it is always very bad, when attended with another very bad Sign, and much more so, if attended with many such Signs. Of such a Respiration *Hippocrates* speaks, 11 *Aphor.* 50. where he says, "In a Fever not intermittent, a Dyspnoea, attended with a Delirium, is mortal."

If it be asked, what are these bad Respirations? we answer, they are the great rare Respiration, and the small frequent one, which, in dying Persons, *Hippocrates* usually calls *Βραχυπνοια*, *Brachypnoia*, [See BRACHYPNOEA.] a small, slender, weak, diminished Breathing. Those Respirations are also very bad, which are performed with a Sound of the Thorax, like that of Persons on the Point of Suffocation by Drowning, being obscure, stertorous, and interrupted. Of such we find *Hippocrates* speaking, 11 *Aphor.* 67. "In Fevers, says he, the Breath striking with a Noise in its Passage [*τὸ πνεῦμα ἀκούσθαι*, See PNEUMA] is bad; for it indicates a Convulsion." By this striking or impinging Breath, *Galen*, in his Comment on that *Aphorism*, understands one which is interrupted in the Middle, and stops. A sobbing kind of Respiration [*κλαυθώδης πνεύματι*] is also very bad, as we are taught by *Hippocrates*, 6 *Aphor.* 54. But the worst of all Respiration, and such as is observed in dying Persons, are the cold, as when the Breath is expired cold from the Mouth and Nostrils. Next to these, are those we find mentioned, *Coac.* 260. with the Epithets, *extended*, *urgent*, and *obscure*, [*ἐκτετατόν, καὶ κατενέμον, καὶ ἀφανές*] where they are pronounced very bad, and Signs of approaching Death. By the first of these, we are to understand the same with the *sublime* or *apparent*, [See PNEUMA.] in which the Breast, and sometimes the Scapulæ, are distended, and the Lobes, or Pinnæ, of the Nostrils, are moved; but what is inspired, is so little as to be scarce perceptible to Sense, and yet the Inspiration is very quick and frequent, on account of the extreme Urgency of the Heat, which gives Occasion for the two other Epithets of *obscure*, and *urgent*, or *hasty*. These then are the several Kinds of bad Respiration; and we shall now treat of the Prognostics, which may be drawn from them separately.

A great and quick Respiration, tho' it indicates a Redundance of fuliginous Excrements in the Body, according to *Galen*, *de Difficult. Resp.* *Lib. I. Cap.* 20. yet it shews us, he says, the Soundness and Integrity of the Faculty; and that none of the Organs serving to Respiration is injured; for their Greatness, or Fullness, and Quickness of Respiration, is occasioned by the Necessities of Nature, when there is a Promptitude of the Organs, and an entire Soundness of the Faculty. A great or full Respiration, and at the same time slow; or 22 long

long Intervals, shews a Delirium; and a small and quick Respiration indicates a Collection of fuliginous Excrement, or a Pain in some Part which is moved by Respiration, or, as *Hippocrates* says, in his *Prognostics*, an Inflammation of the Parts above the Diaphragm. A small and slow Respiration, as *Galen* observes, in his *Comment* on the *Cafe of Pythion*, 3 *Epid. Sect. 3. Aeg. 3.* where there is no Collection of fuliginous Excrement, indicates a Pain of some Organ subservient to Respiration, or else an Inflammation of some neighbouring Part. These two last Differences of Respiration, with bad Signs, are more to be dreaded than the two former, as they indicate a great Weakness or Decay of the Faculty, or at least a Pain in some Part which moves the Thorax. Upon the whole then, a great and quick Respiration is a Sign of much Heat, and a Redundance of fuliginous Excrement, but attended with a Soundness and Strength of the Faculty. A great, and at the same time a slow Respiration, is better than the former, as it approaches nearer to a sound and healthy State, and is an Indication of the Soundness of the Faculty without much Heat, and without fumous Excrements. All these are to be regarded by the Physician, in Conjunction with other Signs and Prognostics, to be formed from them altogether. But we proceed to speak of Respirations which are both great and dense, and, on the contrary, of great and rare Respirations, the Knowledge of which will afford us many Prognostics, for predicting the Fate of the Patient.

A great, and at the same time dense Respiration, is, when Inspiration is great and full, and Expiration hot and fervent through the Mouth and Nostrils. And this happens, as we read in the *Prognostics*, from a Pain or Inflammation affecting some Organ subservient to Respiration, or a Part of the Thorax; for Instance, the Heart, Diaphragm, Lungs, Pleura, or Muscles of the Thorax; for if these Parts be pained or inflamed for Want of a due Dilatation, a Dense ness of Respiration must of necessity be the Consequence: Such a Symptom, however, indicates a Strength of the Faculty, which gives great Hopes of a Recovery. A great and rare [*αἰσίων*, as when the Breath is long in drawing, in opposition to *dense*, *πυκνόν*] Respiration in acute Fevers, indicates a Delirium, according to the *Prognostics*. But what are we to understand by a great Respiration? Is it where there is a great Dilatation of the Thorax? By no means; for in those who are affected with a Tumor, or a Straitness of the Organs of Respiration, without any flammeous Heat, there is a very great Dilatation of the Thorax, but Inspiration is but small; we say, therefore, that a great Respiration is so called on account of the great Quantity of inspired Air, and expired fuliginous Particles; and this seems to be expressly the Sense of *Hippocrates*, in those Words, *μύστα δ' ἀναπνεύμενον [πυκνόν]* which must be understood of the great Quantity of Breath in Respiration, and not of the Dilatation of the Thorax. To this it may be added, by way of Confirmation, that among the Differences of Respiration, what they call the sublime and apparent one, tho' attended with a very remarkable Dilatation of the Thorax, is yet but small and slender, as appears from *Galen*.

But why is a great and rare Spirit an Indication of a Delirium? *Galen*, *Lib. 2. de Difficult. Resp.* has demonstrated the Truth of this Observation at large; but then it does not follow, that all delirious Persons should breathe after this manner; for a Delirium may be attended with a Straitness of the Breast, or a Pain, or a Decay of Strength; all which occasion a small and rare Respiration. All, however, who labour under this Symptom of great and rare Respiration, are certainly delirious, as was particularly observed by *Hippocrates* of *Philiscus*, *Silenus*, the Wife of *Dromeades*, and others. As to Prognostics, from this kind of Respiration, they are always of Importance, because a Delirium is always bad, though not mortal, except when it is attended with other bad and mortal Signs, as it was in the Cases of *Philiscus*, *Silenus*, the Wife of *Dromeades*, and the phrenetic young Man of *Melibæa*. Of *Philiscus*, 1 *Epid. Aeg. 1.* it is said that his Breath was constantly *ἀσπάζον ἀναπνεύμενον, ἀσπάζον, μύστα*, “as if it were” “revoked inwards, rare, great, [See PNEUMA] his Spleen” “was elevated into a round Tumor; he was always in a cold” “Sweat, and he had Exacerbations on even Days.” In this Sense, cold Sweats were one fatal concomitant Sign. *Silenus*, *Aeg. 2.* “had, from the Beginning to the End, a great and” “rare Respiration, accompanied with a continual Palpitation” “of the Hypochondrium,” which at length proved mortal; for in the Beginning he made black Urine, which deposited a black Sediment, was delirious, and had pinguious Stools. On the sixth Day he sweated a little above his Heart, and his extreme Parts were cold and livid, with other Symptoms, which in Conjunction with his great and rare Respiration, were more than sufficient Indications, not so much of a Delirium, as of the Fatality of the Disease. Of the Wife of *Dromeades*, *Aeg. 11.* we read, “That on the sixth Day in the Morning,

“she was seized with a Rigor, which was soon succeeded by” “an universal Heat, then by a Sweat all over, and a Cold-” “ness of the Extremities, a Delirium, and a great and rare” “Respiration; and a little after she was seized with Convul-” “sions, which began at the Head, and carried her off on a sud-” “den.” The young Man of *Melibæa*, 3 *Epid. Aeg. ult.* “had a rare and great Respiration, and at long Intervals,” “with a softish Tension of the Hypochondrium, of an oblong” “Figure, was continually molested with a Palpitation of the” “Heart, and made Urine like Oil.”

A small Respiration is what *Galen*, *Com. 3. in 3 Epid.* after *Hippocrates*, calls *slender* and *diminished*, [*λεπτὴ καὶ μειωμένη*] and also *obscure*, because the Patient can hardly be perceived to breathe. Such a Respiration is always bad, as proceeding from Weakness, and a Decay of the natural Heat; and if this small Respiration be also frequent, it is an Indication, according to *Galen*, of a Pain or Inflammation in some Part above the Diaphragm. But the Author of the *Coac.* 260. says, that a frequent and small Respiration indicates a Pain or Inflammation in the principal Parts. Such a Respiration is very much to be dreaded in acute Diseases; and the more, if it be consequent upon a great Respiration; for it is an Indication either that Nature is very much sunk, as was before observed, or that some principal Part suffers under a Pain or Inflammation, or both together; nothing, however, can, with Certainty, be predicted from this Respiration alone, unless it be confirmed by other Signs; for many under acute Diseases, whose Respiration has been small and frequent, have recover'd. But when it is accompanied with other bad Signs, we have the greatest Reason to be apprehensive of the Event, and most when from frequent it becomes small, as is observed in the last Stage of a Consumption. A frequent, then, or quick, and at the same time a small Respiration, with bad Signs, is mortal, as it was in the Case of the Sister of *Temeneus*, 4 *Epid. T. 28.* who, on the sixteenth Day, was observed to have such a Respiration, and died soon after.

A small, and at the same time rare, or an unfrequent Respiration, is perhaps the worst of all, as it indicates that Nature is oppressed and exhausted to such a Degree, that it must of necessity sink under the Disease; for which Reason it is by Physicians justly called a cold Respiration, as being a Sign of an extreme Degree of Cold, or an Extinction of the natural Heat, agreeably to that of *Galen*, *Com. 3. in 3 Epid.* where he says there is a kind of small and rare or unfrequent Respiration, which, when cold, shews that the vital Faculty is extinguished. This is confirm'd by *Hippocrates* in his *Prognostics*, where a cold Expiration from the Nostrils is pronounced mortal in a high Degree, as it was for Instance, in dying *Pythion*, 3 *Epid. Sect. 3. Aeg. 3.* and others observed by the same Author.

Having made these Remarks on Respirations, and what is indicated and portended by them, we shall proceed to examine in particular those Respirations which are observ'd in dying Persons, of which Nature are the cold, the sublime or apparent, the stertorous, or what is attended with Noise, and sometimes the sobbing and interrupted. Of a cold Respiration, which is the most mortal of all, and never observ'd but in those who are very near Death, *Hippocrates*, 6 *Epid. Sect. 4. Aph. 27.* thus speaks; “Among deadly Signs is to be reckon-” “ed a hot Vapour exhaling through the Skin and the Nostrils,” “when a cold Expiration through the Nostrils has preceded” “it.” This is better express'd by *Galen* in the following Words: “One of the most mortal Signs is a hot Vapour” “proceeding from the Skin, after a cold Breath discharg'd” “by Expiration; but the Exhalation of a hot Vapour thro’” “the Skin and Nostrils, is not always a sufficient Warrant” “for predicting Death; for, as he says a little after, such a” “Symptom only happens to those who die of a very hot Fe-” “ver, which having torrefy'd the very Substance of the” “Heart, ends at last in a Refrigeration of the same; the” “vital Faculty then ceasing to act as the Heart dies. Some-” “times there is an Eruption of Sweat, as when the Body is” “full of Humours; but when it has been before exhausted and” “dried by the Heat of a violent Fever, a hot Vapour instead of” “Sweat seems to exhale, and offer itself in a sensible manner” “to the Touch.” Hence in *Coac.* 160. “A febrile and fuligi-” “nous Respiration is pronounced mortal, tho' in a less De-” “gree than the cold.” Physicians, therefore, usually call these three Signs deadly, which are, a Burning Fever, a cold and rare Respiration, and a hot Vapour from the Skin, which we may sometimes call Sweat, or Moisture, and which in Fevers is a Forerunner of Death.

An obscure Respiration, also, as when the Patient can hardly be known to breathe, is no less mortal than a cold Respiration. An *obscure* Respiration is when hardly any Breath is discharg'd by the Mouth and Nostrils. In this Sense a Respiration may possibly be very obscure, and yet appear very manifest to all, as when the Thorax, Scapulae, and Lobes of the Nostrils

Nostrils are moved, which kind of Respiration Physicians properly call the *sublime* and *apparent*, tho' a very small Quantity of Breath be expired, on which Account it may be very obscure. Of such a Respiration we read, *Coac.* 260. where it is said, "The worst of all Respiration, and what shews Death to be very near, is the extended, urgent, and obscure."

We come next to treat of a stertorous Respiration, or such as is perform'd with a Sound or Noise. A stertorous Respiration is when, in Breathing, there is perceived in the Throat a kind of Ebullition, or Noise, which we call a *Stertor*, or such as Persons make in Snoring. This Word is express'd in *Latin* by the Words *Streptus*, *Senus*, and *Ebullitio*; and in *Hippocrates* by *ῥῆγξος* (*Rhencos*), *ῥῆγξος* (*Rhencis*), and sometimes by *ῥῆγξος* (*Cerchnos*). In those who die of acute Distempers this Fervor or rattling Noise in the Throat is generally heard for a little more than a Day before their Decease, and indicates an Extinction of the Faculty, which is become too weak to expel the excrementitious Particles from the Fauces. In others, who labour under Diseases of the Thorax, as a Pleurisy or Peripneumony, this Stertor is occasioned by a Straitness, or a Retention of the Spit, attended with a small Respiration, and oftentimes with an Orthopnoea, the most difficult of Respirations. In almost all dying Persons this Fervor, or Stertor, is perceived a little before their End; but most of all in those who die of Pleurisies, Peripneumonies and Suppurations of the Lungs, who are every one affected with it, for which reason we must pronounce it a mortal Sign. But we are carefully to distinguish here with respect to the Time when this Stertor first comes upon the Patient, as whether it be in the Beginning, or Increase of the Disease; for if it is to be fatal, it never comes but after some other mortal Signs, as it did in the Case of the pleuretic Son of *Antiphanes*, 7 *Epid.* 28. and of *Menon*, another pleuretic Patient, 47. of whom *Hippocrates* says: "On the sixteenth Day his Respiration was stertorous; he had a Sweat about his Neck and Forehead, but seldom about his Breast; his Forehead and extreme Parts were perpetually cold in a moderate Degree. He had a continual Palpitation of the Veins about the Temples; and for some Time before his Death, was affected with a Coma, which held him Night and Day." A stertorous Respiration, therefore, in acute Diseases, is generally pernicious; and when preceded by, or attended with other bad Signs, the most fatal of all Symptoms, as it proved in the Case of *Menon* before-mention'd, who, among other bad Signs, had a Sweat about his Neck and Forehead, which *Hippocrates* in his *Prognostics* pronounces mortal in acute Diseases, and a Coldness of the extreme Parts, one of the worst of Symptoms. But in a Pleurisy, or Peripneumony, and that they call a catarrhus Fever, because consequent or attendant upon a Catarrh, a Stertor is sometimes occasion'd by the Plenty of excrementitious Particles, or a Redundance of the Matter of the Catarrh falling down upon the Breast and Fauces, and is no more a mortal Sign, than it is in an Asthma or Orthopnoea, where the Patients are frequently relieved by an Excretion or Resolution of the Humour. But a mortal Stertor is distinguished from another, in that it not only begins, but increases more and more with the Disease, and is still more and more sensible; for such a Stertor is mortal in the highest Degree, and is attended with all the mortal Signs: Whereas a Stertor, which begins with the Distemper, and in a little Time after, as the Disease increases, either through a plentiful Excretion of Humours by Means of a Cough, or the Consumption of it by the igneous Heat of the Fever, leaves the Patient, is not so much to be dreaded, as occasioned only by a Redundance of Humours, especially if it ceases for some obvious Reason. But a Stertor, which tho' it be occasion'd in the Beginning of a Disease by a copious Catarrh, yet every Day increases, must of Necessity be pernicious, because it is a sure Sign that Nature is so far burden'd and oppress'd with the Multitude of Humours, as to be rendered incapable of making the necessary Excretions, whence a Suffocation is to be apprehended. Thus it was with the Wife of *Polemarchus*, 5 *Epid.* 62. of whom it is said, "That about the fifth Day she had a painful Tumor of the Left Knee, and something seem'd to be gather'd about the Region of the Heart, and her Respiration was like that of one on the Point of Suffocation by Submersion, with a rattling Noise in the Breast. On the seventh Day she died." The Son of *Antiphanes* also, 7 *Epid.* T. 28. who was affected with an Empyema, died with a Stertor upon him. To this we may add, that *Hippocrates*, 1 *Prorrh.* 25. tells us, "That under an Aphony, or Loss of Voice, a conspicuous [*ῥῆγξος*. See *PNEUMA*.] Respiration like that of Persons suffocated, is pernicious." And so much for a stertorous Respiration, called also by some *Regmos* and *Cerchnos*.

We come now to consider the sublime or elevated, and apparent Respiration, which also is never observ'd but in dying Persons. Some call this kind of Respiration *sublime*, some

apparent, some conspicuous, [*ῥῆγξος*, *promptum*, readily offering itself to View] and some erroneously a *great* Respiration, because they observe the Thorax very much moved and dilated under it. Persons under this Circumstance, as *Galen Com.* in 1 *Prorrh.* says, may very properly be said to be strangled, because they want Air. And it is customary with the same Author to call this kind of Respiration *φανέρωτος* (*Phanomenon*) "apparent." The Patient in this Case seems in drawing his Breath, to move his whole Scapulæ; so that their Motion appears conspicuously through his Cloths, and the upper Parts of the Thorax seem to labour in the Work. For this reason *Galen* calls it, also, *μετέωρος* (*meteoron*) "sublime," because the Patient in such a Case seems to move the higher and more elevated Parts of the Thorax. He gives us also the Causes of this kind of Respiration in what follows. "Such a Respiration, he says, may be owing to a Straitness of the Organs, or to some Disorder in the Origin of the Nerves, which latter *Hippocrates* justly thought might be the Cause of a great Respiration, he had more properly said not a great Respiration, but a great Dilatation of the Thorax, by which some being deceived, have erroneously called it a great Respiration, tho' Expiration in this Case be but small." We may add that *Galen* and *Hippocrates* bestow the Epithet of *sublime*, not only on this kind of Respiration just describ'd, but on that also under which the Lobes of the Nostrils and the Muscles about the Scapulæ are visibly moved, which latter Respiration happens in acute Diseases from an extreme Weakness. *Galen, Com.* in 3 *Epid.* 24. speaking on this Subject, says, "By those who are said to fetch their Breath by the Extremity of the Nose, [*ἀπὸ τῆς ῥίνας*] are meant those I suppose, who in Respiration move the Lobes of their Nostrils, for we have seen many sick Persons breathe in such a manner as to contract those Parts in Expiration, and dilate them in Inspiration." This is a usual Symptom with those who are suffocated by a Quinsy, Peripneumony, or Suppurations of the Lungs, as well as those who are extremely weak and exhausted, and proceeds from an Obstruction of the Passage for the Breath by an Inflammation of the Aspera Arteria, whence the Patient is under a Necessity of fetching his Breath short, and with all his Thorax, and often strives to raise himself up when just suffocated, and attracts the external Air with all the Remainder of his Strength, and with his whole Thorax; and perhaps this Sort of Respiration was by *Hippocrates* called *sublime*, or elevated (*μετέωρος*) because the Patients in such a Circumstance strive to raise themselves. This *sublime* Respiration, then, is usual in Persons labouring under a Quinsy, Peripneumony and Empyema, and for the Reasons assigned.

In other acute Diseases, under which the Patients are not suffocated by the Straitness of the Organs, this Respiration by the Extremity of the Nose has another Cause, of which *Galen, de Diffic. Resp. Lib.* 1. *Cap.* 23. gives the following Account. "If any one would have the proper Signs of a Disorder in the Faculty of Respiration, or of any Animal Faculty in general, and especially when under a Perfrigeration, he will have for those Signs the Motion of the Lobes of the Nostrils, the Action of all the Muscles about the Scapulæ, and the precipitate Collapsion of the Thorax; for when the Faculty by which Respiration is perform'd, moves with less Vigour than it ought, it is assisted in Inspiration by the Lobes of the Nostrils, which also help towards attracting the external Air, after the same manner as when we would draw in any Thing by the Mouth, we contract the Lips; and thus again in Expiration there is a precipitate Collapsion, and not a gradual Demission of the Thorax." In short, then we may conclude from what has been said, that what we call a *sublime Respiration*, however occasioned, is always mortal, as indicating an extreme Straitness of the Organs of Respiration, by which Nature is in imminent Danger of Suffocation; or else an utter Decay of Strength, and Extinction of the natural Faculties, for which Reason it is never observ'd but in dying Persons. It is, also, never without some other precedent, attendant, or subsequent mortal Symptoms, for this kind of Respiration never appears without some other deadly Sign; whence it is said by the Author of the *Coac.* 260. that "The worst Kind of Respiration, and what shews Death to be just at hand, is the extended, urgent and obscure." We observed that tho' this Sign alone was a sure Prognostic of Death, yet it was always attended with other deadly Signs; as it was, for instance, in the Wife of *Olympiades*, 7 *Epid.* 49. of whom it is said, "That her Eyes were cast down, and that she drew her Breath in the sublime Manner through her Nostrils; that she was ill-coloured; and just before she died, had a Sweat about her Feet and Legs." Such, also, was the Case of dying *Aristocrates*, 52. of whom *Hippocrates* says, "That towards Night his Respiration was sublime, that he had a small Sweat about his Forehead, his lower Parts were cold, and he was restless."

To the other mortal Kinds of Respiration, we add the sobbing, [*σπασμωδία*] but small and rare Respiration, agreeably to the Judgment of *Hippocrates*, 6 *Aph.* 54. "In acute Diseases attended with a Fever, a sobbing Respiration is bad." An interrupted Respiration is no less pernicious, but this perhaps is the same with the former, which Opinion seems to be favour'd by *Galen* in his *Comment* on the before-cited *Aphorism*, where he says that "Children when they cry seem to draw in their Breath for a-while, then to have their Inspiration interrupted, their Thorax standing the mean time unmov'd, and afterwards to draw in a fresh Supply of Breath to what was wanting;—this is occasioned sometimes from a Weariness of the Faculty, sometimes from a Hardness of the Organs, and sometimes from both Causes in Conjunction. It may proceed, also, from a convulsive Disposition of the Muscles of the Breast." But whatever be the Cause, this sobbing and interrupted Respiration in acute Diseases is bad; and if the Strength of the Patient happens at the same time to be very much exhausted, pernicious in the highest Degree. Such a Respiration is also but small and slender, and in acute burning Fevers indicates a Hardness and convulsive Disposition, and is always bad, as well as Convulsions from the same Cause, which is a Dryness of the nervous Parts. Of this Kind of Respiration it is, also, that *Hippocrates* speaks, *Aph.* 67. where he says, "That an impinging or colliding, [*σπασμωδία*, which *Galen* explains by "interrupted"] Respiration is bad; for it indicates Convulsions." And Convulsions excited by Dryness in very hot Diseases are incurable, and consequently in acute Disorders mortal. But that we may rightly form our Prognostics concerning the Event of a Disease, from such Convulsions, we are to consider the Signs which precede, accompany or succeed them; and if none of these Signs are bad, we are to suspend our Judgment of the Fate of the Patient. *Prosper Alpinus de Præfag. Vit. et Mort.* p. 252.

RESSELLA. An obscure Term in *Paracelsus*, which he explains no farther than by telling us, that *Resella* is what removes Heat, and *Assa* what promotes it.

RESTA BOVIS. Rest-Harrow. See **ANONIS**.

RESTINCTION. *Rulandus* defines Chymical Restinction, A Gradation by which Substances heated red hot, are extinguished in an exalting Liqueur, and thus brought to their greatest Perfection.

RESTITUTIO, Restitution, in Surgery, is the Reduction of a luxated or fractur'd Limb.

RESTORATIO. The same as **ANALEPSIS**.

RESUMPTIVA. Restoratives.

RESUSCITATIO. Resuscitation, in Chemistry, is the Restoration of any disguised Body to its original Form.

RETE MIRABILE. A Congeries of Blood Vessels in the Brain is thus called. See **CEREBRUM**.

RETENTA. Things retain'd in the Body; or which ought to be retain'd in a State of Health.

RETEPORA. A Name for the *Eschara Rondeletii*.

RETICULARIS, or **RETIFORMIS.** Reticular, or like a Net.

RETICULUM. The second Ventricle of a ruminating Animal.

RETINA. The Expansion of the Optic Nerves on the internal Surface of the Eye, is thus called. See **OCULUS**.

The *Retina* is liable to two Sorts of Diseases; the first is a Separation of some Parts of this Membrane from the Choroides. At the Place where this Separation is made, there follows an Elevation or Fold, which stops the Light, and hinders its Passage to that Part of the Choroides, which is cover'd by this Fold; this occasions a sort of a Shade, which the Patients see in the Air. The second Disease of the *Retina* is an Atrophy or Wasting of that Membrane.

The Cause of the first Disease may, with a great Shew of Reason, be thus accounted for, that the Blood Vessels of the *Retina* become varicous; for it is easily conceived, that the Dilatation of these Vessels may separate the *Retina* from the Choroides, in that Part which answers the dilated Vessels. I have always observed this Disease to proceed from a Cold in the Head, after some violent Exercise, or whatever else may have put the Blood into a violent Motion. Hence I infer, that the external Cold, by obstructing the Pores of the Skin, has stop't the Perspiration of some Part of the Humours rarefied in the Blood Vessels, on the Surface of the *Retina*, which, from the Fineness of its Texture, is damaged by this Infarction, after the above-mention'd manner. I call this Disease a Separation of the *Retina* from the Choroides. As this Membrane fills a considerable Space in the Eye, this Separation is often made in several Places; so that the Signs of this Disease answer to the Number of the Parts separated.

Its Signs are certain Appearances in the Air, more or less distant from the Patient's Eyes. They are a kind of Shadows

of different Figures, modified according to the Size and Form of the Parts of the *Retina*, which is separated.

As to the Prognostic, there is no Danger of losing the Sight in this Disease; it is only troublesome to the Patient. As this Disease begins with the same Signs as a Cataract, one Disorder may be taken for the other; but to prevent the like Mistake, we shall propose the Difference. In a Cataract the Sight shortens and decreases daily; whereas, in the present Disease, the Sight continues the same both in Quickness and Extent.

Though Remedies do not perfectly cure this Disease, and that the Persons once attack'd with it see some of these Shades all their Life their Number and Compass, in Breadth may be still be lessened. The following Remedies are of Service; such are Broths made of Crabs, repeated Purges, Eye-Bright Tea drunk in the Morning, Powder of Vipers, Wood-Lice, and Eye-Bright mixed together.

In an Atrophy of the *Retina*, as the Rays of Light are not sufficiently modified in that Membrane, they make too vivid an Impression on the Choroides, which is very detrimental to it. Hence ensues a confused Vision; so that the Patients, at the first Look, can see very well; but if they continue to read any time, or to look at any shining Object, they feel a sudden Weariness in their Head, and a Dimness in their Sight, which obliges them to close their Eyes; then opening them a Moment after they see, as at the first Look, but for a short Time.

Embroiderers, Stocking-Weavers and Shoemakers are subject to this Disease; the first because the Brightness of the Gold, Silver, and other Colours, damages the Sight by the lively Impression it makes on the Eye; and the Shoemakers, in order to find the Hole made by their Awl, to run the End through it, by this continual Attention fatigue and weaken their Sight so much that they are obliged to quit their Trade. These People can work but a few Days in the Week.

There are some People, though they do not work as these Handicrafts, cannot, however, make use of their Sight a Quarter of an Hour, but their Head is disordered; of those I chiefly treat.

No Remedies cure this Disease. Nothing avails, but rest and little Exercise of the Sight. All those Persons who are employed at fine or shining Work, if they have a mind to continue, must make use of green Spectacles.

RETINACULUM. A Chirurgical Instrument, used in Castration, and the Operation for a *Hernia*, in order to prevent the Intestines from falling into the *Scrotum*.

RETORTA. A Retort; a chymical Vessel with a large Belly, and crooked Neck, resembling a Horn; for which reason the French call it *Cornue*.

RETRACTIO. The same as **ANTIPASIS**.

RETRAHENS AURICULAM. The Name of a Muscle called also *Triceps Auris*, because it has sometimes three Beginnings. *M. Du Verney* says it is composed of five or six fleshy Fibres, which have their Origination from the superior and Fore-part of the *Apophysis Mastoidea*, and descend obliquely to their Insertion in the Middle of the *Concha Auriculae*. *Cowper*.

RETRANSMUTATIO. When a Substance originally in a fluid, but afterwards in a solid State, is again reduced to a Fluid, this is called, by *Paracelsus*, a Retransmutation.

RETRIMENTUM. An Excrement, or Recriment of Metals, or any other Substance.

RETROCESSIO. The same as **EPANACLESIS**.

REVERBERATIO. The Calcination of a Body in a Reverberatory Heat.

REVERBERATORIUM, or **REVERBERIUM.** A Reverberatory. See **IGNIS**.

REVERSIO. A Relapse.

REVIVIFICATIO. Revivification. The same in Chemistry as **RESUSCITATIO**.

REVIVISCENTIA. The same as **REVIVIFICATIO**.

REVOCATIO. The same as **EPANACLESIS**.

REVULSIO. Revulsion. See **INFLAMMATIO**, and **PHLEBOTOMIA**.

REX. A King. The Invention of several Branches of Physic is ascribed to Kings and Heroes, some of which in ancient Times were very skilful in this Science. I don't know that this Word relates farther to Medicine, unless the Royal Touch could be thought medicinal; in which there is nothing so wonderful, as that a Man of the celebrated *Wise man's* Understanding, should treat it as a Reality.

RHA. See **CENTAURIUM**.

RHABBARBARUM. *Offic.* J. B. 11, 989, 1075. *Ger.* 316. *Ogilb. Chin.* 1. 212. *Rhabarbarum Officinatum*, C. B. P. 116. *Rhabarbarum genuinum Officinatum*, Park. *Theat.* 156. *Rhabarbarum ficcatum*, *Ger. Emac.* 393. *Rhabarbarum lanuginosum, sive Lapathum Chinense longifolium*, Munt. *Herb. Brit.* 196. *Raii Hist.* 1077. *Rhabarbarum, sive Rheum Officinatum*, *Geoff. Tract.* 296. **TRUE RHUBARB.**

We do not certainly know the Plant of which Rhubarb is the Root; it is probably a Species of *Lapathum*, called by *Herman*, *Lapathum Sinenfe*. It is brought from *China*, but *Muntingius* pretends that he cultivated it in *Holland*, in his Book *De Vera Herba Britannica*.

It is one of the best and mildest Catharticks in the whole *Materia Medica*; it operates very well on the Bile, and on all the Viscera of the Abdomen, and at the same time strengthens the nervous Fibres. On these Accounts, it is proper in weak Stomachs and Intestines. It is given in Substance from twelve Grains to half a Dram; and in Infusion, from half a Dram to a Dram and a half; and in a small Dose, it becomes an excellent Alterative. It purges the Bile very effectually, and has a greater Force than any other Purgative, in opening Obstructions of the Liver. It is found by certain Experience, to evacuate the Bile, preferably to any other Fluid. On this account, it is the Panacea of Children; and also because it strengthens the Stomach, and carries off all sorts of Matter that stagnate therein. It is a very good Remedy for Worms, and is given to Children subject to chronic Diseases, in a Pisan, called Rhubarb-Water. The Use of Rhubarb is, however, dangerous, when the Kidneys or Bladder are suspected to be inflamed, because it heats considerably; and for this Reason it is improper in Hæmorrhages. It is very good in a Looseness, because it purges and strengthens at the same time. In Cachexies, it ought to be given in small Quantities for a considerable time. *Geoffroy*.

There are two Sorts of *Rhabarbarum* sold; an Oriental, imported from *China*; and this is ponderous, distinguished by gold-coloured and red Veins, bitterish and astringent, sweet-scented, rather of a yellow Colour; and being moistened, stains the Hand with a Colour like that of Saffron; and is much esteemed for its Virtues. The other Sort comes from *Russia*, and is ponderous, and of a darker Yellow, and less valued than the other.

Rhubarb is a mild and gentle Purger of yellow Bile, and viscous and tartareous Phlegm from the Stomach and first Region. It is a Specific for the Liver cures a Jaundice, and for its astringent Quality is commended beyond other Medicines, for all Disorders proceeding from Relaxation, as a Diarrhæa, Dysentery, and the like.

This Root was unknown to *Dioscorides* and *Galen*; and therefore some are very erroneous, in confounding the *Rha*, or *Rheum*, of the Ancients, with our Rhubarb; for the *Rheum* of *Dioscorides* has less of a cathartic Quality, and wants the Characters of the true Rhubarb, which is a compact Substance, ponderous and dry, of a bitter Taste and acrid Smell, of a reddish Colour on the Outside, and of a light Red inclining to Yellow within, with some Veins of a deeper Colour, and being macerated or chew'd, dyes of a Saffron-Colour. *Rapontic*, on the contrary, is not of a close but thin Substance, and not ponderous but light, and wants the sweet Scent of Rhubarb. *Dale*, from *Le Brun*.

A Decoction of the Leaves very gently evacuates the Belly, resists the Scurvy, and strengthens the solid Parts. Some old Persons say, that the Root of this Plant is the only Cathartic which ought to be given in Diseases; and one of eighty Years in particular tells us, that he was deceived in all other Medicines but Rhubarb. Some assert it to be effectual for correcting a vitiated Bile, and for removing chronic Disorders which owe their Rise thereto. The Root consists of subtle Parts, whence it penetrates through the thinner Parts of the Blood, and tinges the Blood with the Colour of Saffron; for if you take ten Grains of it in the Morning, it will communicate its Saffron-like Colour and Smell to the Urine, which proves it to be of very tenacious Parts with respect to Colour. Hence it becomes effectual for depurating the Blood from thinner Impurities, for cleansing the Kidneys from Sand and Gravel, and for resolving lubricous, grumous, and pituitous Matter. It is an excellent Remedy in all Extravasations and Stagnations of Blood; and it is said to be of extraordinary Efficacy in the Stone, Jaundice, Dropsy, and other Affections of the Liver, proceeding from a vitiated Bile. It is commended also against Inflammations, Weakness of the Stomach, and all Pains incident to it; for Convulsions, for Disorders of the Spleen, Liver and Kidneys; for racking Pains of the Bladder, and Disorders of the Thorax; for Distensions of the Hypochondria, Affections of the Uterus, and the Sciatica; for spitting of Blood, attended with Difficulty; for the Hiccups, Dysentery, Cæliac Passion; to prevent the Return of the Fits in Fevers, and for the Bites of venomous Animals; outwardly applied with Vinegar, it removes the livid Marks of Blows, and the Impetigo. The Root is a very good Remedy in Contusions; cleanses the first Passages, strengthens the Intestines after purging, and is an admirable Cathartic for Infants whose Fibres are too lax. It deserves all the high Commendations bestowed on it for the Dysentery, Diarrhæa, and all Diseases proceeding from a schirrous and cancerous Matter, being exhibited to the

Quantity of two Scruples. Ten Grains given every Morning, so as to be just enough to purge, is the best of Deobstruents in inveterate, hypochondriacal and scorbutic Diseases, and restores the Strength of the Viscera, and the obstructed Fibres. The Virtue of the Root consists in the Mixture of a subtle and acrimonious Salt, with mucilaginous and earthy Particles; those saline and acrimonious Particles, in proportion as they are more or less disengaged from the Mixture of mucilaginous and earthy Particles, in which they stuck and were intangled, the more or less they exert of their stimulating Force. Sometimes they excite so great a Commotion, as to press upon the Liver itself, and especially the Gall-Bladder, whence may follow a double Excretion of Bile; which proves the Root of extraordinary Efficacy in the Jaundice, as was before observed. Its cathartic Virtue consists in its Salt, and not at all in its Resin or oleous Particles, as appears from its Tincture, which is extracted with Water. Now it is clearly demonstrated from Chymistry, that Water can never resolve resinous nor oleous Substances; and besides, the Tincture extracted by Spirit of Wine is not so potent a Cathartic as what is extracted with Water; nay the Water itself, after Mixture, does not become milky, as it happens in all other Tinctures, which are extracted from oily and resinous Substances; and it is further to be observed, that these saline Particles may be so dissipated or dissolved by the Quantity of Liquids, as to be incapable of exerting their Force. The Root when dried up with Age, loses its Acrimony, and all its cathartic Virtue; as it does, also, in Boiling. The Smell of it in some provokes to Stool. It is of Service in a Gonorrhæa, by allaying the Heat of Urine, expelling the Malignity, and stopping the Flux. It is usually prescribed in Substance from half a Dram to two Drams; the Dose of the Extract is two Drams, of the Tincture one Dram. The Root roasted or dried is astringent, and as effectual in a Dysentery as Terra Sigillata; and being mixed with Nutmeg and Laudanum, proves an excellent Remedy for an immoderate Flux of the Belly, its astringent Virtue diffusing itself into all Parts. *Pechlius* employed it for Hæmorrhages of the Nose, and such like Cases. The Root is sometimes hurtful in a Vertigo; it destroys Worms, and is an Ingredient in many official Compositions. *Hist. Plant. ascript. Boerhaave*.

Alexander Trallianus, in the Opinion of *Dr. Friend*, was the first Physician that mentioned Rhubarb, who recommends it in a Weakness of the Liver, and a Dysentery, tho' *Mr. le Clerc* tells us, that the *Arabians*, indeed, in translating *Dioscorides* and the *Greek Physicians*, confound this Root with the *Rhaponticum*, and ascribe the Virtues, which the Ancients have observed in this latter, to what is properly the *Rhabarbarum*; as may be evident to any who will look into the Description, which *Rhazes* gives of it. And I believe *Alexander* himself, tho' 'tis plain Rhubarb was known in his Time, was in the same Mistake; for he mentions it only as an Astringent, as the elder *Greeks* describe the *Rhaponticum*, without the least Hint of its purging Virtue. *Paulus* seems to be the first who takes any Notice of the purging Faculty in the *Rheum*, (he calls it simply so) and tells us, how we may make some laxative Medicines stronger, by the Addition of this. And *P. Alpinus* says, that some have observed, that even the *Rhaponticum* would sometimes purge, tho' in a less Degree than Rhubarb. The modern *Greeks* gave this Root the Name of *Barbaricum*, not from the Place of its Growth, but from the Place it was imported to; for the Country in the *Upper Ethiopia* was called *Barbaria*, as *Salmasius* well observes, from its lying upon the *Sinus Barbaricus*, in which were many great Emporiums, particularly *Rhapta*, the Metropolis of this Region. This Gulf, upon the East, joins with the *Indian Ocean*; and therefore *Actuarius*, and after him *Myrepsus*, calls this Plant *Pice Indica*. No doubt, in those times it was imported this way to *Alexandria*, and so might be known to these latter *Greek Physicians*. However, I must observe, that *Salmasius* does not take notice of *Alexander's* mentioning Rhubarb; but quotes *Paulus* for it, who does not mention it, but only in general speaks of, and describes the *Rha*. *Garcias ab Horta*, Physician to the *Spanish Viceroy*, tells us, he had learnt in *India*, that all the Rhubarb which was imported thither, and into *Persia*, grew in *China*; that it was brought thither by Sea and Land; but that the latter way of bringing it over *Tartary* to *Ormuz*, was much the best; for by Sea-Carriage, 'twas more subject to rot. *Freind's History of Physic*.

RHABDOIDES. Ραβδοειδής. A Name for the Sagittal Suture.

RHACHIA, or RECHIA. Ραχία, or Ραχία. An Overflowing or Redundance of Humours. *Galen. Exegesf.*

RHACHIS. Ραχίς. The Spine of the Back.

RHACHISAGRA, from Ραχίς. The Spine of the Back, and ἄγρᾱ, a Prey. A Species of Gout fixed upon the Spine of the Back.

RHACHITÆ, or RHACHILÆI. Ραχίται, or Ραχίαι. The Muscles belonging to the Spine of the Back.

RHACOS.

RHACOS. *ῥακος*, from *ῥακω*, to break or tear. A Rag used by Surgeons in dressing Wounds.

RHACOSIS, *ῥακοςίς*, is a Relaxation of the Skin of the Scrotum without that of the contained Bodies, being an Affection very indecent to the Sight.

The Method of Cure used by *Leonides*, was to lay the Patient upon his Back, and to cut off the superfluous Skin against a Board, or a Piece of hard Leather, after which he sewed up the Wound. But *Antyllus* used to take up the superfluous Skin with three or four Stitches of a Needle, and then with a Knife or sharp Pair of Scissars, cut off what was without the Stitches; then securing the Place with a Suture, he cured it as he did other bleeding Wounds. *P. Æginet. Lib. 6. Cap. 67.*

RHÆBOS. RHÆBOIDES. *ῥαῖβος, ῥαῖβουδής*. Incurvated, or intorted. *Hippocrates.*

RHAGADES. Fissures, or Chaps.

RHAGADIÆ. Apostemations of the *Pudenda*. *Rulandus.* Or Abscesses of the Knees. *Paracelsus.*

RHAGADIOLUS.

The Characters are;

The Calyx consists of narrow-channel'd Leaves, which, after the Flower is fallen off, become membranaceous Vaginæ or Sheaths, each containing a single Seed.

Boerhaave mentions two Sorts of *Rhagadiolus*, which are,

1. *Rhagadiolus*; alter. *Casalp.* 511. *Hieracium Stellatum*. *J. B.* 2. 1014. *Raii Meth.* 31. *Intybus*, *sive Endivia lutea*; *humilis, stellato semine.* *M. H.* 3. 53.

2. *Rhagadiolus*; *Lampfanæ foliis.* *T. C.* 36. *Boerb. Ind. Alt. Plant.* Vol. I. p. 92.

It has its Name, perhaps, from the *Rhagades* or Fissures of the Anus, Uterus, and Hands, which it is said to cure. *C. Baubine* gives it the Name of *Hieracium Foliatum Siliquosa*. *Hist. Plant. ascript. Boerhaave.*

RHAGADIOLUS, is also a Name for the *Hedynopsis*; *Annua.*

RHAGE. *ῥαγή*. A Fissure, or Chap.

RHAGES. *ῥαγές*. The Stones of Grapes; but the Extremities, or Pulp of the Fingers, are called by this Name. *Castellus.*

RHAGIUM. The Name of a venomous Insect, mentioned by *Ætius*, *Tetrabib.* 4. *Serm.* 1. *C.* 18.

RHAGOIDES. An Epithet for the *Tunica Uveæ* of the Eye.

RHAMMA. *ῥάμμα*. The same as *ACIA*.

RHAMNOIDES.

The Characters are;

It has the prickly or thorny Appearance of the *Rhamnus*; the Flower, which grows only on the Male Plant, is male, apetalous, and consists of a few Stamina, which arise from a bifolious Calyx. The Fruit on the Female Plant consists of a monospermous Berry, containing a roundish Seed.

Boerhaave mentions three Sorts of *Rhamnoides*; which are,

1. *Rhamnoides*; *florifera*; *falidis foliis.* *T. Cor.* 53. *mas.*
2. *Rhamnoides*; *fructifera*; *falidis foliis*; *baccis aureis*; *T. Cor.* 53. *fœmina.*

3. *Rhamnoides*; *fructifera*; *falidis foliis*; *baccis leviter flavescens.* *Tourn. Coroll.* 53. *Boerb. Ind. A.* 2. 174. *Raii Synop.* 3. 445. *Oleaster Germanicus*, *Offic. Rhamnus secundus Clusii*, *Ger. Emac.* 1334. *Rhamnus primus Dioscoridis Lobelio*, *sive littoralis*, *Park. Theat.* 1006. *Rhamnus falidis folio angusto, fructu florescente*, *C. B. P.* 477. *Raii Hist.* 2. 1592. *Rhamnus*, *sive Oleaster Germanicus*, *J. B.* 1. 33. **SALLOW-THORN.**

It grows in sandy maritime Places, flowers in *June*, and the Fruit is ripe in *September*. An acid Rob is prepared of the Berries, which is recommended for the *Dysentery*. *Dale.*

RHAMNUS.

The Characters are;

The Flower is monopetalous, Funnel-shaped, and tetrapetaloid or pentapetaloid. The Pistil, or Pointal, becomes a soft Berry, full of Juice, and full of four callous Seeds, which are gibbous on one Side, and flat on the other.

Boerhaave mentions eleven Sorts of *Rhamnus*, which are,

1. *Rhamnus*; *Catharticus.* *J. B.* 1. 55. *C. B. P.* 478. *Raii Hist.* 2. 1625. *Synop.* 466. *Tourn. Inst.* 593. *Boerb. Ind. A.* 2. 212. *Rhamnus Catharticus*, *Spina Cervina*, *Offic. Rhamnus solutivus*, *sive Spina insectoria vulgaris*, *Park. Theat.* 243. *Spina Cervina Gesneri & Officinatum*, *Volck. Flor. Nor.* 368. *Cervi Spina*, *Rapp. Flor. Jen.* 74. **BUCK-THORN.**

This is a Hedge-tree or Bush, whose Branches are full of long stiff Thorns, and yellowish green Leaves, about as big as the Sloe-tree, more neatly serrated about the Edges. The Flowers grow several together, being small, four-leaved and yellow, which are succeeded by little round Black-berries when ripe, yielding a purplish bitter Juice, and having three or four

angular Seed. It grows in Woods and Hedges, and flowers in *June*, the Berries being ripe about the latter End of *September*.

The Juice of the Berries purges serous, watery Humours pretty briskly, and is good against the Dropsy, Gout, Jaundice, and Scurvy, and very serviceable against the Itch, and all manner of Eruptions on the Skin.

The only Official Preparation is the *Syrupus à Spina Cervina*, Syrup of Buck-thorn. *Miller's Bot. Offic.*

By the Chymical Analysis, the Berries yield a great deal of acid Phlegm and Oil, a little fixed Salt and Earth: They are purgative, and very good to remove serous Humours in chronic Diseases; by which it relieves those who have the Gout, Palsy, Cachexy, Sciatica, and Rheumatism. Take a Dram, or a Drachm and a half of its Berries, powdered and mixed with a little Conserve of Orange-Flowers. They boil fifteen or twenty Berries in common Broth, adding half a Dram of Cream of Tartar; strain it through a Cloth, and give it the Patient to drink; some mix with it two Drams of Tincture of Steel, or boil half an Ounce of Iron-Rust in a Rag tied up in a Knot, for the Green-Sickness. The most common Use of these Berries is to make a Syrup of them. The Dose is from one Ounce to two, and even to three, when necessary; but it is proper to eat some Pottage after taking it. *Martyn's Tournefort.*

The Berries of this Shrub appear under three Colours; in the first Place, being gathered in the Time of Harvest, then dried, bruised, and macerated in Water and Alum, they appear of a yellow, or rather a Saffron-like Colour. Secondly, in Autumn, when through Maturity they have acquired a Blackness, being gathered, bruised, and kept in a Glass-Vessel, they represent a beautiful green Colour, which they call a SAP-GREEN. And, lastly, if they be gathered about the Feast of St. Martin, at which Time they still adhere to the Tree, they appear, according to *Tragus*, of a Scarlet-Colour. *Raii Hist.*

SYRUPUS DE SPINA CERVI

Syrup of Buck-Thorn.

The College-Dispensatory orders it to be thus made.

Take of the Juice of ripe and fresh Buck-Thorn Berries, gathered in the Month of *September*, two Pints: Let the Fæces subside, and to the clear Liquor add of Cinnamon and Nutmeg, each three Drachms; and let them stand in Maceration for the Space of a whole Day; then strongly press it out, and put to it one Pound and an half of white Sugar, to be boiled up to the Consistence of a Syrup in a Bath-heat.

This has not, till lately, been received by the College into their Dispensatories. The Spices are commonly tied closely in a thin Bag, and suspended in the Syrup while boiling to a Consistence.

The *Edinburgh Dispensatory* directs it in the following manner.

Take of the clarified Juice of ripe Buck-Thorn Berries, three Quarts; brown Sugar, four Pounds; and with a gentle Fire boil them to a Syrup; and while it is yet warm, mix therewith a Dram of the distilled Oil of Cloves, received upon a little Sugar.

To add the Corrector here in the Form of a chymical Oil, saves the Trouble of steeping the Spices ordered for that purpose in the *London Dispensatory*, and answers the End more certainly.

Sydenham observes, that Syrup of Buck-Thorn alone evacuates Water plentifully and little else, without disturbing the Blood, or rendering the Urine high-coloured, as other Purgatives generally do, and has only one bad Quality, as occasioning great Thirst during the Operation. But if it be given, even in the largest Dose, to such as are difficult to purge, it will neither give many Motions, nor carry off enough of Water.

I remember well, adds the same celebrated Author, for it was my first dropical Patient, that I was called about twenty seven Years ago to Mrs. *Saltmarsh* in *Westminster*, who had the Dropsy in the greatest Degree I have yet seen, her Belly being swelled to an incredible Size. I gave her an Ounce of Syrup of Buckthorn before Dinner, according to the Custom of that Time, and it brought away an almost inconceivable Quantity of Water, without causing any Disturbance or Faintness. Encouraged by this Success, I gave it every Day, interposing only a Day or two occasionally, when she seemed weaker than ordinary. And the Water being by these Means car-

carried off by Degrees, the Swelling of the Belly diminished daily, and she recovered.

And now being young and unexperienced, I could not help thinking that I was possessed of a Medicine effectual for the Cure of any kind of Dropsy; but in a few Weeks I discovered my Error. For being called afterwards to another Woman, afflicted with the Dropsy, which succeeded an inveterate Quartan, I gave this Syrup, and repeated it frequently, increasing the Dose by Degrees; but having ineffectually attempted to evacuate the Water, inasmuch as the Medicine did not operate, the Swelling of the Belly increased, and she dismissed me; and if my Memory does not fail me, recovered by the Assistance of another Physician, who administered more efficacious Remedies.

The usual Dose is an Ounce, or an Ounce and an half.

2. *Rhamnus*; spinis oblongis; Cortice albo Monspelienfium, *J. B. 1. 6. 31.*

3. *Rhamni primi*; altera Species. *Clus. H. 109.*

4. *Rhamnus*; spinis oblongis; flore candicante, *C. B. P. 477. Boerb. Ind. A. 2. 212. Raii Hist. 2. 1592. Rhamnus albus*, Offic. *Rhamnus primus Clusii*, Ger. Emac. 1334. *Rhamnus secundus Monspelienfium sive Primus Clusii*, Park. Theat. 1005. *Rhamnus Cortice albo Monspelienfis*, *J. B. 1. 31. RAM-THORN WITH WHITE FLOWERS.*

This is a thorny Shrub, with a smaller Fruit, consisting of a humid Pulp, inclosing a single Seed.

It is a Native of Spain, Portugal, and other southern Countries, flowers in May, and the Fruit is ripe in Autumn. A Catapasm of the Leaves, as *Dioscorides* says, is good for an Erysipelas, and spreading Ulcers.

5. *Rhamnus*; Hispanicus; folio Buxi; minor, *T. 593. Lycium, Hispanicum, folio Buxi*, *C. B. P. 478.*

6. *Rhamnus*; Afer; folio Pruni sylvestris leviter serrato; spinis brevioribus.

7. *Rhamnus*; Americanus; folio Buxi rotundo; spinis alternis.

8. *Rhamnus*; Afer; spinis longis; cortice albo; fructu caeruleo. *Ind. 246.*

9. *Rhamnus*; Afer; folio Pruni longiori, subrotundo; flore candicante; spinis longissimis. *Lycium Pruni folio subrotundo, flore candicante*, *Ind. 246.*

10. *Rhamnus*; Hispanicus; folio Buxi ampliori. *T. 593.*

11. *Rhamno similis*; Africana; fructu triloculari; folio Pyracanthæ. *Lycium Ethiopicum, Pyracantha folio*, *H. A. 1. 163. Boerb. Ind. Alt. Plant. Vol. 2.*

The Berries of the first Species are gathered in the End of September, or Beginning of October, and their Juice expressed while they are fresh, and boiled up with Sugar, makes what they call Syrup of Buckthorn, which is an excellent Cathartic, and a Specific against a Dropsy, but excites a great Thirst. It is commended by *Hippocrates* for its purgative Quality, but is of no Virtue, as he says, on other Accounts. The Berries purge Bile and Phlegm, but principally serous Humours, whence it is of good Service in a Cachexy, Rheumatism, Arthritis, and Palsy. The Decretion of the Berries, with an Addition of aperient Tincture of Steel, is a very good Medicine for the Chlorosis. *Hist. Plant. Ascrip. Boerhaave.*

RHAMNUS is also a Name for the *Paliurus*, and also for the *Rhamnoides*; fructifera Salicis foliis; baccis leviter flavescens.

Rhamnus tertius, Dioscorides, a Name for the *Mespilus*; spinosa; Pyrifolio.

Besides the foregoing Species of *Rhamnus*, Dale mentions the following:

Rhamnus niger, Offic. *Rhamnus niger Theophrasti*, Park. Theat. 1007. *Raii Hist. 2. 1593. Rhamnus tertius Clusii*, Ger. 1152. Emac. 1334. *J. B. 1. 34. Rhamnus tertius, flore herbaceo, baccis nigris*, *C. B. P. 477. Tourn. Inst. 593. BLACK RAM-THORN.*

It is sometimes found in our Gardens, and flowers in May. The Decoctum of the Fruit is good in Relaxations and Weaknesses of the Limbs, and for the Pains of the Gout. Dale.

RHANTERES. ῥαντηρες. The internal Angles of the Eyes.

RAPHANEDON. ῥαφανεδον. The same as CAULEDON.

RAPHANELCEON. Oil of Radish-Seeds.

RAPHANUS. See RAPHANUS.

RAPHHE. ῥαφη. A Suture.

RAPHIS. ῥαφίς. A Needle for Chirurgical Uses.

RHAPONTICUM.

Rhaponticum Offic. Alpin. Exot. 187. *Rhaponticum Thracicum*, Bocc. Mus. 127. *Rhaponticum folio Lapathi majoris glabro, Rha & Rheum Dioscoridis*, *C. B. P. 116. Rha verum Antiquorum*, Ger. Jen. 44. *Hippolapathum maximum rotundi folium exoticum, sive Rhaponticum Thracicum, sed verius Rhabarbarum verum*, Park. Theat. 154. TRUE RHAPONTIC.

This has a large thick Root, at the Head, and divided into many Branches, of a dark Brown on the Outside, and a deep yellow Colour within, of a bitterish Taste. From this Root arise several large, somewhat crumpled green Leaves, roundish but pointed at the End, of a sourish Taste, growing on reddish Foot-stalks. From among these arises a thick Stalk, three or four Foot high, having small Leaves, and a numerous Company of white, staminous, six-leaved Flowers, succeeded by large, shining, triangular, brown Seed. It is planted in Gardens. The Root of this Plant, if carefully dried, pretty much resembles the finest Turkish Rhubarb, especially the Heads, having the same reddish Veins, and may deceive those who are not very well acquainted with the Difference. This is what ought to be used in the Shops, as being the true Rhapontic; what the Druggists use formerly to sell for it, being the Root of the *Rhaponticum Folio Helenii insano* C. B. which is a Species of the great Centaury, and of far less Virtue than this.

Rhapontic, as to its purgative Quality, is much weaker than Rhubarb; but is accounted more restraining, and good for Fluxes and Weakness of the Stomach, spitting of Blood, and making bloody Urine. It is likewise good against the Bites of venomous Creatures. It is an Ingredient in the *Theriaca Andromachi*. Miller's Bot. Off.

This Root is very like Rhubarb, but may be distinguished from it by its leaving a mucous Taste in the Mouth, its Mucilage being diluted by the Saliva; and because when it is cut it appears regularly marbled, of a red, white or yellow Colour; and these Colours are disposed in a radiated manner. It is less purgative than Rhubarb, requiring a double Quantity to produce the same Effect. It is also a little astringent. Geoffrey.

It is common enough in the Gardens of Botanists, and flowers in May. There is scarce any Difference between this and true Rhubarb, only this is more acrimonious, less solid, and more of a Saffron Colour. Rhapontic is less purgative, and more astringent than Rhubarb. It is vulnerary and anodyne, and is of Use in Diarrhoeas, Dysenteries, Convulsions, Ruptures, the Orthopnoea, periodical Fevers, and venomous Bites. The Dose in Powder is two Drams, in Infusion six Drams.

It is much controverted among Botanists, as Mr. Ray observes, whether the Rhapontic of the Ancients, and the Rhubarb of the Moderns, are one and the same Plant; some affirming, others denying it; and some among the rest are inconsistent with themselves, sometimes making them to be the same, at other times different. The various Opinions and Reasons for them may be found in *J. Baubine's* Appendix to his *History of Plants*; we shall only observe with *Prosper Alpinus*, that our Rhapontic is the true Rhapontic of *Dioscorides*, but quite different from the Rhubarb of the Shops. Dale.

RHASPE. ῥασπη. A Species of Wine mentioned by *Nicolaus Myrepsus*, Sect. 1. C. 500. It is not known what Sort he means.

RHASTONE. ῥαστων, from ῥαδιν, ῥαδων, easy, in *Hippocrates*, 3 *Epid.* signifies a Remission or Alleviation of a Pain or Disease. The Word in *Plutarch, de Precept. Sal.* means a Sort of Indolence, or middle State between Pleasure and Pain. It occurs also in *Hippocr. de Artic.* where it imports an easy and gentle Method of Curing, in opposition to a violent Way of Management, and is there recommended to Practice.

RHASUT ET RUMIGI Maurorum Rauwolff. Lugd. Append. *Aristolochia orientalis Foliis lanceolatis*, Pit. Tournes.

A Species of exotic *Aristolochia*, growing principally among the Moors and about Aleppo; its Root may be used in Medicine instead of those of the other Species of *Aristolochia*. It contains Plenty of Oil and Salt, and is vulnerary, deterfive, drying and resolvent, being outwardly apply'd. Lemery des Drogues.

RHECHIA, ῥηχία, Jon. for ῥαχία. See RACHIA.

RHEGMA, ῥήγμα, of ῥήγναι, to break, a Rupture, is a Species of Solution of Continuity in a softer Part, made by a violent Blow, or Fall, without Section or Punction, and proceeding from an immoderate Distension. Galen, de M. M. Lib. 3. et Lib. de Constit. Art. Med. And the same Author, Com. ad 6 Aph. 22. says that a Rhegma, or Rupture, happens when the carnosus Part of a Muscle is broken or torn asunder. ῥήγματις, in a peculiar Sense, is a Name, as *Hippocrates* says, Lib. 1. de Morb. given by some to those slight Spasms which

which affect the fleshy Parts without a Suppuration. In *Epid.* near the Beginning, those little ulcerated Fissures which affect the Lips and Gums, are called *ῥήγματα τῶν ὀστέων*, "Ruptures of Ulcers," where *Rhegmata* signifies no more than *Rhagades*, or Fissures; and *Lib. 3. de Morb.* Abscesses breaking internally are called *ῥήγματα*, *Rhegmata*.

RHEGMATIAS, *ῥηγματίας ἢ ῥηγματικός* from the preceding Word, *Lib. 1. et 2. de Morb.* is one who labours under the inward Rupture of an Abscess. *Rhegmatis*, *ῥηγματίας*, *Lib. de Aere, Aqu. et Loc.* are Persons affected with a Rupture of some internal Vessels.

RHEGMOCHASMOS, *ῥηγμοχασμός*, from *ῥήγμα*, a Rupture, and *χάσμα*, a gaping Orifice; a Rupture with a subsequent Hiatus, is one of the three Causes of an *Hæmoptoe*, assigned by *Celsus*, *Lib. 4. Cap. 4.* the other two being *ANASTIMOSIS* and *DIABROSIS*. See these Words.

RHEMBE, *ῥήμβη*, from *ῥήμβω*, to wander, is the same as *Plane*, *πλάνη*, an Error or Aberration, *Galen in Exegesi*, where he seems to have an Eye to that Passage, *7 Epid. α. καὶ αὐτὸς ῥήμβηται*, "He stumbled in his Speech," (mistook, and spoke one Thing for another.) Here *Galen*, for *ῥήμβηται*, reads *ῥήμβηται*. Hence *ῥημβήδης* *πυλὸς* in *Artæus de Caus. et Sign. acut. Morb. Lib. 2. Cap. 2.* are erratic, or rather delutory, Fevers in Opposition to *συνίχης*, continual Ones.

RHENANUM VINUM. Rhenish Wine. See **VINUM**.

RHENCHOS, *ῥήγχος*, from *ῥήγχο*, to snore. Snoring. This Affection is otherwise called *Stertor*, which is a Sound like that of the *Cerchnon*, but greater and more manifest. Many confound those Affections, and make them to differ only in Place and Magnitude, calling by the Name of *Stertor* that Sound or Noise which is heard or supposed to be made in the Passage between the Palate and the Nostrils, as in those who sleep; that boiling or bubbling Noise which in Respiration proceeds from the Larynx, or Head, or Orifice, of the Aspera Arteria, they call *Cerchnon*; but if the Sound comes from the Aspera Arteria itself, they will have it called *Cerchnos*, that is, as some understand it, a rattling, or as others, a stridulous, or wheezing Roughness of the Aspera Arteria. In dying Persons this Affection is called by the *Greeks* *ῥήγχος*, *Rhenchos*, which is a Snoring or rattling kind of Noise, proceeding, as it were, from a Conflict between the Breath and the Humours in the Aspera Arteria.

This and such like Affections are owing to a Weakness of Nature, as when the Lungs are full of Pus, or Humors; to which purpose we read in the *Prognostics* of *Hippocrates*: "It is a bad Sign when there is no Expectoration, and no Discharge from the Lungs; but a Noise, as from an Ebullition, is heard in the Aspera Arteria, from a Plenitude of Humors." Expectoration is suppressed either by the Viscidity of the Humor, which requires to be discharged, and which adhering to the Aspera Arteria, and being there agitated by the Breath, excites that bubbling Noise, or *Stertor*; or by an Obstruction of the Bronchia; or, lastly, by a Compression of the Aspera Arteria, and Throat; whence the Passage is straitened, in which the Humours being agitated, excite such a kind of Noise as before described. Hence *Galen* calls those who are strait-breasted *stertorous*. That Author assigns but two Causes of this Symptom, which are either the Straitness of the Passage of Respiration, or the Redundance of Humours, or both together; but it is necessary to add a third, which is the Weakness of the Faculty, which is the Cause of the *Rhenchos* in dying Persons, where Nature is too weak to make Discharges.

From what has been said, we conclude that this Symptom, or this Sort of Fervor, or Ebullition in the Throat, is not always mortal; but only when Nature is oppressed with the Redundance of Humor in such a manner, that the Lungs cannot discharge themselves by spitting; or the Passage appointed for the Breath, being the Aspera Arteria, is very much obstructed, upon which account many dying Persons labour under a *Stertor* with their Mouths gaping. An Instance of this you have in *Menon. 7 Epid. 47.* of whom it is said, "That he had a Wheezing in his Throat, or Aspera Arteria, with a *Stertor*;" and in the Wife of *Theodorus*, 27. where we read, "That she was affected with a stridulous kind of Hoarseness of the Breast and Aspera Arteria, with a bubbling kind of Noise, and Fluctuation of Pus." Again, *Text. 9.* it is said of the Wife of *Polycrates*, that "she was affected with a Wheezing about the internal Parts of the Aspera Arteria and Fauces, and a *Cerchnon*, that is, as *Valesius* renders the Word, *Asperitas rancida*," a harsh kind of Rattling or Snoring. And *Hermippus*, *Text. 16.* afflicted with a *Peripneumony*, on the seventh Day spit a pale kind of Matter, and fell into a *Stertor*. The Woman, also, *Text. 20.* who laboured under a *Quinsey*, dy'd at last in Convulsions with a *Stertor*. And, to name no more, the Son of *Amphibrades*, who lay sick of a *Pleurisy*, was much molested with a Wheezing or *Cerchnon* about the Fauces. In all

these Instances this Symptom must be ascribed partly to the Weakness of Nature, and partly to the Redundance and Viscidity of the Pus or Humor. It is indeed always a bad Sign, and much to be dreaded; but is highly pernicious in the Progress of a Distemper, when the Strength is very much exhausted, as it plainly indicates that Nature is no longer capable of making Excretions, and is on the Point of Suffocation; and this Symptom, in such a Case, is necessarily attended with some other mortal Sign. But in the Beginning of a Disease there frequently happens a kind of Ebullition, or Fervor, in the Throat, from the Redundance of Humour, or its Viscidity, which disposes it to adhere to the Aspera Arteria; but when this Humour comes afterwards to be concocted, and discharged by Spitting, the *Cerchnos*, or Ebullition ceases. And such a favourable Event may be predicted from the Appearance of other good Signs, at the same time, without the Attendance of any bad Sign, as it happen'd in the Case of *Pisistratus*, *7 Epid. Text. 56.* "who had a *Stertor* in the Fauces, but supported himself under the Distemper very well, and had the Use of his Reason. His Fever remitted, he had the Benefit of due Excretion, the *Stertor* ceased, and he recover'd his Health." *Prosper Alpinus de Præfag. Vit. et Mort. Ægrot.*

RHEON. A Name given by Authors both to the true Rhubarb and Rhapontic.

RHETINE, *ῥητίνη*. Resin.

RHEUM. The same as **RHEON**.

RHEUMA, *ῥέυμα*. A Flux, or Fluxion, from *ῥέω*, to flow.

RHEUMATISMUS. A Rheumatism.

The Ancients called all kinds of Pains affecting the external Parts, or the Joints, by the common Name of Arthritis, whilst the Word *Rheumatismus* was not so much as known among them. Thus *Areteus*, in *Lib. 2. Chron. Cap. 12. de Arthritide*, uses the following Words. "This Disorder in some Patients wanders over the whole Body, and is at last convey'd to the Muscles of the Back and Thorax. 'Tis hardly credible how far this Misfortune spreads and diffuses itself; the Vertebrae of the Back and Neck become painful, as also the Top of the Os Sacrum; and soon after this Pain is communicated to the Kidneys and Bladder." But in the last Century some celebrated French Physicians, such as *Carolus Piso*, *Riverius*, *Ballonius* and *Chefneau*, have called the Pains afflicting the intermediate Spaces between the Joints, and Muscles of the Neck, or of either Arm, or of the anterior or posterior Part of the Thorax, the Shoulders, Scapulæ, Thighs, the Hands, by the Name *Rheumatism*. Whilst they called those Pains Arthritic, which afflicted only the Joints and Articulations; tho' these Pains received different Denominations according to the different Parts they affected; thus when they appeared in the Feet, they were called *Podagra*; in the Hands, *Chiragra*; in the Elbows, *Onagra*; in the Teeth, *Dentagra*; in the Vertebrae of the Back, *Lumbago*; and in the Articulations of the Os Ischium, *Dolor Ischiadicus*, or the Sciatic Pain: And even at this Day, 'tis customary to call a Beginning and easily-remov'd *Arthritis*, *Chiragra* or *Podagra*, by the Name of *Rheumatism*.

But as rheumatic and arthritic Pains differ very considerably with respect to the Parts affected, the Causes, Symptoms, and Method of Cure; so the more sagacious Physicians have considered them as distinct and separate: Nor is the Difference between a beginning and inveterate Arthritis of small Importance in the Practice of Medicine.

In a Rheumatism the Muscles, with their common Membrane, and their Tendons, where they are inserted in the Bones, are in various Limbs, and other Parts of the Body, affected with violent Pains and Spasms; whereas, in an Arthritis, the tendinous and nervous Ligaments, by which the Bones are articulated, in consequence of their Cohesion with the Periostium, are violently afflicted. But as in a beginning Arthritis and *Podagra* the Pain is rather lodg'd in the Surface of the Ligaments, so in an inveterate Disorder of this Kind the peccant Humor, which is the Cause of the Pain, is seated deeper, and rather possesses the Space between the Cavities of the Articulations. A true Arthritis and a Rheumatism, also, differ in this, that the former frequently recurs, miserably torments the Patient, continues long, and is not to be cured without Difficulty; whereas a Rheumatism sometimes attacks the Patient but once or twice in his Life, does not continue so long, is more easily removed, and capable of a more expeditious Cure. The Pain in these two Disorders is, also, frequently of a different Kind; for in a Rheumatism it is accompanied with Tension, Oppression, a Sense of Weight and Coldness, without any conspicuous Tumor or Redness; whereas, in an Arthritis, the Pain is more lancinating, distending, pungent, and, as it were, threatening a Rupture, with a considerable Tumor and Redness.

As the Cause of every uneasy Sensation is either a Redundance or peccant Quality of the Juices, stagnating and con-

gested in the minute Vessels of the Coats and Membranes, by which they are violently distended, vellicated and corroded, so 'tis not to be doubted but these Causes concur to the Production of rheumatic and arthritic Pains.

'Tis certain, from Experience, that not only Persons who are young, of sanguineo-serous Constitutions, and of spongy Habits, by the Admission of Cold, or a northerly Wind impetuously rushing in upon any Part; but also that plethoric Patients, Women, and Men otherwise of a robust Habit, by neglecting Venesection or Scarification, especially after an obstructed Perspiration, feel rheumatic Pains in the Neck, Scapulæ, Shoulders, Back, Sternum and Thorax, or are even afflicted with gentle Degrees of an Arthritis. Whereas those who are naturally of lax and less fibrous Habits, who are descended from arthritic and gouty Parents, or whose Strength and the Tone of whose Parts are highly weakened by the immoderate Use of Venery, Wine, Luxury, or violent Fatigue and Commotions of Mind, are afflicted with a true, a deeper and more obstinate Arthritis, especially in the Feet.

Those labouring under a violent Arthritis, especially of the inveterate kind, when this ceases, are easily afflicted with an Inflammation of the Kidneys from the Stone; and when this ceases, they relapse alternately into an Arthritis. Besides, 'tis certain, from daily Experience, that arthritic Patients, especially those afflicted with the Gout in the Feet, generally labour under some Fault of the Digestion, and have their Primæ Viæ turgid with Eructations, Flatulences, Spasms, and a Load of peccant Humours; whilst, at the same time, their Bodies are not sufficiently soluble. Besides, we observe, that many Persons afflicted with the Gout, are also subject to the hemorrhoidal Discharge, tho' without any Relief, violent Pains seizing the Os Sacrum, and the Veins of the Anus sometimes becoming tumid.

As the Nature and Condition of the Humours, which generate and support rheumatic and arthritic Pains, are not always the same, so these Disorders often differ widely with respect to their Degrees, Genius and Symptoms; for where there is only a Redundance of Blood, as yet not much contaminated by impure Particles, the Pains are generally mild and slight, which happens in a simple Rheumatism, and the beginning Arthritis of plethoric Patients. But the Pains are far more violent, when they are sustained and supported by a Collection of impure and excrementitious Serum; for I have often observed, that as in all Pains, so also in those which violently afflict the external and nervous Parts, it rarely happens that a Redundance of temperate and pure Blood alone produces the Effect, since it is generally mixed with an excrementitious Serum; for 'tis either too thin, serous, and impregnated with a small Quantity of red Globules, or contaminated by a viscid, glutinous and tenacious Serum. The excrementitious and impure Salts in the Mass of Blood also differs much with respect to their volatile, fixed, saline and tartarous Acrimony, and consequently produce different Symptoms. So that, according as the Nature and Genius of these Causes differ, the Rheumatism may properly be distinguished, by Physicians, into the sanguineous, cacochymic, scorbutic, fix'd, and wandering.

Hence it happens, that in different kinds of Pains, Blood taken from the Veins differs both with respect to Colour and Consistence: For sometimes, when it is received in warm Water, it is observed to abound with a large Quantity of viscid Mucus, consisting of Fibres variously interwoven. Sometimes the Serum, which floats above it, is immediately form'd into a Concretion resembling Glew or Leather, just as it happens in those afflicted with a violent Peripneumony. At other Times the Serum is very thin, and the Blood of a florid red Colour, which frequently happens in a Rheumatism and wandering Gout, and is a certain Sign, that a Salt of a somewhat alkaline and volatile Nature is mix'd with it. *Carolus Piso*, in *Libr. de Morb. ex Colluv. Serof. oriund. Sect. 5. Cap. 3.* in Pains of the external Parts, tells us, That he has observ'd the Blood so full of serous Sordes, that when it was set by in a Basin, hardly a twentieth Part which had the Colour and Consistence of Blood subsided to the Bottom, whilst the remaining Part, which floated above, was entirely aqueous, but cover'd with a viscid white Pellicle. *Ballonius*, in *Libr. de Rheumatismo*, tells us, that he frequently found the Blood, which he had taken in a large Quantity from the Arm, impure and resolv'd into a putrid Serum. And I myself have often observ'd, that tho' in the Beginning of these Pains the Blood was of a laudable Consistence, yet in Process of Time, or when the Disorders were deeply rooted, it was highly serous, corrupted, and covered with a tough Pellicle. For a Redundance of Blood is the first Cause and Origin of these Pains; but in the Course of the Disease, it is, by the hot intestine Motion, and the continual Agitation, converted into a peccant Serum; for which Reason *Carolus Piso* classes all the Species of the Arthritis and Rheumatism among the Diseases

arising from a serous Sordes; which seems to be confirmed by the thin and copious, as also the slimy and turbid Urine, together with the profuse and fetid Sweats which generally accompany these Disorders.

It is a Question of no small Importance in the Theory of Medicine, how and in what manner, since the Blood is in a perpetual Motion through the Vessels, the peccant Serum is separated from it, becomes stagnant, and is deposited in the external nervous Parts. And tho' the Theory of the Ancients was entirely destitute of the Succours of natural Philosophy and Anatomy, in investigating the Causes and Generation of Disorders, yet *Hippocrates*, in *Lib. de Flatib.* has, as it were, from the Principles of natural Philosophy and Mechanics, made a beautiful Attempt to explain the Causes of these painful Defluxions, and the Method of their Generation; for he tells us, that Blood naturally hot, when forcibly convey'd through a narrow Passage, cannot, in consequence of Obstacles and Obstructions, pass quickly through it: So that the thinnest Part of the Blood is not received into the Veins, but being accumulated, flows through other Vessels, and when it stagnates, produces Fluxions and Pains in particular Parts.

But that we may have a more adequate Idea of the Generation of these Disorders, we must first consider the occasional and accidental Causes, and then the manner in which these Pains generally attack the Patient. Now, 'tis certain, from Experience, that rheumatic Pains of the Limbs are most incident to those Persons, who, after intense Labour, Motion, and Exercise, the Use of the warm Bath, or an intensely hot Atmosphere, suddenly expose themselves to a cold Air, or a northerly Wind. Soon after which they are seiz'd with a certain Horripilation and Weariness, and then with a heavy, oppressive, and contractory kind of Pain in various Parts; such as the Neck, the Scapulæ, the Shoulders, the Back, the Loins, or in that particular Side into which the Cold and northerly Wind has penetrated, and sometimes all over the Body: And the Disorder is the more violent, the more turgid the Body is with Blood: I have, also, frequently observed Persons, after liberal Venesection, Women after copious menstrual Discharges, or Fluxes of Blood, from the Uterus produc'd by Abortion; Patients after violent Fluxes, whether spontaneous or induced by strong and drastic Purgatives, when they have too long exposed their Bodies to a cold northerly Wind, or to a moist and cold Night-Air, afflicted with violent rheumatic Pains; for no other Reason, than that by the Violence of the Cold penetrating the Pores, the small lymphatic Veins and Arteries, which contain and convey the Blood for the Nutrition of the Parts, are compressed, contracted, and clos'd up. Hence it happens, that the Serum being no longer capable of being contain'd in and convey'd thro' its Vessels, overflows like a River, and is deposited sometimes in one Part and sometimes in another, or is placed without the Vessels and the Laws of the Circulation. But since all extravasated Humours, in Process of Time, lose their mild and natural Crasis, assume a foreign Nature, and become partly glutinous and tenacious, and partly acrid and saline; hence it happens, that by the Tension, Compression, Lancination, and violent Stricture of the fibrous and nervous Parts, intense Pains, frequently accompanied with a Sense of chilly Cold, are produc'd. Sometimes it also happens, that the extravasated Serum, like the White of an Egg, degenerates into a thin and corrupted Sordes, which cannot be again coagulated by a strong Heat, and passes from one Part to another; especially from the superior to the inferior Parts, through the fleshy and porous Substance of the Parts. For nothing more frequently recurs in Practice, than to observe a Rheumatism changing its Place, and falling from the Head to the Neck, the Scapulæ, the Shoulders, and Breast, especially in young Persons, whereas in Adults it falls down to the Back, the Parts about the Coccyx, and the Thighs.

'Tis also certain, from Experience, that about the Spring, and in the Month of *October*, when there are remarkable Changes of Weather, from hot to cold, and from cold to hot, or when contrary Winds suddenly succeed each other, arthritic and rheumatic Disorders most frequently attack Persons who abound with an impure Blood and Serum, prey upon the Body, and afflict it with a kind of febrile Commotion. These Disorders are preceded by a spontaneous Lassitude, and Heaviness of the Limbs, accompanied with a Refrigeration of the Extremities, a Horripilation, and a certain Sense of Cold. This State is succeeded by an uneasy internal Heat, especially about the Præcordia, a quick and contracted Pulse, Restlessness, Thirst, Loss of Appetite, Costiveness, and sometimes a Difficulty of Breathing. Afterwards a violent and acute, or an oppressive Pain, accompanied with Tension, seizes sometimes one and sometimes another Part, and is increased in the Night-time, just as it usually happens in catarrhal Fevers. And tho' this febrile Commotion is in some mild, and in others violent, and

is easily remov'd, yet a Pain remains in the Part affected, and often continues for a long time to rack them. But since every febrile Commotion is of such a Nature, as spasmodically to affect the external and nervous Parts, and by contracting and compressing the minute Roots and Extremities of the Vessels, accumulates the Blood and Humours in the large interior Vessels, and produces a quicker Systole in the Heart and Arteries, it can hardly happen otherwise, but that the Blood being convey'd with a great Impetus into the lateral Ramifications of the small Arteries, which do not contain red Blood, should at last deposit its ferous Portion without the Vessels; and this is the Origin of the Pain. But 'tis to be observ'd, that these painful spasmodic Strictures of the sensible Parts are not produced by a thin Serum entering into them, since this Species of Serum is in a great measure dissipated; but rather by its more viscid Parts, and its saline-pointed Spiculae intimately insinuating themselves into their Pores. Hence these Disorders do not quickly and easily yield to Medicines, because the peccant Matter is deeply impacted in the Parts.

From what has been said it is sufficiently obvious, that an Obstruction of the Circulation of the Blood, and of its Regress through the minute Vessels, constitutes the immediate and evident Cause of these rheumatic Pains; which may be more clearly demonstrated from this, that, as I have often observ'd, when a tight Bandage, after Venesection in the Feet for some severe Wound, is left applied for twenty-four Hours, an uneasy Pain, like that of the Gout, and which lasts for many Days, seizes the Articulations of the Foot, and especially of the great Toe. An Accident of this Nature lately happened to a celebrated Physician, who for certain Reasons had a Vein opened in the Calf of his Leg, but was obliged to use a tight Ligature, because the Vein lay low. Next Morning a violent Pain and Tumour had seized not only the Calf of his Leg, but also the Articulations of his Foot; so that there was a Necessity for a careful Discussion of the Tumor, by internal and external Medicines, lest it should degenerate into a greater Misfortune. From what has been said, we, also, see that there is a great Affinity betwixt a Rheumatism and an Arthritis, since the former sometimes so effectually counterfeits the latter, as by some to be called an universal and wandering Arthritis, which sometimes suddenly seizes several Articulations, violently afflicts the Vertebrae of the Spine, and the Joints of the Bones. Nor is it strange to observe, in Practice, that fix'd and wandering Rheumatisms, in those who are frequently subject to them, especially if they have besides contracted a Weakness, are at last transform'd into a true Arthritis. And since an Hemiplegia, a Pleurisy, a spurious Hepatitis, and a Tooth-ache, are Species of Rheumatisms, 'tis not to be doubted, but they are generated by the same Causes, and in the same manner.

'Tis certain, from Experience, that the Rheumatism spares neither that Age nor Sex, which Hippocrates, in Sect. 6. Aph. 29, & 30. in some Circumstances, pronounces free from the Arthritis. But 'tis in a particular manner observable, that those who in their Youth have been subject to frequent Hemorrhages of the Nose, which have afterwards ceased, are subject to Rheumatic Pains; which is also observ'd by Hippocrates, in *Prorrh. Lib. 2.* where he informs us, that those who have Pains and Tumors about the Joints, have large Viscera provided in their Childhood and Youth, the Blood has ceased to flow from their Nostrils; for which reason he orders us carefully to enquire, with respect to the Eruption of the Blood, whether it happen'd in the Patient's Youth, as also whether there are pruriginous Prickings, as it were, with a Nettle, either in the Breast or Back, since these are sufficient Proofs of the Impurity of the Serum. But what Hippocrates affirms, with respect to Hemorrhages of the Nose, may, in my Opinion, be asserted concerning all other salutary Excretions of the Blood: For nothing more frequently occurs in practice, than that Women, especially of a sanguineous Complexion, after the fiftieth Year of their Age, when their Menfes totally cease, are afflicted with wandering Pains here and there, unless such a Misfortune is prevented by seasonable Venesections. 'Tis also sufficiently known to Practitioners, that an usual Discharge from the hæmorrhoidal Veins, proceeding duly and at proper Seasons, may render Persons free both from arthritic and rheumatic Pains; to which they become subject, when that Discharge ceases or is suppress'd: Tho', at the same time, I have known Instances of weak and cachectic Patients, in whom neither the arthritic nor nephretic Pains ceased, even under a due hæmorrhoidal Discharge.

As for the Generation of these Disorders, 'tis to be observ'd, that Persons who have strong Exercise, live sparingly, and drink Water, are free from them; whereas those who indulge themselves in Idleness, drink Wines and spirituous Liquors, live luxuriously, and are addicted to immoderate Venery, especially when young, are frequently afflicted with violent arthritic and rheumatic Pains.

'Tis also to be observ'd, that a remarkable Disposition to these Disorders is produced by other previous and long-protracted Diseases, particularly intermittent Fevers, especially when ill-manag'd. Thus Ballonius, in *Lib. de Rheumatismo*, informs us, that he has observ'd many, towards the End of chronical quartan Fevers, afflicted with violent Pains of all the Joints. I have, also, known long-continued Colics, and Pains of the Abdomen, succeeded by wandering severe Pains of the Joints recurring at stated Periods.

There is also a scorbutic Rheumatism, in which the whole Mass of Lymph and Serum is contaminated with impure, excrementitious, salino-sulphureous and acrid Particles, which now and then discover themselves by Efflorescences, Spots, and a Purple Fever; and this Species of Rheumatism draws its Origin from an improper, heavy, and saline Diet; an idle and sedentary Life; a continual Living in a foggy and vapid Air; and long-protracted Sorrow: For which Reason it is very frequently incident to the Inhabitants of Maritime Countries.

But a venereal Rheumatism is of a more terrible kind, and in the Night-time, especially, afflicts certain nervous Parts in those who by impure Coition, have contaminated their whole Mass of Lymph and Blood, with a virulent and putrid Miasmata. But all the Causes hitherto enumerated, seem to have a Tendency to increase the Serum, render it impure and intemperate, and impair the Strength of the solid Parts, by diminishing the salutary Excretions; by which means Stagnations and Defluxions of the Serum, together with intense Pains, are produced.

Hence the reason is obvious, why rheumatic and arthritic Pains are happily terminated by copious Discharges of Urine, spontaneous Sweats, and natural Hemorrhages; and why the Patients receive great Relief from various Efflorescences of the Skin. Thus Hippocrates, in *Aph. 74. Sect. 4.* tells us, "That where there is a Probability of an Abscess about the Joints, the Patient is reliev'd by discharging a large Quantity of thick white Urine, like that which in some Patients begins to be discharg'd on the fourth Day in Fevers accompanied with Weariness. But if an Hemorrhage of the Nose happens, the Disorder is soon terminated." By Fevers accompanied with Weariness, we may justly understand those of the rheumatic Kind, which seize with a Sense of Pain and Weariness all over the Body. I have, also, frequently observ'd, that arthritic Pains have ceased upon the spontaneous Appearance of Ulcers in the Legs; and again seized the Patient when these were artificially consolidated. I have also known violent arthritic Pains totally removed by the Appearance of a Psoe, or an Itch, resembling a white Leprosy; for as a Translocation of the peccant Matter from the internal to the external Parts is highly salutary, so, on the contrary, a Translocation of it from the external to the internal Parts and Viscera, is highly prejudicial.

So long as rheumatic Pains and beginning Gouts remain in the external Parts, and the peccant Humour is not preposterously drawn inwards to those of a more noble Kind, they are free from Danger, and do not readily prove fatal to the Patient: For as in the first Years of Life, and in Youth, these troublesome catarrhus Defluxions in the Head, and those of a rheumatic Kind in the muscular Parts, accompanied with frequent Hemorrhages of the Nose, denote a remarkable Weakness of Nature, or a diminish'd Tone and Strength of the Solids; so, in Youth and Manhood, they prognosticate various chronical Disorders, which in their Causes and Genus have a near Affinity with these, especially when the Patients are descended from morbid and hypocondriac Parents.

THE CURE.

From what has been said, 'tis sufficiently obvious, that the whole Intention and Method of Cure consists in duly considering the particular Habit of the Patient, and the different Causes of the Disorder; whether it is recent, and proceeds from a Redundance of Blood; or, from a Collection of impure Serum, and is of long-standing and deep-rooted; then in forming proper curative Intentions from these Circumstances; and, last of all, in prescribing Medicines proper for answering these Intentions.

When, therefore, the Patient is evidently plethoric, and an universal Rheumatism, accompanied with a febrile Commotion, has seized all his Limbs, and is therefore, as the Ancients called it, of the sanguineous Kind; the most effectual and expeditious Means of Relief consists in Venesection, used in the Beginning of the Disorder, as is justly observ'd by the most skilful Physicians. Thus Alexander Trallian, in *Lib. 11.* speaks in the following manner: "When you suspect that the Humour collected about the Joints is of the sanguineous Kind, you are, if nothing contra-indicates, to use Venesection."

“ section: For by this means I have known many either totally cured, or rarely afflicted with Defluxions; because, in the very Beginning of the Disorder, they had Blood taken from them, both for the Purposes of Evacuation and Preservation.” This Doctrine is confirm’d by my own Experience, for I have known many plethoric Patients, who, by external Causes, having Perspiration totally obstructed, have been seized with intense Pains of the whole Body, accompanied with a Stupor and Immobility of the Parts; but were totally recovered by seasonable Venesection in the Beginning, which may, if Necessity requires, be safely and boldly repeated about the fourth Day. I have, also, known Persons of a middle Age, and of sanguineo-choleric or melancholic Constitutions, seized with a mild Gout in the Hands or Feet; but have had these Misfortunes prevented, or entirely removed, by Venesection about the Equinoxes, or sometimes about the Summer Solstice.

And as the sanguineous Rheumatism is in no Country more frequent than in France, on account of the sanguineous Complexion of the Inhabitants, and the Tendency of their Aliments to generate a large Quantity of Blood; so ’tis not surprising, that the French Physicians, who first wrote well on a Rheumatism, should greatly recommend Venesection for its Cure. Thus *Ballonius*, in *Lib. de Rheumatismo*, speaks thus: “ I recommend Phlebotomy in a Rheumatism, and affirm it to be a salutary Remedy.” *Carolus Piso* also affirms, that repeated Venesection is of great Importance, both in preventing and curing a Rheumatism, and furnishes us with many memorable Instances of it. *Riverius*, in *Cant. 3. Obs. 42. and Cent. 4. Obs. 42.* mentions an obstinate Rheumatism, removed in two young Men, by Venesection seven times repeated. *Leon. Botallus*, the first Author of Venesection in France, in *Lib. de Curat. per Sang. Mission. Cap. 12.* evinces, by many Reasons and Instances, how useful repeated Venesection is in rheumatic Pains, and how speedy a Relief is afforded by it. *Sydenham* also affirms, that the Cure of this Disorder is to be expected from nothing but Phlebotomy, which is to be repeated in a few Days. In *M. N. C. Dec. 4. An. 9. Obs. 120.* there is a memorable Instance of an universal Rheumatism cured both happily and expeditiously by repeated Venesection alone. But Venesection is still more necessary both for the Prevention and Cure of a Rheumatism in Women, whose Menstrues are either defective or totally suppressed; and in Men who have an usual hemorrhoidal Discharge suppressed.

Supported both by Reason and Experience, I assert, that besides Venesection, in a hot Arthritis and Rheumatism, when beginning and accompanied with a febrile Heat, a present and speedy Relief is afforded by mild Diaphoretics, moderately mixed with nitrous Substances, and exhibited in small but reiterated Doses, persisted in for a considerable Time; since by their Means the intense Heat, Fervour and Orgasm of the Blood, is not only allayed, but also the peccant Humour gently, successively, and equally dissolved. The most proper Sudorifics for this purpose, are the Powder of Crabbs Eyes, fossil Unicorn, burnt or unburnt Hartshorn, diaphoretic Antimony, or its Cerufs, Amber, prepared Shells, and Cinnabar, with the Addition of a sufficient Quantity of purified, or rather artificial Nitre, which are to be exhibited in pectoral and gently anodyne Waters; such as those prepared of the Flowers of Elder, the Egyptian Thorn, Meadow-sweet, and the Lime-Tree; of black Cherries, *Carduus Benedictus*, Ladies Thistle, and Scabious. Nor is it improper, in order the better to check the febrile and erratic Heats, to add to these a due Quantity of Citron-Juice; or to render the Medicine more grateful, of the Syrup of Citron-Juice. For common Drink, we recommend Whey, acidulated with Cream of Tartar, or impregnated with Tamarinds; or Water boiled with the Shavings of Hartshorn, the Roots of Vipers-Grass, Succory, Liquorice and Grass, together with the Seeds of Fennel.

But when Rheumatic Pains arise not so much from a Redundance of pure and well-conditioned Blood, as from a Plenitude of Blood of the impure and serous kind, especially in weak Persons of serous and phlegmatic Constitutions, than Venesection, especially in the Cure, is not to be used without the greatest Caution. Hence *Galen*, in *Lib. 6. Aphor. 47.* justly observes, “ That Patients afflicted with a Plethora, are to be relieved by Venesection; but that to such as abound with corrupted Juices, we are to exhibit Purgatives.” And by these Evacuations, he affirms; that he not only cured many who for a long time before had been every Year afflicted with Diseases, but also removed and warded off a beginning Gout and Arthritis for many Years. But those who have been often harassed with Defluxions of this kind, receive more Injury than Benefit from Venesection, especially if they are old or of weak Constitutions.

Hence ’tis obvious that the Ancients were of opinion, that the Differences of Pains, especially of the arthritic kind, with respect to their Causes, were to be carefully observed in the Cure; for there is one Method of curing a Rheumatism, or

a beginning. Arthritis, tho’ universal, in a plethoric Habit, which is produced by a Redundance of Blood, in consequence of an obstructed Perspiration: But the Method of Cure is quite different, where an intense Pain is obstinately fixed in one Part, accompanied with a violent Sense of Cold, and excited by Cold imprudently admitted to that Part in serous Bodies. But still different Measures are to be taken, when a plethoric Patient, under a long Course of the Disease, or by means of a preposterous and unskilful Cure, degenerates into a cachectic or cacochymic State, and little laudable Blood of a due Consistence, but a great deal of serous and excrementitious Sordes, is contained in the Vessels; for in Cases of this kind, those Remedies are principally indicated as proper, which gently, tho’ effectually, eliminate the peccant Serum through proper Emunctories, that is, by Stool, Urine and Perspiration.

With respect to the Use of Evacuants, Violence is in this Case by no means to be used; but the bilious, viscid, and serous Sordes, are to be gently and gradually eliminated by mild and temperative Laxatives. This Intention I have from Experience found excellently answered by Infusions prepared of Water, mixed with half the Quantity of Wine, and gently boiled with the Roots of Succory, Burnet, and Polypody, Rhubarb, Senna Leaves without the Stalks, *Carduus Benedictus*, the Tops of the lesser Centaury, Agarick, Orange and Citron Peel, the Bark of Sassafras Wood, Raisins, and *Tartarus Tartarifatus*. It is also beneficial to chew about two Scruples or a Dram of Rhubarb, with fat Raisins or Currans; for I can from Experience affirm, that Rhubarb taken in Substance evacuates twice as much as if it was exhibited in Decoctions or Infusions; and at the same time it remarkably corroborates the Tone of the Intestines and Viscera. But it is expedient to exhibit such an evacuating Medicine thrice, or at least twice a Week, that the Sordes left in the *Primæ Viæ* by a bad Digestion may be eliminated; since otherwise they greatly contribute to cherish the Disorder, and augment its Force. And I have learned from repeated Experience, that alterative and evacuating Medicines of this kind are of singular Service in such Pains as recur periodically and at stated Hours.

When the *Primæ Viæ* are thus cleansed, ’tis not only expedient but necessary to eliminate the peccant Serum, by such Decoctions as gently promote Transpiration and Sweat; such as those prepared of China-Roots, the Roots of Sarsaparilla, Succory, Liquorice, and Vipers-Grass; the Wood and Bark of Sassafras, the Wood of yellow Sanders and Guajacum, together with Figs and Currans. When the Disorder is deep-seated and inveterate, I have often found from Experience, that great Relief is afforded by crude Antimony, mixed with double the Quantity of the bezoardic and diaphoretic Powder, above described, and exhibited at proper Seasons, and in due Doses. Instantaneous Relief is also afforded by a celebrated diuretic and diaphoretic Liquor, which restores the Tone of the Parts, and is prepared of the Tincture of Tartar, the acrid Tincture of Antimony, the anodyne mineral Liquor mixed in due Proportions, and exhibited in proper Doses.

When a Rheumatism either of a fixed or wandering kind, seizes a scorbutic Habit, and discovers itself by evident Signs and Symptoms, the Cure is pretty long before it is perfected; for it is neither an expeditious nor an easy Task to restore the whole Mass of Lymph and Serum, when become intemperate, corrupted and impregnated with saline and excrementitious Parts, to its native Sweetness and Consistence. In this Case, the most efficacious Medicines are those of a diluting and demulcent kind, pretty copiously used and persisted in. The most considerable of this sort are sweet Whey, either impregnated with Manna, acidulated with Tamarinds, or mixed with the Juices of antiscorbutic Herbs; as also the temperate mineral Waters, such as those of *Selteran*, *Wildungen*, and *Tounsteinen*; or in robust Constitutions, those of *Pyrmont* and *Egra*, mixed with half the Quantity of Asses or Cows Milk, and used with a proper Regimen, almost answer all the Intentions of Cure.

If a Rheumatism draws its Origin, as it frequently does, from the Remains of a Lues Venerea contained in the Mass of Blood, more powerful and drastic Medicines become necessary; for unless sudorific Decoctions of the Woods, heightened by an Addition of crude Antimony, or even of *Mercurius Dulcis*, are prudently used, the Cure is rarely brought about.

As for Topics for the gentle and successive Discussion of the Humour lodged in any particular Part, great Caution is necessary in the Choice and Exhibition of them, lest they should do more harm than good. If the Rheumatism is of the sanguineous kind, it is most proper totally to abstain from them, and only to cherish the Parts affected with a moderate Heat of the Bed and other Coverings. Since by this means the peccant Matter is more mildly and happily exhaled, than it can be by the Assistance of various Topics. But if a thick, immoveable, and cold Humour is deeply and obstinately seated in any

Part, and accompanied with a Sense of Cold, and a Constriction of the Pores, then Frictions with rough-warm Cloaths powerfully remove the tenacious Humour from its fixed Seat; and after these Frictions, Cupping-Glasses, either with or without Scarification, are to be applied; but 'tis to be observed, that Cupping-Glasses, with Scarification, applied to such painful Parts, even tho' the Incisions are pretty deep, procure an Evacuation of but very little Blood: A satisfactory Proof that the Ramifications of the Blood-Vessels are so contracted and compressed by the spasmodic Stricture, as to obstruct the Circulation of the Blood: So that 'tis highly probable that these Pains are not so much excited by a Redundance of Blood congested in these Parts, as by a viscid and acrid Humour stagnating in them.

When therefore the Humour is deep-seated, and produces violent Pains of the Limbs, we can hardly be entirely without external Remedies. But tho' for this purpose various Medicines are by different Authors highly extolled, yet I have found none more effectual than my nervous Liniment, which is prepared in the following Manner:

Take of *Anhalt* Water two Ounces, of *Peruvian* Balsam two Drams, and of old *Theriaca* one Dram; Infuse and extract by Digestion: To the strain'd Liquor add of the Essences of Saffron, Castor and Nutmegs, each two Drams, and of Camphire one Dram; make into a Liniment, with which the pained Limbs are to be often anointed.

But if after a long protracted Pain, a Rigidity and Immobility, accompanied with a Stupor, remain, which Disorder is called a Paresis, the following Liniment used in the same manner, I have often found to produce admirable Effects.

Take of human Fat two Ounces, and of *Peruvian* Balsam and Oil of Cloves, each two Drams, mix up into a Liniment according to Art.

Baths also, whether natural or artificial, are of singular Use in the Cure of these Disorders, when cautiously used: But they ought never to be used in the Beginning or in the Height of the Disease, but rather in its Decline, both to draw the Remains of the Disorder from their remote Seats, by moderate Sweats, and to soften the rigid Members, and corroborate such as are weakened by the painful spasmodic Strictures and Agitations. But I can from Experience assert, that I have found better Effects produced by none, than by a Bath prepared of the Waters of *Lauchstad* in *Meissen*, which contain a delicate *Crocus Mortis*, and ate of a highly subtile and light Nature.

Tho' in Pains of the external Parts arising from a Redundance of thick Blood, and a Suppression of the salutary Excretions, copious Venesection, especially in the Beginning, is a powerful and divine Remedy; yet when a long-protracted Pain has so destroyed Digestion, a laudable Chylification and Strength, that the Body rather abounds with Serum than with Blood, or is already weaken'd by Age, Venesection is not to be used without the greatest Caution. Neither is Phlebotomy to be used when under the Paroxysm, accompanied with a febrile Commotion; Nature attempts Translations of the peccant Matter to the external Parts; at which time, just as in an Erysipelas, it is by no means expedient to disturb and counteract the salutary Work of Nature for the Patient's Relief.

I have often observed, that Venesection properly instituted before the *Æquinoxes*, excellently preserves Persons of constricted Habits, as also those of sanguineo-melancholic and sanguineo-choleric Constitutions, not only from catarrhus Defluxions, but also from rheumatic and arthritic Pains, to which they were before frequently subject; so that there is not a more powerful Remedy for preventing these Disorders, than Venesection, especially if the Patient uses due Exercise, and abstains from spirituous Liquors and a rich Flesh-Diet.

Tho' a Milk Diet is of singular Service in wandering arthritic Pains, and where the Disorder is produced by a subtile and bilious Acrimony, yet 'tis expedient to abstain from it, when the Vessels are too full, either of a stagnant or too serous Blood, and the Tone of the Stomach and Intestines is destroyed; lest by its Means Infarctions of the Viscera should be produced, and the Way pav'd for a succeeding Cachexy.

When a Suppression of the hemorrhoidal Discharge is the Cause of rheumatic or arthritic Pains, this Evacuation is with all Expedition to be recalled, tho' for this Purpose we are by no Means to use Venesection in the superior Parts, but in the Feet. Then we are to exhibit those Medicines which gently promote this Discharge, such as the *Pilula Avicennae*, the *Pilula Beberiana*, and others of a like Nature, interposing, at proper Intervals, the temperate and nitrous Powders, which allay the internal Heat, that greatly contributes to the Suppres-

sion of the Hemorrhoids. If these Measures should not prove effectual, but Gripes and Vomings should accompany the external Pains, we are without Hesitation to apply Leeches to the Veins of the Anus, a Remedy which sometimes proves surprisingly efficacious.

Those who are subject to catarrhus, rheumatic, or arthritic Disorders, as also those who are disposed to spasmodic Commotions, or Congestions of the Blood and Humours, ought carefully to abstain from all strong, hot, diuretic and diaphoretic Medicines, from acrid Purgatives, from all spirituous balsamic Substances, which throw the Blood into a preternatural Orgasm, from rich spirituous Liquors, after which the Urine is red and deeply tinged; and from all Malt Liquors, except of the medicinal Kind, such as that which does not oppress the Head, is freely discharged by Urine, and assists Digestion: But they ought for common Drink to use either pure Spring Water, temperate mineral Waters, or some grateful Decoction, which creates no loathing. And these Measures are still more carefully to be observed by those whose Juices are contaminated by scorbutic Purples, a very common Disorder in our Age.

When a violent and obstinate Pain for a long Time afflicts the inferior Parts of the Body, such as the Os Isthium, and the Os Coccygis, and the Patient is of a robust and vigorous Habit of Body, more powerful chymical Medicines, such as *Mercurius Dulcis*, Solar Precipitate well prepared, and medicinal Regulus of Antimony, which may also be added to sudorific Decoctions, are of singular Efficacy in removing the thick, tough, tartarous and vellicating Humour, from its deepest and most remote Seats.

When the Pains are so violent, which happens in delicate Constitutions, as to deprive the Patient of his Appetite and Sleep; and when neither Venesection, the nitrous and temperate Powders, nor any anodyne Liquor prove effectual to allay them, it is expedient gradually to pass from gentle Anodynes, such as the Emulsion and Syrup of white Poppy Seeds, to those of a more powerful Nature, such as the *Pilula Wildeganii*, the *Pilula Storckii*, the *Pilula de Stryace*, or even a Grain or two of Laudanum Opiatum, with an Addition of a small Quantity of the Extract of Saffron. But in other Cases, Opiates are not to be rashly used, since it has been often observed, that they render these Disorders so obstinate, as hardly to yield to the most efficacious Remedies, but create a great deal of Trouble both to the Patient and Physician.

In a beginning Rheumatism of the Scapulae, nothing is more efficacious than the Application of a Vesicatory between them; but if this Misfortune should happen in plethoric Habits, as I have often observed in Women about fifty Years of Age, when their Menses cease, great Relief is afforded by applying Cupping-glasses with Scarification, to the inferior Parts every Month.

As Persons naturally disposed to anomalous Motions of the Solids and Fluids, and to Translations or Congestions of the latter, are of a tender Habit, of a delicate Turn of Mind, and easily injured by the exorbitant Workings of Passions, which lay a Foundation for the Generation of these Disorders; so Tranquillity of Mind, sufficient Exercise, and an Abstinence from every Thing which has a Tendency to ruffle and discompose the Mind, are of great Use in the Cure of these Disorders. *Frederic Hoffman*.

The Rheumatism, a very frequent Disorder, bears a very near Affinity to the Arthritis, the Gout, and the Scurvy.

The preceding Causes of this Disorder are, a sanguineous Habit, accompanied with an acrimony of the Juices, a mature Age, luxurious Living, a sudden Admission of the Cold to the Body, when over-heated, the Influence of the Weather in the Autumn, an Obstruction of Perspiration, and a tough inflammatory State of the Fluids, to be discovered by a pleuritic Blood. It begins with a continual Fever, and creates a violent dilacerating Pain, which is greatly increased upon the smallest Motion, is long fixed in one Place, seizes the Joints of any of the Limbs, and is particularly incident to the Knees, the Loins, and the Coxendix. It also sometimes affects the Brain, Lungs, and Viscera, is accompanied with a Tumour and Redness of the Part, and comes and goes periodically.

If it remains for a considerable Time, and is increased, it often, after the most violent Pains, deprives the Limb of Motion, and produces an Anchylosis, which will hardly yield to any Medicine.

The immediate Cause of a Rheumatism seems to be so mild an Inflammation as not to degenerate into a Suppuration, in the lymphatic Arteries of the Membranes contiguous to the Ligaments of the Joints. It is cured by Venesection; repeated antiphlogistic Purgatives, every Evening after which a proper Narcotic is to be exhibited; by mild tepid Baths, and antiphlogistic Fomentations applied to the Parts affected; by drastic Vesicatories and Cauteries; by highly diluting and emolli-

ent Medicines; by attenuating Food; by Rest and the Warmth of the Bed; and towards the End of the Cure by Frictions with warm dry Cloths, together with the Use of Antiscorbutic Medicines.

A Lumbago or Rheumatism seizing the Loins, and sciatic Pains, are cured in the same Manner, tho' with somewhat greater Difficulty.

Hence appear the Reasons why this Disorder is so frequent, and its Appearances so various; why 'tis highly dangerous, when it seizes the Brain or Lungs; why in these Parts it is not discovered without the greatest Difficulty; and why the Use of hot Substances, or the too speedy Exhibition of Narcotics, must be dangerous in it. *Boerhaave Aphor.*

This Disease happens at any Time, but especially in Autumn, and principally affects such as are in the Vigour of Life. 'Tis generally occasioned by exposing the Body to the cold Air, immediately after having heated it by violent Exercise, or some other Way. It begins with a Chills and Shivering, which are soon succeeded by Heat, Restlessness, Thirst, and the other Concomitants of a Fever. In a Day or two, and sometimes sooner, there arises an acute Pain in some one or other of the Limbs, especially in the Wrists, Shoulders and Knees, which, shifting between whiles, affects these Parts alternately, leaving a Redness and Swelling in the Part last affected. In the Beginning of the Illness the Fever, and the abovemention'd Symptoms, sometimes come together; but the Fever goes off gradually, whilst the Pain continues, and sometimes increases, occasion'd by the Derivation of the febrile Matter to the Limbs; which the frequent Return of the Fever, from the Repulsion of the morbid Matter by external Remedies, sufficiently shews.

This Disease, when unattended with a Fever, is frequently taken for the Gout, though it differs essentially therefrom, as will easily appear to those who are thoroughly acquainted with both Diseases; and hence it is, perhaps, that physical Authors have not mentioned it; unless we should esteem it a new Disease. But however this be, it is at present very frequent, and though, when the Fever is gone off, it seldom proves fatal, yet the Violence of the Pain, and its long Continuance, render it no contemptible Disease. For in case of wrong Management, it frequently remains not only several Months, but some Years, and even during Life; though in this Case it is not equally painful, but has its periodical Returns, like the Gout; and the Pain may possibly go off spontaneously after it has been of very long standing. But in the mean time, the Patient is depriv'd of the Motion of his Limbs during Life, the Joints of the Fingers being contracted inwards, with stony Concretions as in the Gout, which rather appear in the internal Parts of the Fingers than the external, while the Appetite may be very good, and the general Health not amiss.

There is another Species of this Disease, though it is not generally esteemed of this kind, which may properly be called a rheumatic Lumbago. It is a violent fix'd Pain of the Loins, reaching sometimes to the Os Sacrum, and resembling a nephritic Paroxysm; only the Patient does not Vomit. For, besides the intolerable Pain near the Kidneys, the whole Conduit of the Ureters, even to the Bladder, is sometimes affected with the same, though in a less Degree. I have been formerly led into an Error hereby, as imagining it to arise from some Gravel lodged in these Parts; whereas, in reality, it proceeds from the peccant and inflamed Matter of the Rheumatism, which affects only those Parts, leaving the rest of the Body free. Unless this acute Pain be removed in the same Manner as the former Species, it continues as long, and proves equally violent; so that the Patient cannot lie in Bed, but is forced either to leave it, or sit upright therein, and be perpetually moving his Body backwards and forwards.

Since both the Kinds of this Disease seem to arise from Inflammation, as appears from their Concomitants just mentioned, and especially by the Colour of the Blood taken away, which exactly resembles that of Persons in a Pleurisy, which is universally allowed to be an inflammatory Disease; so I judge that the Cure ought to be attempted only by Bleeding, the Heat of the Blood being in the mean time abated by cooling and incrasiating Medicines, along with a proper Regimen.

Accordingly, as soon as I am called, I direct ten Ounces of Blood to be immediately taken away from the Arm of the Side affected, and prescribe a cooling and incrasiating Julap, nearly after the following Manner.

Take of the distilled Waters of Lettice, Purslain, and Water-Lilly, each four Ounces; Syrup of Lemons, an Ounce and Half; Syrup of Violets, an Ounce; mix them together for a Julap, of which let the Patient drink at Pleasure; or of the following Emulsion.

Take seven blanched sweet Almonds; of the Seeds of Melons and Pumpions, each Half an Ounce; the Seeds of white Poppies, two Drams; beat them together in a Marble Mortar, then pour on, by Degrees, a Pint and Half of Barley-Water; mix them well, and when strained, add two Drams of Rose-Water, and Half an Ounce of white Sugar.

To ease the Pain, I order a Cataplasm, prepared of the Crumbs of white Bread and Milk, impregnated with Saffron; or a Cabbage-Leaf to be applied to the Part affected, and frequently renewed. With respect to Diet, I enjoin a total Abstinence from Flesh, and even the thinnest Flesh-Broths, substituting in their Place Barley-Broth, Water-Gruel, Panada, and the like. I allow only small Beer for Drink, or which is more proper, a Ptisan prepared of Pearl-Barley, Liquorice, Sorrel Roots, and the like, boiled in a sufficient Quantity of Water. I, also, advise the Patient to sit up some Hours every Day, because the Heat which proceeds from always lying in Bed, promotes and augments the Disease.

The next Day I repeat the Bleeding in the same Quantity; and in a Day or two after, as the Strength will permit, I bleed again; then interposing three or four Days, as the Strength, Age, Constitution of the Patient, and other Circumstances indicate, I bleed a fourth Time, which is generally the last, unless too hot a Regimen has preceded, or heating Remedies have been exhibited without Necessity. But the Use of Opiates requires more frequent Bleeding; and therefore, though the Pain be ever so violent, during the whole Course of the Disease, yet when I intend to effect the Cure solely by Bleeding, I judge it highly necessary to refrain from Opiates, because the Disease is fixed thereby, and does not yield so readily to Bleeding; so that where such Medicines are given too frequently, Bleeding must in consequence be oftner repeated than is otherwise necessary. Besides, in the Height of the Disease they do not answer the Expectations we have conceived of them.

While the abovementioned Remedies and Regimen are carefully continued, I inject Clysters made of Milk and Sugar, between times on the intermediate Days of Bleeding; earnestly recommending the exact Observance of these Directions, for at least eight Days after the last Bleeding; and then I prescribe a gentle purging Potion to be taken in the Morning, and in the Evening a large Dose of Syrup of white Poppies in Cowslip Flower Water; whereby a Check is put to the tumultuary Motion of the Blood, which might otherwise endanger a Relapse. This being done, I allow the Patient to return by Degrees to his customary way of Living, with respect to Diet, Exercise, and Air; but at the same time caution him to refrain, for a considerable time, from Wine, and all spirituous Liquors, salt or high-season'd Flesh, and in general from all Food of difficult Digestion.

After having repeated Bleeding, as above specified, the Pain is greatly abated, though it does not go quite off; but as soon as the Strength returns, which Bleeding had greatly impair'd, the Symptoms will vanish, and the Patient recover perfectly; especially upon the Approach of the following Season of the Year, which will be more conducive to recruit the Strength, than that wherein he was first attacked with the Disease.

But though this, or a similar Method, seasonably used in the Beginning of the Disease, generally proves successful; yet it frequently happens, when the Cure is attempted by a contrary Procedure, that the Patient is severely afflicted during Life with flying Pains, which are sometimes violent, and at others more gentle; whereby the Unskilful are easily deceived, and they are commonly reckoned Symptoms of the Scurvy.

But it is here to be observed, that when the Rheumatism hath taken deep Root by a Continuance of some Years, it is improper to repeat Bleeding at such short Intervals as in the Beginning of the Disease; and better to interpose some Weeks between the Operations. By these Means the morbid Matter will either be quite exhausted, or at least in so great a Degree, that the Remains of it may be carried off entirely, by an Issue made in one of the Legs, and exhibiting a proper Quantity of some volatile Spirit, every Morning and Evening, in Canary.

But though there is a remarkable Difference between the true Rheumatism and the Scurvy, it must nevertheless be own'd, that there is another Species of the Rheumatism, which is near a-kin to the Scurvy: For it resembles it in its capital Symptoms, and requires nearly the same Method of Cure; and therefore I call it a scorbutic Rheumatism. The Pain sometimes affects one and sometimes another Part, but it rarely occasions a Swelling, as in the other Species, neither is it attended with a Fever. It is, also, a less fixed Pain, and accompanied with irregular Symptoms; sometimes it affects one Limb, and sometimes another; sometimes it only attacks the internal Parts, and causes Sickness, which goes off again upon the

the Return of the Pain of the external Parts. In this manner the Patient is alternately afflicted, and the Disease proves of long Duration, like those Distempers which are esteemed most chronic. It principally attacks the Female Sex, and Men of weak Constitutions; so that I should have concluded it ought to be referred to the Tribe of hysteric Disorders, had not repeated Experience taught me, that it would not yield at all to hysteric Remedies.

Such, likewise, as have gone through a long Course of the Peruvian Bark, are subject to this Disease, which, by the way, is the only ill Effect I have ever observed from the Use of this Medicine. But however it be, this Disease, whether it proceeds from this or any other Cause, is easily conquered by the Use of the following Remedies, which I should have conceal'd, had I not preferred the Good of Mankind to any private Interest.

Take of the Conserve of Garden Scurvy-Grass, 2 Ounces; Conserve of Wood-Sorrel, an Ounce; compound Powder of *Arum*, six Drams; Syrup of Oranges, enough to make the whole into an Electuary; two Drams of which is to be taken three Times a Day, for a Month, drinking after it three Ounces of the following distilled Water.

Take of Garden Scurvy-Grass, eight Handfuls; of Water-Cresses, Brook-Lime, Sage, and Mint, each four Handfuls; the Peel of six Oranges; Nutmegs bruised, Half an Ounce; infuse them in six Quarts of Mum, and draw off only three Quarts for Use, in a common Still.

A CONSUMPTION FROM A RHEUMATISM.

In a Gout and Rheumatism, especially those of the legitimate and humoral Kind, which draw their Origins from an acrid Ferment supply'd by the Nerves, there is so manifest a Colliquation of the whole Mass of Blood, that we have no Reason to wonder if a Phthisis should arise from these Disorders, especially when they are obstinate, chronic, or subject to recur frequently. Hence we may observe, that Rheumatic Pains, arising from a contracted Cold, seldom or never invade the Joints, without being accompany'd with a pulmonary Cough. And as I observ'd that the illustrious Mr. *Orlando Bridgman*, Mr. *Philips*, Mr. *Tibs*, and a great many others, have at last died either of a Phthisis or Asthma, after long-continued arthritic and rheumatic Paroxysms; so I have, also, sometimes remark'd, that an acute and fatal Phthisis succeeded the very first Paroxysm of the Rheumatism.

It sometimes happens that a Phthisis succeeding the first Access of the Rheumatism is of the acute Kind, since it draws its Origin from the Colliquation of Humours in the acute Paroxysm of the humoral Rheumatism. As it, therefore, partakes of the Nature of a common Phthisis, its Cure ought to be attempted in the same manner; that is, by lubricating and incrassating Substances, Opiates and other pulmonary Medicines. And even in Cases where there is neither a troublesome Cough, nor a Difficulty of Breathing, I use, and that with great Success, in all Paroxysms of the Rheumatism, to prescribe large Quantities of *Apozems* and *Eclegmas*, of a pectoral, lubricating and incrassating Nature, not only with a View to give a proper *Crafsis* and Softness to the Blood; but, also, in order to guard against a *Phthisis*, which frequently acknowledges a Rheumatism for its Cause.

When a Phthisis arises either from a Gout, or an inveterate and often recurring Rheumatism, it is plainly of the chronic Kind, and may happen for a long Tract of Years gradually to injure the Lungs and other Parts, destin'd for the several Purposes of Respiration. And, indeed, a Phthisis of this Kind partakes of the Nature of an Asthma; since, by reason of the Viscidity of the Phlegm, it is more frequently accompany'd with a Difficulty of Breathing than an obstinate Cough, and seems rather to arise from a *Stupor* of the nervous System, than a Colliquation of the Humours.

But this asthmatic Phthisis has, in my Opinion, something singular in its Nature, since the Choice of Air has not the least Influence upon it; for I have observ'd, that Patients labouring under this Species of Phthisis, even though they were asthmatic, breath'd as free and easy in an Air that was damp, and impregnated with the Smoke of Coals, as in that which was pure and serene. Hence it happens, that lubricating and expectorating Medicines are, at least, of no Service in this Case; whilst, at the same time, Opiates and incrassating Substances produce the most fatal Effects. Greater Relief is justly to be expected from frequent and copious Exhibitions of the Spirit of Harts-horn, Sal-Ammoniac, chymical Oil of Juniper, and such other Medicines as rouse the Spirits and comfort the Nerves, than from any Opiates or pectoral Medicines whatever.

The rheumatic Pains and Swellings are generally lessened in proportion as this Asthmatic Phthisis advances and gains Ground. And indeed a true and legitimate humoral Rheumatism degenerates into a nervous one, accompanied with fitting Pains, without any apparent Swelling, long before it proves mortal.

A rheumatic Phthisis, arising from a chronic Rheumatism, and invading old People, is, for ought I know, altogether incurable, since 'tis a sure Sign that weakened Nature is now no longer able to maintain the laborious Struggle, and grapple with so formidable an Enemy as the Rheumatism.

Gentle Vomits, repeated at proper Intervals, especially if they happen to work easily, and are not called in too late, contribute very much to the Cure of this Species of Phthisis, since they prove Deobstruents to the Brain and Nerves, allay the rheumatic Pains, and lessen the Stupor and Rigidity of the nervous System in general; by which Means the procatactic Cause, or Fomes of this kind of Phthisis is in a great Measure removed, or at least diminished.

Venesection, in the Beginning of this Disorder, before the Strength of the Patient is too much exhausted, is also of singular Service, not only by lessening the hectic Heat, and the rheumatic Pains, but also by proving a grateful Relief to the Difficulty of Breathing.

But when the Disease is considerably advanced, and the Patient labours under an universal and preternatural Languor, I have often observed, that Venesection not only gives an additional Shock to Nature, already too much weakened, but also increases the Difficulty of breathing. And indeed I have not the least Reason to doubt, but this asthmatic Phthisis frequently proceeds from profuse and often repeated Venesections, under the Paroxysms of a Rheumatism; since by that Means, as well as by other immoderate Hemorrhages, the due *Crafsis* of the Blood is destroyed, and its whole Mass impoverished.

I have also had many Proofs of the singular Efficacy of the Peruvian Bark in extinguishing the hectic and colliquating Heat, excited and left in the Mass of Blood, by the Force and Violence of the Rheumatism; and indeed if this Heat is not removed and carried off, either by the Efforts of Nature, or the Assistance of Art, it paves a direct Way, and lays a sure Foundation for a pulmonary Phthisis.

I have also observed, that for this very Reason, chalybeate Medicines, and especially chalybeate mineral Waters, provided they were drunk betimes, and pass'd off freely and copiously by Urine, were of singular Use in the first Stages of this Distemper, for procuring a Respite, at least, if not for perfecting the Cure.

Hot Baths, and artificial Baths, used before the Patient's Strength is too much exhausted, have generally a lucky Influence upon this Species of Phthisis in its first Stages, by removing the Obstructions of the Fibres.

In the Beginning of this Distemper, a Milk Diet is also of singular Service, by diminishing the Heat, and allaying the preternatural Acrimony of the Blood. But I must own it is not so proper when the Disease is advanced, and a Difficulty of breathing already brought on; because, in that case, it generally renders the Phlegm impacted in the *Bronchia* more glutinous than it was before. Nor perhaps is it a groundless Conjecture, that the too plentiful Use of Milk in Rheumatisms, very much disposes the Patient to an asthmatic Phthisis.

CASE I.

One Mrs. Laurence, about thirty five Years of Age, happening, when big with Child, to be seized with an universal Rheumatism, was so unfortunate as to commit the Care of her Health to a certain Apothecary for some Months, till at last considering her Complication of Symptoms, her Cough, her Difficulty of breathing, her hectic Fever, her Languor, and other Symptoms of a like Nature, it became uncertain whether she was to fall a miserable Sacrifice to a Rheumatism or a Phthisis, since her Rheumatism, which was formerly of the legitimate Kind, had by this Time degenerated into a nervous one, accompanied with a certain Rigidity and fitting Pain of the Joints, but without any Tumour or Swelling. When the Patient was in this deplorable State, I was called on the 25th of *October* 1686; and in order to allay the rheumatic and hectic Heat of the Blood and Spirits, together with the hysteric Indisposition arising from them, I prescribed her the following Electuary and Julep.

Take of the old Conserve of red Roses and of Hipps, strained through a Sieve, of each an Ounce, Lavender Flowers powder'd, Magistery of Coral; of each a Dram, of Syrup of Corals a sufficient Quantity, mix them, and make an Electuary, of which let her take the Quantity of 2 Nutmeg every six Hours.

Take the Waters of Rue, and black Cherries, of each four Ounces; of Barley-Cinnamon Water three Ounces, the compound Waters of Piony, and of Briony, of each an Ounce and half; of prepared Pearl a Dram and half; of fine Sugar a sufficient Quantity to sweeten them; mix them, and make a Julap, of which let her take four or five Spoonfuls after every Dose of the Electuary, and likewise at other Times when she has a Mind to it.

To help the Pains and Stiffness of her Joints, I ordered that same Night blistering Plaisters to be applied to the Inside of her Arms, near the Arm-Pits; and I tried a gentle Evacuation by Stool, with two Ounces of Tinctura Sacra, which she bore well. I ordered the following Paregoric Draught to be taken when she was to go to Rest.

Take of red Poppy Water three Ounces, Barley-Cinnamon Water an Ounce, of compound Piony Water two Drams, Salt of Wormwood six Grains, Syrup of Meconium six Drams, mix them, and make a Draught.

October 28. I gave her the following Vomit.

Take of the Infusion of *Crocus Metallorum* an Ounce, Syrup of Violets two Drams; mix them, and let them be given for a Vomit about five o'Clock in the Afternoon, with due Care and Management; and (if it be necessary) let her take between her Vomiting a Scruple of Salt of Vitriol, twice or thrice in a Draught of warm, Posset Ale.

I ordered also the following Paregoric Draught to be taken when the Vomit had done working.

Take of Mint-Water half an Ounce, Dr. Stephen's Water three Drams, Barley-Cinnamon Water, Alexiterial Milk Water, of each an Ounce, of Diacodium six Drams; mix them, and make a Draught.

From the Vomit she found an universal Relief, and that not only from the Symptoms of her Consumption, but also of her Rheumatism. And therefore, after three Days, I ordered the Repetition of the Vomit; and then I endeavoured to extinguish the hectic Flame, which had been kindled in the Blood by the Rheumatism, and thereby to take Care of her Lungs, which had been injured by it, in the Manner following.

Take a sufficient Quantity of the Ingredients of the pectoral Decoction, of the Peruvian Bark an Ounce, Balsam of Tolu a Dram; boil them in a sufficient Quantity of spring Water, to a Pint and half; to the Liquor, when it is strained, add distilled Treacle Water, the Balsamic Syrup, of each an Ounce and half; mix them, and make an Apozem, of which let her take four Ounces three Times a Day for six Days together, taking always in the Night-Draught fifteen Drops of Helmont's liquid Laudanum, if any Gripes, or Looseness, or want of Rest should trouble her.

When she had done using the Apozem, I ordered the emetic Potion to be repeated, and afterwards, Novemb. 13. I prescribed the following Pills.

Take of the Peruvian Bark, finely powdered, an Ounce, Mucilage of Gum Tragacanth, a sufficient Quantity. Mix them, and make them into Pills of a middle Size, to be gilt; of which let her take six Morning and Evening, every Day.

With the Use of these she grew perfectly well, being evidently freed not only from the Pains and Stiffness of her Limbs, but likewise from her Cough, Difficulty of Breathing, Oppression, Fever, and all the other Symptoms of a pulmonary Consumption. Her Appetite also returned, and at length she likewise recovered her Strength, and her Flesh, and still enjoys very good Health, without any Return of her Rheumatism or Consumption. *Morton.*

RHEXIS, *ῥῆξις*, from *ῥήγνμι*, to break, a Rupture, in *Hippocrates*, 5 *Aph.* 15. signifies the breaking of an Abscess; and also 6 *Epid. Sect.* 6. *Aph.* 24. In other Places it is applied to a Rupture of some Blood-Vessel, whence an Hæmorrhage is occasioned.

RHICNOSIS, *ῥηκνῶσις*, from *ῥηκνός*, rugous or wrinkled, is a Congruation of the Skin, attended with an Extenuation of the Body, and opposed to *Ectasis*, *ἔκτασις*, a Distention of the Skin from Repletion.

RHIGOS, *ῥῆγις*, Lat. *Rigor*, a Rigor, is defined by *Galen*, *Lib. de Trem. & Palp. &c.* a Perfrigeration, with an Uneasiness,

and irregular Agitation and Concussion of the whole Body; This is the Definition of a morbose *Rigor*, *ῥῆγις morbos*, or *ἀνίστασις*, as he calls it, *Com. 3. in 1 Epid.* or *ῥῆγις νευρῆσις*, as it is called by *Hippocrates*, *Lib. 4. de Morb.* when the Disorder arises, or has its Original in the internal Parts, and proceeds from no external violent Cause, but invades and comes upon the Body, as it were spontaneously; for *Rigor* in a more universal Sense, or as it signifies any uneasy Perfrigeration, may be incident to Persons in Health. That a *Rigor* is not a Sense of Perfrigeration, with a Trembling, is largely proved by *Galen* in the Book above cited, where he gives the distinguishing Characters of a *Rigor*, and a *Tremor*, or Trembling; and at last concludes, that a *Rigor* is a strong and urgent Sense of a Refrigeration of the natural Heat. *Hippocrates*, also, *Lib. 1. de Morb.* says, that a *Rigor* proceeds from a Refrigeration of the whole Body, occasioned by a Refrigeration of the Blood; and *Lib. 4.* he makes a *Rigor* to take its Rise from a violent Irruption of acrimonious Humours into some Part, and a vehement Conflict of the jarring Humours, attended with a Concussion of the whole Body; and such a *Rigor* as this was always accounted by the Ancients an Attendant upon a Fever, as appears from *Hippocrates*, *Lib. 1. & 4. de Morbis*; for a *ῥῆγις ἀνδραγαθῆσις*, or a *Rigor* not succeeded by an intemperate or feverish Heat, was, as *Galen* says, *Lib. 5. de Symp. Caus.* unknown to the ancient Physicians, on account of their extremely frugal Way of Living, being no more than a Sensation of a kind of Horror, and having very little of the true *Rigor* in it. This owes its Original to a vitreous Phlegm, and cold and crude Juices, Intemperance in Diet, a lazy and idle Life, and to the frequent Use of Bathing; and is very familiar to the Female Sex, as *Galen* in many Places assures us. *Hippocrates*, *Lib. 1. de Morb.* makes a *Horror* to be a weak kind of *Rigor*; and *Celsus*, *Lib. 8. Cap. 2.* uses the Word *Horror* for *Rigor*, from 4 *Aph.* 58. where he says, "That a burning Feve, which the *Greeks* call *καυσώδης*, *Causodes*, meets with a "Solution from the sudden Coming of a *Horror*." The *Latins* also call those Shiverings and Shakings, which affect the Patient under the Fits of Fevers, indifferently by the Name of *Horrores* or *Rigores*.

Rigor is also taken in another and quite different Sense, for an inflexible Hardness and Tension of the Nerves and Muscles, which seems more properly expressed by *Rigiditas*.

RHINARION, *ῥιναριον*, the Name of a smectic or detensive Collyrium, described by *Paulus*, *Lib. 7. Cap. 16.*

RHINE. The same as **SQUATINA**, which see.

RHINEMA, **RHINISMA**, *ῥινημα*, *ῥινησμος*, Scrapings, Shavings, Filings, and the like. *Hippocrates*, *Lib. 1. πρὸς γυναικας*, and *Galen*, *Lib. 3. κατὰ τὸν*.

RHINENCHYSIS, *ῥινηγχυσις*, from *ῥίς*, the Nose, and *ἐγχύω*, to infuse; an Infusion into the Nostrils, which is performed by an Instrument called

RHINENCHYTES, *ῥινηγχυτής*, a Syringe for the Nostrils, mentioned by *Cælius Aurelianus*, *de Morb. Chron. Lib. 2. Cap. 4.* and *Lib. 3. Cap. 2.* where the vulgar Reading is *Rinenchy-tos*; but *Rhodius*, *ad Scrib. Larg.* reads *Rhinenchytes*.

RHINION, *ῥῆγιον*, the Name of a Collyrium in *Galen de C. M. S. L. Lib. 4. Cap. 7.* and of another described by *Celsus*, *Lib. 6. Cap. 6.* for a dry Ophthalmy, and scabrous Eyes. *Castellus*.

RHINOCEROS, *Offic. Schrod. 5. 305. Raii Synop. A. 122. Mont. Exot. 5. Aldrov. de Quad. Biful. 878. Charlt. Exer. 12. Gefn. de Quad. 842. Jonf. de Quad. 66. Abada sine Rhinoceros, Bont.* THE RHINOCEROS.

The Part in Use is the black, fissile, pyramidal Horn, a Cubit in Length, of the Figure of a Buffalo's Horn, and perfectly solid, or without Cavity.

This Horn is commended against contagious Poisons, and other Distempers which require Sudorifics, and therefore in such Cases may supply the Want of the Unicorn's Horn. *Schroder. Monti* writes that the Horn is alexipharmic, cardiac, stomachic, diaphoretic, and a Sweetener.

Though there are various Kinds of Quadrupeds with one Horn, described by Authors, I take them all, says *Dale*, to be fictitious, except the *Rhinoceros*, which is the only Unicorn, or one-horn'd Quadruped, and perhaps the very same with that of the Ancients, whose Horn *Ælian* affirms to be black. And *Schroder*, as well as others, ascribe the Virtues said to be in the Horn of the Unicorn, to the Horn of the *Rhinoceros*.

RHINOPTES, *ῥινοπτης*, from *ῥίς*, or *ῥῆγις*, the Nostrils, and *ὀπταίω*, to see, is a Person who from a Disease in the great Canthus of the Eye, which has laid open the Passages to the Nose, is enabled to see through the Nostrils; an Instance of which we have in *Rungius de Visus Symp.*

RHINOS, *ῥῆγις*, in *Erotian*, is expounded by *ῥῆγις*, the Skin.

RHIPIDION, *ῥῆπιδιον*. A Fan. *Moschion.*

RHIPTASMOS, *ῥιπτασμός*, from *ῥίπτω*, to toss or cast. A Tossing and Restlessness, a Symptom very frequent in Fevers. See **ALYSMOS**.

RHIZA, *ῥίζα*. A Root.

RHIZAGRA. The Name of a Chirurgical Instrument, for extracting the Roots or Stumps of Teeth.

RHIZIAS, *ῥιζίας*. A Liquor collected from Roots by Incisions made therein. *Silphium* is particularly thus called.

RHIZOPHORA. The Name of a Vegetable, of which *Boerhaave* mentions two Species; the first of which is the *Rhizophora*; *Indica*; *Bryonia nigra similis*; ad foliorum ortum verrucosa. *Plukn. Phyf. T. 220. F. 50.*

The second is the

Rhizophora; *Americana*.

RHIZOTOMUS, *ῥιζοτόμος*. The same as **RADICI-SECA**.

RHOA, *ῥοά*. The Pomegranate.

RHODAPSINTHATON, *ῥοδάψινθατον*. A Preparation of Roses. *Ætius* describes several of these, *Tetrabib. 4. Sermon. 4. C. 117.*

RHODELÆUM. Oil of Roses.

RHODIA RADIX, *Offic. Ger. 426. Emac. 532. Raii Hist. 1. 690. Park. Theat. 729. C. B. P. 286. J. B. 3. 683. Telephium luteum minus, radice Rosam redolente, Hist. Oxon. 3. 468. Anacampteros radice Rosam spirante major, Tourn. Inst. 264. Boerh. Ind. A. 269. Raii Synop. 3. 269. ROSE-WORT.*

It grows on hilly Places, and flowers in the Spring. The Part in Use is the tuberous and brittle Root, which is of a dark-brown Colour on the Outside, and whitish within, and of a rosy Smell and Taste. This Root is heating and drying, and cephalic; its principal Use is in Pains of the Head. *Dale.*

RHODIACON, *ῥοδάκιον*. The Name of a Plaster described by *Galen* from *Asclepiades*. *L. 2. de Comp. Medic. p. G. Cap. 17.*

RHODIDES, *ῥοδάδες*. Troches of Roses, described by *Dioscorides*. *L. 1. C. 131.*

RHODINON, *ῥοδινον*. Oil of Roses. Or Vinegar of Roses.

RHODITES VINUM. Wine impregnated with Roses; the Manner of preparing it is described by *Dioscorides*. *L. 5. C. 35.*

RHODIUM LIGNUM. See **ASPHALTHUS**.

RHODODAPHNE. The same as **RHODODENDRON**.

RHODODENDRON. The Oleander, or Rose-Bay. See **NERIUM**.

RHODOMELI. Honey of Roses.

RHODOMELON, *ῥοδόμηλον*. A Confection of Roses, Quinces and Honey.

RHODON, *ῥόδον*. A Rose. Sometimes it imports the Oil of Roses.

RHODOSACCHARUM. Sugar of Roses.

RHODOSTACTON, *ῥοδόστακτον*. Honey of Roses. *Paulus Ægineta. L. 7. C. 17.*

RHODOSTAGMA, *ῥοδόσταγμα*, from *ῥόδον*, a Rose, and *στάλην*, to distil. Dr. *Freind* remarks, that *Æturius* is the first Greek Author who makes mention of distilled Liquors, as the *Rhodostagma*, and *Intyboflagma*, which the Translator calls *Stillatitius Liquor Rosarum*, & *Aqua quam Intybus stillavit*; and which are by the Author used as Ingredients in a Julap. *Gesner* indeed contends, that these Liquors here specified, are not prepared by any chymical Process, and are nothing more than Syrups of those Plants, just like the *Rhodostacton* described in *Paulus*. *M. le Clerc*, following the Opinion of *Langius*, thinks otherwise; and has shewn very plainly, that the stillatitious Liquor of Roses mentioned by *Æturius*, is very different from the *Rhodostacton* of *Paulus*, which is only made with the Juice of Roses and Honey boiled up together. His Judgment seems to be very right in this Matter; and as a further Proof of it, give me leave to observe a Passage or two in *Nicolaus Myrepsus*, one of the last of the Greeks, and who often copies from our Author. He describes the *Rhodostacton* of *Paulus*, only with this Difference, that he says it may be made with Sugar, as well as with Honey: Then he describes the *Hydrosactum*, as it is delivered down to us by *Ætius* and *Paulus*, a Medicine much like the former, with this Variation alone, that Water is added to the Roses: And after that, he proceeds to give this very Julap in *Æturius*, which proves, at least, that he thought it a Preparation very distinct from the other two. And it must appear very evident to any one who considers the Composition itself, that it is a very absurd one, unless the distilled Rose-Water be meant; for otherwise it is just a double Trouble, and making the Medicine twice over, with the very same Ingredients, to little purpose.

RHOE. The same as **RHUS**.

RHOEAS, *ῥοείας*, or *ῥοείας*; from *ῥέω*, to flow, or *ῥύω*, to draw, is a Flux of the Eyes, occasioned by a Diminution of the Flesh

in the greater Canthus, or Angle of the Eye. *Galen, Com. 2. in 6 Epid.* makes four Kinds of it, according to the different Causes; for either it is occasioned, he says, by the Closure or Obstruction of the Passage at the great Canthus, or by a Collection of so much Excrement in the Eye, that this Passage, by reason of its natural Straintness, is incapable of receiving it; and therefore discharges it. Or thirdly, it may proceed from the Stopping of the Passage by a Cicatrix growing therein, as it happens after a Section of the *Encanthides*. [See **ENCANTHIS**.] Or lastly, from any other Ulceration of the Part. The Author of the *Definitiones Medicæ*, defines a *Rhoeas* to be a Consumption of the Flesh in the Angles of the Eye, occasioning a Flux of the Tears. And in the *Isagoge* ascribed to *Galen*, we read that the Eye is affected with a *Rhoeas*, when either the *Canthus*, by some unknown Cause, is perverted, or by a chirurgical Operation so raised, as to be incapable of containing the Tears, or preventing their Efflux.

According to *Ætius*, in *Tetr. 2. Sermon. 3. Cap. 88.* the Disorder by the Greeks called *Rhoeas*, which is a Diminution or Decrease of the Flesh in the large Angle of the Eye, happens when by an Exulceration, or the Removal of a Pterygium, or the natural Flesh, the Angle of the Eye is removed, falls down on the Cheek, and becomes incapable of retaining the Tears. This Disorder also sometimes happens from an ill-cured *Ægilops*. Those Persons are, also, called *Rhoeades*, who in Consequence of continual Defluxions of the Eyes, perpetually discharge Tears. Those, the Angle of whose Eye is totally removed, are to be cured by Medicines of a corroborating and consolidating Quality. But if a Callus is induced, the Parts must be stimulated by some more acrid Medicines. But manual Operation is also necessary for the Cure of this Disorder; for a Ligature is to be applied about the Neck, and some Blood-Vessel about the Nose, are to be marked out and afterwards opened with a two-edged Knife. Then a Sponge being applied to the Eye, a triangular Cautey is to be applied to the Part, tho' not so deep as the Bone, but only so as to affect the Skin and Wound. Afterwards a Lentil with Honey is to be applied. When the Ulcers are sufficiently clean, the Eye is to be kept open till the Angle is filled with laudable Flesh, for fear of a Concretion. In the Cure of this Disorder, Allum and Turpentine are of singular Service.

RHOGE, *ῥογή*. A Rupture, Fracture, or Fissure.

RHOGMOS, *ῥογμός*. A Snoring.

RHOICOS, *ῥοικός*. Fluid. An Epithet for Bodies abounding with Humidity.

RHOIDARIUM, *ῥοιδάριον*. The Name of a Medicine described by *Ætius*, *Tetrabib. 1. Sermon. 2. C. 68.*

RHOITES, *ῥοίτης*. A Sort of Rob of the Juice of Pomegranates, described by *Dioscorides*, *L. 5. C. 34.* But a Confection made of three Sextaries of the Juice of Pomegranates, and one of Honey, boiled to the Consumption of one Third, is thus called by *Paulus Ægineta*. *L. 7. C. 15.*

RHOMBOIDES MUSCULUS.

This Muscle is a thin, broad and obliquely square fleshy Plan, situated between the Basis of the Scapula and the Spina Dorsi; and it is from its Figure that it has been termed *Rhomboides*.

It may be divided into two Portions, one superior, the other inferior, which sometimes appear separate. The superior Portion, which seems in some Subjects to be made up of two, is fixed by an Insertion wholly fleshy in the two or three lowest spinal Apophyses of the Neck, and partly in the posterior cervical Ligament. The inferior Portion is fixed by a tendinous Plane in the three or four uppermost spinal Apophyses of the Back.

These two Portions, of which the inferior is by much the broadest, being united, are inserted in the Edge of the Basis Scapulæ from the small triangular Space to the inferior Angle, the superior Portion covering a small Part of the Insertion of the *Angularis*.

This whole Muscle is covered by the *Trapezius*, and covers immediately the *Serratus Posticus Superior*, being joined to each of these Muscles by a filamentary or cellulous Substance.

According to the Insertions and Direction of the *Rhomboides*, its general Use must be to draw backward and upward the subspinal Portion of the Basis Scapulæ.

It is also a Moderator to the *Trapezius* and *Serratus Major*, when they raise the Shoulder or carry the *Acromium* upward; and it brings the Scapula back to its natural Situation, when the Action of these Muscles ceases.

It may draw the Scapula directly backward, if the inferior Portion of the *Trapezius* acts at the same time. For as this Portion draws obliquely downward and toward the Spina Dorsi, and the *Rhomboides* obliquely upward and toward the same Spine; the joint Action of both must produce a Motion directly backward, as it happens when we pull back both Shoulders equally, in order to disengage them.

It may also, together with the radiated Portion of the *Serratus Major*, draw the Basis of the Scapulae directly backwards. This, however, is but an inconsiderable Motion, and not so easy as the rest; for the *Serratus Major* contributes to it only in proportion to the Action of the *Rhomboides*, which is but very small; and in this Case the *Acromium* can rise but a very little Way. *Winslow's Anatomy*.

RHOMBOS, ῥόμβος. A Species of Bandage mentioned by *Galen*, thus called from its Figure.

RHOMBUS. A Fish called a Turbot.

There are several Sorts of Turbot, of different Sizes; some have Prickles on their Head, and towards the Tail, and others none. They have a delicious Taste, and are best while they are fresh, firm, white, tender and juicy. Some call it *Phasianus Aquaticus*, the Water-Pheasant, because its Taste resembles that of a Pheasant. It contains a just Proportion of oily and volatile saline Principles, and has but few viscous and gross Juices. It is, therefore, nourishing and easy of Digestion; is reckoned good against the Distempers of the Spleen, when applied thereto, and produces no ill Effects, unless immoderately used. It agrees at all times with any Age and Constitution.

There are very large Turbots in the Ocean and Mediterranean. *Rondeletius* says, he had seen some which were five Foot long, four in Breadth, and a Foot thick. This Fish sometimes lives about the fat Soils, and near the Shores, but generally at the Mouths of Rivers, where it watches the small Fishes, on which it feeds, especially the Cray-Fish. *Lemery on Foods*.

RHOMMA, ῥόμμα. The same as **ROPHEMA**.

RHONCHOS, ῥήγχος. Snoring or Snorting; from ῥήγχο, to snore.

RHOPALOSIS, ῥοπαλῶσις. A Disorder of the Hair, which should seem to resemble the *Plica Polonica*, as it consists in a Matting or Concretion of the Hairs together. *Galen Defin*.

RHOPE, ῥοπή, from ῥέπω, to verge, or incline. A violent Tendency of the Humours to any particular Part.

RHOPHEMA, ῥόφημα, from ῥέφω, to sup. This Word is frequently used by *Hippocrates*. *Caelius Aurelianus* translates it, *Sorbilis Cibus*. It is the Cremor of Pisan, that is the Pulp of Barley decorticated and boiled.

RHOX, ῥῶξ. The *Tunica Uvea* of the Eye. Or the Pupil of the Eye, in *Moschion de Morbis Mulierum*.

RHUS.

The Characters are;

The Leaves are pinnated, or triphyllous; the Calyx is quinquefid, small and dentated. The Flowers are rosaceous, pentapetalous, and disposed in Bunches. The Ovary in the Bottom of the Calyx becomes a roundish Capsule, pregnant with a single and almost globular Seed.

Boerhaave mentions twelve Sorts of *Rhus*, which are;

1. *Rhus*; folio Ulmi. *C. B. P.* 414. *Tourn. Inst.* 611. *Boer. Ind. A. 2.* 299. *Rhus Obsoniorum*, Sumach. Offic. *Rhus Coriaria*; Ger. 1291. *Emac.* 1474. *Rhus*, sive Sumach. *J. B. I.* 555. *Raii Hist.* 2. 1590. Sumach, sive *Rhus Obsoniorum* & *Coriarium*, *Park. Theat.* 1450. COMMON SUMACH.

This *Rhus* grows not to be a Tree of any great Magnitude, having its Branches clothed with long pinnated Leaves, whose single-Pinnæ resemble the Leaves of the Elm-Tree, but are somewhat longer; the Flowers grow in large white Clusters, which are succeeded by small, flat, round, hairy Seed, of a refringent earthy Taste. It grows in *Italy*, *Spain* and *Turkey*. The Leaves and Seed are used.

They are both very refringent and stiptic, good for all Kinds of Fluxes and Hæmorrhages, both used inwardly and outwardly. They resist Putrefactions and Gangrenes, and Mortifications. It is an Ingredient in the *Syrupus Myrtinus*.

The *Unguentum Sumach* takes its Name from the Seed. *Miller. Bot. Off.*

It is refrigerating, drying and astringent, and is principally used in Fluxes of the Belly, Uterus and Menfes. It restrains the Hæmorrhoids, and corrects Bile. We think fit to observe, that the *Rhus Obsoniorum*, *Coriariorum*, and *Rubeum* (the *Rhus* of the Cooks, of the Tanners, and the red *Rhus*) of *Galen*, are not different Species of Trees; but the *Rhus Obsoniorum* is no other than the Fruit; the *Rhus Coriariorum*, the Leaves and small Branches; and the *Rubeum* the Seed of the same Tree. This is the Opinion of that very learned Botanist, Mr. *J. Ray*, with whom we agree in our Sentiments on this Head. *Dale*.

2. *Rhus Virginianum*. *C. B. P.* App. 417. *Raii Hist.* 2. 1591. *Tourn. Inst.* 611. *Boerh. Ind. A. 2.* 229. *Park. Theat.* 1450. Sumach sive *Rhus*, *Ind. Med.* 114. VIRGINIAN SUMACH.

It is a Native of *Virginia*, but cultivated with us in the Gardens of the Curious, and is esteemed to have the same Virtues as the common Sumach.

3. *Rhus*; *Americanum*, *Rachi*, cui adnascuntur folia, rubra; folio lato, utrimque glabro, non serrato, *Pistachia* simili.

4. *Rhus*; *Americanum*; *Rachi*, cui folia adnascuntur, rubra; foliis præcedenti angustioribus.

5. *Rhus*; *Americanum*; *Rachi*, cui folia adnascuntur, rubra, alata; foliis molle Clusii brevioribus.

6. *Rhus*; *Africanum*; trifoliatum; majus; folio subrotundo, integro, molle & incano. *Plukn. Phyt.* 219. 8.

7. *Rhus*; *Africanum*; trifoliatum; majus; foliis obtusis & incisis, hirsutiè pubescentibus. *Plukn. Phyt.* 219. 7.

8. *Rhus*; *Africanum*; trifoliatum; majus; foliis acutioribus, incisis, supra viridibus, glabris, infra argenteis, glabris. *H. R. D.*

9. *Rhus*; *Africanum*; trifoliatum; majus; foliis acutioribus, arguticis denticulatis, glabris, subtus argenteis. *H. R. D.*

10. *Rhus*; *Africanum*; trifoliatum; majus; foliis subtus argenteis, acutis, & margine incisis. *Plukn. Phyt.* 219. 6.

11. *Rhus*; *Africanum*; trifoliatum; minus; glabrum; splendente folio, subrotundo, integro. *Plukn. Phyt.* 219. 9.

12. *Rhus*; *Africanum*; trifoliatum; majus; glabrum, splendente utrimque folio, subrotundo, medio quandoque crenato. *H. R. D. Boerh. Ind. Alt. Plant. Vol. 2.*

It is called *Rhus*, ῥῆς, from ῥέω, *rheo*, to flow, because it stops Fluxes. The Fruit, which is disposed as it were in Clusters, and is of a red Colour, and an acid and grateful Taste, is of excellent Service in a *Diarrhæa* and *Dysentery*, especially when it is boiled with the Rinds of Pomegranates in Water. It is no less useful in an immoderate Flux of the Menfes, in the *Diabætes*, *Hæmorrhoids*, and *Gonorrhæa*. The Seeds of the Sumach are only the dry'd Grains, taken out of the Clusters, and are not of so much Virtue, on account of their Dryness; and therefore the recent Berry is to be chosen, being excellent, particularly in resisting Putrefaction, and a Gangrene in a *Paronychia*. The Gum put in a Tooth eases the Tooth-ach. The tender Buds, and green Fruits before they are rendered succulent by Maturity, are of Service in a kind of hectic Fever, attended with profuse Sweats, on account of the too great Tenderness, Flaccidity and Humidity of the Fibres. *Hist. Plant. ascript. Boerhaave*.

Dioscorides tells us, that the Herb *Phoenix*, φοῖνῆξ (which is a kind of *Lolium* distinguished among the Latins by the *Epithet Murinum*) is called by some ῥῆς, and by others *Anchinops*, ἀγχίνωψ; but the ῥῆς ἰσχυρὸς, Red *Rhus*, of the Greeks, is the Seed of the *Frutex coriarius*, or Sumach. As to this last Plant, there is no small Controversy among the Learned, whether there be several Species thereof, or only one, because there are several mentioned, and those under distinct Names, in the Writings of the ancient Physicians. One they call ῥῆς μαργαρίτης (*Rhus Obsoniorum*), another ῥῆς βορσολειῶν (*Rhus Coriariorum*) and a third ῥῆς Συριακὸς (*Syrian Rhus*). Some perhaps will say that these are but different Names for the same Thing; but when all these three are mentioned in order one after another, it can scarce be supposed that they are meant of the same Thing. Now these three before named are mentioned one after another, as so many several Ingredients, in Hundreds of Compositions of *Myrepsus*, for Example, in his third *Plaister*, where we read, καυαίονα, σιδῖον, ῥῆ μαργαρίτης, ῥῆ βορσολειῶν, ῥῆ Συριακὸς, “*Cinamon, Malicorium, Rhus Obsoniorum, Rhus Syriacum, and Rhus Coriariorum*.” Upon this Consideration *Fuchsius* concluded, and not without Reason, that there were as many Species as distinct Names of *Rhus*. But against his Opinion we have a strong Argument from *Dioscorides*, who affirms that the *Rhus Obsoniorum*, which some call *Erythrus* (red) is the Seed of the *Rhus Coriariorum*, where you may also observe a Difference in the Gender, for the Shrub is called ἡ ῥῆς; (*hæc Rhus*), but the Seed ὁ ῥῆς; (*hic Rhus*). When therefore we read ῥῆς μαργαρίτης in Authors, we must understand it of the Seed, which was applied to culinary Uses, but when we meet with ῥῆς βορσολειῶν, or *βορσολειῶν*, it is meant of the Shrub, whose Leaves were used in dressing of Leather. The *Rhus Obsoniorum*, or Seed, was also called absolutely ῥῆς; *Rhus*, as we find in *Galen's Evegefis*, and had also the Addition of ἰσχυρὸς, Red, because when mature it turn'd red.

But the chief Difficulty lies in determining the *Rhus Syriacum*, which *Myrepsus* separates both from the *Rhus Obsoniorum*, and *Coriariorum*. *Theophrastus* says, that the Shrub *Rhus* grows every where; he therefore described the *Rhus* which grew in *Greece*. But *Pliny* accommodates the Description of *Theophrastus* to the *Syrian Rhus*, and reckons the *Rhus* among the Number of exotic Plants which were peculiar to *Syria*, tho' *Theophrastus* makes it to grow every where. Where we read in *Pliny*, quod vocatur *Rhus*, in a certain Manuscript is expressed quod vocatur *Ros*; and agreeably to this we find in *Celsus Ros Syriacus*, which *Brodeaus* and *Crinitus* interpret of Manna, as if he had spoken of the *Syrian Ros*, or Dew, and not of the *Syrian Rhus*, or *Rhus*. *Pliny, Lib. 24. Cap. 11.* reckons two Kinds of *Rhus*, as distinct from the *Rhus Syriacum*, where

where he says, *Nec Rhus Latinum habet*, &c. "Not have we a Name in Latin for *Rhus*, tho' it be useful on many Accounts." He goes on to describe three Kinds of *Rhus*, or *Rhus*; one an Herb with Leaves like the Myrtle, another which is the *Frutex coriarius*, and the third under the Name of *Rhus erythros*, which is the Seed of the second. As to the Herb *Rhus*, some take it for what some call *Rhus Montispefulanorum*, which is a Shrub with the Leaves of the *Oxmyrsine*; but the *Frutex coriarius* there mentioned, is the very same with that, *Lib. 13*, under the Name of the *Rhus Syriacum*. Many called the Seed *ῥῆς ἰσχυρῆς*, to distinguish it from the Shrub. The Medicinal Lexicons of the modern Greeks take the *ῥῆς μαυρίνης*, *ἰσχυρῆς* and *Συριακῆς* for the same Thing, and expound them all three by *σμάκων*, *Sumacin*, or *σμάκων*, *Sumacion*, and it is certain that the Shrub which the Greeks called *ῥῆς*, *Rhus*, is the same with what the Arabians now call *Sumac*, but as for the *ῥῆς Συριακῆς*, *Rhus Syriacum*, I imagine there is no Difference between it and the common *Rhus*, in Genus or Species, but only in Goodness, and perhaps the Seed was brought out of Syria, as being the best and most proper for seasoning of Meat, in which it was employed, as *Pliny* says, instead of Salt, and with an Addition of *Silphium*, was thought to render all Flesh-meat more savoury and grateful to the Palate, *Salmasius de Homonymi Hyl. Jatr. Cap. 58*.

RHYAS. *ῥῡας*. The same as **RHOEAS**.

RHYEMA. *ῥῡμα*. A Sort of Cake made of Honey and fine Flower.

RHYMA. *ῥῡμα*. A Remedy. *Castellus, Gorraus*.

RHYME. *ῥῡμη*. The same as **RHOPE**.

RHYMMA. *ῥῡμμα*. From *ῥῡναι*, to absterge. An Abstergent Medicine.

RHYNDACE, *ῥυνδάκνη*. A Sort of Bird about the Size of a Dove. *Hesychius*.

RHYPODES, *ῥυπόδες*. An Epithet for Medicines of a strigentitious Consistence; from *ῥυπος*, *Sordes*. *Galen, de Comp. M. P. G. L. 2. C. 1*.

RHYPOS, *ῥυπος*, *Sordes*; Filth, in the Galenical Stile, is an Excrement of the third Concoction, and collected on the Superficies of our Bodies. For as each of the two Concoctions, both that which is performed in the Stomach, and that which is afterwards made in the Liver, leaves two Kinds of Excrement, one moist, and the other dry; so from the third Concoction arise, also, two Kinds of Excrement in every Particle of an Animal, being produced from the very Juices with which they are nourished. One of these Excrements is Sweat, which was before a Vehicle for transmitting Aliment, and is a thin serous Humour, like Urine; the other consists of half-concocted Reliques, which could not be assimilated to the Part in order to its Nourishment. This also is of a thin Substance, as being the same which is evacuated through the Pores of the Skin by insensible Transpiration; but it is mixed also with some grosser excrementitious Parts, whence it very frequently stops and stays at the Skin; and hence have the Hairs their Original, and, also, those *Sordes* which are still accumulated and diffused over the Skin. These *Sordes* were not unknown to the Ancients, who very carefully absterged them from human Bodies, for various Uses, giving them the Name of *Strigmenta*, *Strigments*, as well as *Sordes*; the Greeks called them not only *ῥυπος*, *Rhypos*; but *γλοιός*, *Gloias*. They have the Virtue of moderately heating and discussing, which they acquire not so much from the Nature of our Bodies, as from the Mixture of Oil and Dust. For those *Sordes* which were absterged with the Strigil in Baths, were a Mixture of Oil and Sweat; but those which were procured from the *Palæstra*, or Common-Place of Exercises, had, besides, an Addition of Dust, both that which was sprinkled on the Combatants after they were anointed with Oil, and also what was raised by stirring in the Heat of the Conflict: That kind of Sweat which was thus excited, was called by a peculiar Name *πᾶλος*, *Patus*. Those *Sordes* then which had a greater Mixture of Oil, must be acknowledged to have more of an emollient Virtue; but those which had more of Dust in them, were more drying, discutient and digestive, especially if the Dust had more of Asperity and Acrimony than ordinary. For that Dust which is of a finer and more pinguious Substance than usual, and is what *Galen, Lib. 5. de Sanit. Tuend.* calls *χρῆς λιπαρῆς*, "fat or greasy Dust," is of a more emplastic Nature, and prevents a Diffuence and Refolution of the Particles of the Body on which it is sprinkled. But of all *Sordes*, or *Strigments*, those are most discutient, as well as moderately drying and emollient, which were scraped off, by the Ancients, from Statues and Vessels of Brass or Copper, in which Oil was reserved for the Uses of the *Palæstra*, as having contracted somewhat of an *Ærugo* from the Metal, as *Paulus, Lib. 7.* observes. *Gorraus*.

RHYPTICOS. *ῥυπτικός*, from *ῥῡναι*, to absterge. Abstergent.

RHYSIS. *ῥῡσις*. A Flux, a Term much used by the Physicians of the Methodic Sect. See the PREFACE. In o-

ther Medicinal Writers, it imports a Hæmorrhage, a *Diarrhæa*, a Gonorrhæa, or a Falling of the Hair.

RHYSSEMATA. *ῥῡσσηματα*. The Wrinkles and Sordes which appear upon the Skins of old People. *Castellus, Gorraus*.

RHYTHMOS. *ῥῡθμός*. The Cadence or Harmony of the Pulse; or the due Proportion betwixt one Pulsation, and those which are subsequent. See **ARYTHMOS**.

RHYTIDOSIS. *ῥυτίδωσις*. A Wasting, and Corrugation of the Eye. *Galen*.

RIAL ARMENIGOS. *ῥιὰ ἀρμένικος*. A barbarous Name for an Antidote in *Nicolaus Myrepsus, Sect. 1. C. 510*.

RIBES.

The Characters are;

It is a Shrub without Prickles, with large Leaves; the Pedicle ends in an Ovary, crowned with a large Calyx, divided into five great Segments; the Flower is pentapetalous, five small Petals arising from the Interstices of the Segments, and is furnished with five Stamina; the Ovary emitting a long Tube from the Centre of the Apex, becomes a round Fruit, which is umbilicated, produc'd in Clusters, and full of small Stones.

Boerhaave mentions six Species of *Ribes*, which are; 1. *Ribes*; vulgaris, acidus; ruber. *J. B. 2. 97. Boerh. Ind. A. 2. 54. Ribes, Ribesia*, Offic. *Ribes*, *Grossularia*, Ind. Med. 56. *Ribes vulgaris fructu rubro*, Ger. Emac. 1593. Ind. Raii Hist. 2. 1485. Synop. 3. 456. *Ribes fructu rubro*, Park. Theat. 1561. *Ribes rubra*, Parad. 558. *Grossularia multiplici acino, sive non spinosa hortensis, rubra sive Ribes Officinarum*, C. B. P. 455. Tourn. Inst. 639. **RED CURRANTS.**

The Currant-tree is well known to be a somewhat taller Tree than the Goose-berry, with larger Leaves and Thorns without. The Fruit grows in small Bunches of a red Colour, and of a sharp sweetish Taste; it is usually planted in Gardens, but is said to grow wild in the North of England. It flowers in April, and the Fruit is ripe in June. They are cooling and grateful to the Stomach, quench Thirst, and are somewhat restraining; a Jelly made with the Juice and Sugar, is cooling and grateful in Fevers. Currants are very rarely used in the Shops. *Miller's Bot. Off.*

The Jelly of Currants is saponaceous and resolvent, and an excellent Medicine, as well in Fevers, as chronical Obstructions, if taken for a long Time together, diluted with Water.

Currants are of two Sorts, red and white, which have nearly the same sharpish Taste, which proceeds from the acid Salts plentifully contained in them, which are dissolved in a sufficient Quantity of Phlegm. These acid Salts render them cooling, and proper for allaying the Heat of the Bile, and other Humours. They contract the Stomach a little, and resist Poison. The frequent eating of Currants sometimes occasion little Prickings in the Stomach; but the over-sharpness may be qualified by mixing a little Sugar with them. Good Sweet-meats are made of Currants, and also a Liqueur, with Water and Sugar called Currant-wine, used in the Heat of Summer to cool and moisten the Body. A cooling moistening Jelly is, also, made of them, which is used in Physic, and in Food, being very agreeable to the Taste; this mixed with Water is given feverish Patients to drink. Currant Leaves are astringent. *Lemery on Foods*.

2. *Ribes*; flore rubente. *J. B. 3. 98. Grossularia, hortensis, majore fructu rubro*. C. B. P. 455.

3. *Ribes*; quæ *Grossulariæ*; hortensis; majore fructu albo. *H. R. Par.*

4. *Ribes*; vulgaris; acidus; albas baccas ferens. *J. B. 2. 98. Grossularia, Hortensis, fructu Margaritis simili*. C. B. P. 455.

5. *Ribes*; alpinus; dulcis, *J. B. 2. 98. Grossularia, vulgaris, fructu dulci*. C. B. P. 455.

6. *Ribes*; nigrum vulgo dictum; folio olente. *J. B. 2. 98. Raii Hist. 2. 1486. Synop. 3. 456. Boerh. Ind. A. 2. 254. Ribes nigra*, Offic. Park. Parad. 558. *Ribes fructu nigro*, Theat. 1562. Ger. Emac. 1593. *Grossularia non spinosa, fructu nigro*, C. B. P. 455. **THE BLACK CURRANT.**

It flowers in June. The Fruit is recommended in a Quinsy, whence they are called Squinancy Berries. *Raii Hist. Plant.*

RIBESIA, a Name for the **RIBES**.

RICINOIDES.

The Characters are;

The Male Flowers consist of several Leaves, which are placed in a circular Order, and expand in Form of a Rose; these are barren. At remote Distances from these Flowers, upon the same Plant, are produced the Embryo's, which are wrapt up in the Flower-Cup, and afterwards become tri-capsular Fruit, containing one oblong Seed in each Cell.

Boerhaave mentions two Species of *Ricinoides*, which are; 1. *Ricinoides*; Americana; folio Gossypii. *Tourn. Inst. 656. Boerh. Ind. A. 253. Nuxes à Barbadoes*, Offic. *Ricinus Americanus*, Ger. 339. Emac. 496. Park. 183. *Raii Hist. 1.*

166. *Ricinus Americanus major semine nigro*, C. B. P. 432. *Ricinus major Americanus Curcas dictus*, & *Faba Purgatrix Indiae Occiduae*, J. B. 3. 643. *Ricinoides*, seu *Pincus purgans*, vel *Pinbones Indici*, Cod. Med. 97. *Munduy-Guacu*, seu *Nux Cathartica Americana*, Pil. 169. *Mundubi-Guacu Brasiliensis*, *Pinbones Lusitanis*, mihi *Nux Cathartica*, Marcz. 96. *Quauhay-shuatli* 1. *Avellana Cathartica*, Hern. 87. BARBADOES NUTS.

This grows in Barbadoes, and other Parts of the West-Indies. The Fruit is oblong, oval, of the Size of a small Bean, having one Side convex, the other depressed, including under a hard Pellicle a white Hemel. It agrees with the *Ricinus* in Virtues.

2. *Ricinoides*; Arbor; Americana; folio multifido. Tourn. Inst. 566. Boerb. Ind. A. 253. *Palma Christi*, Tourn. Mat. Med. 75. *Ricinus Americanus tenuiter diviso folio*, Raii Hist. 1. 167. *Avellana purgatrix*, C. B. P. 418. Raii Hist. 2. 1386. *Avellana purgatrix Novi Orbis*, J. B. 1. 322. *Avellana purgatrix*, Park. Theat. 1621. *Nuces purgantes*, Ger. 1362. Emac. 1546. PURGING NUTS.

This is an American Plant. The Nuts are of a whitish Colour, and are excessively cathartic. It is said, that a single Nut both vomits and purges for several Days, but that if the Pellicle is taken off, and it is divided into smaller Doses, it purges gently. Hist. Plant. Boerb. ascript.

RICINOKARPOS.

The Characters are;

The Male Flowers, which are dispos'd in a Spike, are produced in the following Manner: At the End of a little Tender, hairy Pedicle, grows a naked, tripetalous, herbaceous, Floscule, the Petals, which are acute, being expanded in the Form of a Star. From the Center of this Floscule, which is raised in the Form of a Cone, are produced nine Stamina, each furnished with one Fertilus.

Almost in the same Place of the Plant arise the Ovaries, furnished with shorter Pedicles, round, hairy, triangular, tri-anguliferous, and trilocular, like the *Ricinus*. The Place whence the Flower and Ovary have their common Origin, is surrounded with a Sort of common Calyx, from which the Ecdicles of the Flowers are produced.

Boerhaave mentions two Sorts of *Ricinokarpus*, which are;

1. *Ricinokarpus*; Afra. *Mercurialis procumbens, dicoccus, Africana, folio violae tricoloris*. Par. Bat. App. P. 10.

2. *Ricinokarpus*; Americana; flore albo spicato, foliis Circæ acutiori. Boerb. Ind. Alt. Plant. Vol. 1.

RICINUS.

The Characters are;

The Root is fibrous; the Leaves are alternate, large, and ragged; the Flowers are some Male, some Female, on the same Spike of the same Plant. The Male Flower consists of a monophyllous quinquefid Calyx, expanded like a Star, from whose Center arise Multitudes of fertile, Male Stamina, which appear, while they are beheld united, like a brachiated Thyrsus.

The Female Flower, or Ovary, consists of three Cells growing to one Axis, and so resembling a triangular Fruit, whose Apex is adorned with many Pinnule, from the Middle of which arise three Tubes, each of which has a rough, bifid Apex. Each Cell contains a single Seed, in Shape and Bigness resembling a Pine Kernel.

Boerhaave mentions five Sorts of *Ricinus*, which are;

1. *Ricinus*; vulgaris. C. B. P. 432. J. B. 3. 642. Raii Hist. 1. 166. Tourn. Inst. 532. Boerb. Ind. A. 2. 253. *Cataputia major*, *Ricinus*, Offic. *Granadilla Peruviana* Pharmacop. *Ricinus*, Ger. 399. Emac. 496. *Palma Christi*, Cod. Med. 88. *Ricinus* seu *Cataputia major vulgarior*, Park. Theat. 182. *Nhambu-Guacu* seu *Ricinus Americanus*, Pil. 180. MEXICO SEEDS.

This Plant grows to be as tall as a little Tree, with a smooth jointed hollow Stalk, a Finger thick or more, covered with a glaucous Meallines. The Leaves are large, roundish in Circumscription, but cut into five, seven, or sometimes nine sharp pointed, and serrated Divisions; the Foot Stalks are long, centring in the Middle of the back Part of the Leaves. The Flowers are small and staminate, growing on the Top of the Stalks, but lower down, and upon the Body of the Plant grow Bunches of rough triangular Husks, each including three white Seeds less than Horse Beans, which, in their brittle Shells, contain spotted Kernels, of a sweetish oily Taste.

These Kernels, which are the only Part used, are given by some Persons to purge watery Humours, which they do both upwards and downwards with great Violence; but considering we have much better and safer Purges to answer all Intentions, they are but seldom used. The Oil expressed from the Seeds, is good to kill Lice in Children's Heads. Miller's Bot. Off.

2. *Ricinus*; Americanus; major; caule virecente, H. R. P. 156.

3. *Ricinus*; Africanus; maximus; caule geniculato, rutilante. H. R. P.

4. *Ricinus*; Americanus; perennis.

5. *Ricinus*; vulgaris; minor. C. B. P. 432. *Erawai*, *Ricini pusillum genus*. Clus. Exot. 48. *Ricinus minor*. H. Eyft. Hist. o. 8. F. 11. F. 1. Boerhaave Ind. Alt. Plant. Vol. I.

It is called *Ricinus*, because the Seed resembles the Animal of that Name, which so greatly infects Dogs and Black-Cattle; it is also called *Palma Christi*, because the Leaves are said to resemble the Palm of a Hand; and some believe it is the Tree which shaded Jonas after he was discharged from the Whale.

The fifth is called the *Purging-Bean*; of this is prepared the Oil of *Kerva*, the *Oleum Cicinum*, called the *Oleum Ficus Infernalis*; so much celebrated in the Indies as a Lenitive, tho' this be the most acrimonious of all the Species. If it be stripped of its Pellicle, it purges upwards and downwards to such a degree, as to be prescribed by Hippocrates in the room of the *Grana Cnidia*, or *Cervus Cnidius*. But being taken with this Pellicle, it purges so violently as to cause an Inflammation of the Stomach and Intestines, whence it may pass for Poison. But tho' the Seeds are highly acrimonious, the Oil is very lenient, and excellent for a Rigor or Stiffness of the Limbs, and also for the Itch, Ulcers, and to destroy Worms. The fourth and fifth Species taken inwardly, work violently both by Stool and Vomit, whence they are prescribed in Apoplexies, Lethargies, and as Hydragogues in Dropsies. Hist. Plant. ascript. Boerhaave.

RICINUS is also a Name for an Insect, which is thus distinguished.

Ricinus, Offic. Schrod. 5. 345. Aldrov. de Insect. 559. Jonst. de Insect. 91. Charlt. Exer. 52. *Ricinus Olapae*, Raii Hist. Insect. 10. THE TICK.

It is a nasty little Animal, of a livid Colour, with a blunt and roundish Tail, and full of Blood, and very much infects Cows, Swine, Goats, Sheep and Dogs.

The Blood of those Ticks which live about Dogs, as Pliny says, is a *Psilothrum*, or Medicine to take off Hair, and mitigate an Erysipelas; and we are told by Amatus, that it is an admirable Remedy for an obstinate and malignant Impetigo. Dale.

RIGOR.

Before we treat of the Prognostics which may be drawn from *Rigors*, with respect to the Death or Recovery of the Patient, it will be necessary, first to settle the Notion of a *Rigor*; for if this be omitted, no certain Judgment in Diseases can be formed from such a Symptom. A *Rigor* then is a sudden and violent, or as Galen, Lib. de Trem. Palp. Convuls. & Rigore, says, "A dolorific Perfriction or Refrigeration of the natural Heat, with an unequal Concussion and Agitation of the whole Body, proceeding from the expulsive Faculty of the sensible Part, endeavouring to expel the noxious Humours." It is distinguished from a *Tremor*, in that a *Tremor* is only a Vibration of one Member, but a *Rigor* of the whole Body. But of this we shall speak more accurately a little below. A *Rigor* sometimes happens without a Fever, but generally attends it. That a *Rigor* may be excited without a Fever, we are taught by Galen in the Book abovementioned, Cap. 7. and de Caus. Symptom. Sect. 2. Cap. 5. and in his Book de Inæqual. Temper. Cap. 8. where he has demonstrated, against the Ancients, that *Rigors* may happen without a Fever. And he himself observed at Alexandria, a young Man who was seized with a *Rigor*, after eating unripe Dates, from the gross Humour obstructing the Veins. That a *Rigor* could be without a Fever was unknown to the Ancients, except Hippocrates, who, 1 Epid. Sect. 3. Aeg. 5. says of the Wife of Epicrates, that "when the Time of her Labour approached, she was seized with a *Rigor*, but had no Increase of Heat, as was said; the next Day, the same Symptom continued, and the third Day she was delivered of a Daughter." There may be therefore a *Rigor* without a Fever, which Galen and the Greeks call *ῥίγος ἀνέξηκτης*, "a *Rigor* without Heat;" but the *Rigor* which admits of Heat, as being succeeded by a Fever, is a violent, convulsive and morbid Affection.

But how are we to distinguish a *Rigor* from a Coldness and a Horror? Since we are told by Galen, de Trem. &c. before cited, Cap. 6. "For a sick Person to be under a *Rigor*, is certainly not the same as to be under a *Horror* or *Coldness*." And it is usual to say, that the Approach of the Fit is attended in one Patient with a *Rigor*, in another with a *Horror*, and in another perhaps only with a *Coldness*; and this is the common Language and Use of Words in the Writings of Physicians. Thus when a Person becomes vehemently cold, without any Concussion or Agitation of the Body, he is not affected with a *Rigor*; for to deserve that Name, it must be attended with an unequal and involuntary Motion. If this Coldness be

accompanied only with a gentle and unequal Commotion of the Skin, it is called a *Perfriction*; but if this Commotion of the Skin be very considerable, and attacks the Patient by Fits, without attacking the whole Body, it is called a *Horror*; so that a *Horror* is such an Affection of the Skin alone, as a *Rigor* is of the whole Body.

The Causes of a *Rigor* are, first, immoderate Heat or Cold: That these produce sudden and great Alterations in the Body, and induce *Horrors* and *Rigors*, is very well known to such as enter an immoderately cold or hot Bath, and is demonstrated by *Galen, de Caus. Symptom. Lib. 2. Cap. 5.* Justly therefore it is said by *Hippocrates*, that "Cold irritates Ulcers, hardens the Skin, causes intolerable Pains and seizes the *Rigors*." Some are seized with a *Horror* from an Excess of Fear, as others are with a Tremor from Ulcers and Abscesses under a Suppuration; and that *Rigors* are sometimes induced by Section and Inflation, we are told by *Galen, in 6 Epid. Com. 3.* where he says, that "such Operations induce a *Rigor*, as from something acrimonious affecting the sensible Flesh."

Agreeably to this Notion, the same Author rightly pronounces the principal Causes of a *Rigor* to be bilious and acrimonious Humours; for these, by vellicating the sensible Parts, provoke the natural Heat, which, in striving with great Force to expel them, excites that unequal and convulsive Motion of the whole Body, as he expresses it, *de Caus. Sympt. Lib. 2. Cap. 5.* These *Rigors* are very apparent in bilious Fevers, especially of the intermittent Kind. In these Cases, the thin, bilious, and highly acrimonious Humours being expelled without the Veins, are under continual Impulses from all the sensible Corpuscles, and forced from one Place to another, till they take their Course either towards the Skin, and there discharge themselves through its Pores in Sweat, or are thrown upon the Stomach, and discharged in vomiting, or forced downwards into the Intestines, and evacuated by Stool. Hence *Rigors* are usually succeeded by bilious Evacuations, as *Galen, Com. 2. in 6 Epid.* observes, where he says, "In our Discourse of a *Rigor* we have shewn, that Excretions of bitter Bile, which hurries through the sensible Bodies in order to be discharged, are the Consequence of that Disorder. This then is the Origin of a *Rigor*: The noxious and acrimonious Humours are, by the expulsive Faculty of the Veins, forced without those Vessels upon the other Parts, from which, since they as much infest and irritate them by their Acrimony, and excite their expulsive Faculty, as in the other, they are equally expelled and forced upon others; and thus successively, till they make their Retreat to the Skin, Stomach or Belly; where they find a Vent, as has been said. Now the injured and irritated Parts, in striving to expel the noxious Humour, call in the natural Heat to their Assistance, whence the extreme Parts are refrigerated, being destitute of that Heat. But when the Expulsion of the Humours is finished, which is when they have made their Way to the Skin, or some other Place, whence they may be excreted, the Heat is recalled, and the extreme Parts recover their Heat, and the sooner and more effectually, if the natural Heat be vigorous; but if this be very weak, those Parts are very slowly and insufficiently heated, or hardly return to their usual Warmth. Under this Expulsion of the Humours happens that unequal or irregular Concussion and Vibration of the whole Body, which we call a *Rigor*; during which the extreme Parts are refrigerated, the natural Heat retiring inwards; for which reason the Body is always cold under a *Rigor*."

This Affection, which we call a *Rigor*, is not only excited by acrimonious Humours, but sometimes by a gross Humour obstructing the Veins. Of this Nature was the *Rigor* of the young Man of *Alexandria*, observed by *Galen* as above-mentioned; for which he accounts in the following Manner: "In this Case a *Rigor* is occasioned by an Obstruction of the Motion of the natural Heat by Force. For this Heat, being entire and unimpaired, both in Substance and Strength, strives to expand itself, and to be distributed into all Parts of the Body; but being forcibly restrained, and repelled to the more inward Parts, it retreats to its own Original; but being incapable of making any Stay there (for to a Substance of a moveable Nature, Consistence in Place is Death) collecting, and, as it were, concentrating itself, it recurs not with an equable and free Motion, but rushing forth with an Impetus, and as it were a Horse starting from the Barrier, it directs its full Force against what obstructed its Passage, endeavouring to propel the same, and clear the Way; but being repelled, and its Violence check'd in the Midst, the whole Body is shock'd at the Encounter. For besides other Effects, it is rendered vaporous by dashing against those Obstacles, and recoils inwards, as tho' from Repercussion, and retreats again to its Principle or Original; thence again breaking forth, it falls on with more Violence, and being again repulsed, renews its Attacks till

"it has removed the Nuisance." A *Rigor* begins at the Back and Loins; to which Subject relates that of *Hippocrates, 5 Aph. 69.* where he says, "A *Rigor* in Women begins principally at the Loins, and proceeds by the Back to the Head: In Men, they begin in the anterior rather than the posterior Parts of the Body, as in the Cubits and Thighs. In Men also the Skin is of a rare Texture, as appears by the Hairs."

But let this suffice for illustrating the Notion of a *Rigor*; we are now to examine what may be predicted from it; and here we shall treat first of such *Rigors* as are of good Prognostication. Among *Rigors* observed in Fevers, those are good which are periodic, and the proper Symptoms of Fevers. Periodic *Rigors* which happen every Day, or every second or third Day, and precede intermittent Fevers, are all salutary, and by *Hippocrates, 4 Aph. 43.* pronounced void of Danger; and the more so in proportion to the Greatness of the Intermittion, and the Shortness of the Fit. *Hippocrates, 4 Aph. 63.* tells us, that "quotidian *Rigors* are solved by quotidian Fevers;" for, as *Galen* says in his Comment on the Place, since *Rigors* happen with Commotion, through the whole Habitat of the Body, succeeded by an Expurgation and Evacuation of the Humours, the Intermittion of such Fevers may be rationally expected to terminate at last in an utter Cessation of the Disorder. What he (*Hippocrates*) says of quotidian *Rigors*, that they are solved by quotidian Fevers, is as true of tertian and quartan *Rigors*, as appears from Observations on Tertian and Quartan Fevers, whose Returns are always preceded by a *Rigor*.

But the most salutary of all *Rigors* are critical ones; such are those which attend a Fever upon some critical Day, with Signs of Concoction, and are succeeded by copious and kindly Sweats, or Vomiting, or Stools, or an Hæmorrhage from the Nostrils, which are followed by a perfect Removal, or at least a remarkable Abatement of the Fever. Of such *Hippocrates* speaks, *4 Aph. 58.* where we are told "if one under a burning Fever be seized with a *Rigor*, he becomes freed from the Disease." There seem to be two Properties belonging to a good *Rigor*; the first is, that it be succeeded by a remarkable Heat, of which *Galen, Lib. de Trem. &c. Cap. 6.* assigns three Causes; first, that the natural Heat being repressed from the Superficies, is collected in the internal Parts, in order to assist in expelling the noxious Humours; after which being cherished and increased by the Humour which resides within, it breaks forth all at once, and expands itself with more Vehemence. Secondly, that in its violent Recourse, its Motion being much accelerated, it kindles in striking upon the external Parts, and is increased after the same manner as Stones and Iron acquire a considerable Heat by Motion and mutual Attrition. And lastly, that the Heat, in its Return to the Superficies, brings along with it some hot Humour, which must have its Effect in heating the external Parts; and the more vigorous the State of the natural Heat, the hotter is the Body after a *Rigor*, and the weaker this Heat, the less Warmth will accrue to the Body. Hence it is a good Sign for Bodies to be well heated after a *Rigor*, since it indicates a Firmness and Strength of Nature, as on the contrary, which will appear hereafter, for a Patient, after a *Rigor*, to acquire little or no Heat, shews him to be in a very bad State, and that Nature is very weak and low. For the Body therefore to acquire an extraordinary Degree of Heat after a *Rigor*, by what Cause soever procured, is a very good Sign.

The other Property of a beneficial *Rigor* is, that it be succeeded by very beneficial Evacuations or Purgations; to which we may add, that it wholly removes, or at least diminishes, the Fever. Such were the *Rigors* observed by *Hippocrates* in many of his Patients, particularly the Wife of *Epicrates*, *Charion*, the Virgin of *Larissa*, the Woman which lay ill at the House of *Timeneus*, and *Philistis*. Of the Wife of *Epicrates*, *1 Epid. Sect. 3. Ægr. 5.* he says, "On the fourteenth Day (of her Illness) she was seized with a new *Rigor*, succeeded by a high Fever; on the fifteenth she vomited at several times bilious yellow Matter, sweated, and was free from a Fever; towards Night was highly feverish, and her Urine was thick, with a white Sediment." And of *Charion*, *3 Epid. Sect. 2. Ægr. 5.* we are told, that "on the seventh Day he was seized with a new *Rigor*, had a high Fever, sweated all over his Body, and had a Crisis." In the same manner when he relapsed on the seventeenth Day, "he was taken with a new *Rigor*, succeeded by a high Fever, sweated, had a Crisis, and was freed from his Fever." In his Account of the Virgin of *Larissa*, *3 Epid. Sect. 3. Ægr. 12.* he tells us, "On the sixth Day she had a copious Hæmorrhage from the Nose, and was seized with a *Horror*, succeeded by a copious and hot Sweat all over the Body, had a Crisis, and was freed from her Fever." The Woman also at the House of *Timeneus*, *4 Epid. T. 25.* had a *Rigor* succeeded by a happy Crisis. The same was the Case of *Philistis* the Wife

Wife of *Heracles*, 7 *Epid.* 136. Sometimes a *Rigor* is a good Sign in an *Hæmorrhage*, as we find it pronounced, 1 *Prorrh.* 150. where it is said, that "they who in the Beginning are molested with a copious *Hæmorrhage*, have the Course of it stopped by a supervening *Rigor*;" and not without Reason, since, under an immoderate Evacuation, the Heat, together with the Blood, sometimes retire to the inward Parts. A *Rigor*, however, in Diseases of this Kind, portends their long Continuance; for as *Galen* says, in his Comment on the Place, "If an Eruption of Blood does not mitigate the Disorder, but is succeeded by a *Rigor*, both this and the Disease are rendered of long Duration, because the Body is difficult to be heated." Sometimes *Rigors* portend a Crisis upon the Coming on of a *Tremor*, according to *Coac.* 27.

We have treated enough of such *Rigors* as are esteemed of good Prognostication in Diseases, and are now to say something of the contrary Kind, or those which portend nothing but the Destruction of the Patient. Of this Nature, in the first Place, is a *Rigor* succeeded by little or no Heat; for this is an Indication of great Weakness of Nature, agreeably to 1 *Prorrh.* 65. where we read, that "Refrigerations from a *Rigor* not succeeded by Heat, are bad." And the Reason is, as *Galen* observes, because it indicates an Extinction of the Heat, as it did in the Case of the Woman who lay ill in *Mendacium Foro*, 3 *Epid.* Sect. 2. *Ægr.* 12.

Those *Rigors* are also pernicious which are succeeded by none, or a bad Evacuation, and are properly reckoned among those bad or imperfect critical Signs which determine nothing. *Galen*, in 1 *Prorrh.* discoursing on this Subject, says, "They who understood this of a *Rigor* in general, should have always remember'd, that if it happened on the third or fourth Day, it was a peculiar Symptom of such Fevers; but if it appeared after that Time, and was not attended with a Crisis, it was of very bad Signification."

Rigors are of a very bad kind, when they are attended with some bad Excretion, because they are of the Number of undetermining critical Signs, which *Galen* affirms to be either mortal, or of difficult Crisis [that shew the Disease will have a fatal, or at least a very hard and dangerous Turn.]. On the same Point we read, 1 *Prorrh.* 66. "If Heat returns not upon a Perfriction, or extreme Perfrigeration, attended with Sweating, it is a bad Sign; and if to those there be an Accession of a burning Heat and Pain of the Sides, with frequent Attacks of a *Rigor*, the Patient is in a dangerous State." Now all cold Sweats are dangerous, especially such as affect the upper Parts, and those which, tho' copious and profuse, remove not the Fever. We find an Instance to this purpose, 1 *Epid.* Sect. 3. *Ægr.* 11. in the Wife of *Dromedus*; in the Account of whose Case it is said, "that on the third Day about Noon she had the Return of a *Rigor*, with a high Fever, Urine as before, a Pain of the Hypochondrium, had a Loathing and Nausea, a troublesome Night, without Sleep, with a cold Sweat diffused over all her Body." She died on the sixth Day. The Woman also who lay sick in *Foro Mendacium*, had several Fits of a *Rigor*, attended with a cold Sweat before her Death. A copious Sweat also, tho' not cold, in a crude State of the Disease, which neither removes the Fever nor its Symptoms, is mortal; and especially if it appears on the sixth or eighth Day. Such was that observed by *Hippocrates*, 1 *Epid.* Sect. 3. *Ægr.* 12. in the Person who was taken ill of a Fever after Supper, of whom he says: "On the eighth Day he was seized with a *Rigor*, had a high Fever, sweated much, seemed to be without a Fever, slept little, and was cold after Sleep." On the eleventh Day he died. And we read, *Coac.* "that repeated Fits of a *Rigor*, with Sweating, are mortal." All *Rigors* therefore, succeeded by a bad Evacuation, or none at all, are bad.

With Respect to a Fever, *Rigors* which neither remove nor alleviate the Disorder, are of a very bad Kind. Thus has *Hippocrates* determined, 4 *Aph.* 56. "A *Rigor*, he says, coming upon a Fever, if the Disease is not mitigated, is a bad Sign." [In that Aphorism it is a Sweat, and not a *Rigor*; but the Aphorism which would pretty well answer the Purpose, is 4 *Aph.* 46. which is, "that a *Rigor* coming upon a Fever, and the Disease not intermitting, if the Patient be weak before, is mortal."] But the Case is worst of all, when a *Rigor* of this Nature is succeeded by a copious Evacuation, as *Galen* rightly observes in his Comment on 4 *Aph.* 46. "For if, he says, an Evacuation follows a *Rigor*, and the Fever be not alleviated thereby, the Patient must probably sink under them in Conjunction; both because the weak Condition of his Body cannot bear the Agitation of the *Rigor*, and also because the Evacuation is sufficient to cause his Dissolution." But if the Strength of the Patient be very much exhausted by the Disease, a *Rigor* will prove mortal, according to 4 *Aph.* 46. before quoted; for all *Rigors*, of what kind soever, which happen under a great Decay of Strength, are pernicious, as indicating an Extinction

of the natural Heat. And to this purpose are we to understand the Author of 1 *Prorrh.* 65. where he says, that "a Refrigeration from a *Rigor*, where the Heat returns not again, is a bad Sign." And *Coac.* 221. "a *Rigor* coming upon a severe Fever, with a Distortion of the Eyes, proves mortal." Perhaps also what *Hippocrates* says, 7 *Aph.* 7. "A *Rigor* and Delirium after a Debauch, are bad," may be applied to these Kinds of *Rigors*; for such a *Rigor* is occasioned, as *Galen* on the Place observes, from an Extinction of the Heat by an Oppression, in the same manner as a Fire is extinguished by heaping too much Wood upon it, or a Lamp by pouring on too much Oil.

The pernicious Signification of *Rigors* is also known from other preceding, concomitant or subsequent bad Signs. In a continual Fever, a *Rigor*, attended with bad Signs, is always to be dreaded. This will appear from what *Hippocrates* says of them, 1 *Epid.* "When burning Fevers, he says, began (to be epidemic) they afforded Signs by which one might judge when they were like to prove mortal; the Patients were first seized with a high Fever succeeded by a *Rigor*, were incapable of Sleeping, were extremely restless, thirsty, and loathed every thing." In Phrensies also accompanied with white Stools, or white Urine, the Accession of a *Rigor*, is a bad Sign, as we are told, 1 *Prorrh.* 13. and T. 64. it is said, "that for a Person under a *Rigor* not to know his familiar Acquaintance, and to be forgetful of what is past, is a bad Sign;" as it indicates, as *Galen* says in his Comment, that the natural Heat is overcome by the extraordinary Refrigeration. And a little after, 1 *Prorrh.* 67. "Burning *Rigors* [*καυκώδεις ῥίγες*] are not without Danger; and when accompanied with a fiery Redness [*ῥοδόχρομα*] of the Face, and a Sweat, are bad Signs." This is repeated, *Coac.* 7. And again, T. 89. speaking of these Kinds of *Rigors*, he says, "For a Person labouring under a Fever, and a Lassitude, with a Distortion of the Eyes, to be seized with a *Rigor*, is of pernicious Signification; and a comatous Disposition in such Cases is bad." Again, *Coac.* 14. "Severe *Rigors*, inducing a *Torpor*, are malignant," as indicating an Extinction of the natural Heat. And, T. 22. "Rigors accompanied with Head-ach and Faintings, are mortal;" because they indicate a considerable Inflammation of the Brain. Our Judgment, therefore, of the bad Event of a *Rigor*, is justified by the Concomitance of other bad Signs. This is further illustrated, *Coac.* 20. or more clearly, 1 *Prorrh.* 101. where it is said, that "such as labour under repeated Fits of a *Rigor*, which is exasperated towards Night, with Watchings or Agitations of the Veins [*φλεβοδυνμία*, see the Article PHLEBODONODES] in Sleep, and involuntary Discharges of Urine, fall at last into a Coma and Convulsions." *Rigors*, therefore, in an acute Fever, in Conjunction with other bad Signs, render the fatal Event more easily to be prognosticated.

Continual and frequent *Rigors* are also of a bad kind, as we find them pronounced, *Coac.* 9, 10. since they indicate either a Suppuration of some one of the Viscera, or vain Efforts towards a Crisis, or else an Extinction of the natural Heat. We have an Instance to this purpose, in the Woman who lay ill in *Foro Mendacium*, before quoted; and whose History will greatly serve to illustrate what has been said of mortal *Rigors*; for she was often seized in the Progress of the Disease with *Rigors*, which were always attended with pernicious Signs. The Case is as follows, 3 *Epid.* Sect. 2. *Ægr.* 12. "A Woman who lodged in the *Forum Mendacium*, after hard Labour with a male Child, was taken ill of a violent Fever, attended at first with a Thirst, Loathing, and Cardialgia; her Tongue was dry, her Stools were thin, and little in Quantity, and voided after much Pain and Gripings, and she had no Sleep. The next Day she felt somewhat of a *Rigor*, succeeded by a high Fever, and something of a cold Sweat about the Head. On the third Day, the Stools were crude, thin, much in Quantity, and voided with Pain. On the fourth she had a new Fit of a *Rigor*, all the Symptoms were exasperated, and she could take no Sleep. On the fifth she was very ill; and on the sixth continued in the same State, and voided Plenty of liquid Matter by Stool. On the seventh Day she was seized with another Fit of a *Rigor*, succeeded by a high Fever, a great Thirst, and continual Tossing, and towards Night, with a cold Sweat all over the Body, with a Coldness of the extreme Parts, into which the Heat could not be recalled. At Night she had another Fit of a *Rigor*, and her extreme Parts recovered no Warmth; she had no Sleep, was a little delirious, but soon came to herself again. On the eighth, about Noon, she recovered Heat, had a Thirst, with a Coma, and a Nausea, and vomited up some bilious yellowish Matter, tho' but little in Quantity; she had a bad Night, passed it without Sleep, and great Plenty of Urine came from her involuntarily. On the ninth, all the Symptoms were remitted,

"remitted, and she was inclined to a Cerna; in the Evening she had something of a Riger, and vomited a little bilious Matter. On the tenth she had a new Fit of a Riger, the Fever was exasperated, and she had no Sleep; in the Morning she made great Plenty of Water, which had no Hypostasis, and her extreme Parts recovered Heat. On the eleventh she vomited virulent, bilious Matter, and soon after was again seized with a Riger, and a Refrigeration of the extreme Parts; towards Evening she fell into a Sweat with a Riger, vomited much, and had a very bad Night. On the twelfth she vomited up much black, fetid Matter, and was much molested with the Hiccup, and a Thirst. On the thirteenth she was seized with a Riger, and vomitings of much black Matter, which had a very ill Smell; about Noon she lost her Voice. On the fourteenth Blood came from her Nose, and she died. The whole Course of the Disease was a Looseness and a Horror. The Woman was about seventeen Years of Age." *Prosper Alpinus de Presag. Vit. & Mort. Aegrot.*

RIGOR. A Stiffness or Inflexibility.

RIGOR NERVORUM, is the same as Tetanus.

RILLUS, is defined by *Rulandus*, a chemical Utensil, into which melted Metals are poured, in order to impart to them an oblong Form.

REMA. A Fissure, or Chap. In Anatomy it imports, the Fissure of the Female Pudenda.

RIMULA. The Aperture of the Glottis.

RINÆUS MUSCULUS. The Name of a Muscle of the Nose mentioned by *Douglas*, which he, also, calls *Nasalis*, and says it arises fleshy from the Extremity of the Os Nasi, and adjacent Part of the Os Maxillare.

It is inserted into all the Cartilages of the Ala.

Its Use is to open and dilate the Nostril, by pulling that Part outwards.

RINAR. *Rulandus* explains this, *Limatura*.

RIPARIUS. An Epithet of Animals which frequent the Banks of Rivers, or the Sea-shore.

RISIGALLUM. The same as AURIPIGMENTUM.

RISTORUM. A kind of nourishing Aliment prepar'd of the Yolks of Eggs. It seems to be a Sort of Egg Caudle.

RISUS. Laughter. See RESPIRATIO. See SARDONIUS.

RITRO, Offic. *Echinopus minor*, J. B. 3. 72. Tourn. Inf. 463. *Carduus globosus minor*, Ger. 990. Emac. 1151. Park. Parad. 332. *Carduus Sphærocephalus cæruleus minor*, C. B. 381. Raii Hist. 1. 383. *Scabiosa Cardui folio Sphærocephala humilior*, Herm. Cat. 539. LITTLE GLOBE THISTLE.

It is cultivated in Gardens, and flowers in June. The Root is used, and possesses the same Virtues as that of the *ECHINOPUS MAJOR*.

RIWAND, and RIWANDTZINI, are Arabic Words, importing Rhubarb.

ROADES, in *Paracelsus*, is an unskilful, simple Physician.

ROB. See DECOCTIO.

ROBERTIANUM. See GERANIUM.

ROBES. Vinegar. *Rulandus*.

ROBIGO. The same as RUBIGO.

ROBORANTIA. Strengthening Medicines. See ANALEPTICA.

ROBUR. The Oak. See QUERCUS.

ROBYS. An Epithet for the best Sort of Wheaten Bread. *Castellus from Langius*.

ROCELLA. See FUCUS.

ROCHETTA. *Antonio Neri* informs us, that *Polverine* or *Rochetta*, which comes from the Levant and Syria, is the Ashes of a certain Herb growing there in Abundance: There is no doubt but that it makes a much whiter Salt than *Barillia* of Spain, and therefore when you would make a Crystal very perfect, make it of Sut extracted from *Polverine* or *Rochetta* of the Levant. For tho' *Barillia* yields more Salt, yet Crystal made of it inclines to a Blueness, and has not the Whiteness and Fairness of that made of *Polverine*.

Upon this *Merret* remarks, that *Polverine* and *Rochetta* are the same Thing, and are nothing more than Ashes extracted from the same Plant, but differing in Goodness. The Name of the latter is wholly unknown to our Glass-Houses, and has now no Distinction at *Moran* itself. The Name of *Polverine* is still kept, and 'tis given to all Ashes which come from the Levant to make Glasses with. The Reason then of their different Names seems to be, that the *Polverine* was that which was brought in small Powder, and the other in hard Pieces or Stones, and therefore named *Rochetta*. And indeed the Workmen observe, that the harder and bigger Lumps yield a whiter and stronger Salt than that which comes over in small Pieces or Powder. And whether this proceeds from the Seasons of their Growth, Gathering and Burning, or from some Sophistication from other fixed Salts mixed with it, or from Sea-Salt or other Moisture with which they are

damaged, I determine not. But certain it is, that to make the strongest Salt, and such as will come into hard and stony Lumps, they make a Lee of their first burnt Ashes, and therewith water the Herbs to be next burnt, and so water the Herbs with new Lees at every Burning, and this will make a most strong Pot-ash for Soap-boylers and Dyers: Tho' I cannot affirm that this Method has been practised in making *Rochetta*, and that it is now omitted.

ROCHUM ALUMEN. Rock Alum.

RODODENDION. See NERIUM, and ÆGOLETHRON.

ROGGA. A Name for the *Secale*; *Hybernum*, vel *majus*.

ROHOB. The same as ROB.

ROMANA ADRIANA ANTIDOTUS. The Name of an Antidote described by *Nicolaus Myrepsus*. Sect. 1. C. 5.

RONAS. A Root used much by the Persians, for dying a red Colour. I don't know that it is used in Medicine.

RONDELETIA.

The Characters are;

It hath a Salver shaped Flower, consisting of one Leaf, which is tubulous, and rests on the Empalement; which Empalement afterwards becomes a roundish coronated Fruit, divided into two Cells, containing many small Seeds.

Miller mentions but one Sort of this Plant, which is, *Rondeletia arborescens, tini facie*, Plum. Nou. Gen.

This Plant was discovered by Father *Plumier*, in America, who gave it this Name in Honour to *Gulielmus Rondeletius*, a famous Physician of *Montpelier*.

The Seeds of this Plant were sent to England by Mr. *Robert Millar* Surgeon, who collected them on the North-side of the Island of Jamaica, where the Trees grow plentifully, as also in several Parts of the Spanish West Indies. *Miller's Dictionary*, Vol. II.

RONDESSA. A Sort of American Cat, which is said to take her Young into her Belly, and bring them out again at Pleasure. *Castellus* from Eph. N. C.

RORELLA. A Name for the *Ros Solis*.

RORIFERUS. Roriferous. An Epithet applied by some Anatomists, to the lacteal and lymphatic Vessels.

ROS. Dew.

If in a long continued Summer's Drought, the Surface of the Earth comes to be greatly parched with the Heat of the Sun, not only Water, but, also, other less volatile Substances, of an unctuous and saline Nature, will thus be raised to some Height into the Atmosphere, tho' invisibly, so long as such Exhalations are agitated by the Sun's Heat, which coming to lessen towards the Evening, the Air soon grows cooler; while at the same time, the Earth retaining the Heat much longer than the Air, still continues to breath out hot Exhalations, whence arises a white, dense, visible Vapour, hotter below than above; this Vapour appears, therefore, first in low watery Places, thence gradually diffuses itself, so as in the Night to cover the Surface of the Earth with a Mist, which is dissipated by the Rising Sun. This Moisture, called by the Name of Dew, is a very compound Substance; nor can we assert any Thing that will hold universally true of its peculiar Nature. It must needs be a Chaos, as it is a Collection of all Sorts of volatile Particles, promiscuously jumbled together by the Heat of the Sun, acting upon the Earth; it must, also, be different in different Parts of the Earth, according as different Kinds of Particles lodge therein. Thus in large Tracts of gravelly or Heath Ground, which lie dry and high, it will be small in Quantity, and almost totally aqueous; as in fat bituminous Earths, near Marshes, and standing Waters, it is far different in Quantity and Quality, and prejudicial to Health; whence it is no Wonder that Chymists, in their analysing of Dew, should find such different Results, that scarcely any two are agreed about them. Certainly they who seek for the Spirit of Life, the universal Solvent, the Mercury of Life, the Nitre and Steel of *Sendivogius*, in Dew, seem not to understand them right; it is better to say, that Dew is of a subtle saponaceous Nature, capable of supporting Vegetables. Some Dew that had been collected in a certain Part of the Earth, has afforded a Liquor, by Distillation, which struck the Colours of the Rain-bow upon Glass, so strong as not to be effaced by Friction, alkaline Lixiviums, or *Aqua Regia*; it, also, burnt like Spirit of Wine. Again, some distilled Dew having been digested with gentle Heat, for eight Days, and then rectified six Times over, till it was exceedingly subtle, is reported to have broke three Glass Vessels successively, tho' it still remained perfectly insipid. Again, some Dew is described to be like a yellowish Butter, that melts by being rubbed upon the Hand, yet grows hard and dry with a moderate Heat, being of a fetid Odour, and to be found in pretty large Lumps in the Night, especially in the Spring and Winter. The Nature of Dew, also, differs surprisingly with the different Seasons of the Year, and the various Successions of Meteors; hence exceedingly small Seeds of Vegetables, and invisible Eggs

Eggs of minute Animals, with numerous other Things coming to be digested, fermented or putrefied therein, it must afford many very different Productions by Distillation; whence Chemists have formed very odd Opinions about it. We can only say that the greatest Part of it is Water; and that the other Parts cannot be ascertained on Account of their infinite Variety. *Boerhaave's Chemistry.*

ROSA.

The Characters are;

It is a Shrub generally covered with a prickly or thorny Bark; the Leaves are pinnated, and end in an odd Lobe. The Extremity of the Pedicle forms an Ovary almost spherical, and surrounded on the Top with a Crown deeply cut into five Parts, radiated, and with its five long-laciniated Segments resembling a Calyx. The Flower is pentapetalous, the Petals arising from the internal Margin of the Calyx; whence also are produced very numerous Stamina. The Ovary produces from the Center of the Apex a small Head, adorned with a Multitude of fimbriated Tubes, and becomes an unicapular Fruit, full of vast Numbers of angular hairy Seeds, and furnished with a foliaceous Apex.

Boerhaave mentions thirty-nine, and *Miller* forty-nine Species of Roses; but those principally used in Medicine are the seven following:

1. ROSA CANINA. *The Common Briar or Dogs-Rose.* See CYNOSBATOS.

2. ROSA DAMASCENA, *pallida*, Offic. *Rosa Provincialis*, *sive Damascena*, Ger. 1079. Emac. 1261. *Rosa Damascena*, Park. Theat. 1017. Parad. 413. Raii Hist. 2. 1468. *Rosa Purpurea*, C. B. P. 481. Tourn. Inst. 637. *Rosa Damascena, flore pleno*, Boerh. Ind. A. 2. 152. *Rosa rubella, flore majore, multiplicato, sive pleno, incarnata vulgo*, J. B. 2. 36. *An Rosa incarnata vulgaris*, Mont. Ind. 51. THE DAMASK-ROSE.

The Damask-Rose grows not so tall, nor so large as the white Rose, but yet taller and fuller of Prickles than the red, especially about the Stalk. The Leaves are whiter and more hairy. The Flowers are less double than the *Provence* Rose, and the Beards prickly; they are of a pale red Colour, and of a most pleasant Scent.

The Flowers are of a gentle cathartic Nature, purging cholic and ferous Humours, being given to Children and weakly Persons, and mixed frequently with stronger Cathartics.

Official Preparations of Damask-Roses, are the *Syrupus à Succo Rosarum*, *Syrupus Rosaceus solutivus*, the *Aqua Rosarum Damascenarum*, and the *Electuarium à Succo Rosarum*. *Miller's Bot. Off.*

AQUA ROSARUM DAMASCENARUM. WATER OF DAMASK-ROSES. See AQUA.

ELECTUARIUM E SUCCO ROSARUM. ELECTUARY OF THE JUICE OF ROSES. See ELECTUARIUM.

SYRUPUS E SUCCO ROSARUM.

Syrup of the Juice of Roses.

This is prepared without any Infusion, from the expressed Juice of the Flowers, with the same Proportions of Sugar to the Quantity of Juice as directed in the *Syrupus Rosaceus Solutivus*.

SYRUPUS ROSACEUS SOLUTIVUS.

Solutive Syrup of Roses.

Take of boiling Water, four Pound; stir into it as much fresh Damask-Rose Leaves as it will contain; let them stand together in a warm Infusion for twelve Hours, and then press it out strongly. Let this again be heated, and new Flowers stirred in, and steeped as before; and proceed to a third Repetition of the same, every Time increasing the Quantity of the Flowers put in, in proportion to the Liquor, which every time will increase almost one Third. When this is all finished, to fix Parts of the Liquor put four Parts of white Sugar, and boil into a Syrup with a Bath-Heat, according to Art.

This is the same as in the former Dispensatory of the College, but at first was ordered to be repeated nine times in the Infusion; but the Shops have been hitherto most accustomed to make it from the clarified Juice of the Roses, or from their Residuum after Distillation.

3. ROSA PALLIDA, Offic. Ind. Med. 98. Chomel. 12. *Rosa rubra pallidior*, C. B. P. 481. *Rosa heloserica*, Lob. Icon. 2. 207. *Rosa sativa*, IV. Dod. Pempt. 187. *Dale* makes a Doubt whether this be not of the same Species with the Damask-Rose.

4. ROSA PALLIDA, Offic. *Rosa maxima multiplex*, C. B. P. 481. Tourn. Inst. 637. *Rosa Hollandica, sive Batava*, Ger. 1081. Emac. 1262. *Rosa Provincialis, sive Hollandica Damascena*, Park. Parad. 413. Raii Hist. 2. 1469. *Rosa Hollandica rubella plena quibusdam, centifolia, spinosa frutice*, J. B. 2. 37. THE DAMASK PROVINCE ROSE.

It is common in Gardens, and flowers in July; the Virtues are the same with those of the common Damask-Rose.

5. ROSA RUBRA, Offic. Ger. 1079. Emac. 1261. Raii Hist. 2. 1468. *Rosa rubra multiplex*, C. B. P. 481. Tourn. Inst. 636. *Rosa rubra Anglica*, Park. Parad. 412. *Rosa rubra valde plena*, J. B. 2. 34. THE RED-ROSE.

This Rose generally grows in lower Bushes than the White Damask Roses; the Flowers have very few Prickles on the Stalks, and the Calyx or Beards are shorter and smoother; they are less double than either the White or Damask, having a great many yellow Anthera in the Middle.

The Red-Rose is more binding and restraining than the Damask and White, and good against all Kinds of Fluxes; they strengthen the Stomach, prevent Vomiting, and stop tickling Coughs, by preventing the Defluxion of Rheum, and are of great Service in Consumptions. The Antheræ or Apices are accounted Cordial, though they are but seldom used.

Official Preparations are, a *Simple Rose-Water*, *Conserva Rosarum*, *Saccharum Rosarum*, *Syrupus à Rosis siccis*, *Mel Rosarum*, *Oleum Rosarum*, *Unguentum Rosarum*, *Tinctura Rosarum*, & *Species Aromaticum Rosatum*. *Miller's Bot. Off.*

The Parts in Use are the Flowers and the Antheræ, which are yellow Floscules, which adhere to the Capillaments in the Middle of the Flowers.

The Flowers are of principal Use in Fluxes, Fevers, Thirst, and Loss of Appetite. Outwardly they are of Service in Vomiting, Head-ach, want of Sleep, Pains of the Ears and Gums, and of the Anus; in Ulcers of the Mouth, Fauces and Eyes. The Antheræ dried, are used in Dentifrices for Astringency of the Gums. *Dale.*

Roses are of singular Service in Medicine, since the Water distilled from them in Consequence of its fragrant Oil, is highly friendly to Nature; and whether internally exhibited, or externally applied, excellently calculated for recruiting the Strength, and alleviating Pains and Inflammations in all hot Diseases. Conserve of Roses, by means of its cordial and astringent Virtues, is peculiarly adapted and appropriated to pithical and hectic Patients. Vinegar of Roses, mixed with the Spirit and Water of Roses, adding Nitre and a little Camphire, makes an Epithem, which, when applied to the Head, I have, from repeated Experience, found to be of incomparable Efficacy in removing Head-achs, preventing Deliriums, and stopping immoderate Hæmorrhages from the Nose. *Hoffman de Præst. Remed. Domest.*

CONSERVA ROSARUM. See CONSERVA.

MEL ROSARUM. Honey of ROSES. See MEL.

OLEUM ROSARUM. See OLEUM.

SACCHARUM ROSATUM TABULATUM.

Lozenge-Sugar with Roses.

Take of Red-Rose Leaves without the white Heels, and hastily dried in the Sun, one Ounce; of the whitest Sugar, one Pound. Melt the Sugar over the Fire in Rose-Water, and the Juice of the same, each two Ounces; and after due Evaporation, mix with it the Roses in fine Powder, and pour it upon a Marble, so as to make it into Lozenges.

SPECIES AROMATICUM ROSATUM. See AROMATICA.

SYRUPUS E ROSIS SICCIS.

Syrup of dried Roses.

Take two Quarts of hot Spring-Water, and in it infuse half a Pound of Rose-Leaves, hastily dried in the Sun; the next Day press out the Liquor, and with two Pounds of Sugar boil it up to a Syrup.

TINCTURA ROSARUM RUBRARUM.

Tincture of Red Roses.

Take half an Ounce of Red-Rose Leaves, well cleared of the white Heels, and thirty Drops of Oil of Vitriol; pour upon them in a glazed earthen Vessel two Pints and an half of boiling Spring-Water, and let them stand close covered for three Hours; then strain off the Liquor, and put to it three Ounces of fine Sugar-Candy.

UNGUENTUM ROSATUM.

Ointment of Roses.

Take of Hogs-Lard, cleared from all its Membranes, and well washed, one Pound; and add to it one Pound of fresh Red-Roses; which suffer to stand together for seven Days; then boil them over a gentle Fire, and press out the Lard; then macerate again with fresh Roses the same Space of Time, and boil and strain as before. Lastly, put to it six Ounces of the Juice of Red-Roses; of Oil of sweet Almonds two Ounces, and boil over a slow Fire, to a Consumption of all the Juice; then strain it again, that it may become an Ointment.

6. ROSA ALBA, Offic. Ger. 1079. Emac. 1260. Raii Hist. 2. 1473. *Rosa Anglica alba*, Park. Parad. 412. *Rosa alba vulgaris major*, C. B. P. 482. Tourn. Inst. 637. *Rosa alba, flore pleno*, Boerh. Ind. A. 2. 251. *Rosa candida plena*, J. B. 2. 44. THE WHITE-ROSE.

The White-Rose Tree grows taller than most other Kinds of Roses, having fewer Prickles on the Branches, and those pretty large; the Leaves are of a dark green Colour; the Flowers are white, and more double, or fuller of Leaves than the Damask or Red, having a less fragrant Scent than either of them.

The Flowers only are used, being drying, binding and cooling, and the Water distilled from them, is much used in Collyriums for sore inflamed Eyes, being the only official Preparation from them. *Miller's Bot. Off.*

7. ROSA MOSCHATA, simpliciflora. C. B. P. 482. Tourn. Inst. 637. *Rosa Moschata minor, flore simpliciflora*, J. B. 2. 45. Raii Hist. 2. 1474. *Rosa Moschata simplex*, Park. Parad. 417. THE MUSK-ROSE.

It grows in warm Places, but was never used among us; it purges violently.

ROSA HIERICHUNTICA. A Name for the *Myagrum*; ex *Sumatra*, & *Syria*; *semine spinoso, simili Capiti Avicula*.

ROSALIA. A Name for the Measles; or for a Distemper resembling the Measles, consisting in Petechial Eruptions, or Asperities of the Skin. *Castellus* from *Martianus*.

ROSBOTH. A soft Excrescence of a hard Part. *Castellus* from *Avicenna*.

ROSCA. An *Erysipelas*. *Rulandus*.

ROSCOLÆ. The Measles.

ROSIO. Corrosion.

ROSMADIAN. Mercury of the Philosophers.

ROSMARINUS.

The Characters are;

It is a verticillate Plant, with a labiated Flower, consisting of one Leaf, whose upper Lip or Crest is cut into two Parts, and turns up backwards, with crooked Stamina, or Chives; but the under Lip, or Beard, is divided into three Parts, the middle Segment being hollow, like a Spoon; out of the two or three teeth'd Flower-Cup rises the Pointal, attended as it were by four Embryos, which afterwards turn to so many Seeds, that are roundish, and are inclosed in the Flower-Cup.

Boerhaave mentions six Species of *Rosmarinus*, which are;

1. *Rosmarinus*; *hortensis*; *angustiore folio*. C. B. P. 217. Tourn. Inst. 195. Boerh. Ind. A. 179. *Rosmarinus*, Offic. *Rosmarinum coronarium*, Ger. 1109. Emac. 1292. *Libanotis coronaria, sive Rosmarinum vulgare*, Park. Theat. 71. ROSEMARY.

This is a Plant very well known, growing almost in every Garden. It grows larger and more woody in England than in many other Countries, having woody tough Branches, with long narrow thick Leaves, that are hoary and somewhat hollow underneath, and green above; among these grow the Flowers several together in Clusters, of a pale purple Colour, each having a large Galea, and is set in a thick, hoary, five-corner'd Calyx, at the Bottom of which lie four round Seeds. It grows wild in Spain, and the Southern Parts of France; but with us is planted in Gardens, and flowers in April. The Leaves and Flowers are used.

Rosemary is a Plant of great Service in Affections of the Head and Nerves, helping the Apoplexy, Palsy, and all Kinds of Convulsions, Pains, and Dizziness of the Head. It strengthens the Sight and Memory, and opens Obstructions of the Liver and Spleen. The dried Herb burnt is good to sweeten the Air, and correct noxious filthy Smells.

Official Preparations are the *Conserve Anthos*, *Aqua Regina Hungaria*, and the Chymical Oil and fixed Salt. *Miller's Bot. Off.*

Rosemary, with respect to its Virtues, bears a great Affinity to Spike and Lavender; and as it abounds with a penetrating balsamic Oil, its Spirit proves equally efficacious in Disorders of the Head, with Spirit of Lavender. An Infusion

of Rosemary in Water or Wine, is highly beneficial in the *Fluor albus*, and Sterility proceeding from it, in Hoarseness, in Asthma's and a disagreeable Breath. *Arnaldus de Villa Nova* affirms, that he has often seen Cancers, Gangrenes, and Fistulas dried up and perfectly cured, tho' they would yield to no other Medicines, by frequently washing them with an Infusion of Rosemary in Spirit of Wine. *Hoffman de Præst. Remed. Domest.*

AQUA HUNGARICA.

Hungary, or the Queen of Hungary's Water.

Take of Flowers of Rosemary, twenty Ounces; rectified Spirit of Wine, thirty Ounces; let them infuse for some Days, then draw off as much as there was Spirit put in.

This is most conveniently made by the Copper Alembic, taking Care that the Receiver is closed with a Bladder to the end of the Worm. And this Way common Spirit may be as well used as the rectified, observing not to draw it so low as to be cloudy; for after a certain Standard, the oily Part of the Flowers, which is considerable, will turn it milky. What runs afterwards, as a great deal will, which yet smells and tastes strong of the Flowers, may either be kept to throw into the Still again, when the same is to be made, or used in the Shop for a small Spirit of Rosemary; and the last Runnings of all may pass for a good simple Water, under the same Title. The College have rejected this out of their new Dispensatory; and indeed what is imported from France, and Countries where the Rosemary most abounds, is so good and cheap that it is hardly worth any Body's while to make it here, unless the Wholesale Dealers: For these Gentlemen can in an Instant brew the largest Quantity, at a very small Expence. Their Way is, to impregnate rectified Spirit of Wine with chymical Oil of Rosemary and that of Lavender, and this, with a French Title, they palm upon the Nation for right French Hungary Water.

CONSERVA ANTHOS. *Conserve of Rosemary. Flowers.* See CONSERVA.

For the chemical Oil of Rosemary, see OLEUM.

For the fixed Salt, see SAL.

2. *Rosmarinus*; *striatus*; *five aureus*. Park. Theat. 74.

3. *Rosmarinus*; *hortensis*; *angustiore folio*; *argenteus*. H. R. Par. 158.

4. *Rosmarinus*; *spontaneus*, *folio eleganter variegato*. H. R. D.

5. *Rosmarinus*; *spontaneus*; *five latifolius*. C. B. P. 217.

6. *Rosmarinus*; *spontaneus*; *five latifolius*, *folio Apice inhamum curvato*. Boerh. Ind. Alt. Plant. Vol. 1.

Rosemary Leaves are antihysterical, uterine, emmenagogue and cephalic; when used in Fomentations and Cataplasms, they are of an alleviating and detergent Nature. Rosemary, in consequence of its heating and dissipating Quality, is an excellent Remedy in a *Fluor albus* arising from Languor. The Leaves bruised, made up in Form of a Paste, and swallowed, powerfully strengthen the Stomach and rouse the Spirits. This Plant is an excellent Medicine in Disorders of the Head and Nerves, such as a Vertigo, a Carus, an Epilepsy, a Palsy, a Cholic, hysterical Fits, and Weakness of Memory. Its Leaves, when put in a Bath, are excellent against Barrenness, render the Sight clear, remove a disagreeable Breath and Difficulty of Breathing, and resolve Obstructions of the Liver and Spleen, for which Reason they are highly beneficial in the Jaundice; externally they contribute to strengthen the Nerves, prevent Gangrenes, and resolve cold Humours. In Catarrhs, and the Disorders arising from it, the Smell of this Plant is beneficial; Rosemary is produced in England, Spain, and some Parts of France. Its Leaves smell like Camphire; and from its Flowers are obtained a Spirit, an Oil, and a Quintessence. The Water distilled from its Flowers is, *The Queen of Hungary's Water*, so called because a certain Hermit taught its Composition to that Queen. This Water is excellent in *Deliquiums*, and what we call a Sinking of the Spirits. Melancholic and hysterical Patients are greatly relieved and exhilarated by the grateful Smell of this Water, which is, also, excellent for those who faint upon seeing the Blood spring from an opened Vein; for it excellently revives the Spirits, when applied to the Nose, an Organ of all others the most easily affected. In the same Case, it is taken internally in Rain or Spring Water, and externally the Temples, Nostrils, and nervous or muscular Parts, are to be rubb'd with this Water. In Contusions, Wounds, Tooth-achs, Gangrenes, and Congestions of cold Humours, this Water is used with great Success. Of Rosemary Flowers, gathered in the Middle of the Day, bruised with Sugar, and afterwards preserved from the Air in a Galley-pot, is made the celebrated English Conserve, known in the Shops by the Name of *Conserve Florum Anthos*. This Conserve is an excellent Remedy in Vertigos, arising

arising from a cold Cause, as also in cold Distempers. Hence 'tis an excellent Stomachic, and proper in that Disorder of the Eyes called *Lema Lippea*, when not proceeding from an Inflammation. The Leaves of Rosemary, boiled in Wine, strengthen the Nerves. A Conserve is also made of its Leaves for the Use of the Poor. The Oil obtained from the Flowers and Leaves of this Plant is cephalic, anti-scorbutic, emmenagogue, and in Virtues greatly approaches to the Savin. It is an excellent Medicine in Epilepsies, cures the various Symptoms of the hysterical Passion, and promotes a Discharge of the Lochia and Menes; for when the Foetus or Menes are retained, 'tis customary among the Women to exhibit some Drops of this Oil in Wine. *Hist. Plant. Ascript. Boerhaav.*

ROSMARUS. The Sea-Cow. See MANATI.

ROSANIA or ROSALIA. The same as ROSEOLÆ.

ROS SOLIS.

The Characters are;

The Leaves are thick set with bristly Hairs distilling Drops. The End of the Pedicle becomes an oblong tubulated Calyx, divided into five acute Segments, within which is seated a roseaceous pentapetalous Flower, furnished with five Stamina. The Ovary from the Center of the Calyx, within the Flower, is of a conic, acuminate Figure, gaping when mature, and full of a Multitude of Seeds.

Boerhaave mentions two Sorts of *Ros Solis*, which are;

1. *Ros Solis*; folio subrotundo. C. B. P. 357. *Raii Hist.* 2. 1100. *Synop.* 3. 356. *Tourn. Inst.* 245. *Boerb. Ind. A.* 216. *Ger. Emac.* 1556. *Ros Solis*, Offic. J. B. 3. 761. *Ros Solis major*, *Ger.* 1366. *Ros Solis sive Rorella vel Rosa Solis*, *Park. Theat.* 1052. *Ros Solis*, *Rosa Solis*, *Sponsa Solis*, *Rorida* & *Rorella etiam dicta*. *Chab.* 559. ROSA SOLIS.

This is a small low Plant, having a little fibrous Root, from which spring small round hollowish Leaves, on Footstalks of about an Inch in Length, covered and fringed with short red Hairs or Bristles, which make the whole Leaf appear red; from among these arise naked Stalks three or four Inches high, having several small five-leav'd Flowers on the Top, standing one Way, which are succeeded by little longish Seed Vessels, containing very small Seed; it grows in boggy Grounds, and flowers in June and July.

Rosa Solis is commended by some as a great Cordial, and good for Consumptions, Convulsions, and the Plague. Formerly a cordial Water, in which this Herb, with several Spices, was a principal Ingredient, was in great Repute, under the Name of *Rosa Solis*, tho' now almost out of Date. *Miller's Bot. Off.*

Some Authors affirm it is a Caustic, and improper for internal Use.

2. *Ros Solis*; folio oblongo. C. B. P. 357. *Boerb. Ind. Alt. Plant. Vol. I.*

ROS SYRIACUS. The same as ELÆOMELI; which see.

ROSTRIFORMIS. The same as CORACOIDES.

ROSTRUM. The Beak of a Bird. Hence several Chirurgical Instruments are, from their Similitude, called by this Name. Thus there is the *Rostrum Corvi*, the Crows Bill Forceps; the *Rostrum Gruis*, Crane's Bill; the *Rostrum Psittacini*, Parrot's Bill; and the *Rostrum Vulturis*, Vulture's Bill. *Rostrum Leporinum*, is a Hare Lip.

ROTANG. The Name of a Species of Reed mentioned by *Piso*.

ROTATOIRES. The Trochanters. See TROCHANTERES. The Alchymists are called *Rotatores* by Way of Derision.

ROTLA, in *Paracelsus*, is the same as RUBRICA.

ROTULA. The Patella, or Cap of the Knee. In Pharmacy, *Rotula* is a Troche.

ROTUMHA. A Vessel like a Cucurbit. *Rulandus*.

ROTUNDUS MAJOR. The Name of a Muscle of the Shoulder. See TERES MAJOR.

ROTUNDUS MINOR. See TERES MINOR.

ROUCOU. See ACHIOTL.

RUB, in *Rulandus*, is the same as ROB.

RUBEA ICTERITIA, in *Paracelsus*, is an Erysipelas.

RUBECULA. Offic. *Jonf. de Avib.* 87. *Mer.* 178. *Bellon. des Oyse.* 349. *Gesn. de Avib.* 681. *Charlt. Exer.* 97. *Erithacus sive Rubecula*, *Aldrov. Ornith.* 2. 742. *Rubecula sive Erithacus*, *Raii Ornith.* 219. *Ejusd. Synop. A.* 78. THE ROBIN-RED-BREAST, or RUDDOCK.

This Bird, when eaten, is by some esteemed to excite Venereal Inclinations.

RUBEFACIENTIA. Topics which excite a Redness of the Skin; the same as PHENIGMI.

RUBELLA. This is defined by *Dornæus*, a spiritual Essence, extracting a Tincture from Bodies by its resolute Power.

RUBELLIANÆ. The Berries of the white Bryony. *Rhadius in Scriben. Larg. N°.* 249.

RUBELLIO. The Sea-Roach.

This Fish has two sharp Fins on the Back, and feeds upon small Crabs and other little Fishes; it is more esteemed in Winter than in Summer; and this may be occasioned by its different Way of feeding in these two Seasons; for in Winter it keeps in the open Sea, but in Summer it draws near the Shore; or, according to some Authors, the Difference may arise from its spawning in the Summer.

This Roach is easy of Digestion, because 'tis tender, delicate, not very compact in its Parts, and has but little gross Juice. It is nourishing, restorative, and promotes the Semen, by Reason of the balsamic, oily Parts, and volatile Salts with which it abounds. It is, also, reckoned good for stopping a Looseness; operating on this Occasion, by calming and suppressing the sharp and pungent Humours, which cause this Inconvenience, by its oily Principles. It agrees, especially in Winter, with any Age and Constitution. *Lemery on Foods.*

RUBEOLA.

The Characters are;

The Leaves grow four, or more together; the Flower is monopetalous, Funnel shap'd, and quadrifid, resting upon one, or a double Ovary; the Ovary becomes a Fruit containing two Seeds.

Boerhaave mentions two Species of *Rubeola*, which are;

1. *Rubeola*; latiore folio. T. 130. *Rubia, latifolia, spicata*. C. B. P. 334. *Pseudo-Rubia, latifolia, spicata*, M. H. 3. 333.
2. *Rubeola*; angustiore folio. T. 130. *Pseudo-Rubia, spicata, angustifolia*. M. H. 3. 333. *Boerb. Ind. Alt. Plant. Vol. I.*

This Plant is recommended in a *Quinsy*. *Hist. Plant. Boerb. Ascript.*

RUBETA. The Toad. See BUFO.

RUBIA.

The Characters are;

The Leaves are rough; the Fruit consists of two succulent Berries, which contain each an umbilicated Seed.

Boerhaave mentions four Sorts of *Rubia*, which are;

1. *Rubia*; Tinctorum; sativa, C. B. P. 333. *Boerb. Ind. A.* 147. *Tourn. Inst.* 114. *Rubia Tinctorum*, Offic. *Ger.* 957. *Emac.* 1118. *Raii Hist.* 1. 480. *Synop.* 3. 223. *Rubia sativa*, J. B. 3. 714. *Rubia major sive hortensis*, *Park. Theat.* 274. Madder.

The Roots of Madder are about as thick as a large Goose-Quill, round and much branched, of a reddish Colour, clear, and somewhat transparent, having a small, slender, hard, tough String in the Middle, of a sweetish Taste, with a little Bitterness; from these spring many square, rough, weak Stalks, full of Joints, about which are set five or six long sharp-pointed Leaves, that are broadest in the Middle, and narrow at both Ends, rough almost to Prickliness. The Flowers grow in long Spikes, coming forth at the Joints with the Leaves, small and yellow, of one Leaf cut into four Segments, each succeeded by two small, moist, blackish Berries, containing two round umbilicated Seeds. It is planted in Fields and Gardens, and flowers in May.

The Roots of Madder are opening and attenuating, good for Obstructions of the Liver, help the Jaundice and Dropsy, and cleanse the Kidneys of tough and slimy Humours, and are of Use against the Stone and Strangury. They are accounted good to dissolve congealed Blood, and to be serviceable in Wounds and Contusions. A great Quantity of the dried Roots are used by the Dyers to dye a red Colour. *Miller's Bot. Off.*

2. *Rubia*; sylvestris; aspera; quæ Sylvestris Dioscoridi. C. B. P. 333. *Raii Hist.* 1. 480. *Synop.* 3. 223. *Boerb. Ind. A.* 147. *Rubia sylvestris* & *Rubeola*, Offic. *Rubia sylvestris*, *Park. Theat.* 274. WILD Madder.

It grows wild in Hedges. The Root agrees in Virtues with the *Rubia Tinctorum Sativa*.

3. *Rubia*; sylvestris; Monspeffulana; major. J. B. 3. 715.
4. *Rubia*; quadrifolia; asperrima; lucida; peregrina. *Boerb. Ind. Alt. Plant. Vol. I.*

RUBIA SYNANCHICA, Offic. *Rubia Cynanchica*, C. B. P. 333. J. B. 3. 723. *Raii Hist.* 1. 485. *Rubeola vulgaris quadrifolia, levis, floribus purpurascens*, *Tourn. Inst.* 130. *Raii Synop.* 3. 225. *Synanchica Lugdunensis*, *Ger. Emac.* 1120. *Asperula repens Gesneri, seu saxifraga altera Casalpini*, *Park. Theat.* 453. SQUINANCY-WORT.

It has a black, thick, woody Root, which runs to a great Depth in the Earth, and is furnished with very numerous fine capillary Fibrils, divided into a Multitude of Heads, and shoots up many smooth, slender angulous Stalks, a Span in Length or more, clothed at the Joints, which are frequent near the Head of the Root, with four Leaves, very short and broad, so as that the Length is scarce the third Part of the

the Breadth. About the Middle of the Stalk the Joints are frequent, and the Leaves longer, narrower, sharper, and grow also by Fours. The Flowers on the Tops of the Stalks and Branches, form a kind of Umbellas, as in the *Valeriana*, and are expanded from an oblong Tube into four Segments, of a beautiful red Colour, and a pleasant Smell; sometimes they are white like those of the *Jasminum*, which they resemble in Colour and Smell, but are of the Size of the *Rha* of *Dioscorides*.

These are succeeded by a Coacervation of Seeds, which grow two together, and are rugous or rough, oblong, and bear like those of the *Phaseolus*, double the Size of those of the common *Gallium*, and when dry of a yellowish Colour.

It abounds in barren Places, and chalky and sunny Hills, as on *Gogmagog Hills*, *Suffex Downs*, and the like Situations.

It is supposed to be of extraordinary Efficacy in the *Squintancy*, (whence its Name) a Quinsy, whether inwardly or outwardly used. *Dale*.

RUBICILLA Offic. Mer. Pin. 176. Schw. A. 346. *Rubicilla*, *Pyrrhula*, Charlt. Exer. 17. *Rubicilla seu Pyrrhula*, Gesn. de Avib. 664. Will. Omith. 180. Raii Omith. 247. Ejusd. Synop. The Flesh of this Bird is recommended against the Cholice.

RUBIFICANTIA. The same as **RUBEFIACIENTIA**.

RUBIGO. The Rust of Metals, or Mildew; or Smut of Corn.

RUBINUS. See **CARBUNCULUS**.

RUBRICA FABRILIS. Offic. Mer. Pin. 218. Matth. 1359. Calc. Mus. 134. Dougl. Ind. 80. *Rubrica*, Charlt. Foss. 2. Worm. 4. Aldrov. Mus. Metall. 257. *Rubrica Fabrilis Mollis*, Kentm. 8. **RED OKER**, **RUDDLE**, **MARKING STONE**.

This is an earthy, ponderous, and intensely red Substance, found in many Parts of *England*, and is used in vulnerary and drying Plaisters.

RUBRICA SINOPICA. Offic. Matth. 1354. *Rubrica Sinapis Agricol*. 583. *Terra Sinopiana*. Tourn. Voy. Ed. Lond. 2. 159. **EARTH OF SINOPE**.

This ought to be thick, heavy, and all of one Colour, resembling Liver; and when diluted with Water, it ought to diffuse itself therein.

It is dug out of the Earth in *Cappadocia*, is esteemed drying, and is said to restrain a *Diarrhæa*.

RUBUS.

The Characters are;

The Calyx is quinquifid; the Flower is rosaceous, pentapetalous, and furnished with a great Number of Stamina; the Placenta is in the Centre of the Calyx, to which it grows; the Fruit is round, and compos'd of a great Number of succulent *Acini*, fixed to the Placenta, and furnished with oblong Seeds, each being furnished with a long Tube.

Boerhaave mentions seven Species of *Rubus*, which are;

1. *Rubus vulgaris*; five *Rubus fructu nigro*. C. B. P. 479. Tourn. Inst. 614. Boerb. Ind. A. 2. 60. *Rubus vulgaris*, Offic. *Rubus*, Ger. 1089. Emac. 1272. *Rubus vulgaris major*, Park. Theat. 1013. *Rubus major fructu nigro*, J. B. 2. 57. Raii Hist. 2. 1639. Synop. 3. 467. **THE BRAMBLE OR BLACK BERRY BUSH**.

The Bramble has many long, creeping, angular, tough Branches, beset with a Multitude of very sharp crooked Thorns. The Leaves grow on the younger Twigs, usually five on one Foot Stalk in the lower Parts, and three on the upper Part next the Flowers, which grow in Clusters at the End of the Branches, consisting of five Leaves a-piece, in some Plants white, in others of a pale Red; with several Stamina in the Middle. The Fruit is a Cluster of *Acini*, green at first, then red, and when ripe, of a black Colour, and of a pleasant sweet Taste. It grows every where in the Hedges, flowering in *June* and *July*, and the Fruit is ripe at the latter End of *August* and in *September*. The Leaves and Fruit are used.

The Leaves are accounted Restringent, and are frequently prescribed in Gargarisms for sore Mouths and Throats; the unripe Fruit is very binding and restringent, useful for all Kinds of Fluxes and Bleeding; for Thrushes and sore Mouths. The Juice of the ripe Fruit made into Syrup, is accounted good against Heat of Urine. *Miller's Bot. Off.*

The Leaves of the Bramble are styptic, and of an earthy Taste; they stain the blue Paper with a deep red; the Fruit gives it a much deeper, and almost as deep as Alum; this Fruit is vinous, and of a very good Smell upon some Brambles, and insipid and disagreeable upon others. It is very probable that the acid Part of the natural Salt of the Earth, which in the Leaves is very little disengaged from the other Principles, is almost entirely freed from them in the Fruits, and produces there, with the terrestrial Parts, a Salt which resembles

Alum; so that the Antients had a great deal of Reason to use the Fruit of this Plant to bind. The Bramble is astringent, deterfive and absorbent; the Decoction of its Branches, as *Dioscorides* affirms, stops a Looseness and the Fluor albus. Its Leaves, chew'd, clear the Ulcers of the Gums and Mouth; bruisd and applied to the Tetters they kill them, and cure the Piles. The Juice of the young Shoots thickened in the Sun, acts more powerfully. *Galen* was of the same Opinion; he made Use of the Leaves for Wounds; of the Flower and Fruit for spitting Blood, and of the Root for the Stone. *Pliny* has stolen out of *Dioscorides* what he has said of the Bramble; but he adds to the Virtues of this Plant that of being diuretic. This Plant is now used to cleanse and bind, taken either outwardly or inwardly. The Decoction of it is used for the Wounds of the Legs. *Tabernæmontanus* says, that a Bolster dipped in the Juice of the Bramble, and put into the Fundament, will stop the Flux of the Piles. Mr. *Ray* relates, that Dr. *Needham* set a great Value upon the Syrup of Black-berries for the Heat of Urine. A simple *Diamaron* may be prepared of it for the Diseases of the Throat. The Juice of the Bramble is an Ingredient in the *Diamaron Nilai usitatum*. The Gun-powder made of the Coals of this Plant is quicker and stronger than the common Sort. *Martyn's Tournefort*.

2. *Rubus*; repens fructu cæcio. C. B. P. 479. Tourn. Inst. 614. Boerb. Ind. A. 2. 60. Ger. Emac. 1271. *Chamaebatos* Offic. *Rubus minor Chamaerubus sive Humirubus*, Park. Theat. 1013. *Chamaerubus spinosus fructu cæruleo*. Jonst. Dendr. 272. *Rubus minor fructu cæruleo*, J. B. 2. 59. Raii Hist. 2. 1640. Synop. 3. 467. **THE DEW BERRY**.

It is found amongst the Corn. It flowers in *May*. The Fruit becomes ripe in *Autumn*. The Fruit is in Use. It agrees in Virtues with the *Rubus vulgaris*, or the Bramble or Black-berry Bush. *Dale*.

3. *Rubus*; *Idæus*; spinosus; fructu albo. C. B. P. 479. J. B. 2. 59.

4. *Rubus*; *Idæus*; spinosus; fructu rubro. J. B. 2. 59. Raii Hist. 2. 1640. Synop. 3. 467. Boerb. Ind. A. 2. 69. *Rubus Idæus*, Offic. Ger. 1089. Emac. 1272. Park. Theat. 557. *Rubus Idæus spinosus*, C. B. P. 479. Tourn. Inst. 614. **THE RASPBERRY-BUSH**.

The Raspberry-Bush has slender brittle Stalks, covered with an ash-colour'd Bark, beset with small weak Prickles; it has five high-vein'd, oblong, sharp-pointed Leaves, growing upon one Foot-stalk, white underneath and green-above, indented about the Edges. The Flowers consist of five Leaves, of a white Colour, with a Cast of Red; each of which is succeeded by a roundish Fruit made of a Cluster of *Acini*, for the most part red, but in some Plants they are of a white Colour. It grows wild in some Parts of *Wales*, and the North of *England*; and flowers in *May*, and the Fruit is ripe in *June*.

The Fruit, which is the only Part used, has a pleasant grateful Smell and Taste, is cordial, and strengthens the Stomach, stays Vomiting, is somewhat restringent, and accounted good to prevent Miscarriage.

The only Official Preparation is the *Syrupus de Rubo Idæo*. *Miller's Bot. Off.*

They make a Wine, a Syrup, a Ratafia, and a Vinegar, of the Fruits of this Plant. Spirituous Water is also drawn from them. These Preparations are strengthening, and good in malignant Fevers and the Small-Pox. Nitre dissolved, and chrystallized with the Juice of Raspberries, is very agreeable. *Martyn's Tournefort*.

The red Raspberry is more common than the white; such as are large, full of sweet and vinous Juice, and pleasant to the Taste and Smell, are the best.

They are of a moistening and cooling Nature, cordial, and fortify the Stomach; they sweeten the Breath, purify the Blood, and are reckoned to be antiscorbutic and antinephritic.

Their refreshing Taste and Smell proceed from their essential Salt, intermixed with some oily Parts a little refined, which lightly pricking the Nerves of the Taste and Smell, excite an agreeable Sensation in them. They have nearly the same Principles, and consequently the same Effects as Strawberries; but they are moister and more phlegmatic, and not so compact in their Parts; for which reason they easily corrupt in the Stomach, if they continue there too long. The Flowers are used against the St. *Anthony's* Fire and Inflammations of the Eyes.

Raspberries are proper in warm Weather, and suit young bilious People, and those whose Humours are too sharp, and over-much agitated. *Lemery on Foods*.

5. *Rubus*; odoratus. *Cornuti*, 158.

6. *Rubus*; flore albo, pleno. *H. R. Monsp.*

7. *Rubus*; *Alpinus*; humilis. J. B. 2. 61. Tourn. Inst.

615. *Boerb. Ind. A. 2. 60. Chamaerubus, Offic. Chamaerubus Saxatilis, C. B. Pin. 479. Raii Hist. 1. 654. Synop. 3. 261. Rubus Saxatilis, Ger. 1090. Emac. 1273. Rubus Alpinus Saxatilis, Park. Theat. 1014. STONE-BRAMBLE.*

It grows on high Mountains, flowers in June, and the Berries have the same Virtues with Raspberries.

All these Species of the *Rubus* are received in Medicine; the Roots of the first, second, third and fourth Species, digged up in February or March, about the Full Moon, and boiled in Honey, are a very good aperient Medicine, whence it is proper for a Dropsy. The Fruit boiled in Red Wine, was accounted by the Ancients a sovereign Remedy, where the Case required Strengthening, and for the Hemorrhages, and Fluxes of the Belly. The ripe Berries are full of a nitrous and aromatic Juice, which is highly aperitive, resolves dry and harden'd Coagulations, and expels them by Urine, and is on that account very serviceable in Diseases, which require laxative and lenient Remedies, and such as are endowed with a saponaceous Quality. The Leaves, which way soever prepared, are corroborative and astringent; the Fruit is laxative and aperient, and the expressed Juice of the Leaves is of Use in all acute Diseases. Hence the *Syrupus de Rubis*, or *de Rubo Ideo*, is very good in all Disorders proceeding from Bile, and Inflammations. A few Berries of the fourth and fifth Species, put into Wine, communicate to it a fine Colour and Fragrance, and greatly exhilarate the Heart. They call this Wine *Ruboides*. Of the same they prepare a Jelly, which is commended for hot Distempers. The Leaves and Fruit are commended in a Diarrhæa, Fluor Albus, Vomiting, and immoderate Fluxes of the Uterus and Nostrils; they cure Ulcers of the Gums, and are an excellent Remedy for the Aphthæ and Ulcerations of the Mouth. The bruised Leaves extirpate Warts, cure Wounds and Ulcers, and remove the Itch. *Hist. Plant. ascript. Boerhaave.*

RUCMA, or LUCMA. *De Laet.* An American Fruit, somewhat like an Orange with respect to Size and Shape. It is not esteemed a good Food, nor is it used in Medicine.

RUCTUS, or RUCTATIO. An Eructation, or discharging of Wind upwards.

RUELLIA.

The Characters are;

It hath a funnel-shaped Flower, consisting of one Leaf, which is cut into several Parts at the Brim, from whose Emplacement arises the Pointal, which is fixed like a Nail in the Bottom of the Flower, and afterwards becomes a membranaceous Pod, which opens into several Parts, and is filled with small Seeds.

Miller mentions three Species, which are;

1. *Ruellia; Americana; humilis; Asphodeli Radice.* Plum. Nov. Gen.

2. *Ruellia; Carolinana; foliis oblongis angustis, flore purpureo.* Houft.

3. *Ruellia; Americana; humilis, parvo flore cæruleo, capsulis teretibus.* Houft.

The first Sort was discovered by Father Plumier in America, who gave this Name to the Genus in Honour of Dr. Ruellius, a Person learned in Natural History, who flourished in the Sixteenth Century. The second Sort grows plentifully in South-Carolina, from whence it was brought into the English Gardens. This Sort grows much taller than the other two. The third Sort was discovered by the late Dr. William Houston in Jamaica, who sent the Seeds into England. The Flowers of this Kind are much smaller than those of the other Sorts, and are of short Duration, seldom continuing above one Day. *Miller's Dictionary.*

RUFUS EPHESIUS, or RUFFUS EPHESIUS. This ancient Physician lived under the Emperor Trajan, and was esteemed by Galen one of the most skilful of his Profession. The same Author tells us, that Rufus wrote of the *Materia Medica* in Verse; he also wrote a Treatise of the *Atra Bilis*, and some others cited by Suidas; but now lost; and we have nothing left of his Works, but a small Treatise of the Greek Names of the different Parts of the Body, and another of the Diseases of the Kidneys and Bladder, with a Fragment of a Treatise of Cathartic Medicines. His principal Scope in the first of these Works, was to give a general Idea of Anatomy, and in particular to prevent the Mistakes of his Contemporaries, who studied Medicine in reading ancient Authors, some of whom had distinguished certain Parts of the Body by Names different from those given them by others. Besides this, we may infer from what Rufus says in this Book, that Anatomic Operations, in his Time, were only exercised upon Beasts. "Chuse, says he, an Animal the most like Man that can be, you will not find all the Parts in every Respect resembling those of the Human Body; but they will, however, have at least some Relation one to another. Formerly, he adds, Anatomical Demonstrations were made upon human Bo-

"dies." We learn also from the same Book, that the Nerves, which were afterwards called *recurrent*, were then newly discovered. "The Ancients, says Rufus, called the Arteries of the Neck *Carotides*, or *Carotics*, as much as to say, *soporific*, because they believed, that by a strong Compression of these Arteries the Animal was laid asleep, and lost his Voice; but it has been discovered in the present Age that such an Accident proceeds not from a Compression of those Arteries, but from that of the Nerves contiguous to them." This Physician seems also to have seen certain Vessels of the Matrix, of which Anatomists before him had made no mention. "Herophilus, says he, believed that Women had nothing of varicose Parastatæ, but we have found, by examining the Matrix of a Brute, certain Vessels which arise from the Testicles, and being reflexed on both Sides in the Form of Varices, proceed to terminate in the Cavity of the Matrix. They also yield a glutinous Humour when pressed, and it is undoubtedly believed that they are seminal Vessels of that Kind which they call *varicose*." Rufus had before observed, that there are four spermatic Vessels in Man, two varicose, and two glandulous; and that the Extremity of the first, which joins to the Testicles, went by the Name of *Parastatæ*. The little Treatise of the Diseases of the Kidneys and Bladder contains nothing particular. Rufus also wrote some Commentaries upon Hippocrates.

The Three Books of *Rufus Ephesus*, of the Names of the Parts of the Human Body, were published in Greek by Jac. Goupylus, at Paris, 1554, in Octavo, Typis Regiis, ex Officina A. Turnebi. They had been translated, together with *Aretæus*, into Latin, by Junius Paulus Crassus, and printed at Venice, 1552, in Quarto, and were revised by the same Goupylus, and reprinted at Paris, 1554, in a smaller Size; and again, among the *Medici Principes* of Hen. Stephanus, 1567, in Folio. They were also revised a second time by Crassus, and reprinted at Venice, 1555, and at Basil, 1581, in Quarto.

His Book of the *Diseases of the Kidneys and Bladder*, with his Fragment of *Cathartic Medicines*, were published in Greek with the other three Books of Rufus abovementioned, and *Soranus de Utero & Muliebri Pudendo*, by the same Goupylus, at Paris, ex Officina Turnebi, 1554, in Octavo, and printed the same Year in Latin in a lesser Size; and were afterwards reprinted in Latin among the *Medicæ Artis Principes* of Hen. Stephanus, 1567, Folio.

A new Edition of Rufus in Greek and Latin, revised and compared with the Bern Manuscript, was designed by Martinus Bogdanus, as we are told by Bartholinus, Cent. 4. Medic. Epist.

Labbeus, *Bibl. nov. Manuscript.* mentions *Rufus de Veneris, & de Offibus*; and Rhasis ascribes to Rufus the Books *περί υγιείας*, "Of Health," which are found among the Writings of Galen.

Works of Rufus which are lost, are five Books, *περί διαίτης*, "Of Diet," mentioned by Suidas, and the second of them quoted by Oribasius. Four Books, *περί βλάστης*, "Of Herbs," in Hexameter Verses, mentioned by Galen, *Præf. Lib. 6. de Simp. Med.* who seems also to quote some of them. Galen in the Place just mentioned, quotes also the *Συνομιλία Βιβλία*, "Books of Therapeutics;" whence most of the Fragments of Rufus, which we find in *Ætius*, seem to be taken. Galen also commends a Treatise of Rufus concerning Melancholy, or *Atra Bilis*.

Besides these Works of Rufus mentioned by Galen, Suidas takes notice of his Treatise of the *Diet of Corpulent Persons*; of another on *Vulnerary Medicines*; and a Treatise of *Ficous Tumors or Excrescences*; another of *Ancient Medicine*; and a Treatise of *Milk, Wine, and Honey*. There was another *Rufus*, called *Menius Rufus*, mentioned by Galen, *Lib. 7. Le C. M. P. G. Fabricii Biblioth. T. G. p. 102.*

RUGA. A Wrinkle. The following Prescription is an approved Cosmétique in Wrinkles of the Face. Boil Hartshorn, not old, in Water, till it yield a Sort of Juice. Then strain the Water, and with the same knead Bean-Meal, which afterwards reduce into Troches, and dry them in the Shade. When Occasion requires, dissolve a sufficient Quantity of these Troches in Water, till it becomes of the Thickness of a liquid Cerate, with which anoint the Face, and when it is agglutinated, wash it off with warm Water. *Ætius, Tetrab. 2. Serm. 4. Cap. 4.*

RUGITUS. A Murmuring of the Intestines; the same as **BORBORYGMOS**.

RUMA. The Gula, or the external Part of the Throat.

RUMEX. The same as **ACETOSA**.

RUMINANTIA ANIMALIA. Ruminating Animals, that is, those who chew the Cud.

RUMPHAL. A Species of *Indian Arum*, called also **IGNOME**. The Juice is poisonous; but the Roots are recommended as an excellent Application to the recent Bites of Serpents;

pents; but if the Wounds are not fresh, cut them open, and then apply the Roots. It is, farther, esteemed an excellent Topic for Parts affected with the Venereal Disease.

RUPICAPRA. See **CAPRA ALPINA**.

RUPTORIUM. A Caustic used in Surgery for breaking or opening Abscesses.

RUSCUS.

The Characters are;

The Calyx is monophyllous, and multified, from the Middle of which proceed monopetalous, campaniform, and globous Flowers; the Ovary becomes a globous soft Fruit, filled with one or two Seeds, which are generally hard.

Boerhaave mentions four Sorts of *Ruscus*, which are;

1. *Ruscus*; angustifolius, fructu folio innascente. See **BISLINGUA**.

2. *Ruscus*; latifolius; fructu folio insidente. *Tourn. Inst.* 79. *Boerb. Ind. A.* 2. 63. *C. B. P.* 305. *Laurus Alexandrina*, Offic. *J. B.* 1. 574. *Raii Hist.* 1. 663. *Alexandrina genuina*, *Park. Theat.* 700. *Hippoglossum Matthioli*, *Ger.* 761. *Emac.* 909. **LAUREL OF ALEXANDRIA.**

The Root of this Bay is hard and knotty at the Head, sending out several long Strings and small Fibres; the Stalks are tough and limber, growing not to any great Height, having the Leaves set alternately upon them, which are hard, firm, and full of straight Nerves, of an oval Shape, but sharp-pointed at the End, about two Inches long; on the Middle of the Back-Part of each grows a small mossy green Flower, which is succeeded by a red Berry about as big as a Juniper-Berry. This Plant grows in the mountainous Parts of *Italy* and *Hungary*.

It is commended by *Dioscorides* and *Galen* to open Obstructions of the Kidneys and the Womb; to provoke Urine and the Menses, and as helpful in long and hard Labour. It is also accounted a good vulnerary Plant, and useful to dry up old Ulcers and Sores; but is rarely used in our Days. *Miller's Bot. Off.*

3. *Ruscus*; angustifolius; fructu summis ramulis innascente. *T. 79.* *Laurus Alexandrina*, fructu longis pediculis caulibus aligato. *M. H. Bloef.*

4. *Ruscus*; myrtifolius; aculeatus. See **BRUSCUS**. *Boerb. Ind. Alt. Plant. Vol. 2.*

RUSMA. A Preparation of Honey which the *Turks* and *Tartars* use by way of *Dropan* or *Pislothrūm*. It is made by boiling Honey to the Consistence of a Rob or Sapa.

RUSTICULA. The same as **GALLINAGO**. The Woodcock.

RUTA.

The Characters are;

The Leaves are divided into Segments; the Calyx is monophyllous, quadrifid, quinquesid, and stellated; the Flowers are resaceous, tetrapetalous, and pentapetalous, furnished with eight or ten Stamina, four or five of which arise from the Unguis of the Petals, and four or five from the Interstices of the Petals; the Ovary seated in the Bottom of the Calyx, becomes a roundish, quadrangular, or pentangular Fruit, consisting of as many Capsules, in which are contained kidney-shaped or angular Seeds.

Boerhaave mentions ten Species of *Ruta*, which are;

1. *Ruta*; major; hortensis; latifolia. *Boerb. Ind. A.* 260. *Ruta*, Offic. *Ruta hortensis*, *Ger.* 1070. *Emac.* 1255. *Ruta hortensis major*, *Park. Theat.* 132. *Ruta hortensis latifolia*, *C. B. P.* 336. *Tourn. Inst.* 257. *Ruta sativa*, vel *hortensis*, *J. B.* 3. 197. *Raii Hist.* 1. 874. **GARDEN-RUE.**

Rue is a shrubby Plant, whose elder Branches are tough and woody, having smooth blueish green Leaves, divided into an uncertain Number of small oval Sections, which are somewhat thick and fat, and round-pointed at the End, abiding all Winter. The Flowers grow on the Top of the younger Shoots, consisting usually of four yellow, hollow, scoop-like Leaves, torn in about the Edges, and having eight yellow Stamina, encompassing a roundish green Head, cut as it were into four Parts, growing large, and seemingly punched full of Holes, containing small black rough Seed. The Root is woody, having many Fibres. *Rue* is planted in Gardens; the Leaves and Seeds are used; the whole Plant has a very strong Scent.

Rue is a Plant of many Virtues, being alexipharmic, and good against infectious pestilential Diseases, and the Plague itself, and all Kinds of Fevers. It helps Disorders of the Head, Nerves, and Womb, Convulsions and hysteric Fits, the Colic and Weakness of the Stomach and Bowels; it resists Poison, and cures the Bites of venomous Creatures, and mad Dogs. It is an Ingredient in the Compound-Water of *Briony*, and in *Treacle-Water*.

Official Preparations are a simple Water, and a Conserve of the Leaves, and an Oil by Decoction. *Miller's Bot. Off.*

That *Rue* was greatly esteemed by the Ancients, is sufficiently certain; since it was the principal Basis of the Antidote of King *Mithridates*. *Rue* abounds with a highly acrid and penetrating Oil, capable of stimulating the languid Fibres to a brisker Motion, and consequently imparting an additional Strength to them. The Leaves of *Rue* mixed with recent Butter, and eaten in the Morning with *Rye-Bread*, are beneficial to those who abound in Phlegm, and an excellent Preservative against the noxious Influences of a moist and vapid Atmosphere, and the contagious Miasmata of epidemical Disorders. The Leaves bruised with Pepper, common Salt, and strong Vinegar, and applied to the Arteries of the Carpus, provided the morbid Matter is before duly managed, excellently check the febrile Impetus, and are often used with more Efficacy and less Danger, in stopping obstinate Quartan Fevers, than internal Astringents, and the so much celebrated *Peruvian Bark*. Strong Wine-Vinegar, richly impregnated with the Juice of *Rue*, when applied to the Mouth and Nostrils, is not only an excellent Preservative against the Contagion of epidemical Disorders, but also more effectual in preventing Deliquiums, than all the cephalic, rich, balsamic and apoplectic Spirits. *Hoffman. de Præstant. Remed. Domest.*

Rue is an Herb very much commended as an Alexipharmic, and is esteemed one of the best Simples for Hysterics, Epilepsy, Apoplexy, Convulsions, Pestilence, Inflammations and Gangrenes; in which last Case, the Herb bruised and applied with Wine and Salt, quickens the dead Part, prevents a Suppuration, and effects a Cure. *Nicander* commends it against the Bites of all venomous Creatures. There is no better Herb in the Pestilence; it has something of an aromatic, acidish, fragrant and oily Quality, and is heating in a high Degree, with a kind of Acidity. The Smell revives Women under a Syncope, and raises them under hysteric or epileptic Fits. It is of mighty Efficacy against Phlegm, and is very good, externally applied, for cold and pituitous Tumors; and it is highly celebrated for clearing and sharpening the Sight. It has a very acrid but not burning Taste, and abounds with a Salt, Oil, and a very penetrating Spirit, and is on that Account of singular Service in moving and stimulating the Nerves, and in attenuating gross Humors, and expelling them by insensible Perspiration and Sweat. It is an excellent Plant, as *Pliny* assures us, against all Sorts of Poison, and for all hysteric Melancholy, and hypochondriac Disorders, and for Faintings. It provokes the Menses, and expels the Lochia, Foetus, and Secundines; and drank in the Morning instead of Tea, and the Vapour received into the Eye, sharpens the Sight. The Seed is much commended for the Worms, and the Gonorrhæa, and consumes the Semen by its excessive Heat and Dryness. The Herb is of Service in the Small-Pox and Measles, the Epilepsy, lethargic Disorders, and the stultulent Colic. *Rue* externally used is good for cold, humid and watry Tumors. A Cataplasm is prepared of *Rue* bruised and boiled with Wine, which resists an Inflammation. *Rue* may be given inwardly in the most acute Diseases. *Hist. Plant. ascript. Boerhaave.*

2. *Ruta*; hortensis; latifolia; arbuseulæ similis, *C. B. P.*

3. *Ruta*; Africana; maxima, *Catal. Schwerin.*

4. *Ruta*; Chalepensis; tenuifolia; florum petalis villis scetentibus, *M. H.* 2. 508.

5. *Ruta*; Chalepensis; latifolia.

6. *Ruta*; hortensis; minor; tenuifolia, *M. H.* 2. 507.

7. *Ruta*; hortensis; minor; tenuifolia; foliis variegatis argenteis.

8. *Ruta*; sylvestris; minor, *C. B. P.* 336. *J. B.* 3. 200. *Peganium Narbonensium*, *Lob.*

9. *Ruta*; sylvestris; major, *J. B.* 3. 200. *C. B. P.* 336. *Park. Theat.* 133. *Raii Hist.* 1. 874. *Tourn. Inst.* 257. *Boerb. Ind. A.* 260. *Ruta Montana*, Offic. *Ger.* 1071. *Emac.* 1255. **WILD RUE.**

It grows on Mountains, and flowers in July, and is supposed to have the same Virtues as the Garden-Rue, but is more acrimonious.

10. *Ruta*; sylvestris; linifolia; Hispanica, *Bocc. Mus. Part. 2.* 82. *Tab.* 73. *Boerb. Ind. Alt. Plant. Vol. 1.*

RUTA is also a Name for the **HARMALA**; which see.

RUTA CANINA. A Name for the *Scrophularia*; *Ruta Canina dicta vulgaris.*

RUTA CAPRARIA. Goats Rue. See **GALEGA**.

RUTA HYPERICOIDES. A Name for the *Hypericum*; *foetidum*; *frutescens.*

RUTA MURARIA. See **ADIANTHUM ALBUM**.

RUTA PRATENSIS. A Name for the *Thalictrum*; *pratense*; *angustifolium.*

RUTACEUM. Vinegar of Rue. See **ACETUM**.

RUTETA. The same as **TARANTULA**; which see.

RUTICILLA. A Bird called the Red-Tail, or Red-Start. The same as **PHOENICURUS**.

RUTILUS. Offic. Schonf. Ichth. 63. *Rutilus, fœve Rubellus fluviatilis*, Gefn. de Aquat. 821. *Rutilus fluviatilis*, Jonf. de Pisc. 99. *Rutilus, fœve Rubellus fluviatilis* Gesneri, Aldrov. de Pisc. 732. 621. Raii Ichth. 262. Ejusd. Synop. Pisc. 122. *Rutilus, fœve Rubellus*, Mex. Pin. 190. **THE ROCHE.**

The Flesh of this Fish, which is very common in Rivers, is said to promote Venereal Inclinations.

RUYSCH. A celebrated Anatomist of Holland. See a farther Account of him under the Article **ANATOME**.

RUYSCHIANA.

The Characters are;

The Root is perennial, and the Leaves are not so thick as those of Rosemary; the Galea is hollow, bifid and trifid, the Beard trifid, the middle Segment hanging forward, bifid, and spirally convolved. The Flowers are beautiful, generally set at first by Sixes in thin Whorles, but afterwards collected into a Spike.

Boerhaave mentions but one Sort of this Plant, which is, *Ruyschiana*; flore cœruleo, magno. *Hyssopus Austriaca*, magno flore, folio Chamæpitidis. H. L. *Chamæpitys, cœrulea, Austriaca*, C. B. P. 250. *Prunella, Hyssopi folio viridi, ample flore cœruleo*, M. H. 3. 364. *Boerb. Ind. Alt. Plant. Vol. 1.*

S.

S. For the Signification of this Letter in the Chymical Alphabet, see **ALPHABETUM CHYMICUM**.

S. f. or fs. immediately following any Character importing Quantity, signifies *Semis*, Half.

SAAMOUNA. A Name for the **PAVIA**.

SABDARIFFA. A Name in *Boerhaave* for the *Ketmia*; *Indica*; *vitis folio*; *ampliore*.

SABINA.

The Characters are;

The Leaves resemble those of the Cypress, but are more compact; the Berries are verrucose; it has a very strong and singular Smell.

Boerhaave mentions two Sorts of *Sabina*, which are;

1. *Sabina*; folio Tamarisci; Dioscoridis. C. B. P. 487. *Boerb. Ind. A. 2. 207. Sabina*, Offic. Park. Parad. 607. *Sabina vulgaris*, Theat. 1027. Raii Hist. 2. 1415. *Sabina sterilis*, Ger. 1193. Emac. 1376. J. B. 288. **SAVINE.**

Savine is an ever-green shrubby Tree, that seldom grows very tall, having the Branches set close together, clothed with narrow, short, somewhat prickly Leaves, pretty much resembling Cypress, of a very strong Smell; among these, after the Tree is old, and has stood long in a Place, grow small mossy greenish Flowers, which are succeeded by small flatish Berries, less than those of Juniper, of the same blackish, blue Colour. It is planted in Gardens, where it seldom produces Fruit, and has therefore generally been reputed barren.

Savine is hot and dry, opening and attenuating, and a powerful Provoker of the Catamenia, causing Abortion, and expelling the Birth. It is very good to destroy Worms in Children. Mr. Ray recommends the Juice of it, mixed with Milk, and sweetened with Sugar, as an excellent Medicine for that Purpose; beaten into a Cataplasm, with Hog's Lard, it cures Children's scabby Heads.

Official Preparations are, the *Oleum Sabinae per infusionem decoctionem*, and the *Oleum Sabinae chymicum*. *Miller's Bot. Off.*

Boerhaave, in his Chymistry, asserts, that a Water prepared from *Savine*, by repeated Cohobations, is a most excellent Ecbotic, Emmenagogue, and Promoter of the Hæmorrhoids; that it is heating, and a most excellent Medicine, if used discreetly. He farther informs us, that the chymical Oil of *Savine* is a most powerful Promoter of the Menfes, when their Retention proceeds from a Languor and Debility only.

A Cataplasm, made of the Seeds of *Savine*, bruised with Sal Gem and Oil, is said to be good for an Anchylosis; and a Cataplasm of the same Leaves, mixed with Honey, is frequently applied to the umbilical Region, in order to destroy Worms in the Belly.

2. *Sabina*; folio Cypressi. C. B. P. 487. *Boerb. Ind. A. 2. 207. Sabina* Offic. *Sabina baccifera*, J. B. 1. 288. Ger. 1193. Emac. 1376. *Sabina baccifera major*, Park. Theat. 1026. *Cedrus baccifera fructu minore cæruleo*, Raii Hist. 2. 1415. *Juniperus alpina Sabinae referens*, Pluk. Almag. 201. **BERRIED SAVINE.**

This Plant is cultivated in Gardens, and is said to be attenuating, and inciding; powerfully to provoke the Menfes, to promote the Expulsion of the Secundines, and to destroy Worms in the Intestines.

SABON, or SABENA. Soap, or a Lixivium from whence Soap is made.

SACCELLUM. The same as **SACculus**.

SACCHAR, or SACCHARUM. *σάκχαρ, or σάκχαρον*. Sugar.

With respect to the Sugar, or *σάκχαρον, Saccharum*, of the Antients, which is said to be the same with *μέλι κακάμυος*, "Honey of Reeds," of *Theophrastus*, and which others called *σάλας Ἰνδικῆς*, "Indian Salt," *Salmasius* says, that it was gathered from some Reeds or Canes, as tall and big as Trees, and that it is the same as they now call *Sacar Mambu*. The *Arabians* gave it the Name of *Tabaxir*, which is still in Use in *Turkey* and *Persia*, to signify that Kind of Sugar. But as neither the *Arabians*, any more than the *Greeks*, had ever seen in their own Country the Reed which produced it, and spoke of it only by Hearsay, they entertain us with nothing but mere Fables on that Subject. *Avicenna* tells us, that it is supposed that the Canes of the *Tabaxir* being agitated by the Wind, shock and bruise one another in such a Manner as to take Fire, and kindle into a Flame, and that the Ashes which are collected after this Combustion, at the Bottom of the Canes, is the *Tabaxir*. He confesses indeed, that this is a vulgar Story, to which he gives no Credit; but he believes, however, that the *Tabaxir* is the Ashes of *Indian Reeds*, or of their Roots, which are burnt on Purpose; and *Averroes* says, that it is the Charcoal made of the Joints of the same Reeds.

Salmasius observes, that this Error of the *Arabians*, in supposing their *Tabaxir* was a Kind of Ashes, because it was in the Form of a greyish Powder, gave Occasion to the modern *Greeks*, who translated those *Arabians*, to render the Word *Tabaxir* by *Spodium*, which comes from *σποδός, Spodos*, Ashes. And this has been the Cause of great Confusion in Medicine; for the antient *Greeks* gave the Name of *Spodium* to what we now call Tutty, [*Dale* says the *Spodium Græcorum* was Putty] but the modern *Greeks*, and all the Physicians and Apothecaries after them, have called burnt Ivory by that Name; so that there are three very different Things, a Kind of Sugar, the Ashes or Soot of a Mineral, and the Ashes of Ivory, all under one Denomination.

To return to the *Spodium*, which is the *Tabaxir*, it is further to be observed, that the *Arabians* distinguished it from the Sugar of the Ancients, tho' it was, as we said, the very same Thing, because they believed that their *Tabaxir* was a Kind of Ashes, whereas the Sugar of the Antients was described as a Dew which fell upon the Canes, or as a sweet and fat Juice which flowed from the Cane itself, when it was burnt. On the other hand, they believed that our Sugar was the same which they found in the Writings of the *Greeks* under the Name of *σάκχαρον, Saccharon*, and upon that Account they called it *Suchar*, or *Zuchar*, tho' there be really a good deal of Difference between those two Sugars. The first, or that of the Antients, besides, that it proceeded from a very large Reed, as we before observed, flow'd from it naturally and spontaneously, like a Kind of Manna, whereas our Sugar is the Juice of a much smaller Cane, which must be ground and pressed in order to extract its Juice; and this Juice must afterwards be boiled and purified, to acquire the Consistence it has.

Salmasius shews, that the Sugar which we now use was absolutely unknown to the Antients. *Seneca*, says he, tells us, "It is reported that Honey is found among the *Indians* in the Leaves of Reeds, which is generated either by the Dew of that Climate, or the sweet and fat Humour of the Reed itself." You see by this how little known and used the *Tabaxir* was by the Antients, since *Seneca* speaks of it only by Hearsay. The *Arabian* Authors who reckon several Kinds of Sugar, omit this which was the only kind known to the Antients by that Name; and the Reason was, as we hinted before, they did not take it for a Sugar, but a *Spodium*. Thus

Salmasius,

Salmafius, who believes, however, that the Antients, tho' utterly unacquainted with our modern factitious Sugar, might have heard speak of the Cane which produces it, and of its Juice; but that the *Indians* themselves of those Times knew not how to make the Sugar, and only used the expressed Liquor of the Cane, which is sweet, for a Drink. As a Proof that the Antients had some Knowledge of the Sugar-Cane, he quotes those Verses of *Varro Atacinus*:

*Indica non magna nimis Arbore crescit Arundo,
Illius è lentis premitur radicibus humer,
Dulcia cui nequeant succo contendere Mella.*

"In *India* there grows a Cane of a moderate Bigness, from whose viscid Roots is expressed a Liquor with which Honey itself cannot be compared for Sweetness." *Salmafius* however intends not to prove that the Invention of Sugar, or the Way of preparing it as we now have it, is very new; but acknowledges that it was discovered above eight hundred Years ago, and that it was grown very common in the Time of *Avicenna*.

The Cane which produces the common Sugar is thus distinguished.

Arundo Saccharina, J. B. 2. 531, Ger. 35. Emac. 38. Raii Hist. 2. 1278. *Arundo Saccharifera*. C. B. Pin. 18. Theat. 193. Boerh. Ind. A. 2. 162. *Harundo Saccharifera*, Park. Theat. 1210. *Canna Saccharifera*, Ogilb. Chin. 1. 228. *Arundo Viba Brasiliensis* dicta, Pis. (1648.) *Tacomaree* sive *Arundo Saccharifera*, Ejusd. (1658.) *Vuba* & *Tacomaree Brasiliensis*, Marcg. 82. THE SUGAR CANE.

This Species of Cane is produced in large Quantities in the *East* and *West Indies*, and the Islands most contiguous and adjacent to them. Its Stalk and Leaves resemble those of the common Cane, only its Stalk or Trunk is not so high as that of the other, since it is only six or seven Feet in Length. The Stalk of this Species is of a Colour like that formed by a Mixture of yellow and green. 'Tis more than an Inch in Circumference, furnished with Knots or Joints, and full of a spongy, white and sweet Pith. Its Root is not unlike that of the common Cane, but is not so woody, tho' it abounds with a sweet Juice. *Lobelius* in *Adversar.* informs us, that its Root dried and reduced to a Powder, is a Meal used by many of the *Indians* for making a Species of Bread of a very agreeable Taste. The best Cane is produced in the *Canary* and *Madera* Islands. That growing at *Java* and *Madagascar* is also excellent. This Species of Cane yields the Sugar by Latin Writers called *Saccharum*, *Zuccharum*, *Zuccorum* and *Sucharum*. The *Arabians* call it *Zuchar*, *Zucara*, *Sucbar*, *Zozar*, and *Sutter*, and the *Greeks*, *Σάκχαρον*, *Σάκχαρ*, *Σάκχαρι*, and *Σάκχαριον*. Many call it *Mel Arundinaceum*, after it is boiled, evaporated, and put in wooden Vessels for Exportation.

There are in the Shops various Species of Sugar, which receive their Appellations either from the Parts in which they are produced, or from their Goodness and Fineness. Thus we have *Canary Sugar*, *Valentian Sugar*, *Malta Sugar*, *Powder Sugar*, *Refined*, and *Double Refined Sugars*, *Thomasian Sugar*, from an Island of the *Indies* bearing the Name of *St. Thomas*, *Sugar Candy* and *Penidian Sugar*, and *Coarse Red Sugar*, most generally used in Clysters, on Account of its abstergent and resolvent Quality. *Barley Sugar* is also a factitious Sugar, and is accounted good for the Breast and Throat. The best of it is white, spongy, large, and easily broken. For Coughs in Children it is exhibited with Oil of sweet Almonds, or Syrup of Violets. The Diapenidion of the Shops cures Disorders of the Breast, alleviates Coughs, is good against pleuritic Pains, a Difficulty of Breathing, Consumptions, Disorders of the Lungs, and Spittings of Blood. Liquid Sugar remains always in the Consistence of Honey or Syrup, and is no more than the Froth gathered in refining the other Sugars. As for the Nature and Qualities of Sugar in general, it is temperate, heating, emollient, resolvent, purgative, and calculated to resist Putrefaction. If it is properly used, it nourishes the Body; for according to *Claud. Diodat. Panth. Hygiast.* L. 1. Cap. 21. nothing nourishes which is entirely free from Sweetness. It is good for the Stomach, Lungs and Breast, cures Coughs, and all Diseases of the Thorax, promotes Expectoration, softens internal Tumors, cleanses Ulcers of the Kidneys, Bladder, and Intestines, hinders all corrosive Substances from so easily corroding the internal Parts, makes agreeable Sweet-meats, and renders ungrateful Medicines agreeable. But the more white and pure Sugar is, the less sweet it, also, is, as we are informed by *Pis. 1. 4. de Facultat. Simpl. cap. 1.* and *Erasm. Francis*; for if coarse brown Sugar is dissolved in a Lixivium of Lime Water, refined and separated from its grosser and more impure Parts, it assumes an acid Taste, different from what it had

before, and overheats the Blood; for which Reason, Persons of hot and bilious Constitutions ought to be very cautious in using it, except in Medicines, since it will soon be converted into Bile: For according to *Ettmuller*, by its volatile Acidity it disturbs the Bile, and excites a preternatural Orgasm in it. And according to *Henricus ab Heer, Obs. Med.* 5. it is principally injurious to scorbutic, hypochondriac, cachectic, and feverish Patients, if they use a considerable Quantity of it; because, being easily converted into Bile, it augments the Fever and all its Symptoms. It is also injurious to Women who labour under a Suffocation and Strangulation of the Uterus, relaxes the Mouth of the Stomach, and, according to *Ettmuller*, on account of its easily fermentable Quality, soon becomes ascetic in the Stomach, and *Primæ Viæ*. It weakens Digestion, and produces Flatulences, and sudden Heats, impairs the Appetite, generates a corrosive Blood, produces Pains of the Belly and Dysenteries. According to *Joh. Cbr. Fromman. Tr. de Hemorrhoid. Part. 1. Probl. 33.* it lays a Foundation for the Hemorrhoids. This Opinion is also confirmed by *Melch. Sebix. L. 2. de Facult. Aliment.* and *Val. Henr. Volger. Diætet. Comment. cap. 9.* *Simon Pauli in Quadripart. Botan.* informs us, that in England an excessive Use of Sugar produces Consumptions; and *Ehrenfr. Hagendorn, in Hist. Med. Phys. 23. Cent. 3.* tells us, that Sugar produces an irregular Gout. Not only Women, but, also, several Physicians are of Opinion, that Sugar and Honey generate Worms in Children; but if we reflect on the Generation of these Animals, we shall easily perceive that it is hindered by nothing more than by Sugar and Honey. In *Act. Med. Leips. An. 1700.* Sugar copiously used is recommended against Worms. This Piece of Practice is also authorized by *Levinus Lemnius, L. 1. de occult. Nat. Mir. Cap. 21.* *J. Heurn. de Peste, Cap. 21.* *J. Varand. de Morb. Intestinar. Cap. 2.* *Laur. Strauff. Palæstr. Med. L. 3.* And *A. Vincent de Petrone*, in his *Consilium de Vermiculis quibusdam in Corvorum & Aprorum Hepate inventis*; for 'tis certain that Worms are generated either by a coarse, crude, and verminous Matter, subject to Putrefaction, or by the Eggs of Insects taken in with the Aliments. But Sugar and Honey never putrefy, as we are told by *Galen, in Lib. 3. de Simpl. Med. Facultat. cap. 15.* On the contrary, Sugar and Honey, by means of their balsamic Quality, which resists Putrefaction, are very proper for preserving Substances for a long Time. For this Reason in the Shops, Conserves, Syrups, Electuaries, Linctures, and Confections, cannot be made without Sugar: Neither can Roots, and various other Things be preserved without it; for it not only assumes the Smell, Taste, and Colour of all the Ingredients, but also preserves their Virtues and Qualities for many Years. For this Reason also the Antients embalmed their Dead with Honey. Confirmations of this may be found in various practical Authors. *Ant. Mizald. in Cent. 5. Aph. 27.* informs us, that not only Butter, but also sweet Substances and Raisins kill Worms. And *Sanctor. in Lib. 5. Meth. Vitand. Error. Cap. 11.* tells us, that Honey and Sugar are possessed of a certain intense Acrimony and Heat, by which they are greatly defended against Putrefaction. Externally Sugar cures recent Wounds, purifies Ulcers, removes white Spots and Films from the Eyes, according to *Marc. Gatinar. in Prax. Med. cap. 21.* The Turks, in order to cure their Wounds, wash them twice a Day in Wine, and afterwards put Sugar in them. *Joh. Haricis, in his Thesaurus aureus, Part. 2.* informs us, that Sugar sprinkled on the Crown of the Head, removes Head-achs. In *Riedlin. Lin. Med. An. 2.* we are told that Sugar, mixed with Oil of Marjorum or Cloves, and taken up the Nostrils, removes a Coryza. According to *Joh. Beguinus in Tyrocin. Chym. L. 2. cap. 6.* Oil of Sugar relieves Pains of the Breast, Coughs, Asthma's and Hoarseness, in some Measure stops Catarrhs, and promotes Digestion. The same Author also informs us, that Tincture of Sugar, exhibited in Cinnamon or Rose Water, is excellent in Syncope and Deliquiums.

Sugar is the essential Salt of the *Arundo Saccharifera*, or Sugar-Cane, the different Kinds of which are these:

Muscovado, the first Sugar got from the Juice of the Canes. *Cassonada*, Sugar refined from the former by the Whites of Eggs, Lime-Water, &c. which being more oily than the more refined Sorts, is to be preferred for all inward Uses. It is also most proper for Confectioners, because it does not candy so easily.

Loaf-Sugar; *Cassonada*, still further refined, and clarified in different Degrees. It has the same Qualities with the former, but in a less Degree for inward Use. They both cut Phlegm, promote Expectoration, and animate the Blood; but they excite Vapours and the Tooth-ach. They who use much Sugar, are liable to Fevers and to rotten Teeth. In *Brazil*, the Skimmings of Sugar are given to the Hogs, by which they are soon fattened, and their Flesh becomes very delicate.

Sugar Candy, or Crystals of Sugar is of three Kinds, white, yellow, and red; which are only the three former Sorts boiled to a due Consistence. White Sugar Candy comes from the *Leaf Sugar*; yellow from the *Cassanada*, and red from the *Muscovado*. Sugar Candy is most proper in Colds, because it melts slowly, and thereby gives Time to the Saliva to mix with it, and thus to blunt the Acrimony of the Phlegm.

Red Sugar. This was used very much formerly in Loosenesses; but at present Oil of Sweet Almonds, and other Things of that Kind are substituted for it.

Syrup of Sugar, or *Molasses*, is the glutinous Part which drains from Sugar, and was formerly used for the red Preserves or Sweet Meats; but it gave them a disagreeable burnt Taste. In the *West Indies* they ferment and distill it; but the Brandy or Spirit which it yields is unpleasant and very intoxicating. A much better Spirit might be made of refined Sugar.

To these we may add the *Saccharum Acerum*, Maple Sugar; which is the Product of *Canada* and *New England*, in which Countries the Natives collect the Juice that runs from a kind of Maple Tree by Incision, and then evaporate that Juice to the Consistence of Sugar, which, while it remains unctuous, is better for internal Use than any other Kind; and the famous Syrup of Maiden-Hair of *Canada* is made with it. As it is brought to us, it is of a greyish Colour, and tastes like other Sugar. With this Sugar the Inhabitants of these Countries prepare also a Sort of Liquor, which is their common Drink; and also make Brandy and Vinegar from it. *Geoffroy*.

As Sugar is a temperate Salt, friendly to Nature, and capable of producing an intimate Union of oleous and pinguious Parts with Water, hence appears the Reason why some both among the Ancients and Moderns, used to mix Honey, Sugar, Figs, and dried Grapes, with the Food intended to fatten old Animals; for the pinguious Parts of the Aliments, which, when intimately incorporated with the aqueous Parts, constitute the Milk and Chyle, are by this Means more quickly dissolved, united with the aqueous Parts, and form a large Quantity of Chyle, which is conveyed with the Blood to all the Parts of the Body.

Hence also appears the Reason why either Honey or Sugar, mixed with Milk, prevents its Elaboration into Butter; for the Sugar more firmly unites with the Phlegm the numerous oleous Particles in the Cream; whereas, in order to the Churning of Butter, or its Collection into one Mass, these ought rather to be separated and disjoined from each other.

Hence we may also learn, that Sugar is not so unfriendly to the Mixture of the vital Fluids, as is commonly believed, since it neither induces any Change on the Blood, Milk or Serum, when mixed with them, but rather by stimulating the intestinal Fibres, facilitates the Excretion of the Fæces by Stool. And as it greatly promotes the Union of the oleous with the aqueous Parts of the Aliments, hence 'tis probable that it greatly contributes to the Generation of a large Quantity of Chyle. This accounts for the usual Method of fattening Capons and Geese, by mixing a little Honey, Sugar, or Salt with Wheaten or Barley-Meal for their Food. *Hoffman, Observat. Chym. L. 1. Obs. 7.*

I have had Reason to give a great Character of Sugar, on account of some extraordinary Effects it seemed to have on my Grandfather forty Years since. He made it his daily Practice to take or lick up as much Sugar as his Butter spread upon Bread would receive, for his constant Breakfast, unless he happened to exchange it for Honey sometimes. He frequently sweetened his Ale and Beer with Sugar: He had Sugar put to all the Sauces he used with his Meat: He had all his Teeth in his Mouth at eighty Years, strong and firm; never had any Pain or Soreness in his Gums or Teeth; never refused the hardest Crust. In his eighty second Year one of his Teeth drop'd out, and soon after that a second, which he put into my Hand, and was one of the Fore-teeth: He bid me feel the Cavity, where I struck my Nail upon a Bone. In short, all his Teeth came out in two or three Years, and young ones filled up their Room: He had a new Set quite round. His Hair, from a very candid white, became much darker. He continued in good Health and Strength without any Disease, and died in his 99th or 100th Year, of a Plethora, as I guess, for want of Bleeding. He was a *Bedfordshire* Gentleman of an old *English* Family, and the Case well known. This reconcil'd me much to vindicate Sugar, which I have formerly done before the Royal Society; and have shewn the unjust Calumny of the famous *Willis* against Sugar, who charges it with a corrosive Liquor, as bad as *Aqua Fortis*; he calls it *Aqua Stygia*. I examined it, and found the Charge unjust; that Sugar contained no worse Substance in it, than Milk and Honey, and Manna, nay even Bread itself. The Experiments were approved of, and are in your Journals. *By Dr. Stare, in the Philosophical Transactions abridged, Vol. 5. p. 311.*

Mr. Sarrazin, a Physician of *Quebeck*, and Correspondent of the Royal Academy, found in *North America* four Species of Mapple-Trees, which he sent as a Present to the Royal Garden, after having given a Name to each. The fourth of these Species, which he calls *Acer Canadense Sacchariferum, fructu mirori*, *D. Sarrazin*, is a Tree about sixty or eighty Feet high, whose Sap, which ascends from the first of *April* to the Middle of *May*, is pretty often richly impregnated with Sugar, as the Natives of that Country and the *French* have found. For obtaining this Sap they make an Incision in the Tree, from which it flows into a Vessel. This Juice, when evaporated, leaves about a twentieth Part of its primitive Weight, which is true Sugar, and proper to be used in making Confections, Syrups, and other Things, in which Sugar is generally employed. One of these Trees, which is three or four Feet in Circumference, will in one Spring yield sixty or eighty Pints of Juice, without losing any Thing of its Vigour. But if more was drawn from it, it is obvious that the Tree would be weakened, and a proportionable Decay brought on. This Juice, in order to be impregnated with Sugar, requires very singular Circumstances, which one would not easily conjecture, but which *Mr. Sarrazin* has carefully adverted to; for, first, at the Time the Juice is drawing, the Root of the Tree must be covered with Snow, which must be brought for that Purpose, if it is not there already: Secondly, this Snow must be melted by the Sun, and not by a warm Air: And, thirdly, it must have been a Frost the Night before. This Method used by Nature in forming the Sugar of the Mapple-Tree, resembles some delicate chymical Operations, where the Chymist does Things apparently opposite, and where those Things which appear the most similar do not produce the same Effects.

Another curious Remark of *Mr. Sarrazin's* is, that the Juice of this Species of Mapple-Tree, which is not good for making Sugar, will become so half an Hour, or an Hour at most, after the Snow with which the Root of the Tree is covered, begins to be melted. This Snow must therefore enter the small Filaments of the Mapple-Tree, and operate in them with great Expedition.

Mr. Sarrazin also informs us, that the *Apocynum Majus Syriacum rectum*, furnishes a Juice of which they make Sugar in *Canada*; for this Purpose they also gather the Dew found in the Bottom of its Flowers. *Hist. de l'Acad. Royal des Sciences, An. 1730.*

SACCHARUM HORDEATUM. Barley Sugar.

It is made from Sugar boiled over a slow Heat, in a Decoction of Barley, briskly beat up with the Whites of Eggs, and frequently scummed whilst upon the Fire. It is then to be strained through a Flannel, and again set upon the Fire, where it must boil slowly till it rises in large Bubbles, and upon Trial is found not to stick to the Teeth. It is to be poured upon a Marble-Stone rubbed over with Oil of sweet Almonds, as soon as the Bubbles subside, and its Extremities, as it runs out, turn back again, till it grows of the Consistence of a thick Turpentine, when it must be fastened to something, and nimbly drawn out by Hands rubbed over with Starch, into thin or thick, long or short Threads at Pleasure, and laid upon a Plate provided on Purpose, till it hardens into Lozenges.

SACCHARUM NITRATUM. Sugar with Nitre.

Take Crystal Mineral, one Dram, fine Loaf Sugar three Drams, mix together.

This is cooling and diuretic, and also serviceable in the scalding of Urine in a Gonorrhœa; but it is principally good to cool the Inflammation of the Uvula, and ease a sore Throat, by letting it melt gently in the Mouth.

SACCHARUM ROSATUM. See ROSA.

SACCHARUM SATURNI. See PLUMBUM.

SACCHARUM SCORBUTICUM. An Antiscorbutic Sugar.

Take any Quantity of the Juice of Scurvy-Grass, keep it in a Glas Bottle close stopped up till the Fæces are precipitated; then decant the clear, put a good Quantity of Sugar in a Marble Mortar, and work it well together, then gently dry it. Afterwards put more Juice to the same Sugar, dry it again, and repeat this Operation several Times, and keep it close stoppt for Use.

SACCHARUM TABULATUM SIMPLEX ET PERLATUM. Simple and Pearl Lozenge Sugar.

The first is made by pouring Sugar, which hath been sufficiently boiled with half its Quantity of Damask Rose-Water upon a Marble: And the latter by adding to every Pound of the former, towards the End of its boiling, half an Ounce of prepared and levigated Pearl, with eight or ten Leaves of Gold.

SACCHARUM TABULATUM COMPOSITUM.

Compound Lozenge Sugar.

Take of fine Rhubarb four Scruples, of the Troches of Agaric, of Coralline, burnt Hartshorn, of the Leaves of Cretan Dittany, of Worm-seed, of the Seeds of Purslain and Sorrel, of each one Scruple; of Cinamon, Zedoary, Cloves, and Saffron, of each half a Scruple; of the finest Sugar powdered one Pound. Let the Sugar be dissolved in five Ounces of simple Wormwood Water, and one Spoonful of strong Cinnamon Water; and the forementioned Species mixed with it, so as to make it into Tablets.

SACCITONIUM. Wine strained through a Bag. *Castellus* from *Codronchius*.

SACCULI ADIPOSI. The Cells of the Cellular Membrane filled with Fat.

SACCULI MEDICINALES. Medicinal Bags; that is, Bags filled with Medicinal Ingredients.

SACCULUS CHYLIFERUS. The Receptacle of the Chyle.

SACCULUS CORDIS. The *Pericardium*.

SACCUS. The *Intestinum Cæcum*.

SACCUS LACTEUS. The *Receptaculum Chyli*.

SACER. Sacred or holy. But it is used in a very different Signification, that is, to express *dreadful, horrid, or execrable*. Thus *Virgil* calls the Love of Gold, *Auri sacra fames*. In both these Significations it is used by Medicinal Writers. Thus,

SACRA FISTULA, is the Spinal Marrow, according to *Blancard*.

SACER IGNIS, is a malignant Species of *ERYSIPELAS*.

SACER MORBUS, is the Epilepsy.

SACER MUSCULUS, is the Name of a Muscle, called by *Winslow Transverso Spinalis Lumborum*.

This Muscle is composed of several oblique converging or transverso-spinal Muscles in the same Manner as in the Back and Neck; and it lies between the spinal and oblique Apophyses of the Loins, reaching to the *Os Sacrum*.

The lowest of these Muscles are fixed to the superior lateral Parts of the *Os Sacrum*, to the *Ligamentum Sacro-Iliacum*, and to the posterior superior Spine of the *Os Ilium*. The rest are fixed to the three lowest transverse Apophyses, and to the four lowest oblique Apophyses of the Loins, and to their lateral Tuberosities. From thence they run up to all the spinal Apophyses of these Vertebrae, the external, or those that appear first, being longer than the internal, which lie immediately on the Vertebrae, especially toward the lower Part. *Winslow's Anatomy*.

SACRUM OS.

The *Os Sacrum* is situated in the posterior and lower Part of the Trunk, as the Basis by which the whole Spine is supported, and from hence it has by some been termed *Os Basilare*.

Its Figure comes near that of a long Triangle, with the Basis upward, and the Apex downward. It may be divided into the upper Part or Basis; the lower Part or Apex; two Sides, the anterior or concave; and the posterior or convex; and two lateral Parts or Edges. We here consider it as one Bone only, as it is in an adult Subject.

In young Subjects it is made up of several distinct Pieces, termed false Vertebrae, united together by Cartilages, which in time diminish, grow hard, and disappear, leaving no Marks behind them, but little Ridges or Lines more or less prominent. These Pieces are five in Number, and sometimes six, all of them resembling the Vertebrae in something. The first is much larger than any of the true Vertebrae; but their Size diminishes by very great Degrees as they descend, so that the lowest, which makes the Point of the *Os Sacrum*, has scarcely the Appearance of a Vertebra.

In the anterior or concave Side, we commonly see four Pair of large Holes, and sometimes more (according to the Number of false Vertebrae) disposed in two longitudinal Rows, and appearing to be formed by the Notches in the original Pieces meeting each other. Between these two Rows of Holes, through the whole Length of the Middle of this Side, we observe the Bodies of five or six false Vertebrae cemented together, of which the uppermost or first comes nearer to the Structure of a true Vertebra than the rest. The last is very small, and below the Holes it has a Notch on each Side, and sometimes a Production in the Shape of a little Horn.

The posterior or convex Side is very uneven. The same Number of Holes appear here, as in the fore-side, and disposed in the same Order, but they are not so large. Between the two Rows of Holes, is a Sort of spinal Apophysis more or less imperfect, especially toward the upper Part. In these Apophyses we often find Openings, sometimes in the superior, sometimes in the inferior, and thus perpendicular Fissures are formed of different Breadths. Sometimes a transverse Open-

ing is left between the several Spines; but in all that has been here said, great Varieties are observable. On the Outside of each Row of Holes are Tuberosities which appear like transverse and articular Apophyses confounded together. At the Basis or upper Part of the *Os Sacrum* are two articular Apophyses, answering to the inferior ones of the last Vertebra of the Loins. Below each of these Apophyses, laterally, is a large Notch; and between them, we see distinctly enough the upper Side of the Body of the first false Vertebra, which is like that of the Lumbar Vertebrae; being very much inclined backward: so that the Body of this false Vertebra, as well as of the last true one, is longer, before than behind. From this Obliquity it happens, that the *Os Sacrum* and last Lumbar Vertebra, form, at their Connexion, a very considerable Angle.

Behind the Body of this first Vertebra of the *Os Sacrum*, between the articular Apophyses lies the Orifice of a large Canal, triangular and flat, which runs down in the Middle Substance of the Bones between the two Sides, and between the four Rows of Holes, behind the Bodies of all the false Vertebrae. It contracts as it descends, and communicates with all the large Holes, being the Continuation of the great Canal of the Spine. It is often broke into by the Fissures already mentioned, on the Back-side.

The lateral Parts are broad toward the Top, forming on each Hand, a large, uneven, irregular, cartilaginous Surface, in the Figure of a great S, and sometimes of a Bird's Head. By these two Sides the *Os Sacrum* is connected with the *Os Innominata*, by a cartilaginous Symphysis. Between each of these lateral Sides, and the nearest posterior Holes, there is a large rough Depression, and under that, another not so large. These Depressions are often pierced by several Holes, which lose themselves in the inner Substance of the Bone. *Winslow's Anatomy*.

SACRA TINCTURA. See **HIERA**.

In *Paulus Aegineta*, L. 7. C. 8. there are several *Hieras* described, which imports the same as *Sacra*. Thus there is the *Hiera Archigenis*, *Hiera Antiochi*, *Hiera Jusii*, *Hiera Galeni*, and *Hiera Ruffi*.

SACRA VASA. The Vessels which belong to the *Os Sacrum*, and Parts adjacent.

SACRANUS COLOR. A Purple Colour. *Johnson*.

SACRES. Pigs about ten Days old. *Castellus* from *Langius*.

SACRO-LUMBARIS MUSCULUS. This is a long complex Muscle, narrow and thin at the upper Part, broad and thick at the lower, representing a kind of flat Pyramid. It lies between the Spine and posterior Part of all the Ribs, and along the back Part of the *Regio-Lumbaris*, all the Way to the *Os Sacrum*.

Through all this Space it is closely accompanied by the *Longissimus Dorsi*, which lies between it and the Spinal Apophyses of the Vertebrae, a narrow, pinguious, or cellular Line running between them. The Name of *Lumbo-Costalis* would better express the Situation of this Muscle than that of the *Sacro-Lumbaris*. It might be termed *Medius Dorsi*, to distinguish it from the *Latissimus* and *Longissimus Dorsi*, between which it is placed.

It is fixed below by a broad thin tendinous Aponeurosis to the superior Spines of the *Os Sacrum*, and to the neighbouring lateral Parts of that Bone; and lastly, to the external Labium of the posterior Part of the *Crista Ossis Ilium*, all the Way to the great Tuberosity. The Aponeurosis covers and adheres very closely to the lower Part of the *Longissimus Dorsi*, and where it is fixed to the *Os Sacrum*, it is a little covered by some Insertions of the *Gluteus Maximus*.

From thence this Muscle runs upward, and a little laterally, over all the *Regio-Lumbaris*, the Aponeurosis sending off from its Inside a Mass of fleshy Fibres, which are divided from below upwards, into several large Fasciculi inserted in all the transverse Apophyses of the Loins.

Afterwards it runs up obliquely over all the Ribs, sometimes as high as the two or three lowest Vertebrae of the Neck, sometimes higher, and sometimes it ends at the first Vertebra of the Back.

Through all this Extent the Side of the Muscle next the *Longissimus Dorsi*, or Vertebrae, is very even; but that next the Ribs is divided into several Portions, in an oblique Disposition from below upwards, resembling in some measure the Branch of a Palm-Tree. These Portions or Digitations are fixed in the transverse Apophyses of the Neck, in the Tuberosity of the first Rib, in the lower Part of the angular Impressions of the ten following Ribs, and near the Extremity of the last Rib.

This Digitation belonging to the last Rib is broad, and more fleshy than tendinous. Those of the other Ribs are tendinous, flat and narrow, and those of the Neck are something fleshy, but very slender. The most superior Portions are longer and narrower than those below them, they growing gradually shorter and broader as they descend.

In dissecting this Muscle with Care, between these Portions and

and the Ribs, we meet with several long thin muscular Fasciculi, which crossing the Portions, and adhering to them, are afterwards fixed in the Ribs above and behind the Insertions of the several Portions.

These muscular Fasciculi begin at the transverse Apophyses of the same Vertebrae of the Neck, from whence they run down and are fixed in the eight or nine following Ribs. Sometimes they pass over several Ribs without being inserted in them; but this varies in different Subjects, and sometimes in the two Sides of the same Subject.

In this manner these Fasciculi form a particular Plane, which some take for the internal Portion of the *Sacro-Lumbaris*; others, after *Siens*, call it *Musculus Accessorius Sacro-Lumbaris*. Some take it for a distinct Muscle, calling it the *Cervicalis Descendens* of *Diemerbroeck*.

The two *Sacro-Lumbares* maintain the Back and the *Regio-Lumbaris* in their natural Situation when we stand or sit; and by the Relaxation of their Fibres more or less, the Trunk is proportionably bent forward by the Weight of the Head and Breast. They also extend the Back and Loins in all Postures, keep them steady and fixed under the Weight of Burdens, and bend the Loins backward.

One of them acting alone, may have the same Uses of bending forward, extending, resisting, and bending backward, but with less Strength, and in an oblique Direction, as when the Body is inclined obliquely forward, and to one Side at the same time, or extended from that Posture. They also serve to counter-balance the oblique Muscles of the Abdomen, in turning the Thorax upon the Pelvis.

These Muscles may in some respects be compared with the *Splenii*; that is, their superior Insertions with the Mastoide Insertions of the *Splenii*, and their inferior Insertions with the vertebral Insertions of these Muscles. The Mastoide-Portion of the *Splenius* is longer, more distant from the Articulation, and more disposed to perform large Motions, and to resist great Efforts than the vertebral Portion. In like manner, the Costal Portion of the *Sacro-Lumbaris*, by the Length of the tendinous Series, by their graduated Insertions in the Ribs, and by their Obliquity, is better disposed for the Uses already mentioned than the vertebral Portion.

The small muscular Fasciculi which cross these tendinous Portions, called *Musculus Sacro-Lumbaris Accessorius*, seem to counterbalance and moderate the Depression of the Ribs in the great Efforts of the *Sacro-Lumbaris*.

The Use of these Muscles in progressive Motion, is not sufficiently demonstrated. It is supposed that while we lift one Leg to make a Step, the *Sacro-Lumbaris* of the other Side sustains the Vertebrae of the Loins and Back, to prevent their yielding to the *Psoas* which lifts the Leg, and puts it in Motion; but the Direction of the greatest Part of the Fibres of the *Sacro-Lumbaris* is very improper for such an Use.

The Use of the *Sacro-Lumbaris* in Respiration is also attended with Difficulties; for when the Body is very much inclined forward, and even much loaded, the Ribs continue still to be raised with the same Ease as they are depressed, tho' the *Sacro-Lumbaris* is principally employed in this Case; but it is to be remembered that I speak here only of bending and loading the Back, not of loading the Shoulders. In the first Case, the Ribs move easily; but not in the second. *Winflow's Anatomy*.

SACTIM. Vitriol. *Rulandus*.

SADIR. The same as SCORIA. *Rulandus*.

SÆPÆ. Large eroding Pustules. *Castellus*, from *Foefius*.

SAFFATUM, is, according to *Johnson*, a Species of Salt, but he does not explain what.

SAGADENON. *σαγαδηνον*. A Name for the best Species of Opobalsamum, which *Galen*, de *Antidot.* L. 1. C. 4. says, was produced in *Palestine*.

SAGAPENUM. Offic. C. B. P. 494. *Raii Hist.* 1. 1844. *Schrod.* 214. *Park. Theat.* 1544. *Ger.* 898. *Emac.* 1056. *Mill. Bot. Offic.* 384. *Sagapenum Veterum.* J. B. 3. 156.

This is a Gum flowing, as is supposed, from a Species of *Ferula*, which grows, according to *Dioscorides*, in the Country of *Media*, though it comes to us from *Alexandria*. It is of a reddish-brown Colour, made up of Drops usually clung and clotted together, of a somewhat clear horny Colour in the Inside, a little like *Asa Fœtida*, but harder, with somewhat of the Garlick Smell. We sometimes see it in small Drops not clotted together, of a light yellowish brown Colour; but this is not often to be met with.

Sagapenum is opening and attenuating, cleansing the Breast of tough Phlegm, helping the Asthma and Difficulty of Breathing. It is likewise good for the Dropsy, promotes the menstrual Evacuation, and prevents hysteric Disorders. Outwardly applied, it helps hard Tumors and Swellings. *Miller's*

Bot. Off. See FERULA MAJOR, seu FÆMINA PLINII.

This Gum is imported from *Alexandria*. That is most esteemed which is pure, pellucid, on the Outside of a fallow, or brownish Colour externally, but within whitish; of an acrid Taste, and strong Smell like Garlick. It is attenuating and opening, and purges off viscid and serous Humours, lodged in the Stomach, Intestines, Uterus, Kidneys, Brain, Nerves, the Joints and Breast. Hence it is serviceable in a Dropsy, inveterate Cough, Asthma, Head-Ach, Convulsions, Epilepsy, Palsy, Tremors of the Limbs, Obstructions and Tumors of the Spleen, and Cholic. It provokes the Menfes, and excites Urine; but destroys the Fœtus. *Schroder*.

SAGDA. The Name of a Gem mentioned by *Pliny*, L. 37. Cap. 10. of a green Colour, which he informs us, the *Chaldaans* find adhering to Ships. In *Samo-Thracia*, he farther tells us, a light black Gem is found, resembling Wood, which bears the same Name.

SAGIMEN VITRI. Alkaline Salt. *Rulandus*.

SAGITTA.

The Characters are;

The Root is fibrous, thick, fungous and creeping. The Leaves at first resemble those of Plantain, but afterwards the bearded Head of an Arrow; the Stalk is just as usual in umbelliferous Plants; the Flower is tripetalous, like that of the *Plantago Aquatica*; and the Fruit consists of a Collection of Seeds like a Strawberry.

Boerhaave mentions four Sorts of *Sagitta*, which are;

1. *Sagitta*; aquatica; major. C. B. 194. *Ranunculus, palustris, folio sagittato, maximo.* T. 292.

2. *Sagitta*; aquatica; minor; latifolia. C. B. P. 194.

Boerb. Ind. A. 46. *Sagitta*, Offic. J. B. 3. 789. *Raii Synop.*

3. 258. *Sagitta minor*, *Ejulf. Hist.* 1. 619. *Sagittaria minor latifolia*, *Park. Theat.* 1247. *Ranunculus, palustris, folio sagittato minori*, *Tourn. Inst.* 292. ARROW-HEAD.

It grows in Brooks and Waters, flowers in May and June, and the Parts in Use are the Herb and Seed. It is, says *Matthiolum*, of a cold and moist Temperament, and has the same Virtues as the *Plantago Aquatica*.

3. *Sagitta*; aquatica; minor; angustifolia. C. B. P. 194. *Ranunculus, palustris, folio sagittato, angustiori*, T. 292.

4. *Sagitta*; aquatica; major; folio angustiore.

It has the Virtues of the *Plantago Aquatica*, but the Smell and Taste shew it to be of a heating Quality. *Hist. Plant. ascript.* *Boerhaave*.

SAGITTALIS SUTURA. The Sagittal Suture of the Cranium. See CAPUT.

SAGITTARIA. The same as SAGITTA.

SAGITTARIA ALEXIPHARMICA. Offic. *Canna Indica, radice alba, Alexipharmica.* *Raii Hist.* 3. 573. *Arundo Indica, angustifolia, flore rutilo, pediculis donata*, *Hist. Oxon.* 3. 250. *Agutiguepoobi Brasiliensibus*, *Raii Hist.* 2. 1203. *Radix quædam in Malaca, quæ adversus vulnera Sagittis toxico illitis facta, præsentaneum remedium est Garzias*, C. B. P. 301. *Radix Malaca quædam toxicis Sagittis resistens*, J. B. 2. 173. ARROW-ROOT, DART-WORT.

This Plant has a Root two or three Inches in Length, geniculated, of the Thickness of a Man's Thumb, white, and of a conic Figure, every Interode or Space between the Joints being half an Inch in Length, and every Joint sending forth several Fibres two or three Inches long, for attracting Nourishment. From the Root arise various Leaves on Pedicles three Inches in Length, and of a good Breadth, embracing one another, or the outer ones wrapping themselves about the inner, and surrounded with a white Ring at the Place of Apposition. The Leaves are four Inches long, and two Inches broad near the round Base where they are broadest, and are thin, fibrous, and grassy, and of a greenish-yellow Colour. In other Respects it is like the *Canna Indica*.

Sir Hans Sloane observed this Plant in the Gardens of *Jamaica* and the *Charibbee* Islands. It was transplanted to *Jamaica* from the Island of *Dominica*, and is highly valued on account of its alexipharmic Virtue, and its Efficacy against Wounds inflicted by poisoned Darts and Arrows; for which purpose it is frequently used by the *Indians*, who bruise the Herb, and apply it to the injur'd Place. *Raii Hist. Plant.*

SAGMINALIS HERBA. Vervain. See VERBENA.

SAGOU. See Palma, Japonica; spinosis pediculis; Poly-podii folio.

SAGZENE. A Name for two Medicines described by *Avicenna*, the greater and the less, which are recommended against cold Disorders of the Stomach, Intestines, and Uterus.

SAHAFATUM, or SAHAFATI. The same as ACHOR.

SAHARA. The same as PERVIGILIUM.

SAIC. Quicksilver.

SAIRE. The same as ESSERE.

SAKMUNIA. The Arabic Name for Scammony.

SAL. Salt. For an Account of Salt, considered as a Chymical Principal. See **PRINCIPIA**, and **ACIDULÆ**.

A Salt is, by *Geoffrey*, defined to be a solid, friable, pellucid and sapid Mineral Body, dissoluble in Water, fusible by Fire, and easily concretescible in Form of Crystals. This Definition agrees to alimentary Salt, Nitre, Vitriol, Alum, Sal-Ammoniac, and Borax.

OF ALIMENTARY SALT.

Alimentary Salt, or that which is used in Food, is distinguishable from all other saline Bodies by the cubical Figure of its Crystals, which it retains even in the least Particles, which are the Objects of Sense. It is of two Kinds, being either dug out of the Earth, from whence it is called Fossile Salt, or Sal Gem; or prepared by evaporating the Sea-Water, being from thence termed Sea-Salt; or by evaporating the Water of Salt-Springs.

OF FOSSILE SALT OR SAL-GEM.

There are several Kinds of this fossile alimentary Salt, differing from each other only in their Colour, which is white, grey, of a yellowish red, or pellucid like Crystal; which last, most properly called Sal-Gem, is preferred to all the rest, as being judged most pure. It is of an octagonal or cubical Figure, and salt Taste, pellucid like a Gem, and often resembles Crystal, both in Colour and Brightness. In the Mountains of *Catalonia*, near the City of *Cardona*, and also in deep Mines in *Poland* near *Cracow*, huge Rocks of this Salt are found, and they beat them to pieces with proper Instruments of Iron.

The Virtues of Sal-Gem are the same as those of Sea-Salt. This Salt is used as a Stimulus in Clysters and Suppositories given to soften and evacuate the indurated Fæces, in this or the like Manner:

Take of despumated Honey two Ounces; Sal Gem, a Dram and a half; boil them to a due Consistence for a Suppository. Or, take of Honey, boiled to a due Consistence, one Ounce; Sal Gem, and Species of Hiera, of each half a Dram, Diagridium, fourteen Grains; mix and make them into a Suppository.

Take of the Root of *Spanish* Pillitory half an Ounce; Leaves of Marjoram and Rue, of each one Handful; Leaves of Senna, Agaric, and the Pulp of Coloquintida, of each two Drams, boil in a sufficient Quantity of common Water to twelve Ounces, of strained Liquor, in which dissolve of Sal Gem two Drams, and add of Emetic or Antimonial Wine, three Ounces, for a Clyster in Apoplexies, and other sleepy Diseases.

In these Affections even the strongest and most stimulating Clysters are sometimes of no Effect, because the Intestines are become paralytic; and they are never to be used in an Inflammation of the Intestines. The Chymical Preparations of Sal Gem are the same as those of Sea-Salt. *Geoffrey*.

Fossile Salt is dug out of very deep Mines in *Transylvania*, *Hungary*, *Russia*, *Siberia*, *Tartary*, and many Places in *Germany*. But the most remarkable Salt Mines are those of *Bochna* and *Viliske*, not far from *Cracow* in *Poland*.

The Salt Mines near the small Town of *Viliske*, which (the Church excepted) is altogether dug hollow under Ground, have four Descents; of which the two principal being in the Town itself, are those through which the Salt is drawn up; the other two serve for letting down Timber and other Necessaries. These Descents or Holes are four or five Foot square, lined all the Way downwards with Timber. Above is a great Wheel, with a strong Rope of the Thickness of a lusty Arm, drawn about by a Horse, like as in a Horse-mill.

He that will descend, must cover himself with a Frock, and have another Man that fastens another Rope to the aforesaid big Rope, and having so tied it about himself as to sit in it, he takes him in his Lap, and holds him fast about; whereupon the big Rope being somewhat let down, another fastens likewise a Piece of Rope to the other thick Rope, and does like the former, seating himself in it, and taking and clasping another Man in his Lap, and being also let down a little Way, gives Place to others to do the like; in which manner, thirty, forty, and more Persons, may be let down all at once; of whom the first having touched the Ground, steps out and goes aside, the rest following him, and doing the like; and thus they descend to the Depth of a hundred Fathoms. But then they take a Lamp, and lead People about by strange Passages and Meanders, still more and more descending, till they come to certain Ladders, by which they go down an hundred Fathoms deeper, where there are double Passages and Holes,

one above another, in Abundance; for the Mine-men dig on still, and cut out every where, and on all Sides, as long as the Salt Vein lasts. The great Holes, to secure both the Town above, and the Work below from falling in, are carefully supported by strong and well-compacted Timber.

These Mines were first discovered in 1251. Within them is found a kind of subterraneous Republic, which has its Polity, Laws and Families, and even public Roads, Carriages, and Horses for drawing the Salt to the Mouth of the Quarry, where it is taken up by Engines. These Horses, when once they are down, never see the Light again; but the Men take frequent Occasions of breathing the Village Air. When a Traveller is arrived at the Bottom of this strange Abyss, where so many People are interred alive, and where so many are even born, and have never stirred out, he is surprized with a long Series of lofty Vaults, sustained by huge Pillasters cut with the Chissel, and which, being themselves Rock-Salt, appear, by the Light of Flambeaux, which are incessantly burning, as so many Crystals or precious Stones, of various Colours, shedding a Lustre almost intolerable to the Eye.

The Rocks of Salt are hewn in the Form of huge Cylinders; the Workmen using Hammers, Pick-axes, and Chissels, much as in our Stone-Quarries, to separate the several Banks of Stone. As soon as the massive Pieces are got out of the Quarry, they break them into Fragments, fit to be thrown into the Mill, where they are ground and reduced to a coarse Farina or Flower, which serves all the Uses of Sea-Salt.

In these Mines there are three Kinds of Sal Gemmæ, one is common, coarse and black; the second somewhat finer and whiter; the third very white, hard and transparent, which last is the Sal Gemmæ of the Druggists and Dyers. It cuts like Crystal, and is frequently used for Toys, Chaplets, little Vases, and the like; the other Sorts are less compact, and only fit for Kitchen Uses. The coarse and black Salt is cut out in great Pieces, roundish, and three *Polonian* Ells long, and one Ell thick, which are sold from fifty to seventy *Polonian* Florins.

The greatest Pieces lie before their Doors, where they are lick'd by the Cattle as they pass. The Colour of these Salt-Stones is darkish grey, with some Mixture of yellow.

But the principal Wonder of the Place is, that through these Mountains of Salt, and along the Middle of the Mine, there runs a Rivulet of Fresh-water, sufficient to supply the Inhabitants.

The Imperial Salt-works at *Sooswar*, near *Eper* in *Upper Hungary*, are also remarkable for many curious Particulars; of which *Dr. Bruckman* gives the following Account. They are at least an hundred and forty Fathoms deep. In the Cuts of them, one sometimes finds Alleys of Rock-Salt, of the most delicate blue and yellow Colours. He observed, that the first Colour being exposed to the Sun for some Days, lost entirely that beautiful Ultra-marine, and became white as the other Rock-Salt, which did not happen to the yellow, which preserved its Colour; but when you pound them together, the Salt was neither blue nor yellow, but extremely white.

Melissantes, in his Geography, speaking of Salt-works which the *Spaniards* have in *Catalonia*, says, that there is Rock-Salt, the Colour of which is so diversified, that it comes near the Rain-bow, in having green, red, yellow, and blue Colours; but that, by first preparing, and then grinding it, it became white. The same happens also to the red Rock-Salt of *Salzburg*, which being pounded becomes white.

But one Thing very remarkable, in the Mines of *Sooswar*, is a Chapel, which can easily contain a hundred People, cut in the Rock-Salt, with an Altar, a Pulpit, a Sacristy, Chairs and Forms cut in the same Rock. They celebrate once every Year, the Week after *Epiphany*, divine Service in this Chapel, and the Sermon is always preached by a Jesuit of *Eper*. This Service was founded for the Officers of the Excise and the Miners.

But that which is most curious in these subterraneous Fosses, are the Flowers of Salt, which grow as the Beard of a Goat, with this Difference only, that these are much whiter and finer. One cannot enough admire these Effervescences, which seem to vegetate, yet one cannot find them in all the Cuts, nor at all Times, but they appear and grow according to the Temperature of the Seasons, which in those Parts is very wholesome. These Sort of Plumes of Salt are very brittle, they melt also in moist Places, and dissolve into an Oil; but are nevertheless the most pure Salt, the finest, the most acid, the whitest and most beautiful; so that it is not without Reason they have given it the Name of the Flower of Salt.

At *Neufel*, there is a Statue of Rock-Salt, as large as the Life, which serves as the Barometer of the Town; for when it begins to sweat or grow moist, it presages Rain or wet Weather; but when it is dry you may certainly promise yourself settled Fair.

There are also several Salt-mines in *England*, about the *Wyches* in *Cheshire*.

OF SEA-SALT.

ANALYSIS OF SALT.

The artificial Sea-Salt is obtained by the Heat of the Sun, or by Coction from Sea-Water, or Salt Springs or Wells. In *Britany* in *France*, the Manner of making Sea-Salt is, to dig shallow broad Trenches, which are lined with Clay. These being filled with Sea-Water by the Tide, the Heat of the Sun evaporates the Water, and a large Proportion of Salt remains behind. In *Normandy* they make small Heaps of Sand upon the Shore, which imbibe the Sea-Water, and the insipid Humidity being afterwards evaporated by the Heat of the Sun, the Salt remains among the Sand. To separate it, they first boil it in fresh Water, and then having strained off the Lixivium, containing now only a Solution of Salt in fresh Water, they boil it again with a gentle Heat in leaden Cauldrons, to a certain Degree of Thickness; then putting out the Fire, the Salt chrySTALLIZES.

Salt is made from Salt Fountains likewise, by boiling the Water till the Humidity exhales; and whilst it is boiling, they mix with it either Gall or Bullocks Blood, which makes the Salt form itself more easily into larger Lumps; for the Parts of the Gall or Blood inviscate or entangle the bituminous or earthy Parts, which hinder the Concretion of the Salt, and are altogether thrown up as a Scum, or at least remain in the Strainers. Sea-Salt, prepared by the Heat of the Sun, is preferable both for culinary and officinal Uses. The Taste of it is well known; the Colour is greyish, because of the Particles of Earth mixed with it; but if it be dissolved and chrySTALLIZED by a gentle Heat, it is formed into very white cubical Grains. Salt made by boiling is white, but the Grains thereof are not exactly cubical, because of some Mixture of different Salts.

Before Sea-Salt has felt the Fire, it changes neither the Syrup of Violets, nor Tincture of Heliotropium, it makes no Effervescence with the Oil of Tartar per Deliquium, but discovers, however, some small Signs of Acidity. It lessens the Transparency of the urinous Spirit of Sal-Ammoniac, and darkens the Colour of the Infusion of Gall. By other Trials it seems likewise to discover an alkaline Nature; for it turns a Solution of corrosive Sublimate white, and makes an hot Effervescence with Oil of Vitriol. A Solution of Salt in Water being evaporated to a Pellicle, and then set in a cool Place, the greatest Part of it will be formed into cubical ChrySTALS; but the Remainder cannot be brought to concrete without Heat; and even then it is formed into no regular Figure, and soon runs per Deliquium in the moist Air. Hence it is evident, that Sea-Salt is made of an Acid of a peculiar Kind, and of a mineral Alkali, and that the acid Portion is so far entangled and involved in the other, as hardly to be able to exert its proper Virtues in a concrete Form.

From Sea-Salt, by Distillation in a Retort, we obtain an acid Spirit, which turns the blue Tincture of Heliotropium into a purple Colour, and ferments vehemently with Oil of Tartar, but without any sensible Heat; but does not raise any Effervescence with Lime-Water. This acid Spirit is the only Dissolvent of Gold and Tin, but cannot dissolve Silver or Lead; and it communicates this Quality to Spirit of Nitre and of Vitriol; which, by being mixed with it, becomes *Aqua Regia*. If this Spirit, when very pure, be saturated with the alkaline Salt of Tartar, it concretes into a *Sal Salsus*, resembling Sea-Salt in Taste, and in the cubical Figure of its Crystals; whence it appears that Sea-Salt is an Acid perfectly saturated with an alkaline Salt. The ChrySTALS of Sea-Salt crackle and crepitate in the Fire.

Its Virtues are, to check too great Fermentation, and prevent Putrefaction; and for that Reason, it is used by Chymists for macerating Plants, to keep them from rotting; and what it does to Plants in macerating, is not different from its Effects on the Aliment in the Stomach; where it both checks too great Fermentation, and prevents Putrefaction. It likewise calms the too great Ebullition of the other Fluids of the Body; and, as it readily joins with volatile urinous Salts, and changes them into a Sal-Ammoniac, it is fitted to soften the Acrimony of the Fluids, and promote the Depuration thereof by Urine. By its little Points it likewise stimulates gently the solid Parts, and thereby increases their oscillatory Motion, by which Means all the Functions of the Body are better performed. On these Foundations are built all the Virtues ascribed to Sea-Salt, of drying, heating, deterging, digesting, opening, attenuating, increasing the Appetite, exciting to Veneriness, and of resisting Poisons and Putrefaction.

It is ordered in an *Apepsia*, or want of Digestion, in want of Appetite, in Costiveness, and Obstructions of Urine, and is an Ingredient in the *Unguentum Emulatum*. It is much esteemed by the Chymists, as being the only Menstruum for Gold. *Geoffroy*.

Take any Quantity of Salt, procured either from the Rock, Sea-water, or briny Springs, and as pure as possible; dissolve it in a sufficient Quantity of Water, and digest it for a long Time, in a Vessel so closely stop'd, that none of the Water may evaporate; and, by these Means, an insipid Earth will fall to the Bottom, which cannot again be dissolved in Water. Pour off the clear Liquor, and let it evaporate in a Place free from Dust, till a Pellicle or Scum like a thin Skin appears on the Top; and then set it in a cool Place, and the Salt will shoot into transparent ChrySTALS of the Figure of a Cube or Dye. Pour off the clear Water from the Crystals, and evaporate again to a Pellicle, and set it in a cool Place, as before, and more ChrySTALS will be formed, but less pure and transparent than the former. Repeat this Evaporation and chrySTALLIZATION so long as any ChrySTALS will shoot, and then an oily, saline Liquor will remain, which is not rendered dry without a good deal of Difficulty, and a considerable Heat long continued. After this has been evaporated to Dryness, it will attract the Moisture of the Air, and run into an Oil per Deliquium, more readily than any other Substance whatever, and then lets fall a small Quantity of insipid Earth not dissolvable by Water; dry the remaining Oil and calcine it, then expose it to the Air till it runs again into an Oil, which will let fall more insipid Earth. If these Calcinations and Solutions are repeated a sufficient Number of Times, nothing will be left at last but pure insipid Earth, of which there will be a pretty large Quantity, if all that is left after each Solution be collected together. All the other Parts being rendered volatile fly off into the Air.

By the Analysis of Salt it appears that common Salt consists of a pure insipid Earth, an acid Spirit extremely volatile, and Water; and it is highly probable that this Earth, before it was united to the acid-volatile Spirit, was of an alkaline Nature, and perhaps exactly the same with the *Natron* of the Ancients. What makes this the more likely is, that if any fixed alkaline Salt is impregnated with the acid Spirit of common Salt, a Salt will be formed very nearly the same with common Salt, which the Chymists call regenerated Salt.

Common Salt has many very extraordinary Properties.

1. The smallest ChrySTALS of common Salt are always of a cubic Figure, that is the Figure of a Dye.

2. Upon the Application of Fire to it, it crackles. This Decrementation or Crackling of Salt, seems to proceed from the Air contained in its Pores, which being rarified by the Fire, breaks its Prison and makes its Escape.

3. Spirit of Salt is the only Thing in Nature that will dissolve Gold; but not without being joined with the Spirit of Nitre.

4. Salt preserves all vegetable and animal Substances from Putrefaction, as also Water, and is itself incorruptible. This Property it entirely owes to the Acid it contains.

5. A greater Quantity of common Salt will be dissolved in a given Quantity of Water, than of any other Salt whatever; for six Ounces of common Salt may be dissolved in sixteen of Water; but it must be observed, that warm Water will dissolve more Salt than cold, and that in Proportion to the Heat of the Water. Thus Water in that Degree of Heat which makes it boil, dissolves more Salt than in any less Degree of Heat, inasmuch, that as it grows cool, it will every Moment let fall more and more of the Salt which was dissolved in it, which will appear at the Bottom of the containing Vessel undissolved; and when the Water is so cold as to freeze, it will expel almost all the Salt, which will stick to the Bottom of the Ice in a solid Form.

6. Salt dissolved in Water of a Heat equal to that of the Atmosphere, renders the Water considerably colder. And yet,

7. Notwithstanding this Increase of Coldness, the Salt will keep the Water from freezing, inasmuch that Water, wherein Salt is dissolved, shall not freeze near so soon as pure Water: And hence we may observe, that Salt, when interposed between the small Particles of Water, has the Power of preventing their Association, that is, their Concretion into Ice; otherwise Salt, by increasing Cold, would promote Freezing.

8. If Spirit of Salt is poured upon Ice reduced to Powder, it will increase the Coldness thereof to a surprizing Degree; to a Degree much greater than ever was produced naturally, and in which every Animal must die.

9. Salt thrown upon burning Coals greatly increases their Heat. This proceeds from the Air, Water and Acid contained in the Body of the Salt; for the Air being forced out of the Salt by Heat, acts upon the Fuel like a Pair of Bellows; and that this will increase the Heat of Fire is known to all Smiths, who, when they would make their Fires intensely hot, frequently sprinkle Water upon the burning Coals.

10. Salt made extremely dry, attracts the Moisture of the Air considerably, even in the dryest Seasons, insomuch that it is a common Thing for People who deal in Salt, to buy it at the *Wyches* very dry, and to sell it a great many Miles distant, for less per Hundred than it cost them; yet are they considerable Gainers, because the same Quantity of Salt that weighs a Hundred at the *Wyches*, will be much heavier, after having imbibed the Moisture of the Air.

With respect to these Properties of Salts, it may be remarked, that as Putrefaction is, always, in Proportion to Heat, that vast Body of Water, which we call the Sea, would putrefy and stink, (as we find, in effect, fresh and stagnating Waters do) especially in hot Climates and calm Weather. Now this Putrefaction would be fatal not only to all the Animals contained in the Sea, but also to those Land Animals that came within the Influence of the Vapours arising from this vast Body of putrefying Waters, which probably would be all Animals upon the Face of the Earth.

Now we find, by the fourth Property of Salt, that it preserves all vegetable and animal Substances from Putrefaction, as also Water; and that there is a great Quantity of this Salt in the Sea, is a Proposition unnecessary to be proved.

By Property the fifth, we find, that a greater Quantity of Salt will be dissolved in warm Water than in cold; and by this it should seem, that more Salt should be dissolved in hot Climates, and in hot Weather, where there is more Occasion for it to guard against Putrefaction, than in cold Climates and cold Weather, where there is less Occasion for it; accordingly we find, by repeated Experience, that in the *Mediterranean Sea*, where the Climate is hot, one Pint of Water contains an Ounce of Salt; but in the *Baltick*, where the Climate is cold, the same Quantity of Water contains only half an Ounce. 'Tis as certain, that under the Equator, the Sea-Water contains still a greater Proportion of Salt, and those Seas that lie more Northward than the *Baltick*, a less.

Agreeable to this is an Observation made by a Friend of Mr. Boyle, at his Desire, who found, by a Glass Instrument made on Purpose, that the Sea-Water increased in Weight, and consequently in Saltiness, the nearer he approached the Line.

The same Author farther informs us, that at *Manar*, near the great Cape of *Comori*, where the famous Pearl-Fishing is carried on, and the Climate is very warm, the Ocean is so salt as to deposit a good Quantity at the Bottom in hard Lumps.

We learn farther, from Property the sixth, that Salt renders Water, wherein it is dissolved, colder than it would otherwise be. Now, as Putrefaction is in Proportion to Heat, this Property must also guard against Putrefaction in hot Climates, and in hot Seasons.

Dr. Halley, in the Philosophical Transactions, has a Dissertation, to shew, that as Salt is perpetually conveyed to the Sea by Rivers, the Sea must daily acquire a greater Degree of Saltiness; insomuch, that if we had any authentic Observations relative to the Degree of Saltiness of the Sea, made at distant Periods of Time, we might from these calculate the Age of the World.

But if there is any Truth in these Observations I have made above with respect to the Saltiness of the Sea, as there undoubtedly is, Dr. Halley's System, however pretty and ingenious, must entirely fall to the ground; as the Reader will easily perceive, if he considers, that the Sea was, in all probability, as salt a Fortnight after the Fall of *Adam* as at this time, since the Necessity and Convenience of it were as great then as now: And it is very unlikely that the Almighty should create his Works imperfect, and leave them to be brought to Perfection by a long Series of Time.

I must add, that although Salt is incorruptible, yet it is capable of being so far destroyed, as to remain no longer in the Form of Salt; as appears by its Analysis. Now, though what the Doctor says be true, that Salt is perpetually brought into the Ocean by Rivers, and that the Exhalations of Water from the Sea are perfectly fresh, yet the Consequence which he thence draws, that the Sea grows every Age more salt, may not be true; for it is highly probable that Salt, by the alternate Actions of other Bodies upon it, may undergo such a Sort of Transmutation, as we have above described in its Analysis; and then the volatile Parts, which constitute the specific Nature thereof, and render the fixed Part, or Earth, dissolvable in Water, being disunited from the fixing Earth, may very likely fly off, and mix with the Air; and then the fixing Earth, now no longer dissolvable in Water, will sink by its own Gravity to the Bottom. And if we consider (as Sir Isaac Newton observes) that Nature delights in Transmutations, it will appear more probable, that there is a perpetual Generation and Dissolution of Salt carrying on in the World.

Before Sea-Salt is distilled, some Preparations are necessary, and especially Calcination or Decrepitation; for since the

Grains of Salt fly and crackle in the Fire, they would burst all the Vessels used in the Distillation, except the watery Fluid, with which they abound, was first carried off by Calcination. This Decrepitation arises from the watery Fluid contained and inclosed between the Particles of the Salt, which being dissolved by the Heat, burst the Prison wherein they were detained, separating the Particles that surround them with a kind of Explosion. The Decrepitation or Calcination of Salt is performed in this Manner:

The Salt is set on lighted Charcoal, in an open earthen Vessel, and stirred constantly with an Iron Spatula. As soon as the Salt begins to be thoroughly heated, it makes a crackling Noise, which increases for some time, and then ceases altogether. When all the Noise is over, the Salt is decrepitated, calcined, dried and burnt, and remains in the Vessel in Form of a Powder. This decrepitated Salt serves for cementing Minerals or Metals, for the Distillation of Spirit of Salt, and for many other chymical Operations.

THE DEPURATION AND CRYSTALLIZATION OF SEA-SALT.

Dissolve common Sea-Salt in six times its Quantity of Rain-Water, strain the Solution hot through a close Linen-Bag, so often as to render it perfectly limpid; then exhale away in a Glass-Vessel one sixth Part of the Water; set the Remainder in a quiet cool Place for three Days, in a Vessel covered to keep out the Dust; if it deposits any Fæces, pour off the Liquor from them by gently inclining the Vessel; if it deposits none, the Liquor is perfect, and may now be evaporated to a Pellicle: Again set it in a cool quiet Place for twenty four Hours, during which time it will shoot into cubical Crystals. Carefully pour off the Liquor remaining after Crystallization, dry the Salt with a gentle Heat, and keep it separate. This is the Salt that I commonly employ for chymical Uses. Let the remaining Solution be again evaporated to a Pellicle, and set to shoot as before. By thus continuing to repeat the Operation, the Liquor will at last become thick, unctuous, austere, and hard to dry, and scarce afford any Crystals. If the Salt thus purified be decrepitated in the Fire, and afterwards fused with a strong Heat, then poured out upon a dry Marble, it resolves in the Air, and deposits earthy Fæces; from which the Liquor being carefully separated, then inspissated, calcined, poured out, and suffered to run in the Air; the Operation being thus repeated, the Salt at length vanishes into the Air, as a very ancient chymical Writer has truly observed.

REMARKS.

Crystallization is the only Method of procuring Salts pure and simple, when their innate Virtue, whilst the Salts are diluted with a certain Proportion of Water, unites the similar Parts together, and separates the dissimilar; and the Water, being attracted more by one Salt than another, one Salt sooner extricates itself than the other. And unless Salts be thus previously depurated, it is in vain to expect they should afford pure Spirits, which are necessary to certain Operations. If any Sea-Salt were in Nitre, the Nitre, upon Distillation, would afford not an Aqua-fortis, but an Aqua-Regia; and the same holds true of Sea-Salt, if any Nitre be mixed among it. The Salt thus obtained is such a Dissolvent of Gold, that, without its Addition, Gold can no otherwise be dissolved, except by fusing with Metals. This Salt is a wonderful Preservative, by means whereof all the Parts of Animals and Vegetables are preserv'd from Putrefaction.

GLAUBER'S SPIRIT OF SEA-SALT.

1. To three Parts of Sea-Salt, prepared as above, and put into a Glass-Retort, pour one Part of the strongest Oil of Vitriol, at the Instant they mix, a volatile white Vapour rises, which is to be carefully avoided, as being suffocating, and capable, if but once drawn in with the Breath, to stop the Action of the Lungs irremediably. Directly apply a large and cold Glass-Receiver, lute the Juncture, apply a very small Quantity of Fire at first, for a furious Spirit will long continue to come over so as to blow through the Luting, or break the Vessel; so that the Fire must be kept gentle for three or four Hours: Then increase it a little, and a less volatile Liquor will come over. After eight Hours have been employed upon the Operation, urge the Fire till the Iron-Pot becomes ignited, and no more Liquor rises; then let all cool, and when the Neck of the Retort is no longer hot, take off the Receiver; the Liquor will fume; and beware of receiving the Fume in with the Breath. Pour it into a Glass well-fitted with a Glass-Stopper, and set it in a cold Place; otherwise

wife the Glas often bursts, by means of the Motion of the Vapour. If thus kept for Years, a white suffocating Vapour immediately breaks out upon opening the Vessel; but if the Spirit thus produced be carefully distilled in a Glas-Body, under a Chimney, into a Receiver, the volatile Spirit will come over, while there remains at the Bottom a more fixed Liquor, of a Colour betwixt a yellow and a green. This Liquor remains quiet without exhaling, but that which comes over into the Receiver has a violent suffocating Volatility, and may be kept apart as a pure volatile Spirit of Salt in a close Vessel.

2. To three Parts of purified and dry Sea-Salt, put into a Retort, add two Parts of clean Rain-Water, and one Part of the strongest Oil of Vitriol. Let the Oil of Vitriol fall in by slow Drops, to prevent the Bursting of the Vessel, by the sudden Heat that would rise from mixing in the whole at once. The Mixture will grow hot, place the Retort in a Sand-Furnace, and apply a capacious Receiver; distil gently for the first four Hours, while the Water comes over slowly; otherwise, if made to rise briskly, it always cracks the Receiver. After this, increase the Fire gradually; the Spirit of Sea-Salt will come over, which is then known to rise, when the Liquor runs in spiral Veins. Now raise the Fire, and gradually urge it, till at length the Iron-Pot grows of a red Heat, and no more Liquor comes over; at which time the Spirit will not fume. Then suffering all to cool, pour out the Spirit, which is now neither suffocating nor smoaking. If this be distilled again with a gentle Fire, in a Glas-Body, there will come over a limpid ungratefully acid Water, of excellent internal Use, being mixed with Juleps, in such Distempers as require it; an excellent fat Spirit will remain in the Bottom, of a Colour betwixt green and yellow.

3. In both Cases there will be left behind a very white and fixed Salt, that can only be fused with a violent Fire.

R E M A R K S.

It seems surprising that Oil of Vitriol should raise so volatile a Spirit, by being barely poured upon so fixed a Salt as Sea-Salt; which Spirit is again fixed by adding fair Water to it, and is not generated when the Oil of Vitriol is mixed with a strong Solution of Sea-Salt for Distillation; or again when the Oil of Vitriol is diluted with Water, and added to the Sea-Salt; in which three Ways this surprising and suffocating Volatility is fixed, and render'd unhurtful; but when the Spirit, thus fixed and render'd wholesome, is urged with the Heat of a hundred Degrees, it lets go its Water, and remains rich, very fat, thick, gratefully acid, fragrant, and of a greenish Colour, and as perfect as can be any way obtained. But here again are certain Limits, for only one Part of the Salt is thus converted into acid Spirit, while the others remain fixed with the Oil of Vitriol. I could scarce gain more than a third Part of pure Spirit, separable from the Water, in proportion to the Salt. This Spirit has some Properties in common with other Acids, and some particular. It is particularly grateful to the Stomach, excites the Appetite, attenuates mucous Humours, resists Putrefaction, and corrects the Bile, when either too acrimonious, large in Quantity, or corrupted. It is of excellent Use in curing Gangrenes of the Gums, Mouth, or Tongue, it prevents the Generation of the Stone, and, according to *Helmont*, helps to dissolve it. It is serviceable in the Strangury attending Old-Age. If the strongest Spirit of Salt be mixed with thrice its Weight of Alcohol, and the two be thoroughly united together, by two or three Distillations, they make a volatile, oily, acid, fragrant, and balsamic Spirit of great Virtue. This acid Spirit dissolves Gold when very strong, or render'd more noble by being several times drawn over from Sea-Salt. In short, this Liquor exceeds all that can be said of it; and this is a highly useful Experiment, which we owe to the Industry of *Glauber*.

SPIRIT OF SEA-SALT WITH BOLE.

1. Take six Pounds of pure dry Sea-Salt, put it into two earthen long Necks, each of them containing three Pounds of Salt; put the long Necks into the Fire, and cover them with Tiles to prevent any thing falling in. Let the Fire be placed around them at some Distance first, and afterwards gradually nearer, and at length up to their Sides. The Salt will for a long time continue to crackle strongly; but this Decrepitation at length ceases, when both the long Necks are thoroughly ignited. When the Fire is burnt down, the Salt is found white, pulverized, and will not crackle, when thrown into the Fire. It loses always one Fourth in the Decrepitation, but seems otherwise unchanged, though it would easily grow moist in the Air. It is now fit for Distillation; wherein had it been employed without Decrepitation, the Action of the Fire would have made it leap into the Receiver, so as to disturb the Operation, and sometimes to burst the Vessels; but its

wild crackling Spirit being drawn out by Calcination, it will afterwards calmly endure the Fire.

2. Take three Pounds of this Salt, as soon as it is decrepitated; grind it in a large hot Mortar, and presently mix therewith ten Pounds of common red Bole; divide the Mixture into two Parts, and charge two Long-Necks therewith, so that the Matter may not come into the Mouths of the Vessels, as they lie horizontally in the Furnace. Then fit them into the Reverberatory, building up the open Side of the Furnace with Bricks and Mortar, so as to leave the Necks of the Vessels to come through the Wall. Apply Adaptors and large Receivers, and also a gentle Fire, increased by Degrees for twenty-four Hours, that all may become thoroughly hot and dry. Then light up a strong Fire in the Morning; a copious white Vapour will come over, like white Clouds, into the Receivers, and dewy Drops appear in the internal Surface thereof. Keep the Fire thus for two or three Hours; then increase it, upon which the Receivers usually become clearer, and the Spirit runs in unctuous Veins. And now the Fire may be increased to the utmost Degree, and continued thus for six or eight Hours, that the Vessels may be thoroughly ignited. When no more Spirit comes over, leave off; let all cool; carefully take away the Receivers, and empty the pure Liquor. It will be acid, gratefully fragrant, of a green Colour, and in the Quantity of about six Ounces from a Pound. The Bole remains saline. I have boiled it in Water, filter'd, and inspissated the Lixivium, and thereby procured a large Quantity of a yellow, saline, styptic Salt, that was not alkaline, but appeared a new Kind of Salt. And this has generally been my Success; whence I wonder *Beguinus*, and others, should write, that they could convert the whole Quantity of Salt into excellent Spirit of Salt. For my own part, I never could, with the utmost Care and Caution, in the most exact manner, and with the strongest Fire, long continued, obtain above half the Quantity, unless there had chanced to be any Moisture adhering to the Salt, or the Bole. This Distillation of Sea-Salt requires a stronger Fire than that of Nitre.

R E M A R K S.

This Spirit shews that a certain Part, but not the whole of the Salt, is here converted into Acid, by means of the Fire and Bole. In this Distillation, towards the End, a yellowish Matter, inclining to white, always fixes to the upper Part of the Receiver, and has a sweetish, styptic, saline Taste; and I have found this in great Plenty, when the Operation was performed with Brick-Dust instead of Bole; it seems to proceed from the Salt and fat Earth mixed together. The Salt obtained from the Caput Mortuum is highly commended by *Helmont* for the Preparation of *Butler's Stone*; and the Spirit is recommended for the same Purposes as that of the preceding Process, where the Particulars relating to this are already considered.

GLAUBER'S SAL MIRABILE.

Take the white, saline, fixed Salt remaining at the Bottom of the Retort, in the Preparation of *Glauber's Spirit of Sea-Salt*, to be got out by breaking the Glas; bruise it, melt it in a Crucible at the Fire, with Care to prevent any Coals falling in, and afterwards dilute it with common Water. Or else dissolve the Salt, as it remains in the Retort, by pouring hot Water to it; strain the Lixivium hot, evaporate it to a Pellicule, and set it in a quiet cold Place; it usually coagulates into a Mass like Ice, or if it remains somewhat fluid, it turns solid upon being poured into another Vessel. If the Salt be dissolved in six times its Quantity of hot Water, then thickened again, and set by in a large Glas, it shoots into beautiful Crystals, of a particular Figure, considerably large, that remain solid, and do not run in the Air.

R E M A R K S.

The famous Inventer of this Salt justly called by the Name of *Wonderful*, not only on account of its being new, but of the surprising Effects it produces. I know some Chymists who are fond of Systems, pretend that no more than a true *Tartarum Vitriolatum*, is here produced, which was long known before the Time of *Glauber*. But *Tartarum Vitriolatum* has not the Properties which are found in this Salt, either with respect to Figure, Taste, or any Thing else; for if this Salt be properly prepared, reduced to Powder, and mixed with thrice its Weight of Vinegar, Beer, Wine, or Water, and set apart, it freezes them. When melted in a Crucible, if a fourth Part of Antimony be thrown to it, by a Piece at a Time, it wonderfully resolves it, and has many other Effects, as to which *Glauber*, *Boyle*, *Becher* and *Stall* deserve to be consulted; all of them Men of the utmost Penetration,

tration, in giving Light to the more abstruse Parts of Chymistry; to whom we must also add the great *Hamberg*. In Surgery this Salt is of excellent Use against Putrefactions and Gangrenes; it is also of Use, when internally taken, by gently stimulating, resolving, purging, and promoting of Urine.

SEA-SALT REGENERATED.

Dilute four Ounces of Oil of Tartar per Deliquium, with thrice its Weight of fair Water; put them into a tall and large Glas Body, with a narrow Mouth, and heat the Liquor strongly: Then, by Means of a Funnel let fall into it, by a Drop at a Time, *Glauber's* Spirit of Salt, or that prepared with Bole, a great Effervescence will be excited. When this is over, shake the Glas, and mix all well together; then drop in more Spirit, and mix as before, till the Alkali be perfectly saturated with the Acid. Now let the Liquor rest, and gently pour it from the Fæces into a Filter; evaporate to a Pellicule, set it in a cold quiet Place, and perfect Crystals of Sea-Salt will be obtained. Treat the remaining Liquor in the same Manner, after the first Crystallization is over, and this will afford the same Salt, which will be fixed in the Fire, and have all the other Properties of native Sea-Salt.

REMARKS.

The vegetable Alkali, which indifferently receives any Acid, is here determined by the Acid of Sea-Salt; and being saturated therewith, assumes the Nature of that Salt.

OF THE SUBTILTY AND SPECIFIC VIRTUES OF THE SPIRIT OF SALT.

Common Salt is of the neutral Kind, and consists of an Acid and Alkali as is sufficiently evident from its artificial Composition, from Spirit of Salt, and Salt of Tartar mixed in a due Proportion to the Point of Saturation. But this Acid cannot be more commodiously disengaged from the common Salt, than by an Addition of Oil of Vitriol, which, when mixed in equal Quantity with it, not only excites a violent Ebullition, because the Acid of the Vitriol acts powerfully upon the alkaline Principle of the Salt, but also a thick, white, and highly penetrating Smoke ascends, which, when concentrated, affords an highly acid fuming Spirit, which must be kept in Glasses well closed with Glas Stoppers. If this Spirit is very strong, it becomes hot on the Affusion of Water, almost in the same Manner with Oil of Vitriol.

The Distillation of this Spirit with Oil of Vitriol, is most commodiously made from a Glas Cucurbit by an Alembic; for by Reason of the violent Effervescence and Froth, the Distillation cannot be commodiously made from a Retort, because 'tis to be apprehended that the Froth may pass over. A proper Quantity of common Water is to be added, which assists the Ingress of the Acid of the Vitriol into the interior Parts of the common Salt, by which Means a larger Quantity of Spirit is obtained.

The Rectification may be made from the Retort; thus a Spirit of a yellowish Green, which is its genuine Colour, is yielded, and the grosser Parts of the Acid of the Vitriol remain in the Bottom. This Spirit tinges the Skin with a Colour resembling that of Roses.

The highly penetrating and subtle Nature of this Acid is obvious from this, that in a gentle Heat, or even in *Balneo Maria*, it passes over the Helm of the Alembic, and when lodged in open Glasses, so exhales as soon to fill the whole Room; and that the penetrating Nature of this acid Salt surpasses that of Nitre, I am induced to believe, because the acid of Salt has a freer Access into the Pores of Gold than that of Nitre, which dissolves all other Metals; for without an Addition of common Salt, the firm Compages of Gold cannot be dissolved.

So great is the Subtily of the Acid of common Salt, that when taken internally, it diffuses its Operation and Efficacy to remote Parts, especially those of the membranous Kind. But it in a particular Manner exerts its Influence on the nervous and sensible Membranes of the Lungs, by stimulating and agitating which, it excites a gentle Cough; for which Reason, the Acid of common Salt ought to be very cautiously used, without losing its Texture; it, also, by its powerful Stimulus, penetrates to the urinary Passages; for there is hardly a more efficacious Medicine for exciting a Discharge of Urine, than Spirit of common Salt.

Those who have Fontanels in their Bodies, and frequently use Spirit of Salt in Broths prepared with Flesh, perceive pungent Pains in their Fontanels. The great Subtily also of this Spirit, is the Reason, why by acting on the nervous Coat of the Stomach, it excites the Appetite far better than all other acid and mineral Spirits.

Strongly concentrated Spirit of common Salt has this peculiar to it, that it does not, like other corrosive and highly concentrated Acids, such as Oil of Vitriol, and my fuming Spirit, by the Addition of a sufficient Quantity of highly rectified Spirit of Wine, lose its acid Taste, and assume a sweet Taste and Smell. The strong Acid of common Salt remains entire in the Bottom of the Cucurbit; for 'tis sufficiently known to Chymists, that Oil of Vitriol, after the Addition of a sufficient Quantity of highly rectified Spirit of Wine, at different Times, may, by Distillation, be converted into a very penetrating Spirit, of a grateful Taste and Smell.

Thus also my fuming Spirit, upon an Admixture of twelve Parts of highly rectified Spirit of Wine, becomes sweet, and assumes a grateful Taste and Smell, because by the oleous and sulphureous Parts of the Spirit of Wine, the acid Spicula are so corrected and sheathed up, as to assume a quite different Nature, Texture and Efficacy. But this is not found to happen in the Spirit of Salt, which rejects this Union of the oleous and phlogistic Spirit; for it retains its Acidity entire, except that its thinner sulphureous Part being united with the inflammable Spirit, in some Measure changes its Smell, and renders it more grateful.

'Tis also peculiar to Spirit of Salt above that of Vitriol and Nitre, that it does not so quickly dissolve Filings of Steel, but leaves the *Lapis hæmatitis*, and the most subtle *Crocus martis* entirely untouched; whereas common Salt, or which is still better, Sal-ammoniac, acts more quickly and powerfully on chalybeate Minerals, the *Lapis hæmatites*, and Filings of Steel, and by dissolving them, converts them into a highly astringent Vitriol, provided they are intimately mixed in a Crucible, and kept on the Fire for a considerable Time, which neither happens with Vitriol nor Nitre.

No Acid so soon extracts the Sulphur, with which Iron is richly impregnated, as the Acid of common Salt; for whether a Solution of Steel, with Spirit of Salt, is inspissated, or whether Sal-ammoniac, with Filings of Steel, is treated by a close Fire, a Vitriol is obtained of a yellowish Colour, an astringent Taste, a grateful Smell, and which is not capable of Crystallization, but melts away in the open Air; and if duly dephlegmated Spirit of Wine is poured upon it, the sulphureous Part of the Steel, and the thinner Portion of Salt immediately enter it, and by this Means is prepared a Tincture of Steel, which is of a yellow Colour, a fragrant Smell, a subastringent Taste, and highly efficacious in restoring the Tone of the Parts; for by this Means the sulphureous Substance of Steel, which is of great Use in Medicine, may be most commodiously separated.

'Tis, also, to be observed, that highly concentrated Spirit of Salt, when mixed with Oil of Vitriol, produces a greater Effervescence, than any other acid Spirit. *Hoffman. Obs. Phys. Chym. Lib. 2. Obs. 17.*

OF THE SOLUTION OF SALTS.

It has hitherto been received as an incontestable Maxim among Chymists, that phlogistic or inflammable Spirits are the most commodious Menstruums for oleous, resinous, and sulphureous Bodies, but not at all for Salts, whose Solution is obtained by aqueous Menstruums. This Doctrine seems to be confirmed by Experience, which convinces us, that Spirit of Wine highly rectified, or deprived of all its Phlegm, neither dissolves and imbibes neutral Salts, nor those of the fixed alkaline Kind, when poured upon them, but leaves them untouched. We shall therefore shew, that this Maxim is not so universal as it is generally thought, but that it has many Exceptions, in which it may be demonstrated to the Eye, that highly rectified Spirit of Wine does not reject Salts of all Kinds, but readily dissolves them, and is incorporated with them; for as for fixed alkaline Salts, we observe, that in the Abstraction of highly rectified Spirit of Wine from Salt of Tartar, especially when frequently repeated, a large Quantity of this Salt is dissolved in the Spirit, which by this very Means becomes highly acrid, alkaline, and proper for the Dissolution of Oils; for when I took ten Ounces of the Salt of Tartar, well calcin'd, and by a gentle Heat drew off two Quarts of highly rectified Spirit of Wine from them, I obtained a Spirit richly impregnated with the Salt of Tartar. But as the Salt of Tartar always separates a great deal of Humidity from the rectified Spirit of Wine, hence it assumes a liquid Form in the Bottom of the Cucurbit. This Humidity I abstracted by a proper Evaporation, and afterwards calcined the Salt in a Crucible, and upon examining the Weight, found that it had lost three Ounces; because only seven Ounces remained. I repeated this Experiment, and poured the same Spirit on the Salt of Tartar, to be abstracted by a gentle Heat, but had only half the Quantity drawn off; and in the Cucurbit there remained two Liquors, one of which floating above the Liquor of the Salt of Tartar, was of a yellow Colour,

four, of a highly acrid Taste, and full of an alkaline Salt. This is by Chymists called the Tincture of Tartar. The other, which was below it, was only a Solution of the Spirit of the Salt of Tartar, by Means of the Phlegm left. This, when dried and calcined, had its Weight considerably decreased.

From this Process 'tis sufficiently obvious, that tho' the Salt of Tartar sustains the Force of the Fire and Air, so as to have no Part of it exhaled, yet it may, by frequent Abstraction, by an inflammable Spirit, become not only volatile, but also capable of being resolved by such a Spirit.

'Tis, also, to be observed, that Salt of Tartar, however strongly calcined, always separates, by Digestion, and Abstraction, from the highest rectified Spirit of Wine, a Portion of Phlegm, in which it dissolves; a certain Proof that the phlogistic or vinous Spirit is nothing but the Oil of those Things which have undergone a Fermentation, resolved into Phlegm, by the intestine fermentative Motion. This I shall afterwards evince by other Experiments.

The yellow Colour of the Tincture of Tartar is owing to no other Cause, than that the Oil of the Spirit of Wine, intimately mixed with the Salt of Tartar, is capable of tinging it with that Colour, which may be confirmed by many Experiments, especially in the Elaboration of the acrid Tincture of Antimony.

Not only fixed alkaline Salts may be rendered soluble, in highly rectified Spirit of Wine, but I can also prove, from various Experiments, that there are neutral Salts, which are more expeditiously dissolved in highly rectified Spirit of Wine, than any fixed alkaline Salt; so that six Parts of the Spirit are capable of receiving and retaining in their Pores one Part of the Salt.

These are two artificial Salts; the one is prepared thus: We take any given Quantity of pure and dry volatile Salt of Sal-Ammoniac in a Glass, into which we gently drop Aqua Fortis, or Spirit of Nitre, till the Point of Saturation is found, by which Means the neutral Nature of this Salt ought to be accurately investigated. This Liquor, which is of a nitrous and acrid Taste, we evaporate in a warm Furnace, by which Means we obtain a highly white and dry Salt, of a nitrous and acrid Taste, which, when thrown upon the Coals, flames, and leaves only very few terrestrial Parts. The other of these Salts is prepared thus: We take volatile and dry Salt of Sal-Ammoniac; this we saturate with Spirit of Salt instead of Aqua Fortis, by which Means there is produced a third Salt, exactly like Sal-Ammoniac, and which is quickly united with rectified Spirit of Wine.

But when this same volatile Salt is converted into one of a third Kind, like Sal-Ammoniac, with Spirit, or Oil of Vitriol, it is by no Means susceptible of an Union with the Spirit of Wine, but flies its Embraces. For which Reason, if rectified Spirit of Wine is poured upon a Solution of this Salt made with common Water, the volatile Salt forthwith subsides, which does not at all happen, if this Spirit is poured upon the before-mentioned Salts when dissolved; for the Solutions of these are capable of an intimate Union with Alcohol of Wine.

The Reason of this Difference seems to be, that the Spirit of Vitriol is a highly fixed Acid, whereas the Spirit distilled from Nitre and common Salt is of a highly volatile and subtle Nature, for which Reason, there is a close Union between these Spirits and this volatile Salt; but its Union is less with a more fixed Acid. For the same Reason, if the Salt prepared of the Oil of Vitriol and the volatile Salt of Sal-Ammoniac is by a brisk Fire urged in a Glass Cucurbit, the volatile Salt flies off, and the Acid of the Vitriol is left; which, however, does not happen with the two forementioned Salts, which, when treated with a brisk Fire, fly totally off in the Air, and leave no Marks of themselves.

These neutral Salts, capable of a Solution in Alcohol of Wine, are of singular Efficacy, both in Medicine and Chymistry; for Nitre thus dissolved in my Bezoardic Spirit, my anodyne or camphorated Liquor, is an excellent Medicine for preventing and discussing internal Inflammations, and for duly expelling exanthematous Disorders.

'Tis also well known, that Nitre is excellent for discussing erysipelaceous Inflammations of the Skin, when mixed with camphorated Spirit of Wine, which is by itself too hot and burning. But as common Nitre is incapable of such an Union, hence the End may be most commodiously obtained by my volatile artificial Nitre.

As for the other Ammoniacal Salt dissolved in Spirit of Wine, it may be rendered a Stomachic Medicine of singular Efficacy, when 'tis invigorated by the Addition of a proper Quantity of the Spirit of Salt; for twenty or thirty Drops of it thus prepared, and exhibited in a proper Vehicle, are excellent for restoring a languid Appetite, resolving those Crudities which are the Causes of various Disorders, and may be properly used as a Succedaneum to the aperitive Tincture of *Meibius*, whose Virtues it in some Measure surpasses;

for 'tis sufficiently known that this Physician got a great deal of Money Means of his aperitive Tincture, which he prepared of rectified Spirit of Salt, somewhat corrected by the Addition of a proper Quantity of Salt of Tartar; for which Reason, its Virtues are derived partly from the subtle Spirit of the acid Salt, and partly from the neutral Salt produced from the Spirit of Salt and the Salt of Tartar. But since we, instead of Salt of Tartar, take the volatile Salt of Sal-Ammoniac, and since the Virtues of this Salt are far more efficacious in correcting the Disorders of the Stomach than those of common Salt, hence it follows that the Tincture prepared from it must be also more efficacious. But *Meibius*, in my Opinion, gave the Name of Tincture to this Liquor, because he tinged it with the Flowers of Daisies or Roses, in order the better to conceal the Secret.

That there are in Nature Salts of very different Kinds, is sufficiently known, since some are natural, and others artificial, some acid, and others alkaline, whilst others are of the neutral Kind. 'Tis also known, that the Effects of these are very different, and that they are all capable of being dissolved in Water, which is, as it were, their specific Menstruum; but at the same time, 'tis to be doubted whether many know that their Solution is very far from being equal; but widely different, since some are sooner and more quickly dissolved, and enter the Interstices of Water in a much larger Quantity, whilst others are dissolved slowly and with Difficulty, and are received into Water in smaller Quantities. Concerning this I made the following Experiments:

One medicinal Pint of Water quickly dissolves four Ounces and an half of common Salt, and one Pint common Measure dissolves six Ounces of it.

A medicinal Pint of Water, by sufficient Agitation, receives six Drams of Nitre, and the same Quantity of Vitriol is dissolved by the like Quantity of River Water.

Only two Ounces of Alum can be dissolved in one Medicinal Pint of Water, and, which is more surprizing, the same Quantity of the *Arcanum Duplicatum* can only be dissolved in the like Quantity of Water.

Among the Salts which are most easily dissolved, and with which the whole Water is, as it were, saturated, the most considerable is the artificial purgative *Epsom* Salt, which is quickly dissolved by an equal Quantity of Water; so that one medicinal Pint of River Water commodiously receives twelve Ounces of this Salt.

The Salt of Tartar, which is alkaline, is also easily dissolved, since one Pint of Water is capable of receiving almost nine Ounces of it. Tho' these Experiments may at first Sight appear trifling, yet they are of singular Importance in Chymistry, since from them we learn,

1^{mo}, How much Water is requisite to resolve and depurate these impure Salts.

2^{do}, From a Solution of common Salt, we learn, that there can be no saline Waters; sixteen Ounces of which can possibly contain more than six Ounces of Salt.

3^{io}, These Experiments, in a great Measure account for the Separation of Salts, when mixed with Waters of various Kinds. Thus, for Instance, if Alum is added to a Solution of Salt, by previous Boiling and Inspissation; the Alum is first separated in the Form of Crystals in the aqueous Menstruum, but the common Salt is left, which by continuing the Inspissation, may also at last be obtained in the Form of Crystals. The Reason of this is, because the Alum requires a greater Space in order to be contained in the Water than the common Salt. Hence this Space being lessened, it is forced to a Separation, and quits the Pores of the Water. Besides, 'tis known that common Salt almost always adheres to Nitre; but this Salt ought carefully to be separated from it, because it not only hinders its Inflammability, but resists the Separation of a laudable and good Aqua Fortis; for when a large Quantity of Salt adheres to the Nitre, an Aqua Regia is rather obtained, which dissolves Gold and not Silver. The Method of Separation is this. The Nitre is dissolved in a due Quantity of Water, and after gentle Boiling, the Vessel exposed to a moderately cold Air, by which Means the Nitre descends in form of pyramidal Crystals, whilst none of the Salt is precipitated. Afterwards, upon Inspissation and Crystallization, the Nitre is separated, and the common Salt remains in the rest of the Liquor. The Reason of this is to be deduced from the more easy Solution and Retention of the common Salt in the Water than of the Nitre.

'Tis sufficiently known that the *Arcanum Duplicatum* is prepared of Nitre and Vitriol, if these two Salts are duly calcined; nor do they however at all Times so closely unite with each other, as to form the *Sal Duplicatum*; but the vitriolic and nitrous Parts often remain separate. If therefore we would separate from these two Salts the *Arcanum Duplicatum*, which is a neutral Salt, the Lixivium duly boiled, must be subjected to Crystallization, by which Means the *Arcanum Duplicatum* is precipitated, whilst the

Vitriol and Nitre remain in the Lixivium; for from what has already been said, 'tis obvious that one medicinal Pint of Water can hardly contain an Ounce of this Salt.

410, If we intend to separate Salts of different Kinds from each other, this must be obtained by a Solution with Water: For those Salts which are copiously conveyed into the Pores of the Water are most speedily dissolved, whereas those which with Difficulty enter the Pores of the Water, require a longer Time for their Solution. Thus, for Instance, if we intend to separate the Arcanum Duplicatum, from another neutral Salt, such as Nitre or Vitriol; or Sal Ammoniac from common Salt or Nitre, we must pour common Water upon them, which imbibes the common Salt or Nitre, and leaves the Arcanum Duplicatum in the Bottom. In like manner, if we intend to separate the Arcanum Duplicatum, or vitriolated Tartar, from an alkaline Salt or Pot-ash, this End must be obtained by an Effusion of Water, which quickly dissolves the alkaline Salt, and leaves the Neutral. Thus also Alum is separated from Vitriol; for the latter is more quickly dissolved than the former.

510, Since there is no Phenomenon in Nature without its adequate Cause, the Reason why some Salts are more easily dissolved than others seems to be placed in the Water itself. The Salts which are most easily dissolved, seem to consist of highly subtle, much divided, and small Particles, whereas those which are with Difficulty dissolved consist of gross, coarse, firmly cohering, and consequently fixed terrestrial Parts; for the highly subtle and minute Particles are capable of entering the minute Pores and Interstices of the Water, from which the grosser Particles are excluded. From what has been said 'tis obvious that *Epsom* Salt is of a highly subtle Nature, because an Ounce of it is received by an Ounce of Water, which is very surprising, and seems hitherto to have been adverted to by none. Hence it also happens, that highly rectified Spirit of Wine, when poured upon a saturated Solution of this Kind, forthwith coagulates it into a firm and stable Mass, like Ice, because the rectified Spirit of Wine has an easy Access into the Water. Hence 'tis necessary that the solid Particles of the Salt, which, when joined together, form such a firm Mass, should be suddenly forced from the Pores of the Water. This Subtlety of *Epsom* Salt is owing to this; that there is a small Quantity of fixed Earth in it; for 'tis remarkable that this Salt, when mixed with Powder of Charcoal, and exposed to the Fire in a Crucible, is totally evaporated, and fills the Room with a sulphureous Smoke. This Salt also, in consequence of its Subtlety, is preferable to others for purging, because it insinuates itself more deeply into the intestinal Coats than any other Salt, such as the *Arcanum Duplicatum*, Nitre, or common Salt. And because common Salt is more subtle than Nitre, it is also more purgative. But a Solution of Alum is not to be procured without great Difficulty; for which Reason, on account of the large Quantity of Earth it contains, it braces up the Pores, and is of a more astringent Quality than Vitriol, because it contains a greater Quantity of Earth, as is obvious from Calcination, in which the Alum affords a greater Quantity of *Caput mortuum* than the Vitriol. Common Salt is, besides its Salubrity, excellently calculated for preserving Fleshes, and preventing Putrefaction, because it enters the Pores of the Fleish to be preserved, and extracts its Humidity, which cannot be so speedily done by other Salts: And on account of the Subtlety and easy Solution of *Epsom* Salt, I am apt to think that Bodies might be better preserved by it than by any other Salts. *Hoffman. Observat. Phys. Chym. Lib. 2. Obs. 5. & 6.*

OF THE CAUSTIC QUALITIES OF SALTS.

That the caustic and virulent Quality of Salts consists in the great Subtlety of their Parts, may at first appear a Paradox, tho' the Truth of the Observation is sufficiently evinced from the following Considerations. 'Tis an important Circumstance, both in Natural Philosophy and Chymistry, to know the various and surprising Natures of the Mixtures of Bodies, since from these arise the various Phenomena and different Operations of these Bodies. Thus, for Instance, tho' the *Pymont* Mineral Waters far exceed all others, in their penetrating and saline Taste, yet in twenty four Hours, if they are exposed to the free Air in a large Vessel, they lose all their Taste and Efficacy, and only resemble common Water, since all the saline, spirituous, and medicinal Parts are evaporated in the Air. 'Tis also to be observed, that if *Pymont* Water is subjected to Distillation in a close Vessel, the Vapour and Water distilled retain no Taste, nor is any Thing of a saline or vitriolic Nature to be found either in the *Caput Mortuum* or in the Water itself.

It may seem surprising, that so efficacious a Salt should thus vanish, and be evaporated. But our Surprise will cease, when we know from Chymistry and Natural Philosophy, that the

most acrid Salts, and even mild alkaline, and fixed acid Salts, when treated in the like Manner, are found to consist of a subtle, volatile and insipid Vapour. Thus quick Lime, by an Affusion of Water, acquires a highly acrid Taste, but by Boiling loses all its acrid Taste and Efficacy. This same quick Lime, with an Addition of Pot-ash, when dissolved and boiled in Water, and then inspissated, affords a Caustic so powerful, as by single Contact to corrode Leather, Paper, Cloths, and other Substances, and convert them into a kind of Mucilage. Notwithstanding this, if a few Ounces of this Salt, dissolved in Water, are boiled and, inspissated, and after the Addition of fresh Water, the Boiling and Inspissation frequently repeated, there at last remains a fourth Part of insipid Earth. The same happens to all fixed alkaline Salts, and to common Salt, which, if they are dissolved, boiled, coagulated, calcined, and afterwards dissolved and coagulated several Times, afford nothing but an insipid Earth.

But the Curious are not equally apprised of another Thing, which happens with respect to the Boiling of Salts, which is, if the Water, which is a Vehicle for the Elements and Seeds of the Salt, is not boiled by a gentle and gradually decreasing, but by a violent Fire, a fourth Part of the Salt is lost, and a great Part of it dissipated in the Air. Nor is it to be doubted but the like happens to vitriolated Tartar, and the *Arcanum Duplicatum*, if they are boiled by too strong a Fire.

'Tis also observable, that an acid Corrosive, if duly managed, degenerates into a similar insipid Matter. Thus Oil of Vitriol, which is a highly fixed and powerful Caustic, degenerates into a black and insipid Earth, and a somewhat acid Phlegm, of a sulphureous Smell. Now that the Oil of Vitriol is a highly concentrated and fixed Acid, is a Thing too well known to stand in need of a Demonstration; yet if this Oil is drawn from sulphureous Substances, whether of the vegetable or animal Kind, such as Opium, Orpiment and Antimony, this highly fixed and strong Acid is converted into an evaporable Smoke, of a highly volatile Nature, almost without any Degree of Acidity, and only leaves an inconsiderable Remainder of Acid in the *Caput Mortuum*. From these Experiments 'tis obvious, that this fixed Acid is compounded of very active and subtle Parts, which active and subtle Nature they immediately assume upon the Admixture of a small Quantity of any pinguous and sulphureous Body.

My Spirit, which, when poured into distilled Oils, produces a Flame, is so highly corrosive, as in a short Time to attack, corrode, and dissolve the most solid Metals, yet it is totally evaporated in the Air, and resolved into Smoke, which can hardly be contained in the closest Vessels; a sure Proof that it consists of highly subtle Parts.

Hence we can easily account for Glauber's Experiment, which is, that common Salt, by an Admixture of a due Quantity of Oil of Vitriol, is dissolved into a highly subtle Vapour, which fills the whole Room. But if this Smoke is concentrated and collected, it is an highly acid and corrosive Spirit.

If we consider Vegetables, we find large Numbers of them composed of highly subtle Parts, closely cohering with each other, whilst at the same Time they are possessed of singular Efficacy. This is sufficiently obvious from drastic Purgatives and Emetics, which exert their Efficacy by a highly subtle, acrid, and caustic Salt, such as White Hellebore and Asarabacca, which are possessed of a very drastic, purgative and emetic Quality, yet these, when infused in Water, and boiled for a considerable Time, lose all their drastic Quality. Tobacco is also a drastic Purgative and Emetic, and works in a very virulent Manner on the human Body; yet if it is boiled in a sufficient Quantity of Water, its drastic Quality is lost, and an Extract obtained from it, highly extol'd by some Physicians for its Efficacy in resolving viscid Humours, which so far injure Expectoration, as to threaten a Suffocation. Aloes, tho' not ranked among the Class of drastic Purgatives, yet purges so strong, and throws the Mass of Blood into so violent Commotions, that a few Grains of it are sufficient for a Dose; but if it is dissolved in River Water, and boil'd for a considerable Time, its cathartic Quality is so much impaired, that it is not in the least purgative, unless exhibited in a very large Dose. Scammony and Coloquintida may in like Manner be deprived of their purgative Quality by Boiling.

It may seem somewhat more difficult to deprive mineral Substances of their drastic, emetic and purgative Quality by Boiling. But the Truth of this is confirmed by the following Experiment. When in preparing emetic Tartar from *Crocus Metallorum* and Cream of Tartar, the Infusion is boiled long, we observe, that by this Means the Efficacy of the Medicine is greatly impaired, so that ten Grains of it must be exhibited for a Dose, whereas otherwise two or three are sufficient.

All these Experiments sufficiently evince, that not only the Acrimony of Salts, but also the virulent and drastic Qualities of other Bodies, are to be ascribed to their highly subtle and moveable

moveable Parts, which, when closely joined, exert a corrosive and acrid Virtue, which the Air, Water, and Heat destroy, by disjoining them; nor is it surprising that Salts consist of highly subtile Parts, because the more subtile any Body is, the quicker Motion it receives and propagates, as is observable in the Æther, the Air and Water.

But the Corrosion and Dissolution of Bodies by Salts are produced by the intense Motion of their Parts, as is obvious from their Effects. The more concentrated therefore the moving Force is, the more conspicuous and noble is the Effect. Thus the fuming concentrated Spirit corrodes more powerfully than the Spirit of Salt, which again is more corrosive than Oil of Vitriol, because the Spirit of Nitre consists of more subtile Parts than the Spirit of Salt, and the Spirit of Salt of more subtile Parts than Oil of Vitriol.

From all these Considerations, we may conclude, that all Salts are made up of a subtile, penetrating, and, as it were, ætherial Matter, and that their Parts, when joined with the Earth, as a Kind of Cement, are of a highly acrid and corrosive Quality, but when disjoined and separated, totally destitute of Virtue and Efficacy. This may be excellently illustrated by a Burning-glass; for, as by its Means the Rays of Light, when much concentrated, produce an intense Heat; so when they are more diffused, they operate in a proportionably more languid and faint Manner. *Hoffman. Obs. Phys. Chym. Lib. 2. Obs. 15.*

SAL ACIDUM. An acid Salt. See ACIDA.

SAL ALEMBROT. See ALEMBROT. *Schroder* describes the Preparation of a *Sal Alembrot*, thus:

Take of common Salt, Sal Gem, and alkaline Salt, each an Ounce; make a Lixivium with the Juices of Mint, and Clove-Gilly-Flowers each two Ounces, and two Pints of Fountain Water; filter and coagulate.

SAL ALCALI, or ALKALI. See ALCALI.

SAL AMMONIACUM. See AMMONIACUM.

SAL ANATRON. See NITRUM.

SAL ANIMALIUM. Animal Salt. See ALCALI.

SAL CATHARTICUM AMARUM. The bitter purging Salt, commonly called *Epsom Sal*. This was first made by Dr. Grew, by evaporating the *Epsom* Waters. Some Years after, several other bitter purging Springs were found in different Counties, and Salts in small Quantities were boiled up from them, but from no Place, nor all the Places put together, in such large Quantities, as from the Springs on one Side of *Shooter's Hill* in *Kent*, about the Year 1700, which were then in the Possession of those two ingenious Chymists, Mr. George and Mr. Francis Mault, and where they made such large Apparatus for evaporating the Water, that they have sometimes boiled down 200 Barrels in a Week, from which, in a dry Season, and when the Land Waters did not get into their Drains, they have obtained 224 Pounds of Salt. After these Works had gone on some time, Dr. Høy found out a more expeditious Way of making a purging Salt, so nearly resembling that from the purging Springs, in all its Properties, that it soon passed on the World for the other, and continued so to do. The great Consumption of these Salts (which then went only by the Name of *Epsom Salts*) as well at home as abroad, engaged some of our Physicians (many Years before M. Bolduc took Notice of it) to suspect, that even what was made at *Shooter's Hill* was spurious, and received an Addition of something to increase the Quantity. But these Suspicions, I dare positively affirm, were entirely groundless, as to the Salts made there, and readily believe the same of any other Place, where the Spring Waters were boiled down for Salt. But upon a Consideration, that there were greater Quantities of this Salt consumed than all the Places where the Waters were boiled could produce, which was the real Fact at that Time of Day, there was sufficient Room to suspect that some of them were not genuine, as appeared to be true some time after. For the Secret, which was then in a few Hands, of making these Salts cheap, gave those who had it an Opportunity of underselling those who made it from the Waters, and, in a Year or two, rendered them incapable of making it to any Advantage: So that the Work on *Shooter's Hill* was thrown up; and I believe there has not been 100 Pound of Salt made from the Waters since that Time in any Part of the Kingdom.

Some Time before this Work at *Shooter's Hill* was broke up, some Pairs were taken to discover the Secret those had, who sold the Salt so cheap; and upon examining the several Salts, that were sold about Town, those disposed of by Mr. G. and F. Mault, were certainly genuine, and were therefore a proper Standard to judge of the rest by. But from all the Experiments then made, there could no material Difference be found between the Salt made from the Waters, and that made by them who were in the Secret. There was indeed a

Salt sold by some, which, in the Course of those Trials, was found to be a *Sal mirabile*, made from the *Oleum Vitrioli* and common Salt, but shot into such small Crystals, as not at first Sight to be distinguished from the other. Necessity being Mother of Invention, it was not long before it was discovered, and the Experiment was tried at the Lady Carrington's Salt-Works near *Portsmouth*; where it was found the same Thing could be done, as at another Work not far from it, and in which Dr. Høy had been concerned. It was some Years after this Salt had been made at *Portsmouth*, before the Salt-Makers at *Lemington* attempted, or indeed knew the Method of making it, who are now the greatest Traders in it, and have sent several Ton in a Year to *London*, besides what has been directly exported from thence.

I remember it to have been the Opinion of the Proprietors of the Salterns near *Portsmouth*, that this purging Salt could not be made at any other Salt-Works except theirs, and that the bitter Taste in the Salt was communicated from the Earth to the Sea-Water, whilst it stood exposed in their Sun-Pans. But Time has proved this Opinion false; for besides what has been said of its being made at *Lemington*, it was about four or five Years ago begun to be made near *Newcastle*, where it is still continued to be made, and doubtless may be made at any Salt-Works, where the common Salt is made from Sea-Water by Evaporation. Whether any Thing of this Kind has been attempted at any of our Inland Salt-Springs, either in *Cheshire* or *Worcestershire*, I am not yet satisfied. There is some Difference in the making the common Salt in *Hampshire*, from that about *Newcastle*: At the first of these Places, in the Beginning of the Summer, at Spring Tides, or at New and Full Moon, the Sea-Water is let into their feeding Ponds, which are their Reservoirs for their Summer's Working; and from hence is conveyed into small square Pans, and again, after some time, from these it is conveyed into larger Pans, or Beds, which they call Brine or Sun Pans, all which are made of Sea-mud and Earth. In these last Pans, or Beds, it lies exposed to the Sun and Wind, in order to exhale the weakest Waters; and it is in these Beds, if the Weather prove very favourable, that they can make as good Bay Salt as any we have from *France*; and at such a Time they never bring their Brine to the Boilers. But if the Weather is not hot enough for that Purpose, their Brine is exposed so long in these Pans, till it becomes of such a Strength as to support their Eggs made of Glass or Wax, to a certain Height above the Surface of the Brine, which from thence is conveyed into large Stone Cisterns, and then into Boiling Pans made of Iron, where it is boiled down (after having been frequently cummed) to a Sea-Salt. 'Tis observable, that whilst the Brine is boiling, there precipitates a hard crusty Matter, which is partly taken out by Vessels placed in proper Parts of the Pan for that Purpose, and Part of it fixed on the Bottom of the Pan so hard, as to be afterwards dug off, and this the Workmen call *Scratch*, and is what Dr. Collins, concerning the Sea-Water boiled at *Shields*, calls a Stone Powder. When the Operation for the Sea-Salt is finished, it is taken out hot, and put into wooden Troughs, with Holes at the Bottom, through which runs the superfluous Liquor: Under these Troughs are set other Vessels (with Sticks fixed in them in a perpendicular Posture) to receive what runs through. In these Vessels the Liquor is suffered to continue some time, and according to the Quantity of Sea-Salt still left in it, will crystallize to the Sticks, something like Sugar-candy, but in much larger Shoots; and this they call Cat-Salt, or Salt-Cats, and it holds some Share of the bitter Salt. When this Salt is broken small, or rather powdered, it is so white, that some Gentlemen choose it for their Tables; but the greatest Consumption of it is among the Cake Soap-boilers. The Liquor that will not shoot to these Sticks, is what, at these Works, they call the *Bittern*, fit for making the *Sal Catharticum*.

Near *Newcastle*, their Method is to receive the Sea-Water into their Reservoirs at High Water, at any Time of the Moon; if there be no Fresh in the River, occasioned by Rain in the higher Country; and from these Reservoirs, without exposing of it in Beds, as at *Lemington*, they pump it into their Boiling-Pans, where evaporating it almost to a Pellicle, they fill it up again eight or nine Times, and then waste it with a gentle Heat for the common or Sea-Salt. The Liquor that runs from this Salt, when taken out, and put into proper Vessels, is what they call the *Bittern*, which, if it stands some Time in those Vessels, a Salt will shoot and crystallize to the Sides, in Taste pretty much like Sea-Salt, but with a Share of Bitterness, and seems to answer to the Cat-Salt of the *Lemington* Works, and very probably would shoot after the same Manner, if they made Use of the same Apparatus.

I could not but mention this general and loose Account of making the common Salt, as necessary to introduce the Liquor called *Bittern*, which, before Dr. Høy found out an Use for it, was always flung away; being so different in its Properties from

from the Brine made use of to produce the Sea-Salt, that it would not boil up into the Operator, to determine the Time when to take out the Sea-Salt from the Pans, before the Bittern incorporated with it, which would otherwise spoil the whole Making.

The Bittern at *Lemington* (as observed before) not shooting to the Sticks, is carried by Channels into Pits made tight with Clay, where it stands for some Months, and there will shoot again. What Liquor remains is boiled down, till it is observed to be in a Disposition to crystallize, and then is conveyed into wooden Coolers lined with Lead. The Liquor, which will not shoot there, is boiled down after the same Manner, in order for another Crystallization. By this Time the Liquor seems to have altered its Property, and becomes of a very pungent biting Taste, and, if boiled down, will not longer shoot into Crystals, as before, but precipitates, during the Boiling, a small grained Salt; and if you should continue to boil down the Liquor, separated from this Salt, each Quantity of Salt thus produced will be still more pungent than the other. If you boil down the whole Quantity of this Liquor, it will produce a Salt, which, if exposed to the Air, will run *per Deliquium*. The Liquor that produces this Salt is always flung away wherever the *Sal Catharticum* is made.

This is what at present I can give no other Name to, than a third Salt produced from the Sea-Water, differing, in some Respects, as much from the other two, as they differ from one another.

To return to the several Crystallizations, such as mentioned to be shot from the Bittern, these will be of different Sizes, as to their Figures, and hold some Share of the third Salt, but now taken Notice of, which makes them subject to give and dissolve; nor is their Taste come yet to that simple Bitter of the pure Salt. These therefore are either separately, or altogether, to be flung into a Copper, with as much common Water as is sufficient to dissolve them, and allow of a gentle Evaporation, till they are again ready to be poured into the Coolers, in order for Crystallization. This generally proves to be the pure *Sal Catharticum*, thoroughly freed (as far as the Experiment I have tried can be convincive) from either a Sea-Salt, or the third Salt. The Liquor decanted from this Shooting may be boiled down again, in order for a second Shooting, and after that a third; but as the Liquors from these Shootings are boiled away more or less, so you will sooner or later meet with the pungent Liquor, which contains the third Salt, as you did in the former Shootings from the Bittern, from which the pure *Sal Catharticum* is as necessarily required to be freed as from the common Salt; a Proof of which cannot be better determined than by one of the Experiments to be taken Notice of hereafter, *viz.* that with the *Oleum Vitrioli*, which will certainly ferment with this Salt, if the Sea-Salt has not been well separated from it, or if it still holds some of the third Salt. And when any of the Crystallizations will not stand the Test of this Experiment, they ought to be dissolved and shot again, as before, by which Means the pure Salt is to be obtained. I do not mention this as a Trial made Use of at the Salt-Works, but what I have by Experience found to be true. And the same Experiment will serve to distinguish a *Sal mirabile* made at these Works, from that made with Oil of Vitriol and common Salt. The Account they give of it is this: They take any Quantity of coarser grained Crystals boiled from the Bittern, which, when dissolved and evaporated, more than they would otherwise do for making the *Sal Catharticum*, they throw into a Wooden Bowl, with some Oil of Vitriol, where it stands for ten Days, and shoots into large Crystals, transparent, and like the *Sal mirabile*. But as this Salt, by this Method, is not sufficiently satiated with the Oil of Vitriol, (if they use any) so it is easily discovered by the Oil of Vitriol, which will readily ferment with it; whereas it has no Effect on the other *Sal mirabile* made as above.

By the Assistance of *Robert Cay*, Esquire, at *Newcastle*, I have received the several Shootings of Salts from their Bittern, as also some of the Bittern itself; from which I have obtained a pure *Sal Catharticum*, as also the like Kind of third Salt, as mentioned from the *Lemington* Bittern. The Method I took for doing it is agreeable to that I have already mentioned, and many Years ago tried at the Salt-Works near *Portsmouth*. It is by Mr. *Cay* that I am informed they sometimes boil their Bittern, without letting it stand any Time to shoot of itself. The Difference is not very material.

If this Account be intelligible, what the *Sal Catharticum* is, will no longer be a Mystery, and the next Thing worth the enquiring into will be, whether this Salt deserves the Reflections that have discouraged the Prescription of it? And why it may not pass for a Salt as excellent in its Kind, and be of the same Nature, and have the same Properties, as that produced from the *Epsom*, or any other bitter purging Springs? Dr. *Grew*, in his Treatise, *de Natura Salis Cathart. Amari*,

Cap. 2. says, that in the Evaporation of any of the bitter purging Waters, they yield a Cream at Top, as also a Sediment, both together weighing six, eight or ten Drams, from a Gallon of Water; and that the lesser Part of this Sediment is, in Substance, the same with the Cream; the rest is all Salt, but consists of two Sorts, one a muriatic Salt, the which is proper or peculiar to these Waters. In the *Epsom* Water, the muriatic Salt is about a twentieth Part of the saline Mixture; in the *Dulwich* it is in greater Proportion, and the same in several others; it is both in its acrimonious Taste, and Figure of its Crystals, not unlike to common Salt. The other Salt is that which he says is particular or proper to the purging Waters, and is made by Evaporation and Crystallization. In this Preparation, first the earthy or plaistery Part is to be separated, next the muriatic Salt, and lastly a brown and dark Liquor from the proper Salt of the Waters. And in the fourth Chapter of the same Part, having shewn the Difference of the Figure betwixt the Crystals of this Salt and those of Alum, he goes on, Neither is there any better Ground to account the purging Salt a Species of common Salt, from which being perfectly freed, it differs as much in Taste as from Alum. And in the same Chapter, he says it will appear, the bitter purging Salt, altho' it hath some Qualities in common with other Salts, yet is truly, or specifically different from them all. Thus far Dr. *Grew*.

Now I cannot see any thing in this Account, but what will, considering all things, very well agree with the Purging Salt from the Sea-Water: For, first, there is an earthy or plaistery Part contained in these Waters, and this must be separated. The very same is in the Sea-Water, and is precipitated in the boiling them down, as has been observed, and by the Operators is called *Scratch*. Next there is a muriatic Salt allowed to be in these Waters; in some more, in some less; and this is also to be separated. The very same is done from the Sea-Water, tho' in a vastly larger Proportion. And lastly, there is a black and dark Liquor to be separated. Tho' this is but an obscure Way which the Doctor makes use of to express himself, it cannot be better explained than by what has been found to be fact in boiling down the Waters at *Shooter's Hill*: That after several Shootings of Salts, by repeating the Boilings of the Waters, there would at last remain a Liquor of a deep brown Colour, which would no longer yield a crystallized Salt; but if boiled up dry, would afford a Salt of the same kind with the third Salt already mentioned. And this explaining Dr. *Grew's* black and dark Liquor, helps at the same time to prove, in this Article too, that the Sea-Water affords the same kind of third Salt. I have tried several of the Experiments mentioned by the Doctor, by which he distinguishes his Salt from other Salts. Such as not affecting the Colour of Syrup of Violets; Curdling of Milk when boiled; in the Figure of its Crystals; in its easy Dissolution in the same Quantity of Water; in its coagulating with the Oil of Tartar *per Deliquium*, in its Calcination; and in the Bitterness of its Taste, as well before as after Calcination, &c. and find this Salt thus separated from the Sea-Water answer to all the Trials. Some few Experiments, that the Doctor has not taken notice of, I shall here subjoin, and then leave the whole to the Opinion of better Judges, whether there is any specifical Difference between those two Salts.

In order to have a Standard for these Experiments, I purposely got Mr. *Hyet*, Apothecary at *Epsom*, (whose Fidelity I could depend on) to boil me down some of their Waters; which he did from the Well in the Town, and sent me a sufficient Quantity of the Salts, to answer the Purpose I wanted them for. I procured, also, some of the first Salts from the *Lemington* Bittern: These do not hold so much of what I have already distinguished by the Name of the third Salt, as I find the *Newcastle* Salts do. This *Lemington* Salt, I (for Distinction-sake) call the first *Lemington* Salt. Part of this I dissolved, and shot into pure *Sal Catharticum*, being freed as well from the Sea-Salt, as the third Salt; and this I call the second *Lemington* Salt. I procured, also, from *Newcastle* the first Salt shot from their Bittern, which I call the first *Newcastle* Salt. Part of these I dissolved and shot, and obtained a pure *Sal Catharticum*; and this is what I call the second *Newcastle* Salt. I am obliged to make use of the *Sal Mirabile*, made from Oil of Vitriol, and common Salt, that having been taken for the *Sal Catharticum*, as also common Salt, that having been represented as the principal Substance of the *Sal Catharticum*.

I took half an Ounce of each of these Salts, and dissolved them in about two Ounces of Water to each half Ounce of Salt. A small Quantity of each Dissolution I poured into as many Glasses, and dropped into them all some Butter of Antimony. The Precipitation that followed, seemed to be alike in them all; and upon dropping a little Oil of Vitriol into each, what was precipitated being more powerfully attracted by the Oil, the several Liquors became clear. These are the

two only Experiments in which I found the Consequences so much alike in them all.

In the following Experiments, the *Sal Mirabile* is sufficiently distinguished from all the rest. Slices of Gall cut into these several Solutions have no manner of Effect upon any, except that of the *Sal Mirabile*, which is soon tinged of the Colour of Sack, or rather deeper. Spirit of Sal Ammoniac, with Tartar dropped into the several Solutions, turns them all milky, except that of the *Sal Mirabile*, which keeps its Transparency. The Spirit of Sal Ammoniac with Lime, the Oil of Tartar per Deliquium, the Tincture of Cochineal prepared with Spirits of Wine do every one, used after the same manner, sufficiently distinguish the *Sal Mirabile* from all the rest.

In the following Experiments, the *Epsom* Salt, the second *Lemington* Salt, and second *Newcastle* Salt, agree together, and differ from the common Salt, the first *Lemington* Salt, and the first *Newcastle* Salt. In the several Solutions I dropped a Solution of Silver in Aqua Fortis, from which followed these Consequences. The Solutions of the *Epsom* Salt, second *Lemington* Salt, and second *Newcastle* Salt, became equally milky, before the Precipitation. The Solution of the Sea-Salt, and first *Newcastle* Salt, let the Precipitation pass without receiving any milky Tinge. The first *Lemington* Salt, as holding less of the third Salt than the first *Newcastle* did, took a little milky Tinge. The Precipitation fell nimbly through the Solution of the *Sal Mirabile*, leaving it milky.

In the Condition these were in, I poured some Oil of Tartar per Deliquium to each of them; on which, after some time, a blueish Scum arose on the Surfaces of the *Epsom* Salt, second *Lemington* Salt, and second *Newcastle* Salt. There also appeared a little on the first *Lemington* Salt, but not on the rest.

A Solution of corrosive Sublimate was made in Water, ten Drops of which, mixed with the several Solutions, produced little or no Alteration; but upon dropping in the Oil of Tartar per Deliquium, the following Appearances were produced: In the Solution of the *Epsom* Salt, second *Lemington* Salt, and second *Newcastle* Salt, the Precipitations were red; in the Solution of the common Salt, and first *Newcastle* Salt, the Precipitations were white; in the Solutions of the first *Lemington* Salt, the Particles precipitated approached pretty near the Colour of the three first.

I took some of these several Salts in Substance, and to each of them poured a little Oil of Vitriol, which is one of the Experiments Dr. Grew tried upon his Salt; and which he says causes a moderate Ebullition, whereby it appears to partake of an alkaline Principle: But without looking for this alkaline principle from its fermenting with an Acid, (Terms justly exploded by the learned Dr. Freind in his *Prælectiones Chymicæ*) I am inclined to believe, that the Salt in which he tried the Experiment had not, according to his own Directions, been thoroughly separated from his muriatic Salt. For this Oil poured on the *Epsom* Salt, second *Lemington* Salt, and second *Newcastle* Salt, produced no sensible Fermentation. On the Sea-salt it acts with Violence, forcing off its acid Spirit with an insufferable Gas. The same Effect in Proportion it had on the first *Lemington* Salt; none at all on the *Sal Mirabile*, as being a Sea-salt already fatiated with the Oil.

What I have all along called the third Salt, answers in most of these Experiments to the Sea-salt, and yet has some Properties exceedingly different from it; to those I have mentioned, these may be added; it will decrepitate like Sea-salt; it readily melts, when put in a Crucible in the Fire; and when calcined till red-hot, affords a Calx equal to, if not stronger than, a Lime-stone, and ferments violently, as well with Water as with Oil of Vitriol. This Calx, when exposed to a moist Air, will Part of it run per Deliquium; but not so soon as before Calcination. All these Properties differ in every respect from the common Salt, and leave me still in doubt what to call it, as also how far Experiments of this kind may be deemed conclusive. By Mr. John Brown Chymist, in the *Philosophical Transactions abridg'd*, Vol. VIII. P. 730.

THE METHOD OF PRESCRIBING THE BITTER PURGING SALT.

It may be taken in any Liquor agreeable to the Patient's Constitution or Palate. I often use the following Method:

Take of Spring-Water, two Quarts; Mace, a Dram; boil them a little, and in the Liquor dissolve such a Quantity of the bitter Purging Salt, as may be agreeable to the Constitution and Disease of the Patient; for an Apozem, to be drank hot, warm, or sometimes cold, in the

Morning fasting, in the Space of two Hours, with a little Exercise. This Apozem may be either taken by itself, or in the Working of other Physic.

The Operation of the Salt may be quickened by the Addition of Sena and Manna in the following Manner:

Take two Quarts of Spring-Water; Mace, a Dram, *Alexandrian* Sena, two Drams or three; boil them a little; and then add an Ounce of the Salt; an Ounce and half or two Ounces of the best *Calabrian* Manna; and run the Liquor through a Sieve.

The Salt may also be safely taken thus:

Take three Pints and a half of Spring-Water; of the bitter purging Salt an Ounce, or ten Drams. Mix them, and when the Water boils, pour upon it half a Pint of new Milk, and strain the Liquor from the Curd.

The most proper Vehicle for this Salt in Summer is the *Tunbridge*, or any other chalybeate Water. For instance a Dram or a Dram and half of this Salt, taken in the first three or four Draughts of *Tunbridge* Water, and repeated for some Mornings, prepares the Humours, and clears the Way for the intended Course. The chalybeate Waters do sometimes bind; which Inconvenience is remedied, by putting a little of this Salt into the first or last Glafs.

Every Draught of the Purging Waters themselves may be, also, usefully impregnated with a Dram of the Purging Salt; three Drams or half an Ounce of which is also extremely proper for sharpening Clysters.

TO QUICKEN A DECAYED APPETITE.

Take a Flask of Spaw-Water, or a Quart or three Pints of any other chalybeate Water; or if not to be had, of maced Water; of the bitter Purging Salt, half an Ounce, six Drams, or an Ounce; mix and drink them fasting.

TO STAY VOMITINGS.

Take of any chalybeate Water, three Pints or two Quarts; or instead thereof maced Water; of the bitter Purging Salt, six Drams, an Ounce, or ten Drams; mix them, and drink them fasting warm or cold. Repeat them thrice either every Day or every other Day.

IN THE PAIN OF THE STOMACH.

Take of the best Sena, two Drams; Mace, a Dram; boil them in a sufficient Quantity of Spring-Water, to three Pints or two Quarts; and to the strained Liquor, add six Drams, an Ounce, or ten Drams of the bitter purging Salt; of the Syrup of Steel, an Ounce and half; for a purging Apozem to be drank in the Morning after the usual Manner. Or it may be made without Sena.

IN THE HYPOCHONDRIACAL AFFECTION WITH HEAT.

Take of any chalybeate Water a Quart, three Pints, or two Quarts; dissolve in each Draught half a Dram, or a Dram of the bitter Purging Salt; drink it at seven or eight Draughts cold. Or instead of Chalybeate Waters, it may be taken in simple Milk-Water, or distilled from the Leaves of Borage and Burnet. The Salt may be, also, successively taken in this Manner for the Heart-burn.

IN THE COLIC.

Take of Spring or River Water seasoned with Mace, three Pints and a half; Chamomile Flower Water, or Mint Water, six Ounces; the bitter Purging Salt, an Ounce or ten Drams; Manna, an Ounce and half or two Ounces. Mix them for an Apozem. Let the Patient take about half a Wine-Pint at a Draught hot, and all of it in an Hour, or an Hour and half, altho' he should vomit some Part of it. A Spoonful or two of the Tinctura Sacra may be taken before every Draught of the Apozem.

IN THE WORMS.

Mix a Dram or a Dram and half of the Salt with any Food commonly made for Children, without Milk.

IN NEPHRITIC PAINS.

Take of Chamomile Flowers, a Handful; Cumine Seeds, sweet Fenil Seeds, and Parsley Seeds, all bruised, of each an Ounce; Marsh-mallow Root sliced and bruised, two Ounces: Boil them in a sufficient Quantity of fair Water. To the strained Liquor add half an Ounce of Turpentine, dissolved in the Yolk of an Egg; of the bitter Purging Salt, half an Ounce; and Syrup of Marsh-mallows, three Ounces; mix them for a Clyster. If the Pains are very great, add to the Clyster forty or fifty Drops of cydoniated Liquid Laudanum.

If the Pains still continue, Recourse must be had to the following Apozem:

Take of the Decoction of Pearl Barley, seasoned with Mace, three Pints, or two Quarts; six Drams, or an Ounce, of the bitter Purging Salt; Syrup of Marsh-mallows, three or four Ounces: Mix them for an Apozem, to be taken hot, in an Hour, an Hour and half, or two Hours, although the Patient should vomit Part of it.

This Apozem may also be used successfully in an ISCHURY or HEAT OF URINE.

IN A DIABETES.

By this Salt, or the Waters, in conjunction with the constant Use of Chalybeate Waters, and Hypnotics, I have restored some, but indeed young Patients to perfect Health.

IN THE JAUNDICE.

In any Sort of Jaundice, with or without Stones in the Gall, the Purging Water or its Salt is very properly given in the following or other like manner:

Take of Pilula Ruffi, half a Dram; Rhubarb, and volatile Salt of Urine, each half a Scruple; Syrup of Wormwood enough to make them into six Pills to be taken going to Bed. In the Morning following let the Patient drink this Apozem.

Take two Ounces of the Shavings of Harts-Horn; boil them in three Quarts of Spring-Water, to two: Then add Mace and Turmeric, each a Dram; and having boiled them a little, dissolve in the strained Liquor the bitter Purging Salt, and Syrup of Steel, of each an Ounce; for an Apozem to be drank as usually.

IN MADNESS.

To quicken the Operation of purging Medicines, use the following Apozem:

Take of the Leaves of Baum and Borage, each a Handful; infuse them in two Quarts or five Pints of boiled Spring-Water while it is hot, and let them stand in a Vessel well covered for half an Hour. Add to the strained Infusion an Ounce or ten Drams of the bitter Purging Salt; of the Syrup of Violets, three Ounces. Mix them for an Apozem to be drank by itself, or with any convenient Purge instead of Posset-Drink. Or,

Take an Ounce of the bitter Purging Salt; dissolve a Dram in a Draught of any chalybeate Water, and let the Patient drink eight such Draughts.

The same Water or Salt may also be taken usefully in the Intervals of other Purgations.

IN THE HEAD-ACH.

After Bleeding, and (if necessary) Vomiting, exhibit the following Medicines:

Take prepared Scammony, powdered Rhubarb, and Mercurius Dulcis, of each ten, twelve, or fourteen Grains; Syrup of Buck-Thorn, enough to make them into five Pills, to be taken at four or five o'Clock in the Morning, and let the Patient sleep upon it. After three Hours let him drink this Apozem.

Take of Spring-Water seasoned with Mace, three Pints or two Quarts; of the bitter Purging Salts, six Drams

or an Ounce; Syrup of Violets, two Ounces. Mix and let the Patient take them by convenient Draughts, being kept warm in the Working.

Let the Pills and Apozem be repeated every third and fourth Day, and the Apozem by itself on the intervening Days, continuing this Course, if necessary, for a Fortnight or three Weeks.

IN THE MEGRIM.

With other proper Remedies, use the following:

Take of Pilula Mastichina, two Scruples; Chymical Oil of Marjoram five Drops: Mix and take them going to Bed. Next Morning drink this Apozem.

Take of Spring-Water seasoned with Mace, a Quart, or three Pints; the Water of Sage of Virtue, four Ounces; sweet Marjoram Water, two Ounces; the bitter Purging Salt, six Drams; mix and take them in the usual manner.

IN FITS OF THE MOTHER.

If a temperate Purge be necessary, use the Purging Salt dissolved in Spaw-Water, or that of Baum.

IN THE WANDERING GOUT.

The Purging Waters or their Salt may be taken, with other proper Remedies, in the following manner.

Take of the Powder of resinous Jalap, half a Dram; of prepared Scammony, six Grains; Calomel, half a Scruple; Syrup of Buck-Thorn, enough to make a Bolus, to be taken at five in the Morning, the Patient sleeping upon it. After three Hours let him drink this Apozem.

Take of Pearl-Barley, an Ounce and half; Currants, three Ounces; boil them in Spring-Water, to two Pints and a half; adding, towards the End of the Boiling, half a Dram of Mace; in the strained Liquor, dissolve an Ounce of the bitter Purging Salt, and half an Ounce, an Ounce, or an Ounce and half of the best Manna, for an Apozem.

If the Patient is not easily wrought upon, let him take six Drams, or an Ounce of the Syrup of Buck-Thorn in the first Draught: And let the Bolus be repeated with this or the like Apozem, every other, or third, or fourth Day.

This Apozem is also excellent in some Sorts of Itch, not that which is contagious, but in that which proceeds from the Scurvy. It is likewise beneficial after the Small-Pox is shelled off, and with most Purges in the Room of Posset-Drink.

Those who on a long Journey, especially in Summer, are usually costive, by two or three Drams of this Salt taken in a Draught or two of Spring-Water, will hereby keep themselves soluble and very cool.

DISEASES IN WHICH THE BITTER WATERS AND THEIR SALTS MAY BE PREJUDICIAL.

In all Dropsies; in a continual Fever; in an Ague; the Green-Sickness; Spitting of Blood; Cholera Morbus; and the Palsy. Nor are they to be allowed to Women with Child, without great Circumspection.

They may also prove hurtful in a Suppression of Urine, which depends upon an Ulcer in the Bladder, or a Stone too big to pass; in either of which Cases the Patient is to abstain from all Diuretics. But otherwise I have often given this Medicine successfully; that is to say, in bringing away the Urine, and Stones with it not of the least Size. *Grew on the Bitter Purging Salt.*

SAL CATHARTICUS HISPANICUS.

This is a Salt produced near *Madrid* from the Waters of a certain Spring, which spontaneously form themselves in Crystals. It is a Salt of the neutral Kind, and in Properties exactly agrees with *Glauber's Salt*; and 'tis even observed to purge more gently, surely and copiously than *Epsom Salt*. *M. Bartlet. Mem. del Acad. Royal, An. 1724.*

SAL SEDATIVUM; Sedative Salt.

This Salt invented by Mr. *Hamburg* is a perfect *Sal Salsum*, which arises in the Form of Flowers, or a Kind of white, light, dry Species of Meal; in the Distillation of a Solution of Borax and Oil of Vitriol, which contains a very strong Acid. It neither alters the Colour of the Juice of Violets, nor acts sensibly on the Solution of corrosive Sublimate, nor upon the Solution

Solution of Mercury by the Spirit of Nitre; it is a Salt very useful in Medicine, tho' it is only sedative, that is, tho' it only alleviates the violent Paroxysms of Fevers for six or seven Hours, during which Time the Physician may prescribe more efficacious Medicines, which could not have been otherwise used. *Hist. de l'Acad. Royal, An. 1732.*

SAL POLYCHRESTUM DE SEIGNETTE. This Salt, which has been used in Medicine for many Years, takes its Name from Mr. *Seignette* a Physician of *Rochele*, who invented it, and during his Life kept it a Secret, which he only transmitted to his Children, who in their Turn kept the Secret so inviolably that no Chymists have hitherto been able certainly to discover the Mystery, some taking it for one, and some for another Thing.

The great Reputation of this Medicine, from its first Discovery to our present Times, induced Mr. *Boulduc* to attempt a Discovery of its Composition.

The first Experiment, says that Author, which I made with this Salt, was to put some of it upon a live Coal, upon which it became fused, bubbled, yielded a Smoke, and at last left a Coal-like Matter. But among all these Effects, what most engrossed my Attention was the Smell exhaled from it, which could not well be mistaken by Chymists, since it was the same with that of Tartar, or Cream of Tartar, which do not differ from each other. I did not confine myself to the Fusion and boiling of this Salt upon the Coals, because these are Properties common to many Salts; but tasting the Coal which remained, after all the Smoke was evaporated, I found that it made nearly the same Impression on my Tongue with fixed and lixivial Salts.

These two Properties, the Smell of burnt Tartar, and the lixivial Taste, joined to its easy Solution in cold Water, made me at first suspect that it might possibly approach to the Nature of soluble Tartar. But not satisfied with this Proof, which to me appeared superficial, I proceeded to Distillation. Two Ounces therefore of this Salt, pushed by the Fire in a Retort, yielded a sufficiently clear Liquor, with a black Oil floating on its Surface. Upon examining both, I found the Liquor to be the Spirit of Tartar, and the Oil was what we call the empyreumatic or fetid Oil of Tartar. Then I distilled two Ounces of soluble Tartar, and the Produce was the same as in the preceding Distillation.

Hitherto I thought I had Reason to believe, that the Salt of Mr. *Seignette*, and soluble Tartar, were one and the same Thing, but at last some Circumstances made me suspect that they were different.

After the two Distillations now mentioned, I viewed the Residuum which to me appeared the same, since they were both a black, Coal-like, porous and rarified Matter, which I took for a calcined Tartar, and from which I could only obtain a fixed alkaline Salt. Accordingly, upon pouring Spirit of Nitre upon both, they both produced a Fermentation; however, the Residuum of the soluble Tartar apparently fermented much more briskly than that of Mr. *Seignette's* Salt, and carrying my Researches farther, I calcined both Residuums in an open Fire, and after having dissolved them in Water, and filtrated them, I found in the Residuum of the soluble Tartar, a Taste simply lixivial, and upon the Filter a kind of Ashes. But the Lixivium of Mr. *Seignette's* Salt had some Smell resembling that of a rotten Egg; and when filtrated, had not the Colour of Water like that of the soluble Tartar, but a blueish Colour. Upon pouring distilled Vinegar upon this Solution, the Liquor became turbid, and after some Time, precipitated a white and apparently sulphureous Matter.

But after all these Experiments, there was nothing certain to distinguish Mr. *Seignette's* Salt from the common soluble Tartar; and tho' I have had frequent Opportunities of conversing with the two Mr. *Geoffroy*s, who frankly communicated their Sentiments on this Subject to me, I confess I always remained uncertain as to the Matter of which this Salt consisted, and for ought I know, might have done so all my Life, if my Friend Mr. *Grosse* had not one Day opened my Eyes, by communicating to me what he had observed in making Experiments on the Salt of Kali; for he shewed me a Salt which gradually separated or subsided from a Solution of that Substance, and which, tho' in Figure it resembled *Glauber's* Salt, yet it fermented with all Acids, and especially very briskly with mineral Acids, but more slowly with vegetable Acids, such as Lemon Juice, Vinegar, and some others, and most faintly of all with Cream of Tartar. But however slow its Dissolution with Cream of Tartar when cold was, yet it was in process of Time perfectly dissolved; and Mr. *Grosse* added, that this Mixture deserved to be examined by Evaporation and Crystallization.

I immediately laid hold of this Hint, and imagined that this Mixture would afford a new Species of neutral Salt, or soluble Tartar; and from that Time forth, I suspected that Mr.

Seignette endeavouring to make a new Cream of Tartar, which as is well known, is nothing else but Tartar rendered soluble by the fixed Alkaline Salt of the same Tartar, might have believed, with some other modern Chymists, that all alkaline Salts obtained from Plants by Calcination, are the same, and that the Fire leaves no essential Part of the Plant from which they are obtained; that consequently one might be indifferently substituted for another, and at last, that according to this Principle, having easy Access to the Salt of Kali, he could of it make his soluble Tartar; and that upon executing this Design, he had obtained from it a Salt, which was not found to be precisely the common soluble Tartar, known for so long a Time, but a new Salt, or rather a new Species of soluble Cream of Tartar, to which he afterwards gave the pompous Epithet of *Polychrest*, on account of the many good Effects it produced.

In this Opinion I remained for a long Time, without making any Trial whether it was really so or not, tho' I had frequently communicated my Sentiments to several Chymists upon this Subject.

But at last I resolved to put the Design in Execution, which Mr. *Geoffroy* did at the same Time; and tho' none of us knew that the other was engaged in this Task, yet we both found precisely the same Thing.

In order to make Mr. *Seignette's* Salt, we take the Salt of the best calcin'd, whitest and hardest *Alicant* Kali, reduced to a Powder; of this we make a strong Lixivium by boiling in Water, and filtrate the Lixivium, which is very transparent.

Then we take separately some Cream of Tartar in Powder, upon which we pour this Lixivium, when warm. This Mixture excites a Fermentation, which lasts for a considerable Time, and which even after it has ceased, is renewed at certain Intervals. In the Time of this Fermentation, the Cream of Tartar is resolved; after which there is a copious Precipitation of a spongy and light Earth, which is to be separated from the Liquor by Filtration. Then we evaporate this Mixture to the Consumption of about a third Part. Then it is to be left at rest in earthen Vessels, by which Means, after some Days we find Crystals transparent like Crystal, which when disengaged, and not supported by the Vessels, are formed into Cylinders or Columns, which through all their Length have many flat Surfaces, above nine of which I have sometimes counted, tho' they are not generally found in so great a Number.

In my Opinion, it is impossible exactly to determine the precise Proportion of the Salt of Kali, and the Cream of Tartar, since some Kinds of Kali contain a larger Quantity of Salt than others. But the most natural Way of finding this Proportion, is to dissolve in the Lixivium as much Cream of Tartar as it will receive, that is, to the Point of Saturation.

A Lixivium of six Pounds of Kali generally absorbs two Pounds and three or four Ounces of Cream of Tartar, and when the Kali is very white and richly impregnated with Salt, the Lixivium of six Pounds sometimes absorbs an equal Weight of Cream of Tartar. This Difference, as we may easily conceive, can only depend upon the Quality of the Kali, according as it is more or less impregnated with alkaline Salt.

But when I took the Salt which subsided in the Solution or Lixivium of Kali, and the Configuration of which nearly resembles that of *Glauber's* Salt, half a Pound of this Salt dissolved, easily received thirteen or fourteen Ounces of Cream of Tartar, and the Mixture precipitated scarcely any Earth. This is the justest Proportion I can propose for the Substances which enter the Composition of Mr. *Seignette's* Sal Polychrestum. If we only wait for a short Time, we have the Crystals of Kali, after which the Mixture is more equally made, and is not subject to the Precipitation of the different heterogeneous Substances which the Kali communicates to the Lixivium.

In a Word, my Salt when formed into Crystals, and compared with that of Mr. *Seignette* also crystallized, was found to be precisely the same in all Circumstances; for they are figured like each other, are easily dissolved in cold Water, when reduced to a Powder, have the same Taste, and communicate a certain Coldness to the Tongue. When put upon a live Coal, they become fused and bubble, yield the Smell of burnt Tartar, and are at last reduced to a black and spongy Coal, which yields Tartar.

If after this Examination, we should doubt of the Conformity of this Salt with Mr. *Seignette's*, we may be convinced of it by an Experiment, which makes a speedy Decomposition of it: For if we dissolve equal Quantities of both Salts separately in warm Water, and pour into each Solution Oil of white Vitriol, till its Action ceases, in Proportion as these Solutions become cold, a saline Concretion is formed, which when examined, is found to be true Cream of Tartar, in Crystals regenerated or separated from the Alkali, whilst the Oil

Oil of Vitriol is united with it, and afterwards by Crystallization, forms with it a *Glauber's Salt*, in the same Manner as if this Oil had been poured upon the Lixivium of the Kali.

Mr. *Seignette's* Sal Polychrestum is therefore a Cream of Tartar rendered soluble by the Alkali of Kali. *Mem. de l'Acad. Royal des Sciences, An. 1731.*

SAL CORALLI. Salt of Coral. See CORALLIUM.

SAL CORUM CERVI. Salt of Hartshorn.

SAL EX DUOBUS. A Name for the ARCANUM Duplicatum, which see.

SAL EBSHAMENSE. See SAL CATHARTICUM AMARUM.

SAL ENIXUM PARACELSI. See ENIXA.

SAL ESSENTIALE. An Essential Salt. See ACETOSA.

SAL FIXUM. A fixed Salt. See ALCALI.

SAL FLUOR. An acid Salt in a liquid Form, before it is fixed by uniting with a terrestrial Substance. *Lemery's Pharm. Univers.*

SAL FOSSILE. Sal Gemmæ.

SAL GEMMÆ. See SAL ALIMENTARIS.

SAL INDICUM. Sugar. See SACCHARUM.

SAL JOVIS. Salt of Tin. See JUPITER.

SAL LIXIVIOSUM. A lixivial Salt. See ALCALI.

SAL MARINUM. Sea Salt. See SAL ALIMENTARIS.

SAL MARTIS. Salt of Iron. See MARS.

SAL MEDIUM. A Neutral Salt.

SAL MERCURIALE. *Hartman* informs us, that this imports *Sal Ammoniac*. But some call Mercury Sublimate by this Name.

SAL MIRABILE GLAUBERI. *Glauber's Salt*. See SAL ALIMENTARIS.

SAL NEUTRUM. A Neutral Salt. See NEUTER.

SAL NITRI. Nitre. See NITRUM.

SAL POLYCHRESTON. See NITRUM.

SAL PRUNELLÆ. See NITRUM.

SAL SUCCINI. See AMBRA.

SAL SULPHURIS. Salt of Sulphur.

Take of Sal Polychrestum, four Ounces, powder it in a Glas Mortar, with a Pestle of the same; put it into a flat wide-mouth'd Glas, and add to it of the Spirit of Sulphur two Ounces, stir them well together, and evaporate in a Sand Heat, which will leave a pleasant acid Salt, which put up in a Vial for Use.

This is not, strictly speaking, the Salt of Sulphur, but Nitre fixed by Sulphur, and afterwards impregnated with its Spirit. It is diuretic, and if given in a large Dose, cathartic, as most Salts. In the former Intention it is given from ten Grains to one Dram, in the latter up to four Drams, dissolved in Broth, or any proper Vehicle warm.

SAL TARTARI. Salt of Tartar.

SAL THERIACALE.

The Ancients made Use of a Compound, which they call Salt of Vipers, or *Sal Theriacale*.

Diascorides describes it, as made by burning a Viper in a new earthen Pot, with some Figs, common Salt and Honey, and when it was reduced to Ashes, adding a little *Spica Nardi* or *Malabathrum*. *Pliny* adds nothing to the Viper, but the Juice of Fennel, and a Grain of Incense. But *Galen*, *Paulus* and *Aetius* describe a much more compound *Sal Theriacale*. *Le Clerc*.

SAL VITRI. Salt of Glas, or Sandiver. See AXUNGIA VITRI.

SAL VOLATILE. A Volatile Salt. See AMMONIACUM, and ALCALI.

SAL VOLATILE OLEOSUM. See AMMONIACUM.

SAL URINOSUM. A Urinous Salt; that is, a volatile Salt, which rises in the Distillation of Animals, and Vegetables, and smells somewhat like Urine.

Besides the Salts above taken notice of, there are some very curious Salts mentioned in the Memoirs of the Royal Academy of Sciences; as the Salt of *Dauphiny*; the *Spanish* Salt; and the sedative Salt.

SALT OF DAUPHINY.

This Salt was first of all accidentally discovered near *Grenoble*, the Capital of *Dauphiny*, by some Miners, who searching in some of the old metallic Mines, which as yet remain'd open, missed what they sought for, but in its stead found an Earth impregnated with small shining Substances, which some of them knew to be of a saline Kind. Thus imagining that they had found an Earth abounding with Salt Petre, they made a strong Lixivium of it, and perceived, in the Evaporation of this Lixivium, Crystals, which bore some, tho' a very imperfect, Resemblance to those of Salt Petre.

But tho' the Crystals of this Salt had borne a greater Resemblance to those of Salt Petre than they did, it does not hence follow, that the former ought to be taken for the latter, if the other specific and distinguishing Properties of Salt Petre

were wanting; since the Configuration alone of any Salt does by no means ascertain its Essence or Characters.

But in order the more effectually to discover what this Salt is, we shall consider its external Properties, and the Principles or Elements of which it is composed.

This Salt then generally comes from *Dauphiny* in large Lumps, the inferior Part of which is about an Inch in Circumference, irregular, white, opaque, and pretty firm; whereas the superior Part, which is about two or three Inches in Circumference, represents a Cluster of small, transparent, and shining Crystals, some of which are disposed in flat Laminæ: But the greater Part are formed into oblong Squares, tho' so much interfering with each other, that they seem to have been prevented in the Configuration to which they had a natural Tendency; for there are very few of them which form small Columns perfectly, consisting of four Sides.

This Irregularity and Confusion is the Effect of too precipitate an Evaporation and Crystallization. But this Salt, in whatever State and Condition, is easily dissolved in about an equal Quantity of common Water, is friable, and becomes tarnished by Heat, and in process of Time by the Influence of the Air. It is easily melted on a live Coal, but does not become fused and take Flame like Salt Petre; for it only bubbles by means of the Water it contains, which being dissipated by the Heat of the Fire, it is transformed into a saline Calx. This Salt, when tasted first, conveys a sensible Bitterness to the Tongue, which is soon succeeded by a Sensation of Cold.

By these Marks and Properties, tho' only external, we generally use to judge of the *Sal Mirabile Glauberi*, similar to which is the Salt of *Dauphiny*, since it is possessed of the same Qualities. But that the Analogy, or rather Identity, of these two Salts may be the more effectually evinced, we shall enquire into their constituent and component Principles.

With respect, therefore, to artificial *Glauber's Salt*, we certainly know that it consists of a saline and an earthy Principle; the former is a fixed vitriolic Acid; and the latter, an Earth of Sea-Salt with which the Acid mixes and incorporates itself; so that the Salt of *Dauphiny* must have the same two Principles, in order to be entirely similar to that of *Glauber*.

Tho' it would be sufficient to prove the saline Principle of the Salt of *Dauphiny*, and deduce the other from it as a just Consequence, since we are convinced that a vitriolic Acid can with no known Substance, except the Basis of common Salt, form a Salt of the same Configuration and Properties which *Glauber's Salt* ought to be possessed of, yet I shall not entirely overlook the second or earthy Principle of the Salt of *Dauphiny*.

In order, therefore, to prove the true Principle of the Salt of *Dauphiny*, 'tis needless to observe, that by means of inflammable Substances, it is easily converted into a Liver of Sulphur, which in this Change can be nothing but a vitriolic Acid. Nor shall I insist upon the Precipitations which it produces of Lead dissolved in Aqua Fortis, or of Sugar of Lead dissolved in Vinegar. I shall only confine myself to its Effects with Quick-Silver; and upon one Experiment made for this Purpose build another, in order to prove its earthy Principle.

I therefore dissolve an Ounce of Quick-Silver in an equal Quantity, or a little more, of good Spirit of Nitre: I pour this Solution into five Ounces of the Salt of *Dauphiny*, dissolved in common Water. Upon which the vitriolic Acid, contained in the Salt of *Dauphiny*, immediately abandons its earthy Basis to the Spirit of Nitre, from which, as being the stronger of the two, it separates the Quick-Silver; and after having intimately united itself with it, they both subside to the Bottom of the Vessel, in a yellow Powder like Turbith Mineral, which is commonly prepared with Quick-Silver and Oil of Vitriol.

After having removed this yellow Powder, which is really a Turbith Mineral, as we shall afterwards shew; and having washed and dried it, I mix an Ounce of it with two Ounces of well-dried Sea-Salt. This Mixture I push in a Sand-Heat, in a Vessel whose superior Part is very convex; upon which a new Scene appears, for the Acid of the Sea-Salt proves superior, and in its Turn separates the Quick-Silver from the vitriolic Acid concentrated in the Turbith, and rising together to the Top of the Vessel, they form a kind of sublimate Mercury; whilst the vitriolic Acid finding an Earth like that which it had abandoned to the Spirit of Nitre, and which in this Case is the Earth left by the Acid of the Sea-Salt, it joins itself to it, and remains with it at the Bottom of the Vessel, in the Form of a saline Powder; which, when dissolved in Water, regenerates a Salt perfectly similar to that which I had employed to precipitate the Mercury, having the same Configuration of Crystals, the same Properties, the same Principles; and, in a word, the genuine Characteristic of *Glauber's Salt*.

Those who are ignorant of Chymistry may possibly be surprized

prized at the different Changes which happen in these two Experiments: For in the former, which is the Mixture of the Salt of *Dauphny*, with a Solution of Mercury, the vitriolic Acid contained in this Salt, enjoys its full Force. "For, almost on all Occasions, it is superior to other Acids; and according to particular Occurrences, separates from them the Salts and Earths they contain. It, also, separates from them their metallic Substances, as it does in this Case with respect to the Mercury, which the Spirit of Nitre had dissolved. It also forces this Acid to yield to it, and is afterwards precipitated with it into a Turbith Mineral." But a Circumstance apparently small produces a very considerable Change in the second Experiment, which is the Mixture of this Turbith with Sea-Salt. Chymistry, as well as other Arts, has Exceptions from its general Rules, one of which occurs in this Experiment, which is, "That every time that certain metallic Substances are dissolved by any Acid, in which there is Sea-Salt, or its Principle, or if these are added to the Acids, they deprive them of their metallic Substances, because they have more Analogy with these than with the other Parts of such Acids. Perhaps this Analogy or Relation depends on the mercurial Nature of these metallic Substances." This Effect is, however, produced by the saline Principle of this Salt upon the Mercury; for it separates it from the vitriolic Acid, which kept it confined in the Turbith, and raises it along with itself into a Sublimate, leaving its Earth behind it, which Effect was in its Turn produced by the vitriolic Acid.

By these two Experiments the constituent Principles of the Salt of *Dauphny* are rendered conspicuous: For it quickly precipitates Mercury into a Turbith Mineral, which can only be done by a vitriolic Acid. This Salt has, therefore, such an Acid for its saline Principle.

The Salt of *Dauphny* must, also, for its other Principle, have the Earth of Sea-Salt: Because, as we have already observed, the vitriolic Acid cannot, without the Concurrence of that Substance, form a Salt possessed of such Properties, and such a Configuration of Crystals, as those of the Salt of *Dauphny*, and which it has in common with the Salt of *Glauber*. This is confirmed by the second Experiment, where the vitriolic Acid of the Salt of *Dauphny*, which was added to the Mercury, finding in the Sea-Salt an Earth similar to that which it had abandoned to the Spirit of Nitre, again forms with it a Salt crystalized in the same manner, and possessed of the same Properties with the first I employed.

Thus the Salt of *Dauphny* has the same Principles with *Glauber's* Salt, and is for that Reason a genuine *Glauber's* Salt of the natural Kind, because Art contributes nothing to its Production; so that 'tis to be hoped a due Regard will in process of time be paid to this Salt, since it produces the same Effects on the human Body with a true *Glauber's* Salt, and is perfectly possessed of all its Characteristics; which are, That it does not become moist in the Air; does not alter the Tincture of Tournsol and Flowers of Violets; and that itself is not altered by the Oil of Vitriol, like other Salts, which still retain some Portion of Sea-Salt. *Mem. del Acad. Royale des Sciences, An. 1727.*

1. SALAMANDRA Offic. Schrod. 5. 345. Aldrov. de Quad. Ovip. 639. Schw. Rept. 163. Gefn. de Quad. Ovip. 80. *Salamandra terrestris*, Raii Synop. A. 273. Jonf. de Quad. 137. *Salamandra terrestris maculis luteis distincta*, Charlt. Exer. 28. THE SALAMANDER, or QUENCH-FIRE.

The Salamander is a Species of Lizard; of a black Colour, mark'd with yellow Spots. Its Head and Belly are thicker than those of the common green Lizard, but its Tail is shorter. It has a sharp Snout and full Eyes. Each of its Feet is armed with four pretty big Claws, but it is much slower in its Pace than the common Lizard. On its Back is a Figure much resembling that of a Cross, and it is mark'd with two Lines, which reach from the Neck to the Tail. There are two kinds of Salamanders, the terrestrial and the aquatic; the first is found in cold and moist Places, the other delights in Fountains and running Streams.

Salamanders are found in *Italy*, *Germany*, and in *Normandy*. It was formerly believed, that they could live in the Fire, because it was observed that they remained a longer Time in the Fire, without being consumed, than other Animals; because they are full of a lacteous and viscid Humour, which for some time diminishes the Heat of the burning Coals, but at length the Fire penetrates and burns them. The Bite of this Reptile is esteemed as dangerous as that of a Serpent. In Biting it discharges a lacteous, virulent, and very acrimonious Juice. It contains a good Quantity of caustic volatile Salt, Oil and Phlegm.

The Salamander is corrosive, burning and depilatory, being

outwardly applied. It can hardly be touched without hurting the Fingers. *Lemery des Droguez.*

The Ashes of a Salamander are an excellent and effectual Cure for scrophulous Ulcers, being sprinkled on the Parts affected. *Schroder.*

2. SALAMANDRA AQUATICA. This is distinguished in the following manner:—

Lacertus aquatilis, Offic. Schrod. 5. 343. *Lacertus aquaticus niger*; Mer. Pin. 169. *Salamandra aquatica*, Raii Synop. A. 273. Charlt. Exer. 28. Rondel. de Aquat. 2. 230. *Salamandra aquatica, aliis Lacertus aquaticus*, Jonf. de Quad. 137. *Scincus aquaticus quibusdam*. THE WATER LFT.

It is found in Fish-Ponds and standing Waters. The Powder of it is commended for facilitating the Evulsion, or Drawing the Teeth.

SALAPPA. Jalap.

SALCÆ OLEUM. Oil of *Salca*. The best Preparation of Oil of *Salca*, and as I prepared it in *Alexandria*, says *Actius*, is in the following Manner:

Take of Aspalathus, half a Pound; of Xylobalsamum, nine Ounces; Cyperus, four Ounces; Elecampane, both Sorts of Iris, each half a Pound; Calamus Aromaticus, eighteen Ounces; Flowers of the Juncus Odoratus, two Ounces and half; of fat Storax two Ounces; two Indian Nuts; Malabathrum, eight Ounces; Spikenard, one Ounce; Cloves, Zedoary, each one Ounce and an half; Amomum, three Ounces; Casia, two Ounces; Castus, one Ounce; Myrrh, one Ounce; Hypnum (a Species of Moss) Xylocasia, each three Ounces; Oil, ten Sextaries. Then boil together in the Oil the Xylobalsamum, Iris, Cyperus, Elecampane, and Xylocasia, decorticated, grossly pounded, and macerated two or three Days in Water; stir them continually, infilling Water by Degrees, when they begin to grow dry. When they have boiled three Hours or more, take them off, and let them stand covered for a whole Night. The next Day take them out, and separating the Water from the Oil, boil them again in pure Water mixed with a small Quantity of Wine; and as soon as they begin to boil up, put in the Calamus, the Flowers of the Juncus Odoratus, all first steeped in old scented Wine. The third Day take them out in like manner as before, and adding more Water, boil them a third Time, putting in the rest of the Ingredients as soon as they begin to boil. They make a secondary Sort, which is done by adding six Sectarii of Oil to what remains after the third; and after boiling it a sufficient time, adding three Ounces of good white Myrrha Stacte; half a Pound of *Siroma* [Water of Opobalsamum;] half a Pound of Mastich; and an Ounce of good Storax. Oil of *Salca* is used by the Women to anoint their Heads, and what I have here given is by far the best Way of preparing it. *Actius, Tetrab. 1. Serm. 1.*

Another Preparation of Oil of *Salca*.

Take of Oleum Omphacinum, twenty Sectarii; Iris Illyrica, one Pound; Amomum, one Ounce and an half; Aspalathus, Hypnum, each one Pound; Calamus Aromaticus, two Pounds; Cloves, Malabathrum, Carpopbalsamum, each one Pound; Xylocasia, five Ounces; Casia, four Ounces; Costus, fat Storax, Saffron, each one Ounce; Myrrh, Zedoary, each three Ounces; Spikenard, four Ounces. Boil them all in Water, and manage them as it is directed in the former Preparation. *Actius, Tetrab. 4. Serm. 4. Cap. 114.*

SALEFUR. Garden-Saffron. *Rulandus.*

SALEP. See ORCHIS.

SALICARIA.

The Characters are;

The Calyx is tubulous, striated, and multifid; the Flowers are rosaceous, hexapetalous, and grow out of the upper Incisures on the Inside of the tubulated Calyx, almost in a Series of Whorls, and are furnished with a Multitude of Stamina, sometimes no fewer than eighteen. The Ovary, which is adorned with a long Tube, that has an Apex shaped like a Bason, when ripe becomes an ovated, bicapsular Shell involved in the Calyx, and full of small Seeds.

Boerhaave mentions four Sorts of *Salicaria*, which are;

1. *Salicaria*; vulgaris; purpurea; foliis oblongis. *Tourn. Inst. 253. Boerb. Ind. A. 221. Raii Synop. 3. 367. Lysimachia purpurea spicata*. Ger. 386. Emac. 476. Park. Theat. 546. Raii Hist. 2. 1036. *Lysimachia spicata purpurea forte Plinii*, C. B. P. 246. *Lysimachia purpurea quibusdam spicata*, J. B. 2. 902. *Blattaria rubra spicata major, glabra, communis* [* S]

foliis acutis, Hist. Oxon. 2. 490. SPIKED WILLOW-HERB.

It grows in marshy Places, and by the Banks of Rivers, and flowers in July. The Herb, which is used in Medicine, is an Ophthalmic. *Mont.* The distilled Water is a present Remedy for Wounds, Punctures and Sugillations of the Eyes, as well as Dimness of Sight and all other Infirmities incident to those Parts. *Park.* It is a Specific in Inflammations. *Raii Hist.* The Decoction of the Herb is an excellent Remedy for the epidemic Diarrhoea of Ireland. *Threk. Synop. Hib.*

2. *Salicaria*; *purpurea*; *foliis subrotundis*. T. 253. *Lysimachia*, *spicata*, *lanuginosa*, *folio subrotundo*, *flore purpureo*. H. R. Par. *Blattaria*, *rubra*, *spicata*, *major*, *lanuginosa*, *folio subrotundo*. M. H. 2. 490.

3. *Salicaria*; *Hyssopi folio*, *latiore*. T. 253. *Lysimachia* *spicata*, *purpurea* *affinis*, *hyssopifolia*. H. L. 397. *Hyssopifolia*, *major*, *latisioribus foliis*, C. B. P. 218. *Hyssopifolia*, *aquatica*, J. B. 3. 792.

4. *Salicaria*; *Hyssopifolia*; *angustiore*. T. 253. *Hyssopifolia*, *minor*, *angustioribus foliis*. C. B. P. 218. M. H. 3. 613. *Boerb. Ind. Alt. Plant. Vol. 1.*

There has been no Virtue observed to belong to this Plant, tho' it be the *Lysimachia* of *Diocorides*, and it only serves as an Ornament in Gardens, on account of its beautiful Flowers. *Hist. Plant. Ascript. Boerhaave*, p. 299.

SALICORNIA.

The Characters are;

It is aphyllous, smooth, succulent, and has the Appearance of Houseleek, consisting of Scales articulated box-wise. The Flower is apetalous, naked, and grows out of the Commissures of the Scales. The Fruit is a Vesicle containing one Seed.

Boerhaave mentions but one Sort of *Salicornia*, which is, *Salicornia*. *Dod. p. 82.* *Salicornia*, *geniculata*, *annua*. T. Cor. 51. *Kali*, *geniculatum*, *majus*. C. B. P. 289. M. H. 2. 611. *Kali*, *geniculatum*, *sive Salicornia*. J. B. 3. 704. *Boerb. Ind. Alt. Plant. Vol. 2.*

A Decoction of the Leaves is very opening, provokes Urine and the Menfes, accelerates the Birth, expels the Foetus and Secundines, and purges watry Humours, whence it is of Service in a Dropsy. Its Ashes are used in making Soap and Glas; and being infused in Water, cure the Itch and all cutaneous Diseases, the Parts affected being washed therewith. *Hist. Plant. Ascript. Boerhaave.*

SALIVA.

By *Saliva* we mean in general, that Fluid by which the Mouth and Tongue are continually moistened in their natural State. This Fluid is principally supplied by Glands, called for that Reason Salival Glands, of which they commonly reckon three Pairs; two Parotides, two Maxillares, and two Sublinguales. These are indeed the largest, and they furnish the greatest Quantities of Saliva; but there are a great Number of other lesser Glands of the same Kind, which may be reckoned Assistants or Substitutes to the former. All these may be determined salival Glands, and they may be enumerated in the following Manner:

Glandulæ Parotides.	Glandulæ Linguales.
Glandulæ Maxillares.	Amygdalæ.
Glandulæ Sublinguales.	Glandulæ Palatinæ.
Glandulæ Molares.	Glandulæ Uvulæ.
Glandulæ Buccales.	Glandulæ Arytenoidæ.
Glandulæ Labiales.	Glandula Thyroidæa.

The Parotides are two large, whitish Glands, irregularly oblong and protuberant, situated on each Side, between the external Ear and the posterior or ascending Branch of the lower Jaw, and lying on some Part of the neighbouring Masseter Muscle. The superior Portion of this Gland lies before the cartilaginous Meatus of the Ear, and touches the Apophysis Zygomatica of the Os Temporis; and it is extended forwards and backwards under the Lobe of the Ear, as far as the Mastoide Apophysis.

From the anterior and superior Portion of this Gland, a white membranous Duct or Canal is produced by the Union of a great Number of small Tubes, representing so many Roots. This Duct runs obliquely forwards on the Outside of the Masseter, and then perforates the Buccinator from without inward, opposite to the Interstice between the second and third Dentes Molares, where the Hole or Orifice represents the Spout of an Ewer.

This Canal is named Ductus salivalis Stenonis, or Ductus Superior. It is about the twelfth Part of an Inch in Diameter, and in some Subjects is partly covered by small glandular Bodies, united with it in different Quantities. The Arteria and Vena Angularis run up over this Duct, and the Portio Dura of the Auditory Nerve runs through the Gland itself; and it also receives Filaments from the second vertebral Pair.

The maxillary Glands are smaller and rounder than the Parotides, and are situated each on the Inside of the Angle of the lower Jaw, near the Musculus Pterygoidæus Inferior. From the Inside, or that which is turned to the Musculus Hyo-glossus, each of them sends out a Duct in the same Manner as the Parotides, but it is smaller and longer, and goes by the Name of Ductus Salivalis Whartoni, or Ductus inferior.

This Duct advances on the Side of the Musculus Genio-glossus, along the inner Part and superior Edge of the Glandula sublingualis, to the Frenum of the Tongue, where it terminates by a small Orifice in form of a Papilla.

The Glandulæ Sublinguales are likewise two in Number, of the same Kind with the former, something oblong, and flattened like a blanch'd Almond. They are situated under the anterior Portion of the Tongue, one on each Side, near the lower Jaw, on the lateral Portions of the Musculi Mylo-Hyodæi, which sustain them. The two Extremities of each Gland are turned backward and forward, and the Edges obliquely inward and outward.

They are covered on the upper Side by a very thin Membrane, which is a Continuation of the Membrane that covers the under Side of the Tongue. They send out laterally several small short Ducts, which open near the Gums by the same Number of Orifices, all ranked in the same Line, at a small Distance from the Frenum, and a little more backward. In many Animals we find particular Ducts belonging to these Glands, like those of the Glandulæ Maxillares; but they are not to be found so distinctly in Men. The Musculi Genio-glossi lie between the two sublingual Glands, and also between the two maxillary Ducts.

The Molares are two Glands nearly of the same Kind with the former; each of them being situated between the Masseter and Buccinator; and in some Subjects they may easily be mistaken for two small Lumps of Fat. They send out small Ducts, which perforate the Buccinator, and open into the Cavity of the Mouth, almost over-against the last Dentes Molares; and from thence M. Heister, who first described them, called them Glandulæ Molares.

All the Inside of the Cheeks, near the Mouth, is full of small glandulous Bodies, called Glandulæ Buccales, which open by small Holes or Orifices through the inner Membrane of the Mouth. The Membrane which covers the Inside of the Lips, a Continuation of that on the Cheeks, is likewise perforated by a great Number of small Holes, which answer to the same Number of small Glands, called Glandulæ Labiales. The Glandulæ Linguales are those of the Foramen cæcum of the Basis of the Tongue.

The Glandulæ Palatinæ belong to the Arch and Septum of the Palate; the Glandulæ Arytenoidææ are described under the Article LARYNX. The uvular Glands are only a Continuation of the Membrane of the Palate, in form of a small Bunch of Grapes. We might likewise reckon among the salival Glands, those of the superior Portion of the Pharynx; and also the glandular Bodies of the Membrana Pituitaria of the Nares, and of the Sinuses that communicate with these.

The Amygdalæ are two glandular Bodies of a reddish Colour, lying in the Interstices between the two lateral half Arches of the Septum Palati, one on the right the other on the left Side of the Basis of the Tongue. Their Appearance is not unlike that of the Outside of an Almond Shell, both because their Surface is uneven, and because it is full of Holes big enough to admit the Head of a large Pin.

These Holes, which represent a Sieve or a Piece of Network, are continued to an irregular Sinus or Cavity within the Gland, filled commonly with a viscid Fluid, which comes from the Bottom of the Sinus, and is from thence gradually discharged through these Holes into the Throat. To see the true Structure of the Amygdalæ, they must be examined in clear Water, having first been washed in lukewarm Water, and handled very gently.

The Thyroide Gland is a large whitish Mass, which covers the anterior Convex Side of the Larynx. It seems, at first Sight, to be made up of two oblong glandular Portions, united by their inferior Extremities, below the Cricoid Cartilage, so as to resemble a Crescent, with the Cornua turned upward. It is of a moderate Thickness, and bent laterally like the Thyroide Cartilage from which its Name is taken. The two lateral Portions lie on the Musculi Thyro-Hyoidæi, and the Middle, or inferior Portion, on the Crico-Thyroidæi. The Thyro-Pharyngæi Inferiores send Fibres over this Gland, and they communicate on each Side by some such Fibres with the Sterno-Thyroidæi and Hyo-Thyroidæi.

This Gland seems to be of the same Kind with the other salival Glands, but it is more solid. Some Anatomists thought they had discovered the excretory Duct, but they mistook a Blood-Vessel for it. We sometimes meet with a Kind of glandular

glandular Rope, which runs before the Cartilago Thyroides, and disappears before the Basis of the Os Hyoides.

This glandular Rope goes out from the common Basis of the lateral Portions of the Thyroid Gland, and is lost between the Musculi Sterno-Hyoidæi, behind the Basis of the Os Hyoides, or between that Basis and the Epiglottis. There are likewise small Openings on the Side of the anterior Ligament of the Epiglottis, or that by which it is connected to the Basis of the Tongue. One of these Openings appears like a small Papilla; and this is the farthest that I have been able to trace the glandular Rope. *Winslow's Anatomy.*

The Saliva is a thin pellucid Humour, incapable of being concreted by the Fire, almost without Taste and Smell, and frothing much when shaken. It is an Humour of the glandular Kind, secreted from the pure arterial Blood: In hungry Persons it is fluid, acrid, and copiously discharged. And in those who have fasted long, it is highly acrid, penetrating and resolvent. In farinaceous and succulent Vegetables, it not only produces a Fermentation, but also augments one already begun. It is swallowed not only by Brutes, but also by human Creatures in a sound State, even when asleep. Too copious an Evacuation of it made voluntarily, produces Loss of Appetite, bad Digestion, and an Atrophy. It consists of a pretty large Quantity of Water and Spirits, and is, also, of a saponaceous Nature in consequence of a small Quantity of Oil and Salt it contains.

By Manducation, therefore, the Saliva is expressed and accurately mixed with the attenuated Food, which contributes, first, to the Assimilation of the Aliments to the Nature of the Body to be nourished; secondly, to the due Mixture of the oleous with the aqueous Parts; thirdly, to the Solution of the saline Parts; fourthly, to Fermentation; fifthly, to a Change of the Taste and Smell of the Aliments; sixthly, to an Augmentation of the intestine Motion; seventhly, to a momentaneous Relief from Hunger; and eighthly, an Application of the sapid Parts, tho' it is insipid itself.

The Saliva, therefore, which is in a curious and surprising Manner elaborated from the arterial Blood, and which, when discharged, is mixed with the Aliments, cannot on other Occasions be evacuated without bad Consequences; but after it is swallowed, has performed its Offices, and is corrected by a fresh Circulation, it assumes a better Quality, as is obvious from certain Disorders, the Remedies appropriated to their Cure, and their several Crises.

An excessive Evacuation of the Saliva disturbs the first, and consequently all the succeeding Concoctions; induces Thirst and Dryness of the Parts; generates black Bile, and forms a Tabes and Atrophy. If the Saliva is not at all secreted into the Mouth, or secreted in a smaller Quantity than usual, the Manducation, Taste, Deglutition and Digestion of the Aliments, are hindered, and the Patient's Thirst is augmented. *Boerhaave's Institut.*

SALIVALES DUCTUS. The Salival Ducts. See SALIVA.

With respect to these Ducts, Mr. *Monro* gives the subsequent Case in the *Medical Essays*, Vol. 2.

Mr. *Ker* of *Frogton*, a young Gentleman of a delicate Constitution, and threatened with a Consumption from an Ulcer in his Lungs, was seized, after riding in a cold Night, with a very hard Tumour about the Middle of his left Cheek, which the Gentleman who attended him, endeavoured at first to resolve; but observing a Suppuration to come on, it was opened with a Lancet on the Inside, and afterwards an external Orifice was also made, and Escharotics were applied to waste down the hard Stool of the Tumor that still remained. When no more Hardness was felt, his Surgeon endeavoured to incise and cicatrize, but was disappointed by a constant plentiful Discharge of a thin clear Lymph. The Orifice was again enlarged, and it was dressed a considerable Time with Astringents and Dryers, in different Forms, but without any Success.

In September 1727, being accidentally in the Neighbourhood of *Kelso*, where Mr. *Ker* lived, I was sent for to advise with Dr. *Abernethy* and Dr. *Scot*, Physicians there, and with Mr. *Jamieson* Surgeon concerning his Cure. The external Orifice in his Cheek was as large as would have received the Point of my Thumb, and at the Bottom of it we could distinctly see some Part of the superior salivary Duct laid bare, with a Hole in the outer Side of it, large enough to allow the Button of a middle sized Probe to enter it; and when he moved his lower Jaw at our Desire, the Saliva ran out plentifully at that Orifice. When the Jaw was not moved, a very small Quantity of the Spittle oozed out; but in Time of Dinner, it made a Napkin, laid eight Fold over the Plaister that covered the Ulcer wet all through.

We agreed to make an artificial Opening for the Saliva into his Mouth, which I did in the following Manner; having

with two Fingers of one Hand stretched his Cheek outwards, I directed the Point of a large Shoe-maker's Awl, which I held in the other Hand, into the open Breach of the Duct, and thrust the Awl obliquely forwards, through the Cheek into the Mouth, betwixt my two Fingers; then drawing back the Awl, I passed an eyed flexible Probe, mounted with a small Cord of Silk, through the Passage made by the Awl, and brought it out between his Lips with my Fingers, leaving one half of the Cord hanging from the external Ulcer; then the Ends of the Seton being disengaged from the Probe, were tied loosely near the Angle of the Mouth; and his external Ulcer was dressed up with dry Lint kept on with a Plaister. He was desired to rinse that Side of his Mouth frequently with Brandy; and the Sides of the external Ulcer were kept from going out too fast, or turning callous, with the lunar Caustic. In less than three Weeks this Management had the desired Effect, of rendering the Passage in which the Cord was engaged, callous, (which the Looseness of the Cord, and the Want of Pain when it was drawn, plainly shewed;) when Mr. *Jamieson* took out the Cord, and healed the external Ulcer very soon. In a little Time I saw our Patient at *Edinburgh*, with a firm Cicatrice on the Part where the Sore had been.

This Operation is plainly directed by my Friend Mr. *Chefelden*, in these Words: "When this Duct is divided by an external Wound, the Saliva will flow out on the Cheek, unless a convenient Perforation be made into the Mouth, and then the external Wound may be healed." None, however, of the chirurgical Writers whom I have looked into, give any Instance of this Operation having been formerly performed.

THE EXTIRPATION OF THE SALIVAL GLANDS.

Though many Methods have been proposed for removing scirrhus and indurated Glands in other Parts of the Body, yet the Method of extirpating the parotid and maxillary Glands, which are sometimes exceedingly tumified, and are connected with the larger Branches of the carotid Artery, has not hitherto been mentioned. What has been hitherto advanced in particular Treatises and Theses, with regard to these Glands, relates very little to their Extirpation; an Operation which has been reckoned by some very pernicious and extremely dangerous.

Nor can I altogether discommend this Opinion; for the Branches of the carotid Arteries passing through these Glands, are so large, that when they are wounded, the Patient may bleed to Death, unless attended by a skilful Physician or Surgeon.

Tho' the Hemorrhage may, in this Operation, be very large, yet it does not follow, that it never can be stopped by a prudent Physician; for whom it is not sufficient that he can relieve the Patient in slight Disorders, but he must also make Experiments where the Case is doubtful, or in the Opinion of some, desperate. And I have often had Recourse to this Method of Extirpation, when these Glands have been violently swelled, and severely indurated, even approaching to a carcinomatous Nature, after they had been treated by other Physicians with Digestives, Corrosives, and other Medicines.

In performing this Operation, it is necessary to be provided with a good styptic Liquor, Linnen Rags, much scraped Lint, a Puff-ball, thick Compresses of different Sizes, and a Bandage about six Ells long. Then let the Patient be placed in a Seat with his Face towards the Light, having his Head and Hands secured by Assistants. The Operator must next open the Skin above the Tumor, with a longitudinal Incision, and carefully separate the scirrhus or indurated Gland from the contiguous Parts with the Knife, and at last from the Arteries with which it is connected. The Blood then rushes out so profusely, that near a Pound will be lost before the Operator can lay aside his Knife and take up the Dressings. He must therefore immediately dip a Ball of Linnen Rags in the styptic Liquor, and press it, also, upon the larger wounded Arteries. The Remainder of the Cavity of the Wound must be well filled with scraped Lint and dry Rags, and compressed with the Finger, then apply a large Piece of Puff-ball, with three or four thick Compresses; securing the whole with a proper Bandage. Thus, by Degrees, the Hæmorrhage will be assuaged, especially if the Patient be laid upon the Bed, and the wounded Part compressed for three or four Hours, by the Hand of an Assistant. But it is necessary to observe, that if the Tumor be extremely large, it may more easily be extirpated by a crucial Incision. The Patient must then rest in Bed for the three or four following Days, without loosening the Bandage, to prevent a fresh Hæmorrhage. That this Time is necessary, I not only know from the Nature of the Wound, but from Experience; for having performed the Operation on a Girl, she was impatient under the Stricture of the Dressings, which

which I attempted to relax a little the next Day; but so violent an Effusion of Blood immediately ensued, that I thought her Life was in Danger, and I was obliged to make the Bandage tighter than before.

After the third or fourth Day, the Bandage and the Compresses, filled with the fetid Blood, may be gently removed, being first softened with warm Wine, or Spirit of Wine; so much of the Puff-ball as is loose may also be removed, leaving every Thing that has a strong Adhesion. New Compresses, dipped in warm Spirit of Wine, or digestive Fomentation, such as Lime-Water, or camphorated Spirit of Wine, must be directly applied, and secured with the Bandage as before, but a little more relaxed, that the Patient may be able to take some Aliment, which was before impossible, or extremely difficult. The second and third Dressings must be performed only every other Day, and the rest must be renewed every Day, because the Wound will discharge much Matter. In every Dressing it must be carefully observed, that none of the Compresses, Puff-ball or Lint be removed, but what are quite loose; and when any of the first Lint comes away, the Wound must be again filled with fresh Lint, spread with some digestive Ointment, till all the Lint and Puff-ball come away spontaneously, which usually happens about the eighth or tenth Day. Then the Wound may be cleansed by some digestive Ointment, and inclosed with a vulnerary Balm; and the Cure may be completed with dry Lint, as in other Wounds. But it ought to be observed, in performing the Operation, to make the Wound behind the Cheek or maxillary Angle, that the Cicatrix may not deform the Face.

It is surprising that *Garengot*, who is so ample in other Parts of Surgery, and even bestows a Chapter on this Operation, should take no Notice of the Method of stopping the Hæmorrhage. He even asserts that there is no Occasion for any Remedies for suppressing the Effusion of Blood, in extirpating these Glands, or even indurated Breasts; because only a few Drops of Blood will be emitted in removing the largest of these Tumors; and that the Wound itself may be easily healed, by closing its Lips with a Suture. Hence, I think, it is evident, that in his general Doctrine he little regarded these indurated, parotid or maxillary Glands, or perhaps never saw the Operation. Hence we may see the pernicious Consequences of writing in general Terms, without Specifications of Exceptions. For it is certain, that whoever follows *Garengot's* Directions in this Operation, must unavoidably destroy the Patient by the Effusion of Blood, as happened to a Surgeon at *Yena*. This Case is related in the *Commerc. Lit. Norimberg. An. 1733*, where the Author adds this Observation, "That we may hence learn how much safer it is to relinquish these Tumors than to extirpate them." This Remark, however, should not deter the skilful Surgeon from the Operation, which I have often successfully performed myself, without the Death of one Patient. I must however allow, that *Garengot's* Assertion may hold in the Extirpation of scirrhous Glands in most other Parts of the Body. Extirpations of this Kind we meet with in *Koehneusen*, Obs. I. and in the Additions of *Tilingius* to *Scultetus*, published at *Leyden* in 1693.

As this Operation, however, is extremely dangerous, and often leaves a large Cicatrix, as these Tumors may sometimes be resolved by proper Remedies; this Method ought certainly to be tried first, rather than to proceed directly to Extirpation. For this Purpose, anoint the scirrhous Tumors daily with Oil of Bricks or of Soap, and a little Camphire, or with warm Oil of Amber, or of Juniper; apply over the indurated Part a Plaister of Diachylon, with the Diaphoretic Mercury of *Mynsicht*, or the Soap Plaister of *Barbette*, with Oil of Amber or Juniper, or the like proper Digestive; warm medicinal Bags will likewise be proper for this Purpose.

In the mean time, internal Medicines are not to be neglected; such as resolvent Decoctions of Swallow-wort and Fig-wort, which may be drank two or three times a Day, or taken in the Morning in Bed to raise a Sweat. Between these Draughts take every Day the Powders of burnt Sponge, Sal Gemmæ, Diaphoretic Antimony, or others of the like digestive Nature. Some prescribe as much bruised Lizards as will lie on the Point of a Knife. I have often found excellent Effects from the *Æthiops Mineral* and *Mercurius Dulcis*; tho' in the Use of these Medicines it is proper to exhibit Purges at proper Intervals. But if all these Remedies prove ineffectual, it may not be improper, if agreeable to the Patient, to proceed to a Salivation; which, according to *Agricola*, and other celebrated Physicians, has been very efficacious in dissolving scirrhous Tumors in the Neck; and I have experienced its Virtues in some Cases.

But when a Scirrhus of this Kind is attended with an Inflammation, and resolvent Medicines prove ineffectual, it may be proper to bring the Tumor to Suppuration, and treat it like an Abscess. And I have known Instances, wherein Dis-

cutients have made these indurated Glands, and also other Tumors of the Neck degenerate into an Abscess. But when the Disorder is inveterate, emollient suppurative Medicines will turn the increasing Tumor into a malignant Ulcer, or even into a Cancer; and the same Effects are produced by the Application of Corrosives, which also occasion a great Effusion of Blood, and consequently Danger of immediate Death, as I had lately an unhappy Instance in a Person of Quality. *Heister's Surgery*.

SALIVANTIA. Medicines which excite a Salivation.

SALIVARIS. Pellitory of *Spain*. See **PIRETHRUM**.

SALIVATIO. A Salivation. See **MERCURIUS**.

A copious and artificial Evacuation of the Saliva is indicated:

1^{mo}, By Crises which tend that Way.

2^{do}, By the particular Nature of a Disease, especially when lodged in the Glands and *Membrana adiposa*. But in no Case is it more indicated than in a *Lues Venerea*. And,

3^{tio}, By the Nature of an epidemical Disease.

The Body is most commodiously prepared for a Salivation, by the previous, duly continued, and liberal Use of attenuating, diluent, lenitive, and warm Decoctions of scabious, Pellitory of the Wall, Burdock, China Root, Sarsaparilla, Sassafras and Sanders.

A Salivation is excited,

1^{mo}, By washing the Mouth with certain Liquors.

2^{do}, By the slow and protracted Mastication of some viscid Matter, such as Mastich, Wax, and Myrrh, especially if acrid Substances are mixed with these, such as Pellitory of *Spain*, the *Leucanthemum Canariense* Sapore Pyrethri, Ginger and Pepper.

3^{tio}, By drawing into the Mouth acrid and irritating Vapours, such as those of Tobacco, Sage, Rosemary, Marjoram, Thyme, and Mother of Thyme.

4^{to}, A Salivation is excellently excited by the Action of such Medicines as produce a gentle but long continued Nausea, such as Antimony, neither entirely fixed nor totally emetic, taken with a small Quantity of common Vitriol.

5^{to}, By such Substances as totally dissolve all the Parts of the Blood, convert it into Lymph, and render it fit for a Discharge by Way of Saliva; such as crude Quicksilver, Cinnabar, a Solution of Quicksilver in Aqua fortis, white Precipitate, red Precipitate, Turbith Mineral, and sublimate Mercury dissolved. The Action of these Medicines is promoted by warm Fomentations applied to the Head, Neck and Face.

An excessive Salivation is lessened or stop'd:

1^{mo}, By a large and continued Use of mild and tepid Drinks, such as Decoctions of Mallows, and Liquorice, in Milk and Water.

2^{do}, By allaying the Impetus of the Humours by means of mild, oleous, and anodyne Emulsions, with a proper Addition of Diacodium or Opium. And,

3^{tio}, By making a Revulsion of the Humours to other Parts, by any large Evacuation, especially that by Stool. But great Caution is necessary, lest the Impetus of the moved Matter, which in this Case is always acrid, should rush to other Parts, and produce a greater Danger; so that here the Caution of the Physician is necessary for the Safety of the Patient. *Boerhaav. Institut.*

It was no doubt owing to Chance that Mercury was discovered to be a Cure for the Pox, by Fluxing. But the Discovery, that it had such a Power of Fluxing, was not made at the same time. For *Guido* recommends an Ointment, which he calls the saracenic Ointment, for the Scabies, which *G. Forella* says, throws out the Humours by the Mouth. Now *Guido* wrote in 1363, long before the Pox was known in *Europe*. Besides, it is plain that this Property of Mercury was known to *Theodoric*, and even by the Way of Uncction; for he describes several Sorts of these Ointments, lays down the Rules, how often, and how long, the Uncction should be continued, till the Flux rises. The Humour, he says, will flow out at the Mouth like a River; and this Method he knows to be attended certainly with Success, in the *Malum Mortuum* and Scabies. This Author wrote soon after 1252.

These mercurial Applications were taken from the *Arabians*. *Rhazes* and *Avicenna*, and the rest, prescribe them in cutaneous Affections, without any View or Apprehensions of Fluxing. *Alfaharavius*, who was later, seems to have a Notion of this Effect; for he treats of the Cure, when the Mouth, the Tongue, and the Throat were swelled, attended with Corrosion, and great Stinking, from mercurial Uncctions.

The first Instance we have upon Record, of a Salivation being recommended, is in *Joh. de Vigo*, who wrote in 1518. He says there is nothing to be done in the Pox, but to use mercurial Uncctions, which, by Salivation, cure it in a Week. The famous *Jacobus Carpus*, or *Berengarius Carpenfis*, who was in great Reputation in the Beginning of this Century, is supposed

supposed to be the first who was Master of this Secret. Perhaps *J. de Vigo* might have learnt this Way of Unction from him. Indeed *G. Torella*, Physician to *Cæsar Borgia*, and to Pope *Alexander the Sixth*, afterwards made Bishop of *St. Justa* by that Pope, mentions mercurial Unctions, but condemns them as pernicious; and takes notice how many Persons ignorant Quacks had killed by this Practice. *G. Torella* practised about 1498.

Fracastorius recommends mercurial Unctions and Fumigations of Cinnabar. Some time after *Aloysius Lobera*, a Spaniard, in a Treatise of his upon the Subject of the Pox, delivers the Method of Unction with great Exactness; orders the Room to be kept close and warm, and the Patient not to shift; and that the rubbing in of the Mercury should be continued till the Salivation comes on well, and the Symptoms abate. But the Time this may take up is undetermined. *Nicolaus Massa*, one of the best Anatomists of his Age, succeeded these Writers. He says the most secure and certain Method of curing the Pox, is Salivation; which may be done safely, even in Children, and Women with Child. He gives several Forms of Unctions, the Basis of all which are Lard and Mercury. He lays down Rules for preparing the Body, and guarding it against all Inconveniences, and all Accidents which may happen both during the Course and after it. He observes, that the Humour sometimes runs off, not only at the salivary Glands, but by Stool, Urine, or Sweat; and that not seldom with Success. He uses this Method of Unction sometimes for thirty-seven Days; continuing or intermitting it by Intervals, as Circumstances require. *Brasavolus* wrote in 1551. He has no new Instructions in him. *Fallopian*, his Scholar, read Lectures upon this Subject, about the Year 1555. He is the first who is particular in some Points relating to Salivation, either as to the Quantity of the Discharge, or the Length of the Course. The Measure he mentions is from seven to ten Pints a Day; and though sometimes ten Days, or thereabouts, be a sufficient Time for the Flux to continue, yet there are Cases, where he thinks it may be proper to prolong it, till the twentieth. However, he thinks this Method ought never to be attempted but where *Sarsa* and *Guajacum* fail. *Freind's History of Physic*.

THE METHOD OF RAISING A SALIVATION BY FUMIGATIONS.

The Patient being first duly prepared, is placed naked in a proper Chair, or Stove; and small Pieces of Cinnabar, to the Quantity of two or three Drams, being thrown upon live Charcoal, the Steam is received through the Pores of the Skin. The Patient grows soon very warm, and sweats more or less, in Proportion to his Strength. This Operation is repeated every Day, or every other Day, till the Gums begin to swell and ulcerate, and the Spitting rises to a sufficient Quantity.

Some prefer Plaisters to Ointments; and it is certain, that the Effects of them are slower and milder. They are applied to the same Places, and with the same Precautions as the Ointment. (See below.) Others are of Opinion, that a Salivation is most safely raised, and afterwards either increased or diminished, as the Physician shall judge the Patient's Strength to require, by the internal Use of the mercurial Panacea: And it must be owned, that both Fumigations and Ointments are hazardous and uncertain; for Fumigations sometimes affect the Head, and produce direful Symptoms; and Ointments raise sometimes too great a Salivation, sometimes none at all; because a greater or smaller Quantity of the Quicksilver enters the Blood, according as the Pores of the Skin are wider or narrower; and this can never be known but by the Event. But the Usefulness and Excellence of the Panacea consists in this; that being given at first in small Doses, the Quantity of it may be increased at Pleasure, till the Patient spits the Quantity required; and this Quantity is either increased, diminished or continued the same at the Pleasure of the Physician, without any Fear of Danger. The other Methods of Salivating are not, however, altogether to be rejected; for it is sometimes necessary to mix them with the Use of the Panacea, which being slow in its Operation, the Ointment is to be used once or twice in some Cases, to bring the Spitting speedily to the desired Pitch. In Persons, therefore, of a very strong Constitution, the Salivation ought to be raised by Unction, and afterwards kept up by the Panacea; but in weak Habits the Panacea alone is to be depended on, or, at least, with the Assistance of only a few Plaisters. In Cases of violent continual Pains, Nodes, or Exostoses, Plaisters are, also, to be applied; as in the pocky Itch, Herpes, Ulcers, Scabs or Pustules spread over the Body, Ointments are most proper. Lastly, Fumigations are usefully mixed with Unctions, or with the Panacea, when there are Ulcers, Venereal or Condylomata in the Pudenda or Anus.

THE METHOD OF SALIVATING BY THE PANACEA.

The Patient is first to be let Blood once or twice, according to his Strength and the Fulness of his Vessels. The Day after the last Bleeding he ought to take a purging Potion, and at a proper Distance of Time, as two Hours or more, four Grains of Tartar Emetic, dissolved in weak Broth. The next Day he should go into a warm Bath, and repeat Bathing once or twice a Day for six or seven times.

By these Preparations the *Primæ Viæ* are cleared of their gross Contents, the Vessels are relaxed, the Blood circulates more clearly, the Juices become more fluid, and the solid Fibres softer, or less rigid. We ought, however, to take Care not to weaken the Patient too much, by Bleeding or Bathing, lest he be unable to bear a due Salivation; neither are Cathartics to be repeated, because they retard the Spitting: For though Venereal Diseases may be cured by Purging, yet Salivation is much more safe.

The Patient's Body being thus prepared, the next Day after his last Bathing, he ought to take ten Grains of Panacea in the Morning, and five in the Evening; the second Day fifteen Grains in the Morning, and eight in the Evening; the third Day twenty Grains in the Morning, and ten in the Evening; the fourth Day twenty-five Grains in the Morning, and fifteen in the Evening; and thus the Dose may be increased every Day from five to ten Grains, till the Quantity spit in twenty-four Hours amounts to three or four Pints; or the Evacuations by Stool are proportionable to that Quantity. No more Panacea is from thence to be given, except the Evacuations begin to lessen before all the venereal Symptoms disappear. In that Case, Recourse must again be had to the Panacea, beginning with the same Dose which the Patient took last, and continuing it till we are assured of a perfect Cure. If, after the Panacea is left off, the Salivation should increase, a Cathartic ought immediately to be thrown in, and frequently repeated at small Intervals. If, during the Salivation, a Looseness should happen with violent Gripings, and a Dysentery be apprehended, detergent, lenient, and strengthening Clysters are to be exhibited. During the whole time of the Cure, the Patient's Nourishment ought to consist of Broths, Eggs, Panada, and other Spoon-meats, but of nothing solid.

The Panacea ought to be given in some proper Conserve, drinking a Draught of Broth after each Dose; and for three or four Hours afterwards no kind of Nourishment should be given. When the Effects of the Panacea are quite over, the Patient ought to be purged two or three times, and then use a Milk Diet for a considerable time.

Nothing can be with Certainty fixed concerning the Quantity to be evacuated in a Salivation: For after the most copious Evacuations, some Patients have remained uncured; whereas others have been perfectly restored after a very slight Course. This, therefore, must be left to the Judgment of the Physician; as also, whether the Patient has Strength to go through a Salivation, when the venereal Disease is complicated with others. Thus, in a Constitution inclining to a hectic Fever, where the Blood being already too much dissolved, passes out of the Body in profuse Sweats, the Mercury, by dissolving it still more, would undoubtedly evacuate it by all the Emunctories of the Body, and Life along with it. In scorbutic Affections, though the Juices are said to be viscid and concreted, yet the Use of Quicksilver has often been fatal; because, as in these Diseases, the Salts in the Fluids are in greater Quantity and more caustic, than in those of the venereal Kind, yet their Force and Energy is much weaken'd by the Lensor of the Fluids; but, if by the Use of Quicksilver this Lensor is taken off, and the Juices made more fluid, the saline Spicula then prove greatly detrimental to the tender Membranes, by pricking and tearing them to Pieces; whence follow those intolerable Pains, Hæmorrhages, Inflammations and Exulcerations, which arise from taking Mercury.

Quicksilver is said to be a great Enemy to the Nerves, being thought to bring on Weakness, Tremblings, and Palsies; but these Symptoms are not to be attributed to Quicksilver, so much as to the injudicious Use of it: For by giving it in very small Doses, the coagulated Humours are unequally dissolved, so that the concreted Portions which still remain, being hurried along by the more fluid Parts, enter the smallest Canals of the Body, and there stick and form Obstructions; which gradually increasing, both in Strength and Number, the Tone of the solid Parts is weakened and destroyed.

It has been often asked, on what the salivating and anti-venereal Virtue of Quicksilver depends. To explain this, some have, without Ground, had Recourse to Acids and Alkalies: But in the Cure of Venereal Diseases, this Medicine

acts neither as an Acid, nor as an Alkali, since it produces the same Effects, whether it be mixed with acid Salts, or be conveyed into the Blood perfectly crude and unmixed, as by Friction and Fumigation. Neither is their Opinion probable, who say that the venereal Poison is an Acid, since the Saliva of those affected with this Disease discovers no Signs of Acidity; but on the contrary, shews itself to be of an alkaline Nature, by turning Syrup of Violets green, raising an Effervescence with acid Liquors, and by corroding Copper. We are not, therefore, to imagine, that Quicksilver acts like an Absorbent or Alkali, by sheathing the acid Parts of the Poison, for other Absorbents would better answer that Intention. It is more probable, that all the Virtues and Energy of Quick-silver depend on two Qualities, its great Divisibility, and the spherical Figure of its Particles; by which it is enabled to penetrate the most inward Recesses of the Body, insinuate itself between all Parts of the Blood and Serum, and divide all Concretions found therein; not only by preventing their mutual Contact, but by increasing their Fluidity; a small solid Sphere being interposed between each two larger Molecules of the Juices. Again, as these Molecules stagnate at the Orifices of the very small Vessels, with the Globules of Mercury between them, they are fully exposed to the Force of the Solids, and of the circulating Fluids, and thereby divided and broke to Pieces, so as to be capable of passing through the smallest Canals of the Body.

Now, when we consider those Emunctories of the Body, which are capable of transmitting a thick viscid Lymph, we find them all reducible to the intestinal and salival Glands; for those of the Kidneys and Skin give Passage only to the finer Parts of the Lymph, because of the Smallness of the Vessels of which they are composed. And, hence it is, that sudorific Medicines have not a sufficient Effect in venereal Complaints, because they drive through the Pores of the Skin only the thinner Parts, leaving the more thick and viscid behind, which they cannot dissolve; but the salival and intestinal Glands are capable of secreting these more concreted Parts. Therefore, on taking Mercury, both or either of these Emunctories transmit this viscid Lymph, according as it is found in the Body in greater or smaller Quantities. This Excretion is made most commonly and most copiously by the salival Glands, because they are the most exquisitely sensible. But when the Lymph to be evacuated is very acrid, and capable of irritating and stimulating even the intestinal Glands to a sufficient Degree, it passes off, also, by these; so that the Determination of this Lymph to both, or to either of these Emunctories, depends on its Acrimony; and for this Reason it is, that when the Irritation of the intestinal Glands is very much increased by a Cathartic Medicine, the Excretion is principally made that Way, and the Salivation decreases, or may be totally stopped. *Geoffroy.*

There are many ways of raising a Salivation, and all by Mercurial Preparations. The Preparations which I have used myself, says *Turner*, as the safest and most commodious, are Calomel and *Mercurius Dulcis* six times sublimed, given inwardly, in the milder Pox; or the same being faster radiated, and got into the Bones, the crude Mercury externally, in the way of Unction.

The *Mercurius Vita*, *Arcanum Corallinum* with the red, yellow and green Precipitates (however in Use with some) I think too churlish, and scarce safe for tender Constitutions; nor indeed can I see any Reason for their Use, whilst we have better and less hazardous Medicines to supply their Room.

In salivating by the internal Method, to an adult Person, of a tolerably good Habit, as to his Strength, and who has not been much used to the Medicine, I generally give fifteen Grains of Calomel with a little Conserve of Roses in the Morning, and the like Dose in as much of Diacordium without Honey, at Night, which I prefer to the larger given once, or, as customarily, twice a Day; because it is now less liable to run suddenly through them, or too hastily sub-lime, and endanger them that way, by the Inflammation. Besides, in this gradual way of proceeding, it comes on more certainly, easily, and also more securely to the Patient; the Effect of each Dose affording Opportunity of foreseeing readily, what more be requisite, and when you must intermit, if not entirely forbear its farther Exhibition. I know a Physical Writer hath lately acquainted us, that we are each time to double the Dose of Calomel; as for the first, fifteen Grains, for the second half a Dram, for the third a Dram, and so till the Spitting comes on; but I would advise, that no Person take this Author for his Guide in this Affair, lest inadvertently he destroy his Patient, together with his own Reputation.

After three, four, or five Days of this Management, we usually observe the Fauces to enflame, the Inside of the Cheeks to become tumid, or high and thick, being ready to fall in betwixt the Teeth, upon shutting of the Mouth; the

Tongue looks white and foul, the Gums also stand out, the Breath stinks, (which is a favourable Omen of its coming on) and in general, the whole Inside of the Mouth appears shining, seems as it were parboiled, lying in Furrows, as it appears, after strong Spirits have been retained in the Mouth. They now begin to refuse their Nourishment, while the Tongue, Gums and Cheeks are swelled, and so fore that they cannot chew, especially solid Food, but must be now content with Liquids and the softer Aliments. Besides, they are often sick at the Stomach, and frequently puke, or bulk up a thin Phlegm, another promising Forerunner of a good Salivation, when the Pukes are moderate and easy, and come by Intervals. But if attended with *Cardialgia*, or violent Pains and Torture at the Stomach, perpetual and incessant Reachings, Fainting and cold Sweats, nothing is more dangerous.

The Inside of the Mouth beginning to appear thus whealed, you may expect soon after to find it ulcerated, especially about the salival Glands; and then it may be proper to desist for a Day or two, if not give over, that you may the better observe the Increase of the Ulcers, what Sloughs are likely to be raised, and of what Depth and Dimension they are like to prove; from which a near Conjecture may be made, of the Duration as well as Quantity of the Spitting, now begun; the Consistence of the effluent Lymph, being at the same time considered.

When the Salivation is thus raised, the Patient ought to be encouraged to proceed cheerfully; and to be sometimes refreshed with a little mulled Wine, of what Sort he likes best; but Red is preferable, if there be any Tendency to a Diarrhæa, adding a third, and sometimes one half of Water. Let his Diet be a small Chicken Broth, Water-Gruel and Panada; his Drink a small Sack-Whey, or Posset-Drink, with a Draught of good Small Beer and a Toast between whiles: But in Gripes or a Looseness, the white Drink, prepared of calcined Hartshorn, or Rice-Water; also the Decoction of the Shavings of Hartshorn and Ivory, boiled with a Crust of Bread, and sweetened to the Patient's Taste, are to take Place of the rest.

Thus having given him some few Days Respite, if after the coming on of the Ptialism, you find him hearty, and his Chops but moderately swelled on the Outside, and not very fore within, the Ulcers not increasing, and few or no Sloughs appearing, the Flux also inconsiderable in Quantity, you may now again give him a Scruple of Calomel in Diacordium, as he goes to Rest, repeating the same for two or three Days following, as you find Occasion.

When in this Way he has taken about half an Ounce of Calomel (tho' there is seldom Occasion to go so high) with but little Alteration as to the Swelling or Soreness of his Mouth, and as little Appearance of the Ptialism; his Pulse and other Circumstances, with respect to any ill Symptom attending, favouring the same, he may be vomited with eight, nine, or ten Grains of the Turpeth Mineral by itself, only made into a Bolus with Conserve of Roses, or farther mixed up with half a Scruple, or fifteen Grains of the Calomel, encouraging the Operation with small Draughts of common Posset-Drink between whiles, upon each Motion to reach; but without loading his Stomach, as is customary in other Emeticks, lest happening to run downwards, it invert the Order or Course of its intended Operation. The same Vomit, if found requisite, may be repeated two or three Days after, which at these Times often answers our End, by raising the Humours towards the Jaws, and forwarding the Salivation much more effectually, than more Doses of the Calomel, simply repeated, would have done; and if, after this, it should so happen, as in spite of all Endeavours to the contrary, it sometimes will, whether from some singular Idiosyncrasy, the Tenacity of the Lymph, or some Defect in the glandular Secretion, that the Spitting will not rise to any Quantity, notwithstanding the Tumefaction, Inflammation, Stench and Putrefaction, and sometimes Ulceration also in the Patient's Mouth, you must forbear and purge it off. The Relief of the Patient must now be attempted some other Way, as by giving Calomel once or twice a Week, and purging it off again next Day, or two Days after; and on the intervening Days, direct some other antivenereal Specific, such as the alterative Pill of Gum Guaiacum, diaphoretic Antimony, and the *Æthiops Mineral*, with a good strong Decoction of the Woods, well chosen and energetic, suiting also with the Temperament of the Patient; as, if cold and phlegmatic, the Scobs of Guaiacum; if hot and dry the Sarsaparilla and China Roots; which, however slighted by some as insignificant, yet observed with a strict Discipline, as to the other Non-naturals, have certainly very great Advantages attending them, as well perspiring the noxious Particles, and drying up the superfluous Serum by the one, as counterpoising the acrid and four Juices by the other. By this Method, duly profecuted, tho' it may be somewhat longer, the Purpose may be at length effected, which by the former

former was not to be obtained. Some have remarked, that those Persons who are purged with great Difficulty, are with great Difficulty salivated; which may arise from the same Cause, the Toughness of the Humours, and slower Secretion. Altho' in the Evacuation downwards, we often find thin, choleric, and dry Bodies, are more easily moved by Lenients, as common Oil, Manna, lenitive Electuary, Cassia, Diaprunum, even a Bit of fresh Butter, or fat Broth, than by stronger Purgatives of Scammony, Colocynth, and the like.

When the Ptyalism proceeds successfully, it may be left to take its Course, till it declines spontaneously, which, in Proportion to the Ulcers or Thickness of the Sloughs about the Parts of the Mouth, may happen at the Expiration of one and twenty Days, or sometimes a Month from the Time of its first Rising, which is usually long enough to subdue this Disease, after it is confirmed. I said, from the Time of its rising, or spitting perhaps a Pint and a half a Day, till it comes to three, four, or five Pints, in twenty four Hours, and so gradually goes off again; for often the first four or five Days, and sometimes a whole Week, is spent in bringing it to the first Proportion.

Besides, this Way of salivating by the Calomel, in the more stubborn and rebellious Pox, attended not only with cruel nocturnal Pains, Gummata, Tophi and Nodes, but also rotten or foul Bones; where the Patient has been long used to the taking of Calomel, or a like mercurial Preparation internally, and has perhaps been often salivated by such Preparations to no Purpose, it is better to attempt the Cure by salivating with the Unction, in which little Regard is to be had as to the Choice of the Ointment with which the Quicksilver is to be incorporated, since the Stress is entirely laid on the Quicksilver. In this Method, as well as in the other by Calomel, Care must be taken not to proceed too hastily.

If you have one Ounce of the Quicksilver to three Ounces of *Axungia* (which is the Proportion I have usually observed) about an eighth Part may be used Night and Morning; letting the Patient rub it gently with his own Hands, into his Limbs before the Fire, beginning from his Ancles up his Shins to his Knees, all round his Joints; and so to his Thighs, which are presently after to be covered close up with his Yarn Stockings and Flannel Drawers; then let him use the Remainder of this eighth Part about his Elbows, and so to his Shoulders, wiping his Fingers and Hands clean about the Glands of his Armpits, or those of his Groin: His Body being all the while defended from the cold Air, by a Screen or Blanket hung behind him, and after wrapt up warm in his Flannels, as he must also be in the other Method of salivating, such I mean as a Flannel Shirt or Shift, Waste-coat and Drawers, a Cap and Muffler pinning up thereto behind, and covering well his Throat, Chin, and Cheeks before, to keep these Parts from the cold Air, which above all is highly necessary.

Some also anoint the Trunk, especially the Spine; but I always found the Pores of the other Parts sufficient to let the Globules of the Mercury into the Blood; and it is not material by what particular Pores it had first its Admittance.

For those who are very weak, once a Day may suffice; but the robust and strong may be anointed twice, or, which is as well, and will save Trouble, divide the Unction into four Parts, and consume one Part about him every Night, after which let him enter into a warm Bed, with Flannel Sheets or Blankets, disposing him to a gentle breathing Sweat, with a Draught of warm Posset-drink, Mace-ale, or, if very feeble, a Cup of his mull'd Wine; by which the Pores being opened, the mercurial Particles may have the freer Entrance.

It is usual to increase the Mercury and Ointment to four Times the Quantity which we have directed. Thus *Harvey* prescribes one Pound of *Axungia* to be mixed with three Ounces, and sometimes six Ounces of Quicksilver, adding also a little white Ellebore and crude Antimony in fine Powder, pretending thereby, to forward the Salivation, and increase the Force of Medicine in mastering any Malignity. *Mr. Wiseman's* Composition was also six Ounces of Mercury to one Pound of the other Materials, of which he used one Ounce, or two Ounces at a Time, once or twice a Day, for four, six, or eight Times, according to the Patient's Strength, and the Ease or Difficulty of raising the Flux. *Hildanus* directs six Ounces of Mercury to twenty Ounces of *Axungia*, and the other Ingredients. But I can see no Reason for using so much *Axungia*, provided a Half, or a fourth Part of it be sufficient to convey the Quicksilver into the Blood; nor to what End any other Ingredients should be added to the *Axungia*, unless the Turpentine, being, as I conceive, more like to hinder, especially the Species or Powders, by stopping up the Pores, than to forward the Operation. But leaving every one to follow the Proportion he likes best, in relation to my own, I must farther observe, that if after the third Unction, supposing the whole divided into four Parts, the Patient begins

to complain of his Chops, or that the Inside thereof appears ulcerated, you must stay a Day or two to see the Effect of what is already done, before you proceed farther. The like must be observed when Gripes, or bloody Stools approach. But if the Spitting comes not on, and no supervenient Symptom contra-indicates, you may expend the remaining fourth Part in like Manner; and perhaps in some Bodies, there may be Occasion for a Half, or full as much more. However, it will always be found safest to proceed leisurely, when you have gone thus far, and sometimes to wait a Day, two, or three, before you continue the Unctions; since altho' at first it may seem as if the Medicine had taken no Effect, you may soon after find it sufficient. For, tho' a Day or two after the fourth Unction, the Flux may be longer than usual in coming forwards, and the Excoriations about the Chops or Inside of the Mouth appear inconsiderable; yet in a Day or two more they may be seen to spread and increase to a copious Spitting, beyond what was expected. But when after rubbing in an Ounce, or an Ounce and a Half of the Mercurial Ointment, the Salivation appears not, it may also be necessary here to administer a Dose or two of the Turpeth Mineral, at a Day or two Days Distance; and where there are Gummata, Tophi and Nodes, you are in the Unction more especially to rub the Ointment well into these Parts, laying over them afterwards the *Emplastrum de Ranis*, with a double Quantity of Mercury. This will both help the Resolution of them, and encourage or keep up the Ptyalism, which being arrived to the Quantity of four, five, or six Pints, in a Day and Night, is accounted a sufficient Discharge. Yet this is no absolute Rule to go by, or upon which we can safely pronounce the Patient whole and sound, any more than the Quantity of the Medicine to be used, can be limited to any one certain, or constant Proportion. Since we have known some who have spit more, yet miss their Cure; whilst others who have come very short of such a Quantity, have notwithstanding obtained theirs. However, during the Salivation this Way raised, upon its too sudden Declension (tho' it commonly happens that the Sloughs being deeper, and their Mouths forer, they usually spit longer than by proceeding internally with the Calomel) it is often expedient to give a Scruple of the same, every Day, or every other Day, for two or three Times, as there may be Occasion; and toward the Conclusion, you are to purge your Patient with two or three Ounces of the common Infusion of Senna, and one Ounce of the Syrup of Buckthorn, or for those that are very weak, an Infusion of sliced Rhubarb, Senna Leaves and Tamarinds, with Salt of Tartar, adding to the strain'd Liquor one Ounce of the best Manna, or solutive Syrup of Roses, which may be repeated once or twice a Week for two or three Times; and when he is a little easy, his Chops growing pretty well, he may be permitted to eat a little Meat, as the Flesh of a Chicken or Rabbit, also Veal or Mutton, but well roasted, without Sauce or Gravy. About this Time also, it is usual to sweat them, at least before they go abroad, in their Bed, or Stove, or under the Cradle, with Spirit of Wine burning just by, to be continued as their Strength will bear, for an Hour or two, and to be repeated at two or three Days Distance, if there be Occasion, observing that the utmost Care be now taken, that your Patient be not injured by the cold Air, and that he gradually cool himself, by lessening or withdrawing the Heat or Bed Cloths he lies under, lest getting Cold, he make some fresh Complaint of Pains, which, tho' arising from this new Occasion, he may impute to the old one, and think the worse of his Cure for some Time.

During his Sweat, let him rub his Body thoroughly with warm Napkins, conveyed to him in the Bed; and when faint, let his Spirits be kept up with three or four Spoonfuls of some proper cordial Julap, or a Draught of his burnt Wine.

In order to promote this Diaphoresis, he may take a little *Venice Treacle*, with a Scruple of the Cinnabar of Antimony, or half a Scruple of Bezoar Mineral, upon which let him drink a Draught of his Diet-drink, made as hot as he can bear it. This Drink he ought to be strictly confined to, for three Weeks or a Month after he comes out of the Salivation, that having by this Evacuation secured his Body from any Relicks of the Disease, or its Remedy, the redundant Serosity remaining after the Colliquation may be dried up, before the Blood is supplied with fresh nutritious Juices. By the Neglect of this Circumstance, and by running over hastily to their wonted Liberty and Custom of Living, they too suddenly fill their Blood with a Load of improper and unsuitable Juice, at this Time in a weak infirm State, and despising their Purgings, Sweating, or Diet, as needless Pieces of Formality, or an useless Penance, too often incur the Misfortune of an unhappy Relapse.

Dr. Sydenham indeed tells us, that the Salivation must take its Course, by which the Mercury, together with the pocky Venom, sufficiently spend themselves needing no other Help

or Way of Evacuation. But certainly, as I have sometimes found, 'tis ill trusting hereunto; for the Sluices being set open, so great a Colliquation, both of nutritive, as well as excrementitious Juices, has then happened, that if the Current were not otherwise to be diverted, and the Tone of the Blood after invigorated, some Patients would be in Danger of losing their Lives by the Pyralism, or at least of falling into a Consumption; others from the impoverished and languid State of the Blood, are subject to incurable Dropsies; which has been the Fate of some, even where Endeavours have not been wanting to turn the Stream.

Yet I think this Author was not mistaken in his Opinion of the Pre-requisites of a Salivation, proposed as necessary by some; such as purging the Patient plentifully; which he has justly censured, as only needlessly harrassing the Body, impairing the Strength, and weakening the Spirits, of all which the Patient is now suddenly more than ever to stand in need, by reason of the Conflict which will be unavoidably excited by the Mercurial Particles in the Blood. However, a lenient Purgative two or three Days before, and the taking a little Blood, from those especially of a plethoric Habit, as also a more than ordinary Abstinence for such Space of Time, may be necessary to keep under a Fever, Dysentery, and Inflammation of the Parts; as also to moderate some other Symptoms which might create Trouble, when these Remedies are not so fit to be put in Practice. Bathing also in warm Water, for some lean, hot, and emaciated Patients, has been found serviceable. If the Case admits of Delay, the best Time for salivating is the more temperate Season, about the End of the Spring or the Beginning of Autumn; otherwise it may be enterprized at any other time, only taking Care to provide a good close Room with a Fire suitable, in the Winter or extreme cold Weather; and one more large and airy in the exceeding Heat of Summer. Let the Women, also, be laid down, just after the menstrual Purgation is over.

One thing of no small Moment in this Affair is, the Choice of a Nurse, who (if possible) should be a Person thoroughly acquainted with the Business, knowing how to succour them under their several Difficulties, taking care not only of their Mouths, by syringing where it is wanting, but of their Bowels, by Clysters, when they are called for to appease their Gripes, and remove the Tenesmus.

The first Accident which usually attends a Patient under a Salivation, is a *Diarrhœa* at the Beginning; and if not timely prevented; sometimes soon terminating in a Dysentery, accompanied with bloody Stools, and horrid Torture of the Bowels; which Accident may be removed in the following Manner.

Take of Diafcordium, and Conserve of red Roses, each half an Ounce; Red Coral, finely triturated, and Japan, Earth, and true Bole, pulverated, each a Dram; Diafcordium, enough to make them into an Electuary: Of which take about the Size of a Chestnut every fourth Hour, or oftner, during the Continuance of the Flux, drinking after three or four Spoonfuls, of the following Julap.

Take of Barley-Cinnamon Water six Ounces; Mint-Water, and Aqua Mirabilis, each two Ounces; Syrup of Quinces, one Ounce; mix them for a Julap.

Let his Drink be prepared of the Decoction of burnt Harts-Horn, coloured with a little Cochineal; and, when the Pains are very urgent, attended also with a Tenesmus, or perpetual Desire of going to Stool, discharging only a bloody Mucus, in the Intervals betwixt them, exhibit the following Clyster:

Take of the Decoction of burnt Harts-Horn, half a Pound; Diafcordium, or Venice Treacle, half an Ounce; dissolve them in the White of an Egg, with two Ounces of Canary Wine. To be repeated as Occasion may require.

Which will, as a Fomentation, not only comfort the Intestines, and alleviate the griping Pain, but also, by its absorbent Quality, correct the sharp Humour, and thereby abate the Stimulus. But if, notwithstanding this Remedy, the Looseness still continues, prescribe thus:

Take of Diafcordium without Honey, and Conserve of red Roses, each half an Ounce; the Barks of yellow Myrobalans, and the Cinnamonum Acutum, a little bruised, each a Dram; Barley-Cinnamon Water, half a Pound: Infuse them warm for an Hour, then strain it; and add, of Mint-Water, an Ounce; Dr. Stephens's Water, two Ounces. Mix them, and (first

shaking the Bottle) take two or three Spoonfuls after every Stool.

Let him, also, at some times drink four or five Spoonfuls of Red Wine or Claret, boiled up with a third of Water and a little Spice, sweetened with double-refined Sugar; which will serve as well as any Cordial, and into which, under great Extremity of Pain, may be infilled twelve, fifteen or twenty Drops of the cydoniated Liquid Laudanum, especially at the Hour of Rest. Now although it must be allowed, that at these times there is nothing to be done without the Help of Opiates, yet the less Occasion we have for them the better; because by retarding or slackening the Motion of all the Fluids in general, together with the glandular Secretion, they are subject, also, to thicken the Lymph itself, which should be discharged by the Glandules of the Fauces. Wherefore, so soon as ever this Accident is overcome, you must lay them aside, forbidding Poffet-Drink, Water-Gruel, Sack-Whey, but especially Malt Liqueurs, for some time; instead of which, as before advised, let him be kept strictly to the Decoction of burnt Harts-Horn, or Rice-Water. Let his Chicken be, also, boiled with a Crust of Bread, a little Rice, or a few Shavings of Harts-Horn. All which are gradually to be left off, and changed again for the more diluting Drinks, when the Diarrhœa is checked, and the Salivation comes forward; which is scarce to be expected so long as the Looseness continues, by which the Humours are carried downwards, the direct contrary way that they ought now to take.

In giving Opiates, the Consequence of one Dose is always to be observed, before another be ordered; which must be at about two Hours Distance, if there should be Occasion for a Repetition; the Quantity being increased according to the Age, Sex, Habit, and Strength of the Patient.

The next Accident we shall take notice of in raising a Mercurial Salivation, is the Sickness and Vomiting; which, if mild and gentle, may be let alone, only ordering the Patient to drink freely of a small Chicken-Broth, Poffet-Drink, or thin Water-Gruel, that his Retching may be the easier; and giving a Sup of mulled Wine with a Sprig of Mint, a little Lemon-Peel, a Blade of Mace, or a bruised Clove infused in it, to comfort the Stomach, and refresh him between whiles; by which this Complaint (the Salivation soon after rising) goes off in few Days, without farther Trouble. But if Cardialgia, or racking and intolerable Pains about the Mouth of the Stomach appear, with incessant or perpetual Vomiting, Spasms of the Members, continual Sickness without Respite, Leipothymia or Fainting, with cold Sweats upon the Forehead and Eyebrows, the Patient is in the utmost Danger; and Mercury must not only be desisted from, but the Course of what has been given must be turned downwards, especially if costive, by directing the common emollient Clyster, with two or three Ounces of the coarse Sugar, and as much of Olive Oil; adding, if there be Occasion, as a Stimulus, a Dram or two of the *Species Hiera*, and as much Sal-Gem; while, in the mean time, you are using all Endeavours to take off the Orgasm in the Spirits, to compose the enraged Stomach, with some proper Cordial Julap, or the burnt Wine; with which, if his Pulse allow, you may mix an Opiate, in such Quantity as the Importance of the Complaint, and the Strength of the Patient shall indicate. A little mulled Sack, with Spice and a few Drops of Liquid Laudanum, after his Bowels are emptied by the Clyster, will sometimes answer: Or you may direct the following Mixture.

Take of the Water of black Cherries, and Barley-Cinnamon Water, each two Ounces; Spirit of Mint, one Ounce; prepared Crabs Eyes, and red Coral finely levigated, each half a Dram; Salt of Wormwood, one Dram; Syrup of Lemons or Quinces, an Ounce; London Laudanum, carefully dissolved, and mixed with the rest, two Grains. Mix them, and (after shaking the Bottle) give two Spoonfuls, every two Hours, sooner or later, as the Exigency may require, during the Vomiting and Pain of the Stomach.

Three or four Spoonfuls of simple Mint Water, well freed from the Empyreumatic Oil that comes over in the Distillation, and swims on the Top, supped hot as Tea is drunk, is, also, proper to alleviate this Illness; likewise Epithems of Decoctions of the Tops of *Roman* Wormwood, with some of the Aromatics, as the Roots of Galangals and Zedoary, the Calamus Aromaticus, Cloves, Nutmegs and Mace, in red Wine, are not improper. Flannel Cloths should be expressed from the same Decoction made hot, and applied to the Pit of the Stomach; after which the whole Region of the Stomach may be anointed with the expressed Oils of Mace and Nutmegs.

Nutmegs, adding a few Drops of the distilled Oil of Worm-wood, and afterwards applying the great Stomachic Plaster.

For this Purpose I have likewise successfully prescribed the following.

Take of Hungary Water, and Liquid Laudanum, each one Ounce; dissolved Camphire, half a Dram; mix them for an Epithem; in which, when warmed, soak a piece of soft woollen Cloth, folded to the Breadth of four Fingers square; which, being strongly wrung, apply to the Pit of the Stomach, to be renewed when dry, or as Circumstances may require.

But this Symptom is often too powerful for these or any other Remedies, and frequently carries off the Patient in a few Hours; usually proceeding from the Ignorance of the Undertaker in hurrying on the Flux, giving disproportionate Doses of the Medicine, repeating them too fast, or continuing them longer than was proper; by which means the Patient is hurried to the Grave.

A third Complaint very usual at these Times (and which is always to be expected) is the soreness of the Chaps. For easing which, at least in some Measure, let the Patient hold in his Mouth, sometimes a little Barley Water, or Chicken Broth, made lukewarm; also now and then a little warm Milk, which is proper to lenify or assuage the Pain. But let them by no means use any restraining Mouth-waters or Gargarisms of Alum, Sage, Plantain, Bramble or the like; nor the digestive ones of fat Figs, the Roots of Marsh-mallows and Liquorice, Raisins, &c. lest by the one, you harden and dry the Ulcers, and stop the Current of the Rheum; by the other you too soon digest, and hasten off the Sloughs before their Time, and healing the Sores too soon, shorten the time of the Ptyalism. However when the mercurial Salts with those of the acrid Lymph, have eaten deep into the Parts, by which the Putrefaction spreading there may be danger, by the Loss of Substance, of a foul Jaw Bone, at such Times the Surgeon must be careful to check the farther Erosion, and promote the Digestion of the Ulcer; consuming the rotten Flesh, by touching the Parts with fifteen or twenty Drops of the Spirit of Vitriol, mixed with an Ounce of the Honey of Roses. Let him also take a Gargarism of the Decoction of Barley, with the Leaves of Plantain, Horse-tail and Strawberries, with which may be mixed a small Quantity of the Tincture of Myrrh and Aloes, with Honey of Roses. If the Putrefaction still increase, let the Parts be touched two or three times a day, with an armed Probe dipped in the following Mixture made hot.

Take of Honey of Roses, one Ounce; Tincture of Myrrh, extracted with White Wine, two Drams; or rectified Spirit of Wine, one Dram; of the Flos Unguenti Ægyptiaci, one Dram; mix them for Use.

It also frequently happens that the Jaws are so locked up, that the Patient cannot without Difficulty receive his Sustenance, nor the Surgeon inspect the Ulcers; for obviating which Inconveniences I have been under a Necessity of thrusting a bit of Stick, covered with a soft Rag, in at the Corner of the Mouth, between the backward Teeth. But if notwithstanding, any Adhesion happen of the Inside of the Cheek to the Gum, occasioning a Stricture, and hindering the Patient in the free opening of his Mouth, or in the Performance of Mastication, such a Stricture is carefully to be divided.

It is not unusual in raising a Salivation or during the Course of it, especially where there are some rotten Teeth, for a Blood-Vessel or some small Artery to burst open, by reason of the stronger Pulsation than ordinary at such times, the Circulation being somewhat impeded by the Fluxion of Humor and Tumefaction of the Parts, and consequently the Vibration of the Coats of the Artery stronger than at another Time; or this Misfortune may proceed from the Erosion of the Coats of the Vessel by the caustic Salts; whence great Hæmorrhages have ensued. At these times a little Peller of Lint covered over with the fine Powder of Crude Alum, or of Vitriol, or dipped in and expressed from the Aqua Styptica Regalis, and thrust close down into the Cavity, stops the Effusion, being held tight with the Finger for a little while; or if the Situation will admit, a Compress dipt in Oxycrate with the White of an Egg, and the Jaws close shut may be sufficient. *Wiseman* recommends an Egg boiled hard, and held between the Teeth, provided the bleeding Vessel can be compressed by it. I once met with a Flux of this Nature so very impetuous, that I found it the safest way to clap a red hot Steel Probe into the Socket of a rotten Tooth which had been some time before extracted, whence the Blood spurted out, and thus searing the Vessel restrained the Flux. The like Accident sometimes happens at the Separation of the Sloughs on the Sides of the

Cheeks; but here a little Oxycrate held in the Mouth will be sufficient; or where the Bleeding is inconsiderable, it may be suffered to run off with the Lymph, which is only streaked or discoloured with it, perhaps three or four Days, without any other Detriment. If it should last longer, discharging in any considerable Quantity, to the weakening of the Patient, some restraining Liquor, such as the Decoction of Oak-bark, or a strong Infusion of the Leaves of red Roses, unripe Galls, Pomgranate Bark, and Balaustine Flowers in Forge Water, acidulated with Spirit of Vitriol, or the like, may be held in the Mouth and spit out again as often as there is Occasion.

We have already taken Notice of the Diarrhæa, and directed how it may be repressed; but if upon renewing the mercurial Medicine either inwardly or outwardly, notwithstanding all Endeavours, because of some Idiosyncrasy, in the Patient, it will fly to the intestinal Glands, the Discharge may be permitted to proceed that way, if the Strength of the Patient permits, and the Symptoms are not too pressing, and by this way have I known the venereal Venom entirely removed; only taking Care to sheath the Intestines, which are deprived of the Mucus, by frequently injecting as a Clyster some good Flesh Broth, or the Broth of a Sheep's Head, or of the Entrails of a Capon, in which dissolve the Whites of new laid Eggs. These not sufficing you must proceed to greater Anodynes, and even to Opiates themselves. The contrary to this Accident is an over Costiveness, which seldom happens, so as to hinder the Salivation in comparison of the Looseness and Bloody Flux. If the Body be hot and dry, and the Patient spits but little, although his Chaps be much inflamed and sore, if he has been without a Stool for some Days past, it may be proper to throw up a laxative or emollient Clyster, such as warm Milk, with Sugar and Oil; or if the intestinal Fibres are very sluggish, a little common Salt may be put in; also a Suppository of the Species of Hiera Picra, Sal Gem, and Honey, boiled and made up in a proper Size; which emptying his Bowels, and cooling his Body, may probably dispose him to a freer spitting. Now also a greater Liberty may be granted him in his Liquors, of which, for the better diluting of his Blood, let him drink freely; as of Small Beer warmed with a Toast, Barley-water, a small Sack-whey or Posset Drink; also by way of Diet, Water-gruel, Oatmeal Caudle, small Chicken or Veal Broth, sometimes allowing him a roasted Pippin, if his Mouth will suffer it, or a few stew'd Prunes, with such other opening, cooling and diluting Liquids, as are forbidden those who are subject to the Diarrhæa.

There are two other supervenient Accidents which sometimes perplex a mercurial Ptyalism, and endanger the Patient's Life, I mean the too sudden Rise of the Salivation, as it were all at once, by which he may be choaked or strangled; and its Continuance, after the Time of its expected Declension, by which the nutritious Juices being thus constantly drained away, an Atrophy or Consumption must necessarily ensue.

The best Way to prevent the former is to begin with the lesser Doses, and when you find the Humors tending upwards, to proceed warily, intermitting the Repetition of the Medicine a Day, two, or three as there may seem Cause. But if by any unforeseen Accident the Fauces should suddenly inflame and tumefy, the Patient is brought into apparent Danger, and Derivation and Revulsion must be immediately attempted; as of sharp Clysters prepared of the common Decoction for Clysters, in which are to be dissolved Confectio Hamech, Species Hiera Picra, Sal Gem, or a small Quantity of the Pulp of Coloquintida tied up in a Rag may be boiled with the other Ingredients. Also some cathartic Medicine may be taken by the Mouth when it can be swallowed. Bleeding under the Tongue, in the Arms, and Cupping with Scarification on the top of the Shoulders, sharp and large Blisters between the Shoulders and behind the Ears, extending along the Jugulars on each Side of the Neck, may be very beneficial; at the same time some moderate attenuating Injection may be thrown into the Throat with a Syringe, to clear it from any viscous Phlegm, such as the Decoction for the Syrup of Marsh-mallows, with the Syrup of the five Roots, and Lemon Juice; or the Pectoral Decoction, a little sharpened with dulcified Spirit of Nitre, Spirit of Sulphur or Vitriol, adding Syrup of Mulberries, Honey of Roses, and Syrup of Brambles, or the like, taking Care not to use repercutient or restraining Gargarisms, which increasating and locking up the Humors in the Glands, would farther hazard a Suffocation. If the Humors are viscous, besides the above Injection, the Patient may drink warm Draughts of the same Decoctions, and where his Lungs are more than ordinarily stuffed with a tough and viscid Phlegm, as is usual in some cold, bulky and asthmatic Persons, he may take a Spoonful of fresh Linseed Oil drawn without Fire; if his Stomach can bear it, with a like Proportion of simple Oxymel; or Oxymel of Squills may be taken between whites in a Draught

of the pectoral Decoction; which is an excellent Promoter of Expectoration.

Purging Clysters and Cathartics are, also, to be repeated at proper Intervals, when the Spitting holds longer than it should; by which the Patient's Strength is daily impaired, and a hec-tical Indisposition contracted. But here the sharper Purga-tives are not so proper, the Humours being more gently car-ried off downwards, or moved that Way at repeated Di-ffances. Diuretics are here, also, requisite, to divert the se-rous Humours by the Glands of the Kidneys, from those of the Mouth: For this Effect the Salt of Tartar is excellent; after which, in order to fix the Mercurial Particles, and re-strain the farther Colliquation, Sulphur is esteemed one of the best Remedies. Wherefore let half a Dram or a Dram of the Flowers of Sulphur, or from a Scruple to half a Dram of its Magistery, called Lac Sulphuris, with a little Conserve of Roses, be administered two or three times a Day; or a little of the following Composition.

Take of the Conserve of red Roses, and Quinces, each half an Ounce; Milk of Sulphur, two Drams; Cina-mon Bark, Japan Earth, and red Coral, all prepared, each a Dram; Leaves of Gold, twelve; Syrup of Myrtle, enough to make them into an Electuary.

Let the Patient's Drink be a chalybeated Tincture of Roses, gratefully sharpened with Spirit of Vitriol, or a small Lime-Water. Mean while, let his old Stockings, Drawers, Shirt, Muffler, Cap, and Sheets, with whatever he had on during the time of the Uction, and in his Spitting Course, be changed for others very well aired before they are put on. If the Patient be already in a hec-tical State, Asses Milk and te-staceous Powders are the fittest Medicines; which may be ordered for him in the following Manner:

Take of the Conserve of red Roses, an Ounce; prepared Crabs Eyes, prepared Pearls, and prepared red Coral, each a Dram; of the Species Diatragacanthi frigidi, a Dram and half; Syrup of Marsh-mallows, enough to make them into an Electuary; of which take about the Size of a Nutmeg, early in the Morning; drinking af-terwards half a Pint of new-milked Asses-Milk, and sleep-ing after it an Hour. Let the Dose be repeated at four in the Afternoon, with the same Quantity of Asses-Milk.

But if there be any febrile Paroxysm, the Bark must be prescribed, which, by its specific Property, will not only take off the Fits, but by its manifest Stypticity, invigorate also the languid Condition of the Blood, and so put a Check to the Salivation.

If a Dropsy happen to ensue, from the broken Texture of the Blood, accompanied with anasarca Swellings of the Feet, Legs and Thighs, and sometimes, also, an Ascites of the Abdomen, the Indications and Remedies are the same as in other watery Tumours.

If a Palsy should be the Consequence, such inciding, vo-latile, and warm invigorating Medicines, as may open the obstructed Tubes, and restore the nervous Fluid to be car-ried on in its accustomed Channels, together with such local or topical Application, as may excite the Spirits, and give a new Tenility to the Nerves themselves, are most effectual. *Tur-ner's Syphilis*.

A CONSUMPTION FROM A SALIVATION.

Salivation is either natural, or procured by Art; and both of them is a plentiful Separation of the nutritious Juice by the Glands which supply the Spitte; upon which Secretion and Expend of the nutritious Juice, after a long Course of Sali-vation, the Blood becomes sharp and grows hot, and the muscular Parts being deprived of their due Nourishment, fall into an Atrophy, or Consumption.

A natural Salivation, or Spitting, for the most Part happens to those that have the Scurvy, and that because the Blood, by reason of its Acrimony, is not able to assimilate the new Chyle, and reduce it to its own Nature, and therefore as it circulates continually, throws it off by the Glands, which supply the Spitte. From whence it comes to pass, that even silly Women know, that Spitting too much inclines Men to a Consumption; for which Reason they do well to pre-scribe the swallowing of the Spitte to prevent a Consumption. Whereby not only the Progress of the Salivation is hindered, (for Spitting does by a certain continual Drawing, as it were, suck the Glands, which afford the Spitte, and put them upon a new Separation of it) but also the Chyle, which is separated by the salivatory Ducts to no purpose, is restored to Nature, to make up the Loss which the Mass of Blood sustains.

It is, also, as certainly true, that every Salivation procured by Art, that is, raised, with Mercurial Medicines, (if it con-tinues long) brings on a hec-tical and consumptive Dispo-sition.

In this Case (the Salivation being ended) the Patient must be put into a Milk Diet for a long time, by which the Sharpness of the Blood may be corrected, and a consumptive Disposition may be prevented. After that he must be sent into an open and benign Air, and be nourished with the plen-tiful Use of such Food as affords good Juice; and besides all this, (if it be necessary) he must drink the chalybeate Wa-ters.

I met with a very remarkable Instance of this kind of Con-sumption in the Daughter of Mr. Daulton, an Apothecary, who, from a Salivation that was raised with Mercury to cure the King's Evil, fell, as soon as ever the Salivation was ended, into a fatal Consumption; and by reason of the great Ex-pence of the Humours caused by her Spitting, she could never be restored, either by the Help of the Air, or by a Milk Diet, or any other Art; but being gradually wasted away with a Consumption, after a Month or two from the End of the Salivation, she died without any Sign of a Consumption of the Lungs. *Morton's Phthisiologia, Lib. 1. Cap. 9.*

SALIUNCA NEAPOLITANA, *sive Nardus ex Apulia.*
Italian Spikenard.

SALIX.

The Leaves are entire; the Flower, which is Male, and grows on a separate Plant, is amentaceous, spiked, and con-sists of a Multitude of Stamina. The Ovary, which is found only on the Female Plant, is furnished with a long Tube, adorned with four Horns; is of a conoidal Figure, and con-stituted in such a manner as to become a spiked Fruit, con-taining a Multitude of Capsules resembling Horns, and gaping by Maturity into two Parts. These Capsules are full of many downy Seeds.

Boerhaave mentions eighteen Sorts of *Salix*, which are;

1. *Salix; vulgaris; alba; arborescens. C. B. P. 473. Tourn. Inst. 559. Boerb. Ind. A. 2. 210. Salix, Offic. Ger. 1203. Emac. 1389. Raii Synop. 3. 447. Salix arborea angustifolia, alba, vulgaris, Park. Theat. 1430. Salix maxima, fragilis, alba hirsuta, J. B. 2. 212. Raii Hist. 2. 1419.*

COMMON WILLOW.

This is the largest of all our Willows, having tough, slen-der, green Twigs, clothed with long narrow Leaves, green above and whitish underneath, serrated about the Edges, and set on alternately. Early in the Spring come long, slender, loose Catkins, which inclose very small Seed in a white Down. It grows every where in moist Places, and by River-Sides.

The Bark, Leaves, and Juli, are cooling and binding, and useful against all kind of Fluxes and Hemorrhages. The Sap which flows from the wounded Bark, is accounted good for inflamed and bloodshot Eyes. The Ancients used to put the Branches of the Green Willow about the Beds of those who were sick of Fevers, to cool and temperate the Air. *Mil-ler's Bot.*

It grows in watry Places, and by the Sides of Brooks. The Leaves, which are used in Medicine, are refrigerating, dry-ing, and somewhat astringent, tho' its principal Use is in re-straining venereal Diseases. Outwardly they are of Service in Hemorrhages from Wounds, or from the Nostrils, and the like Disorders.

The Leaves of the Willow being laid in Water, and the same placed in a Room where the sick Person lies, are com-fortable and refreshing in an extraordinary manner. They are, also, very grateful Food to Cattle. A Decoction of the Leaves is very proper in an Hæmoptoe; and a Clyster is pre-pared of the same for a Dysentery. The Leaves, externally used, are of Service in Baths for the Feet in order to procure Sleep, and cool the Heat of Fevers. The Bark of the Tree has the same Virtues; and besides, the Ashes thereof, as *Dioscorides* says, are effectual for extirpating Warts and Corns. *Hist. Plant. Ascript. Boerhaave.*

2. *Salix; vulgaris; nigricans; folio non serrato. C. B. P. 473.*

3. *Salix; vulgaris; rubens. C. B. P. 473. Tourn. Inst. 590. Boerb. Ind. A. 2. 210. Salix rubens, Offic. Salix angustifolia purpurea seu nigra, Park. Theat. 1430. Salix rubra minime fragilis, folio longo angusto, J. B. 1. 215. Raii Hist. 2. 1421.*

COMMON RED WILLOW.

It grows in watry Places, and the Leaves and Bark, which are the Parts used in Medicine, have the same Virtues with the common Willow.

4. *Salix; lutea; sativa; folio crenato. C. B. P. 473.*

5. *Salix; folio amygdalino, utrimque virente, aurito. C. B. P. 473. Boerb. Ind. A. 2. 210. Tourn. Inst. 591. Salix nigra, Offic. Salix Spontaneo Amygdalino folio, fragilis auriculata, J. B. 1. 214. Salix viminalis nigra, Park. Theat.*

1420. *Salix folio splendente auriculato flexilis*, Raii Hist. 2.
1420. Synop. 3. 448. SHINING WILLOW, or FRENCH WILLOW.

It grows in Plantations among other Willows, but I find no peculiar Virtues ascribed to it.

6. *Salix*; oblongo, acuto, incano, folio. *C. B. P.* 474.
7. *Salix*; folio longo, angusto, acuto, leviter serrato, supra viridi, infra albescente; viminibus luteis.
8. *Salix*; Platyphyllos; Leucophlaeos; Dalechampi. *Lugd.* 276.

9. *Salix*; foliis longissimis, angustissimis, supra atroviridibus, infra incanis, margine crispo.

10. *Salix*; folio longo, utrimque viridi, acuto, serrato.
11. *Salix*; montana; major; foliis Laurinis. *H. R. Par.*
12. *Salix*; latifolia; rotunda. *C. B. P.* 474.
13. *Salix*; folio ex rotunditate acuminato. *C. B. P.* 474.
14. *Salix*; humilis; capitulo squamoso. *C. B. P.* 474. *Salix*, *Helice Theophrasti*. *Lugd.* 277.

15. *Salix*; folio longo, non auriculato; viminea rubra. *Cat. Cantabrig.*

16. *Salix*; pumila; foliis utrimque candicantibus & lanuginosis. *C. B. P.* 474.

17. *Salix*; pumila; brevi angustoque folio, incano. *C. B. P.* 474.

18. *Salix*; minima; flore eleganti luteo. *An Salix, pumila, montana, folio rotundo*. Raii Hist. 1423? *Boerb. Ind. Alt. Plant. Vol. 2. p. 210.*

Besides the foregoing Species of *Salix*, Dale mentions the following.

Salix, Helice. Offic. *Salix, Helice Theophrasti*, Park. Theat. 1435. *Salix Rosea Anglica*, Ger. 1204. Emac. 1390. ROSE WILLOW.

It grows by the Sides of Brooks, and is esteemed only a *Lusus Naturæ*.

SALLENA. A Species of Salt-Petre. *Rylandus*.

SALMERINUS, or SALMERO. A Fish very like the Salmon, but smaller; it is found in Rivers and Lakes. This Fish has something of the Trout, and is at least of as good a Taste as it and the common Salmon. It is tender, delicious and short, and not at all viscous; but on the contrary, so easy of Digestion, that some Physicians allow the Sick to eat it. It corrupts very soon, if not salted, and produces very near the same Effect as the Salmon.

Some pretend this Fish does not at all differ from the common Salmon, and that in time it grows as big as the other. However, *Johnston* makes a different Species of it; and we may easily apprehend by the Description this Author has given us of its Form, that there is some small Difference between it and the Salmon. Besides, *Gesner* says, he once consulted a very experienced Fisherman and Man of Probity upon this Subject, who assured him, this Fish would never grow so big as a common Salmon, tho' it were to continue many Years in the River. *Lemery on Foods*.

SALMO. The Salmon.

The Salmon is a Fish of an excellent Taste, and covered with numerous small Scales, marbled with red or yellow Spots. It is usually two or three Foot long, and very thick, tho' there are some six Foot long; some have weighed from twenty four to thirty six Pound. It has been said that this Fish will not live but in troubled and muddy Waters; but small Fishes have been found in its Belly; nor is it probable that so large and strong a Fish should live only upon troubled Water, and his numerous Teeth seem designed for solid Food.

Tho' the Salmon be a Sea-Fish, it usually comes up the Rivers in the Beginning of Spring, where it is observed that he fattens. But when he has tarried above one Year in a River, he grows pale, dry, lean, and ill-tasted. This Fish lives several Years, and may be kept a long Time out of the Water before it dies.

The best Salmon is well fed, large, of a middling Age, tender, short, reddish, and taken in fine clear and running Water. It is eat either fresh or salted; the first is much more agreeable to the Taste, but soon corrupts. It is tender, short and savoury, and abounds with volatile Salt, and oily and balsamic Principles, which render it nourishing, strengthening and restorative; it also promotes Urine, is pectoral and restorative; but if eat immoderately, being very fat, it causes Reachings and Indigestions; and if too old, it is dry, hard, and heavy upon the Stomach. *Lemery on Foods*.

SALOME. *Σαλόμε*. The Name of a Plaster described by *Galen*, de Comp. M. p. G. Lib. 2. C. 7.

SALOMONIS SIGILLUM. Solomon's Seal. The same as the POLYGONATUM.

SALPA. Stock-Fish.

This is a Sea-Fish pretty large, long, and resembling a common Cod. It feeds upon Sea-ware, and Excrements, but is not much esteemed for Food, because its Flesh is hard, and has no great Taste. They are dried till they are as hard

as Wood, so that before they are prepared, they must be beaten in order to make them tender. They are said to be of an aperient and resolvent Nature. *Lemery des Drogues*.

SALPETRA. Nitre.

SALPINGO-PHARYNGÆUS, according to *Valsalva* and *Douglas*, is one of the Origins of the Muscle of the Pharynx. It arises from the Extremity of the bony Part of the Tuba *Eustachiana*.

SALPINGO-STAPHILINUS MUSCULUS. A Muscle of the Uvula, thus described by *Douglas*. It arises fleshy from the bony Part of the Tube of the Ear, and is inserted into the Basis of the Uvula, where it joins Fibres with its Partner Muscle on the other Side.

Its Use is to draw the Uvula upwards and backwards.

SALSAMENTUM. The same as TARICHOS, which see.

SALSAPARILLA. The same as SARSAPARILLA.

SALSATURA. In the Preparation of the Philosophers Stone, is Dealbation.

SALSEDO. Saltnefs.

SALSEDO MUCRUM. Salt Petre, that is, Nitre.

SALSUGO. Pickle, or Brine.

SALTABRI. The same as *Sal Alembrot*. See ALEMBROT and SAL.

SALVATELLA. A Vein in the Back of the Hand, the opening of which some Physicians have fancied to be of singular Use in Melancholly. It is the Vein which comes from the little Finger, and that next to it; or, according to others, that which proceeds from betwixt the Thumb and Fore-Finger.

SALVIA.

The Characters are;

It agrees almost in every Character with *Scalaria*, or Clary. The Galea is sulcated, or fornicated, the Beard trifid, the middle Segment thereof being almost excavated. The Stamina of the Flowers, by their Inflexion, represent the Fabric of the Os Hyoides.

Boerhaave mentions twenty Species of *Salvia*, which are;

1. *Salvia*; major; an *Sphacelus Theophrasti*? *C. B. P.* 237. *Tourn. Inst.* 180. *Boerb. Ind. A.* 166. *Salvia hortensis major*, Offic. *Salvia major*, Ger. 623. Emac. 764. *Salvia major vulgaris*, Park. Theat. 49. *Salvia latifolia*, J. B. 3. 304. Raii Hist. 1. 509. COMMON SAGE.

Sage is a shrubby Plant that grows in every Garden, and is well known to have long, rough and wrinkled Leaves, sometimes of a hoary Green, and sometimes of a reddish Purple Colour, of a pretty strong Smell; the Flowers grow on long Stalks, set on Verticillatim in Spikes; they are large and galeated, having the Galea crooked and hollow, and the Labella broad, of a bluish Purple Colour, set in large clammy Calyces, in the Bottom of which grow four round smooth Seeds; it is planted in Gardens, and flowers in May; the Leaves and Flowers are used. *Miller's Bot. Off.*

It grows in Gardens, and flowers in June, and the Parts in Use are the Leaves and Flowers. Sage is diuretic; it provokes the Menfes, when retained through Thickness, and moderates their Excess; it is also serviceable in Palsies, Vertigos, Tremblings and Catarrhs; outwardly it absterges Aphthæ in the Mouth. *Dale from Schroder*.

Sage, which is produced almost in every Garden, is an excellent Cephalic, and was always highly esteemed by the Inhabitants of the Eastern Nations, who at present prefer its dried Leaves to Tea. In Consequence of the subtil, vaporous, and sedative Oil it contains, a Decoction or rather Infusion of it by Way of Tea, is highly efficacious in spasmodic Disorders, in Contractions of the Members, and chronical Epilepsies. Baths of it prepared with an Addition of nervous Substances, such as Iron-wort, Origanum, and Mother of Thyme, are very serviceable in curing paralytic Members, and restoring the Tone of the Uterus. In order to allay Inflammations of the Fauces, and other Disorders of the Teeth and Mouth, Surgeons order a Decoction of Sage to be used as a Gargarism. *Hoffman. de Præstant. Remed. Domest.*

See BURO.

2. *Salvia*; major; an *Sphacelus Theophrasti*; floribus candidis? *C. B. P.* 237.

3. *Salvia*; perelegans; tricolor; argentea; *Belgarum*. *H. R. Par.*

4. *Salvia*; major; foliis ex viridi & luteo variegatis. *H. R. Par.*

5. *Salvia*; major; foliis ex viridi & albo variegatis.

6. *Salvia*; latifolia; serrata. *C. B. P.* 237. *Prodr.* 113.

7. *Salvia*; major; arborefcens; foliis vieticis, laceris, Fimbria aureâ donatis.

8. *Salvia*; Cretica; non pomifera. *Clus. H.* 343.

9. *Salvia*; folio lato, amplo, subrotundo.

10. *Salvia*; minor; aurita & non aurita, *C. B. P.* 237. *Tourn. Inst.* 181. *Boerb. Ind. A.* 166. *Salvia hortensis minor*, Offic. *Salvia minor*, Ger. 623. Emac. 764. Raii Hist. 1.

510. *Salvia minor auriculata*, J. B. 3. 305. *Salvia minor frue pinnata*, Park. Theat. 50. SAGE OF VIRTUE.

This Sage is smaller than the common Sort, having lesser, narrower and smother Leaves, of a whitish hoary green Colour, with frequently two small Pieces or Ears growing on them next the Stalk, which in some Plants are wanting, and in others but on one Side; it is of a milder Scent than the common, and has rather smaller Flowers, but much of a Colour, flowering at the same Time, and is also planted in Gardens.

The Virtues of both this and the common Sort are much the same; the common is used more in the Kitchen; they are Cephalic, and good for all Diseases of the Head and Nerves, as the Palsy, Convulsions, &c. They are likewise diuretic, and good for uterine Obstructions, and are much used in Fevers of all Sorts, in Tea or Posset-drink. *Miller's Bot. Off.*

11. *Salvia*; angustifolia; serrata. C. B. P. 237.

12. *Salvia*; Orientalis; latifolia; Absinthium redolens; florecarneo magno.

13. *Salvia*; Orientalis; latifolia; hirsutissima; viscosa pinnata; flore & calice purpureis; inodora.

14. *Salvia*; Africana; frutescens; folio subrotundo, glauco; flore aureo, magno. H. A. 2. 183.

16. *Salvia*; baccifera. C. B. P. 237.

17. *Salvia*; bacciferae similis; sed foliis magis undulatis.

18. *Salvia*; Cretica; frutescens; pomifera; foliis longioribus, incanis, crispis. T. C. 10. T. Voy. 1. 77.

19. *Salvia*; Hispanica; folio Lavandulae. T. 181.

20. *Salvia*; Absinthium redolens. J. B. 3. 307. *Boerb. Ind. Alt. Plant. Vol.*

The first Species of *Salvia* is called *Sphacelus Theophrasti*, because its Leaves bruised and applied to a gangrenous Place, cure a Gangrene, and prevent a Sphacelus. Some of the Species are said to be pomiferous; the Occasion why they are so called is, that in hot Countries a certain Insect half penetrates the Leaf, principally of those Plants which have wrinkled Leaves, and there lays its Seed, whence in the following Year is produced what we name a Gall. These Species being transported hither, are furnished with those Galls for the first Year, which disappear in the next, because we have no such Insects in these Countries.

Salvia is so called from *Salvus*, sound, healthy, because no Plant has a greater Reputation for Healthfulness and Wholeness, whence the Question in the old Verse,

Cur moriatur Homo cui Salvia crescit in Horto?

Why dies the Man whose Garden Sage affords?

All the Species have a very fragrant Smell beyond all other Plants, and if smelled to for a considerable Time, cause a Sort of Ebriety, and at length a Vertigo; for examining this Plant upon an empty Stomach, I found myself almost drunk with the Smell thereof, and when I had taken some of the Flowers, I felt a Heat, with an Accession of Strength from them. The Leaves infused in Water blacken it like Tea, and Ink may be made with the same as well as with Galls. Drank after this manner, it is astringent, stimulates the Fluids, and corroborates and dries the Fibres and Bones; whence I conclude it to be a Strengtheners, Heater, and Raiser of the Spirits. It is justly, therefore, by *Dioscorides* esteemed a most effectual Sudorific, Cardiac and Cephalic, and has given Occasion for the Verse in the *Schola Salernitana* above cited. The Leaves infused in Wine fasten loose Teeth and Gums, and are good for the Scurvy, and by their balsamic Virtue corroborate the Parts. It is an excellent Plant for all Diseases of the Head proceeding from Weakness of the Stomach, and is of Service in the Palsy, Lethargy, Apoplexy, Epilepsy, Podagra, Arthritis, Vertigo, Leucophlegmatia, and Chlorosis or Cachexy of Virgins. It is subject, however, to one very great Inconvenience, which is, that it harbours Toads under its Roots; the Way to avoid which is to plant near it Rue, which these Animals cannot endure. Hence the rhyming Verse,

Salvia cum Ruta faciunt tibi Pocula tuta.

Sage indeed was by the Ancients justly esteemed alexipharmic, sudorific, cardiac, and especially cephalic, but it was only in cold Diseases, where Phlegm abounded. The distilled Water, and the Conserve of the Flowers, were usually exhibited as Preservatives against all Sorts of Poison, by their sudorific and strengthening Virtues. Sage is also reckoned to have an antiseptic Virtue, which renders it very serviceable in seasoning Carcases, and therefore of great Use and Esteem in the Seraglio of the Grand Signior; for, first, it defends the Parts from Worms and Insects; secondly, by its astringent Virtue it causes a Constriction of the Parts; and lastly, by its grateful Fragrance resists Corruption. The *Chinese* are said to have so great a Love for it, that when you present them

with some of it, they cannot forbear asking how the *Europeans* can take such Delight in their Tea, when they have so much Sage of their own Growth. Sage corroborates and constricts the solid Parts, and is employed by the Surgeons in repressing Hemorrhages from Wounds, by Constriction of the Arteries; and the Herb boiled in Wine is very good for a paralytic Limb, being of an aromatic and astringent Quality, attended with somewhat of Austerity. All the Species have the Nature of the *Quercus*, whence they are binding, excite the Spirits, and move the Nerves; hence they are a very good Remedy in a Laxness and Inertness of the Nerves. A Conserve of Sage is very proper for a Weakness of the Stomach in Women, for those of that Sex who have for Years together laboured under an Infirmitas or Debility of the Stomach, are cured by taking half a Dram of the Conserve. *Hist. Plant. ascript. Boerhaave.*

SALVIA AGRESTIS. A Name for the *Scordium*; alterum; frue *Salvia agrestis*.

SALVIA MONTANA. A Name for the *Sclarea*; glutinosa; floris lutei, variegati, Barba amplà cavà.

SALVIA SYLVESTRIS. A Name for the *Stachys*; Canariensis; frutescens; Verbasci folio.

SALVIA VITÆ. A Name for the *Ruta*; muraria. See **ADIANTHUM ALBUM.**

Besides the foregoing Species of *Salvia*, Dale mentions the following,

Salvia folio tenuiore, C. B. P. 237. Tourn. Inst. 181. Raii Hist. 1. 510. *Salvia Indica*, Ger. 623. Emac. 765.

Salvia minor aurita odoratissima Hispanica, Park. Theat. 50. *Salvia tenuifolia*, J. B. 3. 306. **SPANISH SAGE.**

It is cultivated in Gardens, and the Leaves, which are the Part used in Medicine, are endued with the same Virtues as those of the common Sage.

SALZ, SULZ, or SELENIPPUM. Brine.

SAMBACH. A Name for the *Jasminum*; frue *Sambach Arabum Alpini*.

SAMBUCUS.

The Characters are;

The Branches are full of a fungous Pith; the Flower is monopetalous, rotated, multifid, as it were rosaceous, and disposed in Umbellas, or Bunches. The Ovary, which penetrates the Bottom of the Flower, becomes a Berry full of Juice, and generally containing three oblong Seeds.

Boerhaave mentions eight Species of *Sambucus*, which are;

1. *Sambucus*; fructu in umbella nigro. C. B. P. 456. Tourn. Inst. 606. *Boerb. Ind. A. 2. 223. Sambucus Offic.* Ger. 1234. Emac. 1422. Raii Synop. 3. 461. *Sambucus vulgaris*, Park. Theat. 407. J. B. 1. 544. Raii Hist. 2. 1609. **COMMON ELDER.**

The Elder-Tree is a common Hedge-Tree, whose spreading Branches have a spongy Pith in the Middle. The outside Bark is of an Ash-Colour, under which is another that is green. The Leaves are pinnated, of two or three Pair of Pinnæ, with an odd one at the End, which is larger than the rest: They are oval, sharp-pointed, and serrated about the Edges. The Flowers grow in large flat Umbels; They are small, of one Leaf cut into five Sections, with as many small Stamina, and are succeeded by small, round, deep, purple Berries, full of Purple Juice. The Elder-Tree grows frequently in Hedges, especially in moist Places, and flowers in May, and the Berries are ripe in September. The Bark, Leaves, Flowers, and Berries are used.

The inner green Bark purges thin serous Humours, and is much used for the Dropsy, the Leaves are only used outwardly, being good for Inflammations, St. Anthony's Fire, and the Piles. The Flowers are helpful for the same, and are frequently put in Fomentations and Cataplasms, for all kinds of Swellings and Tumours, and Pains of the Limbs. Inwardly used they expel the Wind, and help the Colic. The Berries are cordial and useful in hysteric Disorders. They are diuretic, and good for the Dropsy; and are frequently put into Gargarisms for sore Mouths and Throats.

On the Trunk of this Tree frequently grows a fungous Excrescence, wrinkled and turned up like an Ear, whitish on the Outside and black within, with several little Veins. These are called Jews Ears, or *Auricula Judæorum*. They are accounted good for the Swelling and Inflammations of the Tonfils, sore Throats and Quinsies.

Official Preparations of the Elder, are the *Aqua Florum Sambuci*, the *Oleum Sambucinum*, the *Unguentum Sambucinum*, and the *Syrupus Sambuci*. *Miller's Bot. Off.*

Its Leaves have a Taste at first herbaceous and saltish, afterwards bitter. The Fruit is sweetish, and gives a deeper Red to the blue than to the white Paper.

Its Leaves yield, by the Chymical Analysis, beside some acid and alkaline Liquors, some volatile concrete Salt, a great deal of Oil and Earth. Thus it may probably operate by a Sal Ammoniac, loaded with more Acid than ordinary, and joined

joined with a great deal of Oil and Earth. The Salt of the Elder-Berries resembles Alum rather than Sal Ammoniac. It affords only a little urinous Spirit from these Parts, but a great deal of Acid, Oil and Earth. *J. Baubin* and *Mr. Ray* took its Flowers to be pentapetalous; but it is monopetalous.

Hippocrates says it purges both by Urine and Stool. *Dioscorides*, also, says, that an Infusion of the Roots and Leaves in Wine evacuates Serofities, and affords Relief in hydropic Cases. He, also, commends Elder Wine, especially that of the Berries, for the Biting of Vipers, and in hysteric Cases; and adds, that it assuages Inflammations and the Gout, cures Burns, Ulcers, and the Bitings of mad Dogs. *Tragus* and *Dodonæus* prescribe either the Juice of the middle and green Bark, or an Infusion of them in Wine or Milk, to evacuate Bile and Serofities. *J. Baubin* gives an Ounce and an half of Elder-Bark Water to be drank thrice a Day, in the Morning, Noon, and at Night, in hydropical Cases. Fresh (not dried) Elder-Flowers fried with Eggs, are said to purge well enough.

Infuse dried Elder-Flowers in Whey, and take a Glass of it Morning and Evening for the Small-Pox, and *St. Anthony's Fire*; bathing the Face, in the mean time, with two Parts of Elder infused in one Part of Spirit of Wine.

A Conserve and a Syrup is made with these Flowers. They boil them gently in Vinegar and Honey for Clysters. *Camerarius* prescribes the Decoction of the young Shoots of Elder, with a little Saffron, to provoke the Terms. They are, also, used in a Conserve and Syrup, or Powder, to keep the Belly open, and purify the Blood. A Rob, Extract, Spirit, Wine, Vinegar, Syrup, and Oil, is made of the Berries of Elder. To make the Rob, take one Pound of the Juice, half a Pound of Sugar, thicken them over the Fire. *Quercetan's* Receipt of the Extract is, make a Tincture of dried Elder-Berries, with a sufficient Quantity of Spirit of Wine, add a little Spirit of Sulphur; let them digest in a close-stopped Bottle five or six Days; filtrate the Tincture, drink half a Spoonful or a Spoonful, which is very good in the hysteric Passion; or draw off the Spirit of Wine by Distillation, and the Extract will remain in the Bottom of the Cucurbit; the Dose is from a Scruple to a Dram, in the same Disease and the Looseness. The burning Spirit of Elder-Berries is very sudorific, as also the Juice of the Berries, which are easily preserved either with Oil, or by mixing a third Part of good Spirit of Wine. That which they call Elder-Wine is this Juice kept a Year: Some boil it with Sugar to the Consistence of a Syrup. The Stones of the Berries, by Expression, yield an Oil which eases the Pain of the Gout. An Oil is, also, made for this Distemper by Diffolution of its Leaves. They bruise the Ribs of its Leaves, put them into a Stone Pot, and bury it pretty deep, after having luted it well with Plaister. At the End of the Year a Sort of Oil subsides to the Bottom of the Pot; which is very lenifying. The Stones given from three Drams to half an Ounce, in Powder, are purgative, or else an Emulsion of about an Ounce may be drawn from them; being macerated in white Wine, they are scarcely purgative. The Leaves boiled in thick Wine are very resolvent; they abate the Swelling of the Legs of hydropic Persons, by placing them so as to receive the Vapours or Steam from a Bath of it, or by frequent fomenting and applying the Fæces as a Cataplasm to them. The Leaves and Flowers of Tansey may be mixed with it.

Matthioli prescribes an excellent Ointment for Burnings: Take Oil of Olive, two Pound; middle Bark of Elder contused, one Pound; boil them together, (adding now and then Elder Water) till the Bark be hard and black. Strain and boil it up to an Ointment, with four Ounces of new Wax, and as much of the Juice of young Elder Shoots, to keep it from burning. Before it is removed from the Fire, add Turpentine, and Male Frankincense, of each four Ounces; two hard Yolk of Eggs; keep it in a Stone Pot for Use. Or boil the middle Bark of Elder-Branched, contused in Oil of Olive or Nuts; bring it up to the Consistence of an Ointment with Bees-Wax, and Yolks of Eggs; keep it in a Basin with fresh Water. This is very good for the Gout, Inflammation of the Piles and Burnings. Apply some Honey, add afterwards some Nut-Oil boiled with Elder. This gives great Relief to Burnings by Gunpowder. Wash Ulcers produced by Burnings with a Decoction of Elder and Ash-Bark. *Zwelfer* prescribes an Ointment for Burnings thus:

Take of fresh Butter two Pounds; Elder-Oil, and green Juniper Berries bruised, of each a Pound; fresh Elder Flowers, six Ounces; white Roses, four Ounces; macerate all these together some Days, then boil them a little, and mix them up with five Yolks of hard Eggs. Apply this Ointment to the Burning with a Feather, and cover it with brown Paper. *Martyn's Tournefort*.

Martin Blockwitz has written a whole Book of the Vir-

tues and Use of Elder, under the Title of *Anatomia Sambuci*, "The Anatomy of the Elder-Tree."

The inner Bark (the middle of the Stem) evacuates serous Humours, whence it is of Service in Dropsies. The Buds, or tender Leaves, boiled in Wine, or eaten in Salads, are not so effectual, but fittest for weak Constitutions. The same pulverized, and taken in Pease-Broth, are good for Costiveness. The inner Bark applied to Ambushions, is said to be effectual to extinguish the igneous Heat. *Dioscorides* recommends a Cataplasm prepared of the fresh and tender Leaves, with Polenta, for Combuitions. *Alvarius* also highly commends the *Sambucus* for a recent Combuition. The Flowers are discutient, emollient, resolvent, sudorific, and anodyne. Their principal internal Use is in preventing or curing an Erysipelas; and externally, they are of Service, also, in an Erysipelas, Combuitions and the Colic. Our Domesticks, says *J. Baubin*, take the Bunches of Flowers, and fry them in a Pancake, and make thereof a grateful and wholesome Food. They may as well be mixed with other Meats, or fried with Eggs, being gently loosening of the Belly. The Flowers dried lose their purgative Quality with their Humidity; but retain their digestive and attenuating Virtue. Vinegar, in which the Flowers have been macerated, is grateful to the Stomach, excites an Appetite, and cuts and attenuates gross and crude Humours. The Berries are alexipharmic and sudorific. The Spirit drawn from the Berries is one of the principal Sudorifics, and also a very noble antifebrile Medicine. And the Wine prepared of the Juice, with white or Rhenish Wine, is of admirable Efficacy in the Dropsy. *Camerarius* writes, that the Juice of the Berries, mix'd with Cock-Broth, in which a good Quantity of Parsley-Root has been boiled, and expressed, is very good for hydropical Persons. The Stones, or Seeds of Elder are absterfiv, and purge violently both by Stool and Vomit. The Decoction of the middle Bark of Elder, or Dwarf-Elder, with Syrup of Poppies, are an effectual Sudorific: For Narcotics added to Diuretics or Diaphoretics are the more provocative to Sweat, as appears from the Mixture of Opium in Theriaca Andromachi, and Mithridate. For Inflammations of the Feet, take a sufficient Quantity of Leaves of Elder, and boil them in Oil and Salt, and therewith foment the Parts.

For the Arthritis, take Leaves of Elder, and put them in a glazed Pot, so as that they may fill it without being wrinkled; press them very well and often, then put a Cover upon them, and bury them a Year under the Earth. After which you will find a Crust above, and Oil below, than which Oil nothing is of greater Efficacy, as it has been often tried. A Conserve of the Flowers has the same Virtue.

The *Sambucus* is less hurtful to the Stomach than the *Ebulus*, and the Leaves have not so strong a Smell, nor so much of a cathartic Force as those of the other. The *Germans* frequently use the inspissated Juice of the Berries as a Sudorific, and give it to their Children with Bread; and sometimes exhibit it with good Success to those who are inclined to a Dropsy. The Berries are boiled in Water, and strained; and then boiled again to the Consistence of a Sapa, or Rob.

A Plum-Tree grafted on an Elder-Tree, bears purging Fruit, according to *Camerarius*, who says he has tried it, tho' he could not easily comprehend the Reason. I think neither of them probable, says *Ray*, and cannot comprehend either the Infision of a Plum-Tree into an Elder-Tree; nor, if this be granted, how it should bear a Fruit of a purgative Quality.

For an Erysipelas, we have a Fomentation much in Use, which is prepared of two Parts of Elder-Water, and one Part Spirit of Wine. This Practice is grounded on Reason and Experience: For the Spirit of Wine, by the Subtily and Activity of its Parts, is disposed to reduce the ruffled and distorted Tubes and Fibres of the Skin into their natural Order; and besides, the Parts affected with the Erysipelas are often eased and relieved by it in a remarkable manner. This is the common Remedy in *London*; but I have often in this Case, says *Dr. Hulse*, successfully made use of Water of Elder-Flowers, mixed and shaken together with Oil of Elder, to which I have sometimes added Spirit of Elder-Berries. I have frequently cured this Disorder with Oil of Elder and Canary Wine, mixed and shaken together.

For a quotidian Fever, take of the Bark of the Root of Elder, one Ounce; of Asarabacca, three Ounces, with a Dram and half of Cinnamon; boil them in Milk, and give it in the Beginning of the Paroxysm. It provokes to Stool, and excites Vomiting at one and the same time.

For Burns, or Combuitions, take of the green middle Rind, or Bark of Elder, a Quantity at Discretion, and boil it in Oil till it be withered, and add thereto a little Wax, in order to render it a lucid Ointment. This, says *Chefneau*, I have several times tried with Success. *Raii H. P.*

The Root rasped and infused in Wine, to the Quantity of

an Ounce, purges Water in great Abundance. The Juice of the middle Rind of Elder, expressed in a glazed Mortar, and exhibited from a Dram to half an Ounce, is the best of Hydragogues, for a Person who is just suffocated with a Dropsy, provided the Viscera be sound, for it always cures in a few Days. It dissolves the Humours to such a Degree, that the Body runs with Streams of Water in every Part, and the Patient faints away on Occasion of so great and sudden an Evacuation. The Bark of the Root is esteemed much the best for Use. The Leaves and Tops are commended by *Dioscorides* in the hysterical Passion, Inflammations, Combuſtions and Gout. The same Author exhibited the Juice of the Middle Rind, infused in Milk or Wine, to those who laboured under the Pestilence, in order to provoke Sweat. The bruised Leaves are very effectual in dissolving all scirrhus and inflammatory Tumors, in easing the Pain of the Gout, and dissipating aqueous Swellings, whence they are of Service in an aqueous Hernia. The Flowers are very salutary, and being infused in the manner of Tea, are very proper in all hot, feverish, variolous and morbillous Distempers. Their Decoction is very good to increase Milk in Women's Breasts; and outwardly they are of Service in an Erysipelas, Phlegmon, Head-ach, and Want of Sleep, being applied in a dry or humid Form, by their demulcent Virtue procuring a kindly and quiet Sleep. Of the Flowers are prepared a Conserve and Syrup, of Use in Clysters. The Tops are good to provoke the Menſes; and the Flowers are proper in all cancerous and scirrhus Diseases, the Pain of the Cholick, and a quartan Ague. Of the Berries is prepared a Rob, which is justly accounted of universal Use in chronic as well as acute Disorders, where is required a Dissolution, or an Evacuation by Stool, Urine or Sweat, according to the different Determination or Tendency of the Humours. I never found any Remedy which gave so much Relief under a Cancer as these Flowers. There was an old Man, who lived to above one hundred and twenty-five Years, who regarded this Rob of Elder as his Arcanum, and happily survived many contagious Seasons, by using no other Remedy, but taking every Day some of this Rob, to which only, and to no other Thing, he imputed his Health and long Life. The Extract is very good in Hysterics, and the Berries are of Service in all kinds of Dysenteries and Diarrhæas; and the Oil is very good in the Gout. The Leaves, or middle Bark, made into an Ointment with Oil, are useful in the Hæmorrhoids, Gout and Combuſtions; and half an Ounce of the bruised Seeds mitigate Pains of the Belly, and destroy Worms. The outer Bark is astringent; and the Pith dried and torrefied is of Service in humid Ulcers. *Hist. Plant. Acript. Boerhaave. Bartholine, in Dissert. de Medic. Dan. Lib. 1. informs us, that Elder is at once more safe and efficacious than the celebrated Antidotes prepared of Theriaca and Mithridate. The Flowers and Rob of Elder are highly and justly esteemed by the common People; for the former are with great Success externally applied for alleviating all erysipelaceous Swellings, Toothachs and Gouts; as also for softening Abscesses and hard Tumours, produced by coagulated Milk. The Water of these Flowers, in consequence of its anodyne Quality, is of singular Efficacy in all Diseases, whether acute or chronic; but especially in those Disorders where Expulsion is proper, where the Pain is intense, and where there is an Inflammation of the internal Parts. The Rob prepared of Elder-Berries, is, as it were, the Panacea of the Country People, who use it as the best Preservative, and the safest Medicine in the Beginning of Diseases, mixing it either with warm Ale or Elder Flower Water; for it not only promotes the Excretions by Stool and Perspiration, but is also possessed of an anodyne Quality. Some, in order to render this Rob more diaphoretic, add about a Dram of calcined Hartshorn to it. If this Rob is mixed with an equal Quantity of Sugar-Candy, and a due Quantity of Brandy poured upon the Mixture, and kindled after a sufficient Agitation, it affords a Medicine, one Spoonful of which is of singular Service in long protracted Coughs, and before the Paroxysm of intermittent Fevers. The frequent Use of this Rob generally mitigates, and sometimes stops the Impetus of these Fevers, provided the Crudities of the Primæ Viæ have been previously treated with Laxatives and Correctors. The Middle Bark of the Elder Tree, if boiled in Ale, Water or Wine, powerfully promotes Sweat, Urine, and the Menſes, for which Reason it is highly proper for cachectic Patients. This Bark, when externally applied, removes oedematous and erysipelaceous Swellings, as also Pains and Tumors of all Kinds. *Hoffman. de Præst. Remed. Dæmest.**

AQUA FLORUM SAMBUCI. See AQUA.
OLEUM SAMBUCINUM. See OLEUM.

ROB BACCARUM SAMBUCI.

Rob of Elder Berries.

Take of the Juice of Elder Berries any Quantity, and let it leisurely be inspissated over a gentle Fire, either by itself, or in Conjunction with a fourth Part of Sugar.

After the same Manner is prepared the Rob of Dwarf Elder, of Juniper and Veronica; unless that in the latter, the Sugar and Juices are required of equal Quantities. After the like Manner others, also, may be prepared.

UNGUENTUM SAMBUCINUM.

Ointment of Elder.

Take of Elder Leaves gathered in May, ten Handfuls, of the young Shoots growing about the Bottom of the Tree, two Pounds, of the inner Bark of the same, one Pound. After these are all cut small, boil them in twelve Pounds of fresh Butter, over a slow Fire, continually stirring them all the while. Press out the Butter and strain it: to it put the same Quantity of fresh Leaves, Shoots and Bark, and repeat the Process as before, and then press it out again with less Force, so that it might be an Ointment.

This is entirely new, and wonderfully well contrived to preserve all the Virtues of the Elder, as much as such a Form will admit of: The Measure of Boiling is until the Leaves, &c. grow crisp.

2. Sambucus; fructu in umbella viridi. C. B. P. 456.

3. Sambucus; racemosa; rubra. C. B. P. 456. Park. Theat. 407. Raii Hist. 2. 1610. Tourn. Inst. 606. Boerb. Ind. A. 2. 223. Sambucus montana, Offic. Sambucus racemosa acinis rubris, J. B. 1. 551. Sambucus racemosa vel Geruina, Ger. 1234. Emac. 1422. MOUNTAIN ELDER.

This Elder differs not a great deal from the common, in Branches or Leaves; these are pinnated, and rather narrower than those of the common Elder, having five serrated Pinnæ on a Stalk. The chief Difference is in the Flowers, which are yellow, and grow in thicker Clusters, and in the Berries, which are not so deep, but of a reddish Colour. This Elder is seldom to be met with in England, but grows plentifully in Germany, and flowers in May.

It is not much used inwardly, being accounted somewhat Narcotic. It is an Ingredient in the Unguentum Populeon, but being rarely to be had, the common Elder is used in its Stead. *Miller's Bot. Off.*

4. Sambucus, laciniato folio. C. B. P. 456.

5. Sambucus; humilis; five Ebulus. C. B. Pin. 456. Raii Hist. 2. 1611. Synop. 3. 461. Tourn. Inst. 606. Boerb. Ind. A. 2. 223. Ebulus Chamææste, Offic. Ebulus five Sambucus humilis, Ger. 1238. Emac. 1426. Park. Theat. 208. Ebulus five Sambucus herbacea, J. B. 1. 546. DWARF-ELDER, or DANEWORT.

This is a much less Plant than the common Elder, seldom growing to be above three or four Foot high, having several long pinnated Leaves, growing two at a Joint; they are longer and narrower than the common Elder, and sharper pointed. The Stalks are square and striated, dying down every Year, and rising again in the Spring; on the Top of these grow Umbels of white Flowers, having frequently a Dash of Purple, each of one small Leaf, divided into five Segments; which are succeeded by round Berries, when ripe, of a deep Purple, or black Colour, and full of a purplish Juice. The Root is thick, and creeping on the Surface of the Earth.

Dwarf-Elder is much of the Nature of common Elder, purging serous watery Humours by Stool, and is therefore good for the Dropsy, and other Distempers arising from a Glut of Serum. It is likewise very serviceable against gouty scorbutic Humours, both given inwardly, and applied outwardly, boiled in a Lixivium. *Miller's Bot. Off.*

The Leaves are a little bitter, and the Fruit is more so. It is stiptic, and does not redden the blue Paper. By the chymical Analysis the Leaves and Tops yield a little acid and urinous Spirit, no concreted volatile Salt, and a good deal of Oil and Earth. The Leaves are emollient and resolving, they are heated under the Fire, and used as a Cataplasm for the Gout, and all Kind of Tumors. The young Shoots and Bark are purgative. They often infuse half an Ounce of its Seeds in a Glass of White Wine; then squeeze them a little, and give the Wine to hydropical Persons to drink, but it purges very gently. It is better to make an Emulsion with six Drams or an Ounce of them, to discuss the dropical Swelling of the Legs, or to cure the Rheumatism, make a Balneum vaporis, with the Leaves of Dwarf-Elder, Tansey, Sage, and such like Plants, or else boil these Leaves in thick Wine to bath the Parts, and apply the Faces to them. The Oil expressed

pressed from the Seed is sweetening and resolving. This Herb is a Succedaneum to Elder. *Martyn's Tournefort.*

The *Ebulus* is supposed to be endued with the same Virtues as the *Sambucus*, but in a superior Degree. The Bark and Seeds are Hydragogues, and therefore of Service in the Dropsy, Gout, and other Diseases proceeding from Serum. A Decoction of the Root and Seeds is celebrated by almost all Botanists for the Evacuation of Water in hydropic Cases, but it ought to be corrected on Account of its Violence. An Infusion of the Bark of the Root of *Ebulus* is a very violent Medicine, but the Decoction is milder, the Cathartic Virtue thereof being much diminished, according to *Fernelius*, in the Boiling. *C. Hoffman* says the Berries and Seeds are inferior in Efficacy to the Root of the *Ebulus*; and I suppose, says *Ray*, the tender Shoots and Leaves are, also, of a milder Nature. The Leaves of the *Ebulus* being bruised and applied, are no less effectual in curing Combuitions than those of the *Sambucus*. The Leaves boiled in a Lixivium, and externally applied in Fomentations, are of Service, also, in mitigating the Pain of the Gout, as we ourselves have in Part experienced; the Oil of the Seeds by Expression does the same more effectually; the Berries, as well as those of the *Sambucus*, dye the Hair.

For Affections of the Spleen, take of distilled Water of *Ebulus* to the Quantity of about four Ounces, for ten or twelve Days in the Morning fasting. This is an approved Prescription of *Du Val*, a Doctor of Physic, for Pains, Inflations, and Obstructions of the Spleen.

6. *Sambucus*; humilior; frutescens; foliis eleganter variegatis. *Suth.*

7. *Sambucus*; humilis; five *Ebulus*; folio laciniato. *C. B. P.* 456.

8. *Sambucus*; major; folio nigriori. *Boerb. Ind. Alt. Plant. Vol. 2.*

SAMBUCUS PALUSTRIS. A Name for the *Opulus*.

SAMBUCUS ROSEA. A Name for the *Opulus*; flore glabro.

SAMECH, in *Paracelsus*, according to *Rulandus*, is Tartar, or Salt of Tartar.

The *Balsamum Samech Paracelsi* is thus prepared.

Take of the best and purest Salt of Tartar, one Pound; reduce this to a strong Lixivium, with a sufficient Quantity of Rain-Water; then dissolve and boil in Rain-Water one Pound of Cream of Tartar; mix both Solutions, Drop by Drop, till you observe the Effervescence totally gone; then suddenly filtrate what is capable of Filtration, and evaporate to the Form of a Salt; and thus you have the *Balsamum Samech* of *Paracelsus*; which may be rendered more perfect in the following Manner.

Take of this inverted Salt of Tartar any Quantity; pour upon it a Quantity of alcohol of Wine, sufficient to rise three Finger-Breadths above it: Let them stand in Digestion till the Spirit of Wine has assumed a highly red Colour; then pour off the Spirit of Wine, and add a fresh Quantity of it. Continue this till you have enough of the Tincture; then mix all the Portions of the Tincture together, and evaporate to an Half; for by this Means is prepared a Medicine, which powerfully carries off the Tartar of the Blood by Urine, and effectually expels Sand and Stones from the Kidneys.

The Dose of the Salt is from half a Scruple to a whole Scruple, in some proper diuretic Liqueur; and the Dose of the Tincture from one Scruple to half a Dram. *Collectan. Chym. Leyd.*

SAMEN. Barley. *Rulandus.*

SAMIA TERRA. Offic. *Charlt. Foss.* 3. *Aldrov. Musc. Metall.* 239. *Matth.* 1391. *Worm.* 5. **EARTH OF SAMOS.**

This is an argillaceous, sebaceous, pinguious, and ponderous Substance, of a white or pale Colour, and astringent Taste. It was brought from the Island of *Samos*; and is recommended by *Dioscorides* for checking Fluxes. It agrees in Virtues with the *Lemnian Earth*.

SAMIES. An obscure Term in *Paracelsus*, which is said to import the secret Effect, or Influence of the Air.

SAMIUS LAPIS. The *Samian Stone*. It is found in the Island of *Samos*, and is used by Goldsmiths in polishing and brightening Gold; the white and ponderous is the best.

The *Samian Stone* is astringent and refrigerating; for which Reason, being taken inwardly, it is of Service in stomachic Disorders. It quickens and preserves the sensitive Organs [for *ambrosia* I read *ambrosia*], and used with Milk, is effectual in Defluxions upon the Eyes, and in Ulcers. Employed as an Amulet, it is supposed to accelerate the Birth, and to prevent Miscarriage. *Disse. Lib. 5. Cap. 173.* See **ALANA TERRA.**

SAMOLOIDES.

The Characters are;

It hath a Flower consisting of one Leaf, which is cut into four Parts almost to the Bottom, and expands in form of a Star. In the Centre of the Flower arises the Pointal, which is surrounded at Bottom by a Number of slender Threads, which are expanded, and accompanied by four Chives. This Pointal afterwards becomes an oblong Seed Vessel, which is Vivale, and contains flat Seeds.

Boerhaave mentions but one sort of *Samoloides* which is; *Samoloides*; quæ *Capraria*, *Curassavica*; *Cabritta vulgò dicta*. *H. A. 1. 79. Boerb. Ind. Alt. Plant. Vol. 2.*

This Plant is very common in *Jamaica*, and several other Places in the *West Indies*, where it hath been by some People dried and used as Tea, from whence it had the Name. In *Curacao* the Goats feed on this Plant, from whence the Inhabitants gave it the Name of *Cabritta*. But at present it is not used by any of the Inhabitants of *America* so far as I can learn. *Millers Dictionary Vol. 2.*

SAMOLUS.

The Characters are;

It hath a Wheel shaped Flower, consisting of one Leaf, which is cut into several Segments; the Pointal arises from the Empalement, and is fixed like a Nail in the Centre of the Flower; which uniting with the Empalement, is turned into a Fruit or Pod, opening at the Top, and inclosing many small Seeds.

Boerhaave mentions but one sort of *Samolus*, which is *Samolus Valerandi*. *J. B. 3. 791. Veronica, aquatica, folio subrotundo, non crenato. M. H. 3. 323. H. L. 622. Anagallis, aquatica, folio rotundo, non crenato, C. B. P. 252. Boerb. Ind. Alt. Plant. Vol. 1.*

This Plant grows wild in swampy Places, where the Water usually stands in Winter, and is seldom preserved in Gardens; it is an annual Plant, which flowers in June, and the Seeds are ripe in August.

It approaches in Resemblance to the *Veronica*, but these have a tetrapetaloid Flower, whereas the *Samolus* is pentaphylloidal; it is endued with a slight, nitrous and antiscorbutic Virtue.

SAMPARANTAM. The Indian Name for an orbicular Fruit, the same as the *Lobus Echinatus Molucensis*. *Ponæ. Lobus Orbicularis fuscus, spinosis Tuberculis obsitus, binos Phaseolos nigros continens. C. B. Clusius* supposes these to have some use in the *Indies*, because all those he saw had Holes bor'd thro' them, in order to be strung; but he could not discover for what they were employ'd.

SAMPSUCHINUM. A Compound Ointment describ'd in *Dioscorides. L. 1. C. 57.*

SAMPSUCHUM. See **AMARACUS.**

SAMSTRAVADI. See **JAMBOS.**

SANALIA. The Syrian Name for those Species of Tumors which the Greeks call *Melicerides. Aetius, Tetrabib. 2. Serm. 4. C. 15.*

SANAMUNDA. A Name for the **CARYOPHYLLATA**; **VULGARIS.**

SANCTUM LIGNUM. See **GUAIACUM.**

SANDARACHA. See **AMBRA.**

SANDARACHA GRÆCORUM. The same as **REALGAR.**

SANDARACHA, Officin. *Vernix Arabum.*

This is a Gum Resin, which flows from the *Cedrus Lycia major Dodon.* It is attenuant and resolvent, but is seldom used in Physic, though very much by the Varnishers, being first dissolved in Spirits of Wine. It is, also, used to embellish Writings, being first scattered on the Paper, and afterwards rubb'd with a Wolf's Tooth; for by this Means the Paper continues to bear Ink, and all Erasures disappear. It is sometimes confounded with Juniper Gum, and is very different from that kind of Orpiment, which was the *Sandaracha* of the ancient Greeks. *Geoffroy.*

SANDASTROS. A precious Stone call'd, also, *Garamatites*, mark'd with yellow Spots. It is esteem'd Cordial, and good to resist Poisons, being powder'd, and taken in the Quantity of half a Scruple, or a Scruple. But *Lemery* is of Opinion, that it only acts as an *Alkali*, and Absorbent.

SANDILZ ANGLORUM, five Anguilla de Arena. The foreign Writers upon the *Materia Medica*, in particular *Lemery*, have mistaken this Word. They mean Sand-Eels; a small Fish, dug out of the Sea Sand in many Parts of *Britain*. They are somewhat longer than a Finger, about as thick, of a blue Colour on the Back, and white on the Belly. They are used in Food, and are esteem'd aperitive.

SANDIVER. See **ARUNGIA VITRI.**

SANDIX. See **CERUSSA.**

SANDYX, in *Dioscorides, L. 5. C. 103*, is Ceruss calcin'd in a Pot, till it acquires the Colour of *Sandarach*, that is, *Realgar*.

SANGUICULUM. The same as **HÆMATIA.**

SANGUI-

SANGUIFICATIO. Sanguification; that is, the Elaboration of Blood.

SANGUIFLUUS. The Name of a poisonous Serpent; the same as *HÆMORRHIOUS*.

SANGUIFUCA. A Filtre. *Rulandus*.

SANGUINALIS HERBA. A Name for the *Polygonum*. Knot Grass.

SANGUINARIUS. The same as *ENÆMOS*.

SANGUINEA. Nitre. *Rulandus*.

SANGUINEUS. Sanguine; that is, full of red Blood.

SANGUINIOLUM, in *Paracelsus*, is a Sign in the Urine of a future Exulceration, and Apostemation.

SANGUIPURGIUM. A slight Fever, thus call'd by some Authors, because it is thought to purge the Blood.

SANGUIS. Blood.

As the Welfare of the Animal Oeconomy depends so much upon the Blood, and its due Circulation thro' the Vessels adapted to convey it to all Parts of the Body, it will be of some Importance to examine the Nature of this Fluid, and enquire into the Vital Powers by which it is elaborated, and render'd fit to support the Body in a State of Health.

All our Food consists of Animal or Vegetable Substances, Salt alone excepted, and Water, and many of these require a Culinary Preparation, in order to render them the more easily dissolvable by the Actions employed for their Resolution. The Business of Cookery, therefore, is to diminish the Cohesion of the Parts of Alimentary Substances, and partially digest them before they are taken into the Mouth; and to harden them by Dressing, as is sometimes done, is an Error of the worst Consequence with respect to Health, however it may indulge the Palate.

Aliments, then, prepar'd, or crude, are taken into the Mouth, where they are comminuted by chewing, mix'd with the *Saliva*, and prepar'd for a future perfect Digestion, towards which this is the first Step. Manducation, or Chewing is performed by means of the *Biventer*, or *Digastric* Muscles, which acting, draw the Chin towards the Breast, and open the Mouth; which again is closed by the Contraction of the Temporal Muscles, the Masseters, the external Pterygoide, and Internal Pterygoide Muscles, which being very strong, press the Jaws together with a prodigious Force.

The first Part of Manducation is, the inciding, or cutting the Aliment with the fore Teeth, which is called biting; the Food is then apply'd to the double Teeth call'd Grinders, by the varied Actions of the Buccinators, the Orbicular Muscle of the Lips, the Zygomaticks, the *Elevator Labiorum Communis*, the *Elevatores Labii Superioris propriæ*, the *Elevator Labii inferioris proprius*, the *Depressor Labii inferioris proprius*, the *Depressor Labiorum communis*, the *Obliquus Labii inferioris*, and the *Platysma Myoides*; when these act all together, the Cheeks and Lips are apply'd so closely to the Teeth, that no Part of the Aliment, whether solid or Fluid, can fall from betwixt the Teeth externally; but when they act separately, the Aliment is apply'd to the Teeth in such a manner as the Circumstances most require. The Tongue, also, has a very considerable Share in applying the Aliment properly to the Teeth. The Action of Mastication is of so much Importance to Health, that *Hippocrates* long ago remarks, that those whose Teeth are good, live to a very old Age. It is therefore a very great Error to swallow the Aliment, before it is duly masticated.

During the Action of Mastication, the comminuted Aliment is intimately mix'd with the *Saliva*, discharg'd from the Parotid Glands, the internal Maxillary Glands, the sublingual Glands, from innumerable Emissaries in the Tongue, Palate, Gums, and Lips, and from Glands situated in the anterior and inferior Parts of the Palate, the Uvula, and from the Tonsils. This *Saliva* is a thin, pellucid Fluid, which does not concrete by Heat; is almost void of Taste and Smell, and when agitated forms a tenacious Froth; it is separated by the Glands from the pure Arterial Blood, and during Hunger, is more copious, fluid, and acrid; after long-fasting it is very acrid, penetrating, detergent, and resolvent; it excites and increases Fermentation in farinaceous and succulent vegetable Substances, and Syrups; in both Men, and Brutes in a healthy State, it is swallow'd during Sleep; and if wantonly spit out, Loss of Appetite, Indigestion, and Atrophies, are hence excited; it consists of a pretty large Proportion of Water and Spirits, and a small Quantity of Oil, and Salt, which are united into a natural Soap, very well suited to attenuate the Aliment, and dispose it to a perfect Solution.

Hence the Error is evident which those commit, who lavish this salutary Fluid, and sollicit the Discharge thereof by smoking, or chewing Tobacco, or by any other Means.

The Alimentary Mass thus masticated, and moisten'd, is thrust towards the *Fauces*, whilst the Teeth are closed, the Aliment confin'd within them by the Contraction of the

Muscles of the Lips and Cheeks, and the Tongue is so directed, as to occupy all that Space betwixt the Teeth of the superior Jaw, and the Palate. Mean time the *Genioglossi*, *Styloglossi*, and *Ceratoglossi*, acting successively, from a Cavity at the Root of the Tongue, under the pendulous Veil of the Palate, the Uvula, and Tonsils; but above the *Larynx*, and *Pharynx*, and before the Membranes which cover the Bodies of the Vertebrae of the Neck, and posterior Muscles of the *Pharynx*, and bring thither all the Aliment to be swallowed down. Then the Root of the Tongue is expanded, elevated, and brought forwards by the Action of the *Genioglossi*, *Myloglossi*, *Geniohyoidæi*, *Mylohyoidæi*, *Stylohyoidæi*, whilst the *Os Hyoides* is applied to be pendulous Veil of the Palate, and the Foramen leading to the Nose is closed. At the same time, the *Os Hyoides* and *Larynx* are elevated by the Contraction of the *Thyrohyoidæus*. Hence the Aliment to be swallowed presses upon the *Epiglottis*, whilst the *Uvula* is depressed by its proper Muscles, and the Chink of the *Glottis* closed. At the same time, the *Genioglossi*, *Myloglossi*, *Geniohyoidæi*, and *Mylohyoidæi*, move the Root of the Tongue, *Os Hyoides*, and *Larynx*, forwards; and thus open the *Pharynx*, which is annex'd to the Root of the Tongue, the *Os Hyoides* and *Larynx*. And thus the Fauces are opened, and Room made for the Aliment to be swallowed; especially when, at the same time, the external Pterygoide Muscles, and some Fibres of the Masseter, draw the intire inferior Jaw forwards, thus making more Room, and bringing forwards the *Glossopharyngæi*, *Hyopharyngæi*, *Thyropharyngæi*, and *Cricopharyngæi*. Thus the superior Part of the *Pharynx* is dilated, and applied to what is to be swallowed, whilst the superior Orifice of the *Pharynx* closes, the *Stylopharyngæi* being contracted, and *Oesophagæi* relaxed, for the farther Passage of the Aliment. At the same time, the internal and external Muscles of the *Gargareon* act in such a manner, as to elevate and expand the Veil of the Palate, and to prevent any Particles from falling either into the Chink of the *Glottis*, or Passage to the Nose. The very instant afterwards, all the contracted Muscles abovementioned are suddenly relax'd, and both the *Sternohyoidæi*, *Sternothyroidæi*, and *Coracocervicohyoidæi*, act; by which Mechanism the broad posterior Surface of the *Cricoidæ* Cartilage is pressed downwards and backwards against the *Pharynx*. And at the very same Moment, the *Glossostaphylini*, *Pharyngostaphilini*, and *Azygos* Muscle of *Morgagni*, act with a kind of convulsive Motion, and great Force; so that the Veil of the Palate then distended, and expanded upwards, is suddenly drawn downwards, in such a manner as to press the Aliment into the Orifice of the *Oesophagus*, now elevated, and dilated by the Contraction of the *Glossostaphylini*, and *Pharyngostaphylini*. With these concur the same kind of convulsive Motion in the *Glossopharyngæi*, *Hyopharyngæi*, and *Thyropharyngæi*; by which the Tongue, *Os Hyoides*, *Larynx*, and posterior Part of the *Pharynx* are so pressed together, as to assist, at the same time, with considerable Force, the Intrusion of the Aliment into the Orifice of the *Oesophagus*. Thus the *Pharynx* is closed, whilst the *Oesophagus* contracts, and the Aliment is retained in the Cavity of the *Oesophagus*, under the *Pharynx*, and is immediately farther protruded into the Stomach, by the Contraction of the longitudinal and orbicular Fibres of the muscular Coat of the *Oesophagus*.

By this exquisite Mechanism is the Aliment conveyed to the Stomach. Hence, however, it is evident, that many Disorders in these Parts may interfere with Deglutition, render it laborious, or utterly subvert it; in particular, Tumors in the Parts subservient thereto, and Palsies of the Muscles. Deglutition may, also, be prevented, by a continued swallowing of dry Substances: For by this the *Mucus*, which lines the Inside of the *Fauces*, *Pharynx*, and *Oesophagus*, is abraded, and wasted; and thus the Organs, subservient to Deglutition, are rendered too dry to perform their respective Offices. When the Uvula is lost, or the Veil of the Palate slit, Deglutition is incommoded; in the first Case, the Person thus affected is subject to a Cough when he attempts to swallow, because a Part of the Aliment is subject to fall into the *Larynx*; in the second Case, the Aliment to be swallowed passes into the Nostrils.

As soon as the Aliment has passed into the Stomach, the superior Part of the inferior Muscle of the Diaphragm contracts upon the inferior Part of the *Gula*, which passes thro' it, and thus closes up the Stomach.

The Food thus moistened, and at the same time full of Air, deposited in the close, moist, and warm Stomach, would there spontaneously begin to ferment, or putrify, according to the different Materials of which it consisted; and either Way would be greatly changed, either into an Acefcent, Alcalcescent, rancid, or glutinous Mass. But the villous Coat of the Stomach, which immediately embraces the alimentary Mass, supplies it perpetually, by innumerable Emissaries, with

a thin, pellucid, frothy Humour, abounding with Spirits, and a little Salt, which, in the most voracious Animals, is neither alkaline nor acid, but somewhat acrid, after long fasting; and with a more viscid and mucous Humour, discharged into the Cavity of the Stomach, from the Emissaries of certain Glands destined for the Secretion thereof. See COELIA.

If it be considered that the alimentary Mass is moistened by the Saliva brought into the Stomach perpetually, and that in large Quantities, from the Mouth, *Fauces*, and *Oesophagus*; that the Stomach dilutes it by the Humours abovementioned; that the Relicks of former Aliment is mixed and agitated with it; that the Air contained in the alimentary Mass rarifying, divides it intimately; and that the Heat of the Part excites and promotes the Action of all these, 'tis evident that the Food must in the Stomach be macerated, diluted, swell'd, attenuated, fermented, and dissolved, and thus rendered fit to mix with the Animal Juices, and pervade the minute Canals of the Body.

Besides these, the Action of the muscular or carnos Coat of the Stomach must be taken into Consideration, which closely embraces all the Contents of this Organ, mixes them and grinds them together by a Sort of vermicular Motion, exposes them to the Action of the surrounding Parts, retains the more gross Parts, and expels the more Fluid towards the *Pylorus*, and thence into the *Duodenum*.

Several other Circumstances must be considered as promoting the Digestion of the Aliment in the Stomach; as, First, the Heat communicated to this Organ by all the surrounding Parts. Secondly, the perpetually-repeated Strokes of innumerable Arteries in the Diaphragm, Omentum, Spleen, Liver, Pancreas, Mesentery, and Peritonæum, upon the Stomach. Thirdly, the violent Vibrations of the *Aorta*, situated immediately under the Stomach. Fourthly, the Action of the nervous Fluid, with which no Part is more copiously supplied than the Stomach; a Circumstance not yet perfectly understood. Fifthly, the perpetual Compressure of the Stomach, and all the abdominal Viscera, by the reciprocal Action of the Diaphragm and abdominal Muscles, during Inspiration and Expiration.

The Effects of all these Causes, acting with united Force, must be,

First, To levigate, dissolve, and intimately mix the most easily mutable Parts of the Aliment, and to press them thro' the *Pylorus* into the *Duodenum*.

Secondly, To retain the more tenaceous Parts; and by a Continuation of the same Causes, to produce the same Effects upon them.

Thirdly, To render juiceless the Membranes, Tendons, Cartilages, and Bones of Animals; and the Skins, Filaments, and harder Parts of Vegetables; and thus to expel them out of the Stomach, in order to their being discharged by Stool.

It is worthy of Remark, that all the Juices employed in bringing about the Digestion of the Aliment, are neutral and saponaceous, and neither alkaline nor acid. Hence appears the Absurdity of those idle Dreams of Authors relative to Ferments, and alkaline or acid Menstruums in the Stomach, than which nothing is more absurd.

We have thus conducted the Aliment to the Stomach, whence it is expelled into the *Duodenum*, where it undergoes some considerable Alterations, from the Action of that Intestine, and of the Bile and pancreatic Juice thereon. For which see the Articles DUODENUM, BILIS, CHYLUS, and PANCREAS.

In the Intestines the Chyle is separated from the *Fæces*, which are expelled by the peristaltic Motion of the Intestines thro' the *Arms*, whilst the same peristaltic Motion impels the elaborated Chyle into the Orifices of the lacteal Vessels, which is afterwards convey'd to the Receptacle of the Chyle, and thence through the thoracic Duct to the left subclavian Vein, where it mixes with the Mass of Blood, and by the *Vena Cava Descendens* passes to the right Auricle of the Heart.

The *Vena Cava Ascendens* and *Descendens* unite in one, and open into the right Auricle, where they unite. There is a little Protuberance made by their Coats on the Inside of the Canal, like an Isthmus, which directs the Blood both of the one and the other into the Auricle, and so hinders them from rushing one upon another. The right Auricle, in its Diastole, receives the Blood from the *Vena Cava*, which by its Systole is thrust into the right Ventricle: (For the tendinous Circle, which is at the Mouth of the Cava, contracts and hinders the Blood to return into it) which at the same time is in its Diastole. In the Systole of the right Ventricle, the Blood is thrust into the Pulmonary Artery: For it cannot return into the Auricle, because of the *Valvula Tricuspides*, which communicates with the *Vena Pulmonalis*, which carries back the

Blood into the left Auricle, which in its Systole thrusts the Blood into the left Ventricle, which is then in its Diastole. In the Systole of this Ventricle the Blood is thrust into the *Aorta*, (for it cannot return into the Auricle, because of the *Valvula Mitrales*) which carries it through all the Body. Now the *Aorta*, when it comes out of the Heart, ascends a little upwards, and then turns downwards to form the descending Trunk; and from the upper Side of this Turning the cervical and axillary Vessels arise. By this Artifice the Blood collides against the Sides of the *Aorta*; its Force is broken; Part of it is taken in by the Mouths of the ascending Branches; but its greatest Part is directed downwards.

The Blood conveyed by the Arteries, is carried to corresponding venous Canals, and so again to the right Auricle of the Heart.

Let us now consider which Way the Blood circulates in the Foetus; for this you must observe, that in the right Auricle, on the lower Side of the Protuberance of the Cava, just opposite to the Mouth of the *Cava Ascendens*, there is a Hole called the *Foramen Ovale*, which opens into the *Vena Pulmonalis*. This Hole has a Valve, which suffers the Blood to enter the Vein, but hinders it to come back again. There is likewise a Passage, or Canal, which runs from the Trunk of the Pulmonary Artery to the Trunk of the *Aorta*.

Now the Blood, which comes from the Placenta, by the umbilical Vein, into the *Vena Portæ*, is sent into the Cava by a Canal, which goes straight from the Trunk of the *Portæ* to the Trunk of the Cava in the Liver. This ascends the *Vena Cava*, and is directly thrown through the *Foramen Ovale* into the Pulmonary Vein, which carries it into the left Ventricle, which throws it into the *Aorta*, to be distributed through all the Body. But the Blood, which comes down the *Vena Cava Descendens*, is diverted by the Isthmus of the Cava, from the *Foramen Ovale*, and falls into the right Ventricle, which thrusts it into the Pulmonary Artery, from whence Part of it is immediately carried by the communicating Canal into the *Aorta*. The Reason of these Passages in a Fœtus was, because the Blood could not all pass thro' the pulmonary Blood-Vessels, they being too much compressed by the Substance of the Lungs; but as soon as the Child is born, and the Pressure is taken off from the Blood-Vessels by the Distension of the Lungs with Air, the Blood finding a free Passage thro' the Lungs, runs no more by the communicating Canal, whose Direction, likewise, is not so favourable for its Reception as before; because the pulmonary Artery being stretch'd out with the Lungs, makes it go off at right Angles, and therefore it dries up. And now the pulmonary Veins being distended with the greater Quantity of Blood, which it receives from the Lungs, the Valve of the *Foramen Ovale* is pressed close to its Sides, denying a Passage to the Blood from the Cava, to be mixed with the rest of the Blood. By this you see, that the Blood, which comes from the *Vena Cava Descendens*, passes only through the left Ventricle, whilst the Blood which comes from the *Cava Ascendens* passes only through the right Ventricle.

As the Blood is the only Treasure of Life, so long as it is possessed of a laudable Quality, and in a due Quantity carried through the vascular Parts of the Body, so 'tis necessary the Physician should, by all proper Methods, investigate its Nature and various Mixtures in different Constitutions and Diseases. But nothing has a more direct and immediate Tendency to render us acquainted with the genuine and real Nature of the Blood than a chymical Analysis of it.

In order therefore to this, we must first by statical Experiments discover the Proportion between the solid and fluid Parts of the Blood, both in a fluid and morbid State. The Estimate is to be made in the following Manner: The Blood taken from the Vein is first to be weighed, and then put into a Tin Vessel, in which it is to be dried; then the remaining dry Powder is again to be weigh'd, by which Means the Quantity of the solid and fluid Parts of the Blood may be exactly determined. The larger the Quantity, therefore, there is of a solid Matter, the more thick and tenacious the Blood is; a Circumstance which surprisingly favours the Generation of Obstructions.

We are taught by the Laws of Mechanics, that three of the fluid, and only one of the solid Parts of the Aliments, are necessary to the Preservation of Health. Hence we justly infer, that there ought to be a due Proportion between the Aliments and Drink, since the former by no means contain a due Quantity of Fluid or Moisture.

In the above-mentioned Experiment, 'tis observable that the aqueous Part of the Blood is far sooner evaporated than the same Quantity of any Water placed in a similar Vessel, and exposed to the same Degree of Heat; a certain Proof that the Water mixed with the Blood and vital Humours, is not gross and crude, but highly thin and volatile. Notwithstanding

ing this Circumstance, the human Blood is specifically heavier than Water, on Account of the solid Principle it contains; for if a Vessel full of Water weighs nine Ounces and six Drams, upon pouring out this Water, and filling it with human Blood, its Weight is observed to amount to ten Ounces and two Drams. So that in this Case, the same Quantity of human Blood surpasses the like Quantity of Water by more than half an Ounce.

If the Serum floating on human Blood is put into a Silver Spoon, and held upon live Coals, it is like the White of an Egg, formed into a hard and fissile Body; a certain Proof that this Serum is turgid with a large Quantity of nutritious Juice. And, like the White of an Egg, is it neither of an alkaline or an acid Nature, because it neither produces an Effervescence with Acids nor Alcalis. 'Tis, therefore, no Wonder that it should be coagulated by a Solution of Alum, Oil of Vitriol, and highly rectified Spirit of Wine. Hence 'tis obvious how prejudicial these Liquors must be to the vital Texture and Motion of the Blood.

Blood newly taken from the Vein is totally resolved into Serum, when exposed to a gentle Heat, which is so far from rendering it more solid, that it gradually and successively resolves the Coagulum. If this Heat is continued for a considerable Time, the Blood is still rendered thinner by its Continuance, and, just like the White of an Egg, begins to grow putrid, in which State it not only has a fetid Smell, but also produces an Effervescence, when mixed with Acids. Hence 'tis obvious, that an alkaline Salt is produced by putrefaction. From this Experiment we learn, that the Blood and Serum, by the natural Warmth of the Body, in process of Time degenerate into Excrements, such as Sweat and Urine, and that an Accession of new Chyle is always necessary; otherwise, a long continued Hunger may prove the Cause of Death.

When human Blood is subjected to Distillation from a Glass Vessel, exposed to a gentle Heat, a large Quantity of Water is yielded, which has neither the Appearance of an Acid, an Alkali, nor any spirituous Principle. Hence 'tis obvious, that the spirituous Principle of the Blood is highly moveable, but by no means sulphureous, phlogistic, or of an alkaline and volatile Quality.

If after abstracting the Phlegm of the Blood from the Cucurbit by a very gentle Heat, the coagulated Mass left in the Bottom is put into a Glass Retort, and exposed to a brisk Fire, there is first obtained a yellowish Spirit, and a yellow Oil, after which a volatile white Salt adheres to the Sides of the Vessel in various Figures. Then, upon increasing the Fire, a gross Oil which falls to the Bottom, is obtained, and a large Quantity of volatile Salt ascends.

From the Caput Mortuum no fixed Salt is obtained, except perhaps common Salt, which generally happens if the Person has used large Quantities of that Salt. When the Caput Mortuum is committed to an open Fire, a small Quantity of a whitish Earth remains.

If an equal Quantity of Quick Lime is added to human Blood before Distillation, then, a more pure volatile Salt is obtained, or 'tis rather better to rectify all the Substances obtained from Blood, with Quick Lime.

But we are principally to advert to that Experiment, in which, without the Assistance of Fire, which destroys the primitive, and induces a new Texture, by an Affusion only

of warm Water, the Blood is resolved into its Elements; for if the Blood is dried, reduced to a Powder, and put into warm Water, this Water becomes reddish, and there remains a viscid Matter, of a brownish Colour, which cannot be dissolved by Water. And this Matter, indissoluble on account of its glutinous Substance, is twice as large in Quantity as the Matter capable of Resolution. If it is dried, there remains a Powder of a dark Colour, which easily takes Flame, a certain Proof that it consists of subtil sulphureous Parts, whereas the Remainder consists of more fixed and terrestrial sulphureous Parts.

These two Substances in the Blood may be discovered by the Eye, if Blood flowing from a Vein is received into tepid Water, which is soon tinged with a reddish Colour, whilst in the Bottom of the Vessel there remain white Flakes, composed as it were of Spiders Webs, and incapable of being resolved by Water. Nor is it to be doubted that a Blood thus abounding with such a gross Substance, is very subject to generate polypose Concretions, and produce Obstructions of the Vessels. *Hoffman. Obs. Phys. Chym. Lib. 2. Obs. 21.*

For an Illustration of the Texture and Consistence of the Blood, Dr. Langrish took the Pains to examine it in a statical Way, in every Stage of an acute continual Fever, where Blood could be drawn with Safety; in order to discover the different Proportions of Serum and Gore, and the different Powers of Cohesion between the red Globules which constitute the Crassamentum.

But before we proceed, continues the Doctor, to the Experiments themselves, it may be proper to advertise the Reader of the Manner in which they were made. First, I always took Care to bleed into a Porringer as near the same Shape and Size as possible; because a larger Surface of Blood should not be exposed to the Influence of the Air in one Trial than in another. Secondly, all the Blood was received in one Porringer, because I have found by Experience, that a Pound of Blood does not separate so much Serum when divided into several Parcels, as when contained in one Vessel. Thirdly, I always set the Blood in a cool Place, and after it had stood twenty four Hours, I very carefully weighed the Serum and Cruor separately, in order to find their different Proportions. Fourthly, I took a very thin Glass Tube, twelve Inches long, and one Third of an Inch in Diameter, and having hermetically sealed up one End of it, I blew it out to an obtuse Point, about the Bigness of a middling Pea. Now this Point being set upon the Crassamentum, the Weight of the Tube was not of itself sufficient to press through; and but very seldom when filled with Water; so that my Way of trying the Cohesion of the Gore, was to pour Mercury into the Tube, till it was just heavy enough to cut its Way through; and as the Tube was exactly graduated, I could by these Means very nicely determine the Power of Cohesion between the Globules which constituted the Crassamentum.

N. B. Every Degree was one Eighth of an Inch; so that when it is said in the following Table, *Degrees of Cohesion*, N. 48. we mean that the Cruor was so tough as to be equal to the Weight of six Inches of Mercury, besides the Weight of the Tube, which was three Drams, and fifty six Grains.

The Age of the Person.	The Day of the Disease.	The Symptoms.	The Quantity of Blood taken away.	The Quantity of Serum.	The Taste and Colour of the Serum.	The Colour and Consistence of the Crassamentum.	What Days the Crises happened, and by what Outlets.
A Man aged 45.	IIId	Intense Heat, Thirst, Vomiting, Looseness, excruciating Pains in the Head, Back, and Loins, and clear, pale, limpid Urine.	13 Ounces and two Scruples.	3 Ounces, 3 Drams, and 1 Scruple.	Something more brackish than healthy Serum, and of a flaming yellow.	Very florid, except here and there a blue Speck. Degrees of Cohesion 34.	On the seventh Day by Sweat and turbid Urine.
A Woman aged 32.	III	A quick full Pulse, extreme Pain in the Head and Loins, and delirious.	14 Ounces and 1 Dram.	3 Ounces, 5 Drams, and 2 Scruples.	Almost insipid and of a wheyish Colour.	Extremely florid. Degrees of Cohesion 26.	On the ninth Day by profuse Sweats and thick Urine.
A Man aged 23.	IVth	A foul, moist Tongue, crude Urine, strong full Pulse, Delirium, excessive Heat, and frequent Vomiting.	15 Ounces 2 Drams, and twenty-five Grains.	3 Ounces, 1 Dram, and 1 Scruple.	Quick, saline Taste, and straw-coloured.	Exceeding florid. Degrees of Cohesion 38.	On the 7th and 8th Days by an Hemorrhage at the Nose, plentiful Spitting, turbid Urine, and moderate Sweats.
A Man aged 42.	IIIId	Great Incalcescence, strong full Pulse, a Pain in the Head and Back, giddy and nausea Ventriculi.	14 Ounces, 1 Dram, and 1 Scruple.	5 Ounces, 2 Drams and 16 Grains.	Brackish, and of a Citron Colour.	Of vivid red, with here and there a fizy Speck upon it. Degrees of Cohesion 43.	Died on the 7th Day, by turbid Urine, and profuse Sweats.
A Boy aged 12.	IIId	A Phrenzy with extreme Talkativeness, a wild Stare with his Eyes, a dry brown Tongue, a thick black Film or Skin adhering to the Teeth and Lips, Subfultus, and a quick labouring Pulse.	6 Ounces 1 Dram.	1 Ounce, 16 Grains.	Very Salt, and of a bright yellow Flame-Colour.	A thin white Coat at Top, and florid underneath. Degrees of Cohesion 48.	Died on the 7th Day.
A Boy aged 10.	IVth	A flushed Countenance, an extreme quick full Pulse, a brown parched Tongue, with a white List round it, a Delirium, high-coloured Urine and costive.	6 Ounces. 2 Drams, 12 Grains.	1 Ounce, 3 Drams, 1 Scruple.	Brackish, clear, and Flame-coloured.	Of a vivid Colour. Degrees of Cohesion 23.	On the 8th and 9th Days, by moderate Sweats, and five or six loose Stools.
A Girl aged 14.	IIIId	Exceeding delicious, a full quick Pulse, pale limpid Urine, a dry parched Skin, and costive.	7 Ounces, 2 Scruples.	2 Ounces, 14 Grains.	Very pungent, and extremely yellow.	Of a vivid Red. Degrees of Cohesion 26.	On the 10th Day, by spitting, turbid Urine, and swelled Legs.
A Man aged 34.	Vth	A burning Heat, unquenchable Thirst, general Uneasiness, Watchings, full Pulse, and high-coloured Urine.	12 Ounces 1 Dram, 16 Grains.	2 Ounces, 15 Grains.	Quick saline Taste, and of a bilious Colour.	Very florid. Degrees of Cohesion 56.	On the 11th and 12th Days by profuse Sweats, turbid Urine, and Spitting.
A Man aged 26.	III	Giddiness, sick Fits, great Incalcescence, a strong full Pulse, Pains in the Head and Back, and clear limpid Urine.	14 Ounces, 2 Drams.	4 Ounces, 36 Grains.	No difference to be perceived from healthy Serum.	Of a good Colour. Degrees of Cohesion 22.	On the 6th Day by eight or nine loose Stools.
A Woman aged 22.	IIIId	Excruciating Pains in the Head and Loins, extreme Thirst, inward Burnings, dry parched Skin, and strong full Pulse.	12 Ounces, 1 Dram, 1 Scruple.	3 Ounces, 8 Grains.	Pungent, saline, and draw-colour'd	Exceeding vivid. Degrees of Cohesion 36.	The 8th Day by the menstrual Discharge, and moderate Sweats.
A Man aged 24.	Vth	A very strong, quick, full Pulse, Vertigo, bilious Vomiting, intense Heat, and unquenchable Thirst.	14 Ounces, 26 Grains.	3 Ounces, 5 Drams, 1 Scruple.	Much more brackish than healthy Serum, and deeper coloured.	Very florid. Degrees of Cohesion 28.	The 11th Day by profuse Sweats and thick Sediment in the Urine.
A Man aged 46.	IIId	A brown, dry, parch'd Tongue, Pains in the Head and Back, general Uneasiness and full Pulse.	12 Ounces, 6 Drams.	3 Ounces, 1 Dram, 12 Grains.	Quick, pungent, and yellow.	A thin blueish Film at the Top, and florid underneath. Deg. of Cohesion 33.	The 9th Day by Spitting, Sweat, and thick lateritious Sediment in the Urine.
A Man aged 21.	IVth	A quick full Pulse, great Thirst, Pain in the Head, giddy, clear limpid Urine.	10 Ounces, 2 Scruples, 8 Grains.	2 Ounces, 3 Drams, 15 Grains.	Saline and bilious.	Very vivid. Deg. of Cohesion 28.	The 5th Day by an Hemorrhage at the Nose, and moderate Sweats on the 6th.
A Man aged 38.	IIId	Great Incalcescence, extreme Thirst, bilious Vomiting, a parched Skin, and strong quick Pulse.	15 Ounces, 2 Drams.	3 Ounces, 4 Drams, 6 Grains.	Pungent, and very yellow.	A delicate Red. Degrees of Cohesion 34.	The 7th Day by profuse Sweat.
A Girl aged 15.	XII	A Phrenzy, subfultus Tendinum, a full labouring Pulse, intense Heat, and a parched brown Crust upon the Tongue.	6 Ounces.	1 Ounce, 3 Drams.	Very salt, and of a bright Flame-colour.	Florid and without a Speck upon it. Degrees of Cohesion 28.	The 22d and 23d Days by moderate Sweats, Spitting and very turbid Urine.
A Man aged 36.	XIII	A full heavy Pulse, luvivous Urine, a slight Pain in the Side, a quick and difficult Respiration, a black parch'd Tongue, intense Heat, subfultus Tendinum, and delirious.	8 Ounces, 1 Dram, 16 Grains.	2 Ounces, 22 Grains.	Exceeding pungent, and of a deep bilious Colour.	A thin Buff-coat at Top, and more dusky than ordinary underneath. Degrees of Cohesion 64.	Died on the 19th Day.

I must beg Leave to take Notice of the Reasons which induced me to draw Blood from one Patient on the twelfth Day, and from another on the thirteenth Day of the Disease; especially considering the great Usefulness of Bleeding in the Beginning of this Distemper, and the Danger of doing it towards the Crisis. 1. I was not consulted for either of them till those Days on which I drew Blood. 2. No Evacuations of either Kind had been made before these Times. 3. As to the Girl it was about the Time of Age that we might expect the menstrual Purgations; Pains in her Back, Giddiness, Retchings to Vomit, and the like Symptoms preceded this Illness; her Pulse was full and weak, and seemed to struggle for want of Room. 4. As to the Man, the Day before I visited him, he had taken an Ounce of the Cortex, his Apothecary mistaking a little Remission, for a true Intermission of the Fever; Subtusities, intense Heat, a difficult Respiration, and a slight Pain in the Side soon followed the Use of the Cortex; and for these Complaints I found him taking Boluses, of Lapis Contrayerva, Saffron, Castor, Sal Volatile succinatum, and the like. By this Treatment I presume, he became delirious, his Countenance was flushed, his Tongue black, and dry, his Urine extremely high-coloured, his Pulse full, heavy and something unequal. These were the Symptoms, and these, in my humble Opinion, were sufficient Indications for Phlebotomy, though so late in the Disease. I must add, that I never saw the Blood stream out so violently, and with so large an Arch as it did from the Arm of the Man; and had not my Timidity prevented taking away more Blood, I am persuaded, I had stood a better Chance for the Recovery of my Patient.

From these Experiments it plainly appears, that in ardent Fevers, the red Globules exceed the Proportion which they ought to bear to the serous Part of the Blood: For according to Mr. Boyle's Experiments and Observations of the Weights of the Crassamentum and Serum, after they have separated one from another, it appears that the Quantity of Serum which may be poured off from the Crassamentum, is about one Half of the whole Mass. And indeed, from Experiments which I have purposely made on the Blood of three young Men in perfect Health. I find it to be nearly the same; the Serum in all three Trials, much exceeding one third of the whole Mass, though I cannot say that in any of them, it fully arrived to one Half.

Here we may also observe the different Consistence of the Cruor in a febrile State, from that in Health. The Degrees of Cohesion in the Blood of the three young Men just mentioned, were eight, nine, twelve, or the most viscid of their Blood gave way to the Weight of one and a half Inch of Mercury; whereas we find in the Tables above, that the Cohesion of the Globules which constituted the Crassamentum, was sometimes equal to a Column of Mercury seven or eight Inches in Height.

Since therefore the Blood in acute Fevers is more than ordinary viscid and tenacious, and contains too great a Quantity of red Globules, notwithstanding the usual most fluid Excretions are greatly diminished, even from the very Beginning of the Disease; let us enquire by what Means this Alteration is most likely to be produced.

That accurate Observer of Nature *Leuwenhoek* has shewn us, that the largest red Globules are made up of six smaller Spheres clustered together in a very regular manner; and that so nicely, that in a perfect Globule the Composition comes to be perceptible. He likewise assures us, that he saw Globules in the Blood, much less than those which composed the red Globules; whence we may reasonably conclude, there are several Orders of Globules in the Mass of Blood, the smallest of which, if properly united to others, and those again to the largest Order, exhibit red Globules. And on the contrary the largest Globules may be broken down into their compounding smallest Globules, and by that Means come again under the Denomination of Lymph or Serum.

Hence we may conclude, that whatever will dispose the smallest Order of serous Globules to aggregate or unite into larger ones, and those again into such as are still larger, will at last produce red Globules. Now we know of nothing more likely to produce this great Change than strongly attracting, saline and sulphureous Particles, together with Heat, which invigorates their attractive Power, and thereby greatly conduces to the fixing and uniting the smallest Globules to each other.

It is certain that most of the Antecedents of Diseases are disposed to charge or impregnate the Blood with saline and sulphureous Matter; and indeed, I can give no other Reason why one Man shall catch cold, and have a Fever, and another, perhaps, shall have the perspiratory Ducts more fully stop, and yet have only a serous Defluxion, from the Nose, Eyes, or Lungs, but because in one the Blood is more impregnated, by an intemperate Use of the Non-naturals, with saline and

sulphureous Particles, than in the other; and for that Reason the Juices are more likely to become hot, acrid, grumous, and fit for the Production of a Fever.

To be a little more explicit: Let us reflect on the different States of the Blood under different Diseases. In the Leucophlegmatia, Anasarca, Ascites, and indeed in all Distempers where the vital Powers are depressed, the Pulse weak, low, and slow, and the Heat of the Body is much below the natural Standard; here, I say, we may observe how very subject the Globules of the highest Order are to lose their Contexture, and to be broken down into the smaller compounding Globules, so as to increase the Quantity of Serum. Whereas in ardent Fevers, where the saline acid sulphureous Particles abound too much, where the vital Heat is augmented above the Healthful Standard, and all the Powers of the Body exert themselves to the greatest Degree; there we may observe the smallest compounding Globules intimately united into larger ones, whereby the red Globules increase, and the whole sanguineous Mass becomes more dense, heavy, viscid and tenacious.

Hence we have good Reason to conclude, that the most necessary Requisites towards forming of red Globules in the Blood, and causing these red Globules to coalesce, are a certain Proportion of saline and sulphureous Particles, and a certain Degree of Motion and Heat; whereby the Constituent Parts of the Blood are made to attract each other more vehemently.

Heat, which coagulates the White of an Egg, has not its Effect merely by evaporating the most fluid Part, and thereby suffering the other Parts to approach nearer and nearer to each other; but it performs this sudden and wonderful Change, by increasing the attracting Power of the saline and sulphureous Particles, whereby the smaller Order of Globules run into each other, and form larger ones; and these again join with others till the whole Mass is consolidated.

Thus it is with the Blood; a proper Quantity of saline and sulphureous Matter, and a moderate Degree of Heat are perfectly necessary towards maintaining a natural and healthy Crasis; but whenever they are increased above, or decreased below the natural Standard, either in regard to their Quantity, or Motion, the Blood will become too grumous, and florid, or too thin, limpid, and pale.

In regard to the Action of the Vessels; if they have any Share in compressing and uniting the serous pellucid Globules of the Blood, and forming them into red Globules, we may reasonably conclude, that in ardent, continual Fevers, where the Action of the whole vascular System is greatly increased, the Globules will be most of all compacted and joined together.

From the whole it appears highly reasonable to believe, that a mere Plethora of languid, inert, unactive Matter, is not the Foundation of ardent Fevers; but that the Blood at such Times is too plentifully stored with acrid, sharp, irritating, strongly attracting, saline, and sulphureous Particles. However that nothing may be wanting towards investigating the true Causes of this Disease; I have thought it worth while to separate the constituent Parts or Principles of the Blood, and to take a just Estimate of their several Proportions.

By proper Distillations and the Force of Fire, we may compel Nature to an Account; and though the Bulk and Configuration of the saline and sulphureous Parts are undoubtedly much altered and commuted by the Action of Fire; yet the Proportions of the several Principles of the Blood are not increased or diminished thereby; and consequently by carefully separating and weighing them, and seeing the several Proportions they bear to each other, we may arrive at a Knowledge very useful in accounting for some of the Phenomena of Diseases, and directing us to a right Method of Cure. It is satisfying and useful as well as curious, to reduce to Measure and Weight the constituent Parts of the Blood; and I am persuaded no inquisitive Person will judge it a vain Undertaking.

A CHYMICAL ANALYSIS OF THE BLOOD, BOTH IN HEALTH AND IN ARDENT FEVERS.

EXPERIMENT I.

Eight Ounces of Blood, taken from a young Man in perfect Health, and distilled, afforded as follows.

	Ounces.	Dr.	Gr.
1. Lymph	6	4	45
2. Volatile Salt			38
3. Oil			52
4. Cap. Mort before Calcination		7	25
5. Cap. Mort. after Calcination		2	10
6. Fixed Salt			5
			The

The first three or four Ounces of Lymph seemed to contain little volatile Salt or Oil, it not being fetid or disagreeable either in Taste or Smell; neither did it ferment strongly with Acids; but the latter Part was highly impregnated therewith, and fermented violently with Oil of Vitriol, made a white Precipitate with Solution of Sublimate, and turned Syrup of Violets green.

EXPERIMENT II.

From eight Ounces of Blood drawn from a Man of fifty Years of Age, in perfect Health, something corpulent, and one who indulged in good Eating and Drinking, without using much Exercise, I obtained,

	Ounc.	Dr.	Gr.
1. Lymph	6	4	25
2. Volatile Salt			46
3. Oil		1	12
4. Cap. Mort. before Calcination		7	37
5. Cap. Mort. after Calcination		3	15
6. Fixed Salt			8

Two Grains of the fixed Salt being laid upon a Piece of clean Glas, I dropt upon it one Drop of the Oil of Vitriol, whence arose a violent Fermentation, and a white pungent Fume.

Four Grains of the same Salt being dissolved in two Ounces of Rain-Water, I added to it four Drops of a Solution of Silver in *Aqua Fortis*, which caused a manifest Milkiness, and evidently discovered the fixed Matter to be Sea-Salt; for no other Salt produces a white Fume with Oil of Vitriol, or a white Cloudiness with a Solution of Silver.

EXPERIMENT III.

Eight Ounces of Blood extracted from a Man, on the second Day of an intense Burning Fever, afforded,

	Ounc.	Dr.	Gr.
1. Lymph	6	4	6
2. Volatile Salt			5
3. Oil		1	32
4. Cap. Mort. before Calcination		7	27
5. Cap. Mort. after Calcination		2	45
6. Fixed Salt			4

EXPERIMENT IV.

Eight Ounces of Blood drawn from a Man of a robust Constitution, on the fourth Day of a most acute Fever, afforded,

	Ounc.	Dr.	Gr.
1. Lymph	6	3	28
2. Volatile Salt			34
3. Oil		1	27
4. Cap. Mort. before Calcination		7	56
5. Cap. Mort. after Calcination		2	54
6. Fixed Salt			6

The fixed Salt in these Experiments, exhibited the same Phenomena with that in the preceding ones.

The Lymph in the two last Processes seemed to be more strongly charged with volatile Salt and Oil, than the others, and fermented more violently with Acids.

These were the Proportions of the several Principles which the sanguineous Mass afforded us by the most careful Distillation. Whence it is evident, that the saline and sulphureous Parts did abound more in those seized with acute Fevers, than in those in Health.

DISEASES ARISING FROM TOO GREAT A VELOCITY OF THE BLOOD.

All the Fluids contained in any Vessels arising from the Aorta; are secreted from the Blood alone, which a little before was so effectually mixed in the Right and Left Ventricles of the Heart, that it apparently resembled one homogeneous Fluid.

In Disorders arising from too brisk a Circulation of the Blood, 'tis necessary jointly to consider both the Solids and Fluids of the human Body, the Nature and Properties of the latter of which we shall now investigate.

The Blood then is that universal Fluid which flows into the Right, and is expelled from the Left Ventricle of the Heart. This Organ receives, by Means of the Veins, the whole Blood from every Part of the Body, and having received it, returns it by Means of the Arteries, to all the Parts of the human Fabric. From this Blood, all the Parts of the Body, and all the Viscera, prepare their respective Humours which are different, according to their various Structures. In the Blood therefore are contained all the Humours of the

human Body, not with respect to their particular Nature and Quality, but with respect to their Matter, of which, in all the Parts, according to their peculiar Structure, that is produced which the adorable Architect of the human Body originally and wisely intended. During the Circulation, this Matter changed in all the Parts and Viscera, returns to the Heart, except some Part which is eliminated from the Body. This Fluid is called Blood, both when it is expelled from the Heart, and when it returns to it; and so long as these two Motions are continued, so long Life remains.

Hence we may affirm, that all the Humours are generated of the Blood, and contained in it.

The Blood consisting of so many different, tho' intimately mixed Substances, appears to be an homogeneous Fluid, of a red Colour, but when left to itself in a State of Rest, it is secreted and divided into distinct Parts.

This Blood, when circulating in the Vessels, contains large Globules of a determinate Bulk, a changeable Figure, and a reddish Colour; yellow serous Globules, six times smaller than those of the red Kind; a pellucid Fluid, capable of being concreted by the Fire; and a pellucid, light, and fine Water, consisting of still smaller Globules, which however cannot be discerned on account of their Transparency. The Globules of the first three Species form what we call the Serum, both of which may be discerned by Microscopes.

These Circumstances are supported by the Observations of Mr. *Leeuwenhoeck*; for the human Blood, when viewed through a Microscope is observed to consist of many spherical Parts, collected together, and swimming in a finer pellucid Liquor, whose Parts are not, for that Reason, to be discerned by the Microscope. When with Microscopes, the Motion of the Blood through the Vessels in the pellucid Parts of Animals is observed, it evidently appears that the Molecules of the Blood forced through the narrow Channels of the Vessels, and meeting with other Molecules, have their Figures every Moment changed, and are consequently of a flexile Nature. According to the same *Leeuwenhoeck*, the largest Molecules of the Blood are the red Globules, consisting of six smaller Particles; mutually joined and united; and if these smaller Globules, which by their Union form the red Globule, were not thus united, they would become yellow and be serous Globules. If the same Analogy obtained in all the other Parts of the Blood, then the serous Globules would also consist of six smaller Globules; and the Division would extend to the most subtile Fluids secreted from the Blood: But Experiments are wanting to ascertain the Truth of this; for those Parts of the Blood which are more subtile than the red and serous Globules, are entirely pellucid. But since there are numberless Series of decreasing Vessels between the Aorta, the largest Vessel, and the most minute Nerve, proportionable Humours seem to flow through all these intermediate Series of Vessels. The Congeries of the largest Molecules of the Blood, is called Red Blood, whilst all its more subtile Parts taken conjunctly, constitute what we call Serum; for the human Blood, when taken from the Veins, spontaneously separates into two such distinct Parts.

The red Part of the Blood, when concreted, and separated from the Serum by Rest alone, and in consequence of the Laxity of the Parts, is soon so resolved into Serum as to be almost totally converted, into it.

When the Vein of a sound Person is opened, the Blood flowing out in a full Stream, is a few Minutes after concreted into one red Mass, which gradually begins to be lessened, because its thinner Part is expressed, has its Quantity every Moment enlarged, and generally serves for the red Mass to swim in. Some Hours after this Serum of the Blood is poured off, the red Mass appears still less, and there is a fresh Quantity of Serum collected, till at last almost the whole red Part is converted into Serum. Hence it appears, that the red Portion of the Blood is gradually colligated, and transformed into Serum. According to Mr. *Leeuwenhoeck*, this happens, because the red Globules, consisting of six smaller Molecules, being now freed from the Pressure of the Vessels, gradually recede from each other into those serous Globules, by whose Union they were form'd. Hence appears the Difficulty of determining the Proportion between the red and serous Parts of the Blood, since the former is thus gradually colligated into the latter.

Serum, long kept in an Air moderately warm and moist, by Rest alone, and the Laxity of its Parts, is resolved into a more thin, pellucid, and light Fluid, which gradually becomes putrid, and is so volatile, as to be almost totally evaporated; and these Circumstances are increased in Proportion to the Time.

As the red Part of the Blood is gradually resolved into Serum, so the Serum, when left to itself, is gradually attenuated, begins to putrify, and flies off in Vapours, leaving behind it a small Quantity of feculent Matter. But Serum, thus kept in a moderately warm and moist Place, the thinner it grows, the more acrimonious it also becomes, and can no longer be coagulated by the Heat of boiling Water, or by Alcohol. In the White of an Egg all these Circumstances happen in the same manner: For there are hardly any two Fluids more similar to each other in all their Phenomena, than the White of an Egg, and the Serum of Blood.

All Blood newly taken from the Veins, is, by a gentle Heat, but little surpassing the natural Warmth, and with a small Loss of the exhaling Part, coagulated into a solid, scissile and tenacious Mass, not to be dissolved by Water, Salt, Oil or Spirits. And the like Effect is produced by the Heat of Fluids, which is a particular Sort of Concretion, tho' in its Effects similar to the former.

The Blood, even of the soundest Persons, has a great Propensity to Concretion. When the ruptured minute Arteries of the Nose discharge Blood, it is forthwith concreted into a kind of solid Cake. But this Tendency to Concretion in the Blood is greatly augmented by an Increase of Heat: For as soon as an Heat, surpassing (perhaps) by ten or twelve Degrees the greatest Heat of *Fahrenheit's* Thermometer, is induc'd on the Blood of a sound Person, it becomes totally concreted. Hence it is, that in acute Disorders so great Danger arises from an increased Heat. But Blood once thus concreted, is not to be resolved without the greatest Difficulty. Many Substances, when mixed with the Blood, may prevent its easy Concretion; but when it is once concreted, it can hardly be resolved again; for in this Case neither Salts, nor Spirits, nor Oils, nor Soaps, are of any great Efficacy. Blood thus inspissated by Heat, is afterwards coagulated in the open Air, but then it putrifies at the same time; nor does the Concretion seem to happen, because by the Heat the most subtle Parts are dissipated: For Blood flowing from the Vein into boiling Water, is forthwith coagulated into a scissile Mass. The same Property is also found in the White of an Egg, which, when put into boiling Water, even tho' inclosed in the Shell, is forthwith indurated.

The Redness of the Blood, together with the Serum and Lymph, which are thus capable of Concretion, are produced by the Action of the Vessels, and the Efficacy of the Circulation, as the Change induced on the Nature of the Chyle, Milk and Blood, whether circulating, or without the Laws of Circulation, informs us, and is sufficiently discovered by Microscopes.

'Tis much disputed whence arise the surprising Properties of the Blood here enumerated; such as its Redness, the Yellowness and easy Concretion of the Serum. Philosophers and Chymists have advanced the most palpable Absurdities, with respect to this Affair. No Person, however, could ever, from the finest Aliments, prepare one Drop of Blood; for the human Body alone is capable of preparing its own Blood of a Matter which was not Blood before. Nor is it of any Importance whether the human Body is small, and in the Beginning of its Existence, or whether it is in a robust and adult State: For the Presence of Blood is so inseparable from the Nature of the human Body, that it is found in the weakest Infant, as well as in the most robust Man. Besides, in the human Embryo, as soon as it can be observed by the Eyes, there is red Blood even at the time when there is not the smallest Appearance of red Blood either in the Placenta, the Membranes surrounding the Embryo, or the Fluid contained in these Membranes. Hence we see, that it is the human Body itself which generates the Blood, even in that tender and mucous Principle.

When, in the first Rudiments of a human Creature, red Blood begins to be formed, cannot be easily determined by Experiments: But the incomparable *Malpighi* has demonstrated the Thing in an incubated Egg. An impregnated Hen's Egg, cherished by no Incubation, tho' viewed with the best Microscopes, is observed to contain no red Blood, either in its Shell, Membranes, White, Chalazas, Yolk, or the Bag of the Golliquament.

But in an incubated Egg there appeared a Change almost every Hour; and at the Circumference of the Cicatrix about the Yolk appeared some Vessels visible by the Help of Microscopes. A few Hours after these Vessels began to be distinguished by a Liquor contained in them. About the thirtieth Hour of the Incubation, these Vessels were of a somewhat greenish Colour. At the fortieth Hour they were

of a ferrugineous Colour, resembling that of wither'd Vine-Leaves in the Autumn, because the Congeries of all these Vessels was collected into one, which reaching to the Cicatrix, terminated in a certain Sinus which then first appeared. This Sinus was the right Auricle of the Heart, as afterwards appeared. And in this Sinus, which hung from the Carina, there appeared a manifest Pulsation; and a little after a small red Speck in that beating Body. Then this red Speck appeared diffused through the right and left Ventricles of the Heart; and a little after in the Duct which runs longitudinally along the Carina, or Rudiments of the Spine, and which was the Aorta. Hence we know, that red Blood may be prepared of a Matter which is not red, and that without the Admixture of pre-existent red Blood. This Redness derives its Origin from the beating Point or Speck, for it first appears where the Pulsation is; and there is red Blood present, before any Colour of Blood appears in the Rudiments of the Liver in the Chick. Hence we see, that the Opinion of the Ancients is false, who ascribed the Work of Sanguification to the Liver.

Perhaps, also, the Air (without which neither any Plant can vegetate, nor any Animal live) contributes to the first Formation of red Blood: For after the eighteenth Hour of the Incubation, *Malpighi* (as he informs us in his Treatise *de Ovo incubato*) observed the Cicatrix ascend to the obtuse End of the Egg, where the Air is lodged. In Adults the Chyle to be converted into Blood flows immediately through the Lungs, where, throughout the broadest Part of their Surface, it is in highly tender Vessels almost exposed to the open Air. According to the ancient Alchemists, the latent Food and Support of Life was contained in the Air.

But in adult Persons the Blood is prepared from the Aliments in a similar manner: For the lacteal Vessels receive the Chyle prepared in the Intestines, in the same manner as the Vessels of the Yolk received the White of the Egg attenuated by the Heat of Incubation. As the whole Chyle meets in one thoracic Duct, so in the Chick all these Vessels were united within the Amnion. The Heat of Incubation, the Motion of the Humours through the Vessels, the Force of the Heart, and the Action of the Air concurred within forty-eight Hours to the Production of red Blood in a Chick, which before had none of that kind. But in a sound adult Person the Chyle is converted into Blood in the Space of twenty-four Hours, as is evinced by the Observations of *Lower* and *Waleus*. The Heat of the Body, the Action of the Vessels and Heart, together with the Force of the Air in the Lungs, applied to the Chyle as it passes through them with the Blood, concur to the Transmutation of Chyle into Blood in Adults. But that such a Conversion is sooner performed in adult Persons, than in growing Chicks, seems to be owing to the far greater Action of the Vessels upon their Contents, the Respiration, and the superior Quantity of pre-existing red Blood.

But when these Causes producing red Blood in Adults, are in some measure defective, or act but slowly, red Blood is not produced, but a peccant and degenerating Liquor; as is obvious from what is commonly called the Green Sickness in Virgins, during which Disorder no red Blood is produced; but such a greenish Colour arises all over the Body, as was observed in the Vessels of the Yolk of the Egg, before any red Blood was formed.

Hence the Blood is not, as some imagine, propagated by seminal Force, but produced of a Matter not of the sanguineous Kind in a Body which as yet has no Blood. And as this Circumstance happens in the first Origin and Formation of Man, so it continues to the End of his Life.

When in human Creatures Blood is a forming from the Chyle, various and successive Degrees of Changes are observed: For the Chyle, a few Hours after Meals, is found conveyed to the Blood, tho' not assimilated. Hence, when after a liberal Meal Blood is taken from the Vein, besides the Serum and the red Part, there is a white, sweet, and chylous Part found fluctuating in the Blood.

In a few Hours the Chyle, conveyed with the Blood thro' the Vessels, is separated from the Blood by the Fabric of the Breasts, and affords Milk, which is of a different Nature both from Blood and Chyle; for in Milk there begins to be formed that Tendency to Concretion, which is already present in the Serum of the Blood, for it yields Cheese. But this Tendency to Concretion is never found in the Chyle. Hence we may artificially imitate the Preparation of Chyle in Emulsions, but never the Nature of Milk.

When a sound Woman for twelve Hours totally abstains from Meat and Drink, her Milk begins to be saline and yellowish. If she abstains still longer, nothing is found in the Blood taken from her Veins, but what (like the White of an Egg) is by means of the Fire concreted, which never happens in the Chyle.

Hence

Hence we may conclude that the Bodies of sound Persons are the Formers and Producers of their own Blood, in the same manner as any Plant, by its peculiar Fabric, prepares its Sap from the Juices of the fertile Earth and the genial Influences of the circumambient Air.

But in the human Body the Formation of Blood depends principally upon the Efficacy of the Circulation, by which the Vessels act upon their contain'd Fluids. Hence in the most robust Persons the Blood is reddest, or rather almost black in consequence of its saturated red Colour, and is concreted almost the very Moment it is left in a State of Rest. And in acute Diseases, when the Circulation is increased, all the Parts are intensely red, and the Serum of the Blood is converted into a Scissile Mass. But in weak Persons in whom the Efficacy of the Circulation is far less, all the Parts are pale and languid, whilst the Blood is thin and hardly capable of Concretion. But when, in such Persons, by due Exercise and proper Remedies, the Circulation is augmented, the red Colour and the due Cohesion of the Blood return.

The increased Motion of the Blood thro' the Vessels is produced by more frequent and strong Contractions of the Heart.

After considering the Nature of the human Blood, we now come to investigate the Cause of its Motion and Circulation. Some celebrated Men have imagined that this Cause resided in the Blood itself; for having observ'd that, by the mutual Mixture of certain Liquors, violent Commotions were suddenly excited, they hence concluded that something similar to this happened in the Blood.

But when in the most violent burning Fever, upon the Rupture of a small Artery of the Nose, the Blood is discharged with an uncommon Impetus, and received, whilst as yet hot in a clean Vessel, it is forthwith in a State of Rest, and affords no Signs of an intestine Motion. Hence the Cause of the Blood's Motion is not lodg'd in itself.

But the muscular Action of the Heart, by a strong Force, expels the Blood contained in its Cavities, thro' the Arteries, which immediately after, when the Action of the Heart ceases, by their Elasticity and muscular Force, convey the Blood still farther. These are the true and only Causes of the Circulation of the Blood. But the Beginning or Principle of this Motion is contained in the Heart; for when the Arteries are so contracted that their Diameters are smallest, they would remain in a State of Rest and Inaction; unless they were again dilated by the Blood expelled from the Heart. The muscular Action of the Heart is, therefore, the Cause of the Circulation of the Blood, and when that ceases all the Fluids become stagnant.

If therefore the Action or rather Contraction of the Heart (for in the Diastole the Heart is not active but passive) is rendered more frequent and strong, the Cause of the Circulation will be augmented; for it is not sufficient that the Heart should move frequently and contract itself, since near the Death of any Patient its Contractions are so frequent that they cannot be numbered, whilst in the mean time the Circulation begins to fail because scarcely any Blood is expell'd from the Heart.

But 'tis also requisite, that it should more forcibly contract itself that all the Blood contained in its Cavities may be expelled; for a strong Contraction of the Heart is that which expels all its Contents, whilst the weakest is that which expel none at all. The intermediate Degrees are weaker Contractions of the Heart.

The Contractions of the Heart are rendered more frequent and strong, first by the Brain and Cerebellum promoting a too copious Expression of the nervous Fluid as is observable in Persons under the Influence of any Passion or rack'd with the Agonies of Pain. Secondly, by an Irritation of the Heart, in consequence of an accelerated Motion of the venous Blood, produced either by Friction or the Action of the Muscles; or by some acrid, aromatic, saline, and alkaline, purulent, ichorous, or putrified Substance lodged in the Mass of Blood; and sometimes by a Species of Contagion, Plague or Poison; and when this happens, the Disorder, cannot from the Discoveries hitherto made, be distinctly explained.

We now come to consider those Things which, from Experience, we find capable of exciting and increasing the Motion of the Heart.

1. The Heart has all the Properties of a true Muscle, and is furnished with those Parts which in other Muscles are subservient to their Motions. When the Nerve distributed

to any Muscle is destroy'd, the Action of that Muscle is of course abolish'd, when the Brain is compressed by the Effusion of any Humor, the Action of all the Muscles subservient to voluntary Motion ceases. If, by any Cause, a too brisk Reflux of the Spirits thro' the Nerves into any Muscle is produced, the Action of such a Muscle will be increased even to the highest Spasm. But large and numerous Nerves are distributed to the Heart, which, however, has not a quick and acute Sensation in consequence of these Nerves. The other Muscles of the Body, when fatigued by excessive Motion, are painful, whereas in acute Fevers, when the Heart has for many Days been agitated by an intensely brisk Motion, it perceives no Pain. Now all the Causes which can produce a quicker Motion of the Spirits thro' the Nerves of the Heart, also increase and augment its Motion.

Now that the Passions of the Mind principally and effectually produce this Effect is universally acknowledged, though none has explained the manner in which it happens. The best-natured Man when affronted has such a Change induc'd on the State of his Mind as produces an Alteration in all the Parts of his Body; for the Contractions of his Heart immediately become quicker and stronger, his Pulse large and vehement, his Heat is increased, his Face becomes tumid, his Eyes sparkle, and a burning Fever is sometimes excited, which proves so violent as to determine in Death.

Pain may also so change the whole Brain as to produce a Delirium, after which no farther Pain is felt, or a perfect Syncope, which puts an End to the most racking Tortures. Since therefore Pain is thus capable of changing the common Sensory, it may also affect the Nerves distributed from it. Intense Pain rarely continues long without producing a Fever, that is a quicker Contraction of the Heart, even in Disorders very different from a Fever, such as the Gout for Instance. Hence *Galen* in his Treatise *De Pulsibus ad Tyrones*, Cap. 12. informs us, that "Pain when small and only beginning renders the Pulse more large, vehement, quick and frequent; but when it is increased and becomes so violent as to injure the vital Strength, it renders the Pulse more small, languid, quick and frequent."

2. *As for the Irritation of the Heart;* Besides the Causes of Motion which the Heart has in common with the other Muscles of the Body, there is in the Heart a singular and peculiar Property, which may be called Irritability, or a Capacity of Irritation; for when the Influx of the Spirits thro' the Nerves into the Fibres of the Heart, and the Motion of the Arterial Blood, cease after Death, the Motion of the Heart may be restored by blowing thro' the Veins, or injecting tepid Water into them. The Heart, also, when cut from all the Vessels with which it coheres, retains its Motion for some time, and after it has been in a State of Rest for several Hours, when it is cherished with Heat and prick'd with a Pin, it again begins to move. Physiologists have in a subtle manner explain'd, why the Heart should become alternately Paralytic, and be again contracted, as it were, by an instantaneous and sudden Spasm, and how the Cause producing the Systole of the Heart should every Moment perish, and be immediately after renew'd; and their Accounts of these Phenomena they have deduced from the Structure and Situation of the Parts. But the Heart, when taken out of the Body, and no longer adhering to any Vessels, continues the same Motion, and frequently for a considerable time.

As for the Acceleration of the venous Blood; When in consequence of any violent Passion, or the seeing of any horrid and frightful Object, by any tender Girl, there is an absolute Rest of the Heart, if cold Water is sprinkled on her naked Body, the Parts being contracted by the Cold; convey the venous Blood to the Heart, by which Means its Motion is restor'd. Thus *Homer*, in the Fifth Book of his *Iliad* tells us, that when *Sarpedon* was so excessively wounded as to fall into a Deliquium, he was restor'd by the Blowing of the North-wind on his Body, because the Veins were constricted by the Cold. Hence all these Things which accelerate the Motion of the venous Blood to the Heart, also augment its Motion. Thus an intensely burning Fever may be excited by excessive muscular Motion, and too strong Frictions. See *FIBRA*.

As for acrid and other unfriendly Substances lodging in the Mass of Blood; All the Humours of the human Body, when sound, are mild; since the Blood of a sound Person, when put into the Eye, produces no Pain; and when it is in this State, its Circulation is highly equable. But as soon as acrid Substances are mixed with the Blood, its Motion through the Vessels is, by the Irritation of the Heart, increased, and a Fever produced, which either expels these acrid and unfriendly Substances from the Body, or so subdues them, that they no longer

longer prove injurious. Nor is it of any Importance of what kind this Acrimony is, since they all produce the same Effects, and only differ with respect to the Degrees and Duration of their Actions. In aromatic Substances, the Acrimony contained in a tenacious Oil, is not easily dislodg'd and thrown off. Thus, when large Quantities of Pepper are imprudently taken for the Cure of intermittent Fevers, a mild Tertian is often changed into a burning Fever. The Person who at Dinner uses too large a Quantity of Sea-Salt, will, in the Afternoon, become feverish, and afflicted with Thirst, till by drinking copiously, that Salt is washed off. Vinegar itself, which in putrid Fevers is so efficacious, excites a Fever when too liberally used. When an Imposthuration concealed in the internal Parts collects Pus, this Pus, when reformed and mixed with the Blood, daily excites a Fever, which gradually preys upon the Body, and is called an hectic Fever. When this Pus, by a long Retention, is changed into a thin Ichor, it becomes more acrid; and when reformed, produces more terrible Misfortunes.

Corrupted Bile lodged about the Præcordia, or the putrid Gore of the corrupted Liver, excites violent Fevers, which can never be cured, unless that putrid Fomes could be removed.

But in all these Cases the Acrimony may be discovered by the Senses; tho', at the same time, there are other very surprising stimulating Substances, which can be reduced to no known Species of Acrimony, but yet disturb the Body in all its Functions.

The Contagion of the Small-Pox, by its subtle Miasma, which entirely eludes our Senses, infects the soundest Person, upon which is produced a violent Fever, which in a few Days fills all the external and internal Parts of the Body with a variolous Pus. And in this Pus, by the Disorder formed of the soundest Humours, there is the same Force of propagating the variolous Contagion infinitely, as is obvious from the Method of Inoculation, in which a small Drop of variolous Pus is put into a crude and recent Wound. But none has hitherto been able to explain the Nature of this Stimulus, or demonstrate the Method in which the sound Humours, chang'd by the variolous Contagion, assume a poisonous Nature, and become capable of multiplying the Contagion almost infinitely.

The Kind of Plague peculiar to each Species of Animals, rarely happens to more than one Species at a time. When the Plague raged in Europe among Oxen, even those Persons who used the Flesh of the infected Animals, remained free from every Degree of the Contagion. The most skilful Physicians, after a sedulous Investigation of the Nature of this terrible Disorder, ingenuously confessed, that they knew nothing with respect to the Cause, since its Effects were only subjected to the Senses. The pestilential Virus remains inactive upon Linnen, Leathern, or Woollen Cloths; and upon open and porous Woods, till being applied to the human Body, it becomes active, and by multiplying the Contagion, diffuses itself every where. In this Case, how surprizingly all the Parts of the Body are disturb'd, and what violent Fevers are excited, may be seen in *Diemerbroeck* and others, who have wrote concerning the Plague.

The surprizing History of Poisons evinces, that in some Liquors of poisonous Animals, there are such Stimuluses as have no Acrimony observable to the Senses; but yet, by an inconceivably quick Action, they injure almost all the Functions, and excite violent Fevers. We shall only instance in the Poison of the Viper. The celebrated *Redi*, relying on the Observations and Candour of *Charas*, tasted the yellow Juice adjacent to the Gums of the Viper, and found its Taste to resemble that of the Oil of Sweet-Almonds. Whereas a small Quantity of the same Juice, adhering to an inconsiderable Wound made by a Bite in a Person of Distinction, who handled a Viper imprudently, a few Minutes after produced the most violent Symptoms; so that the Patient hardly escap'd, after numerous Attempts for his Relief.

An increased Motion of the Blood through the Vessels produces a greater Force of the Blood propelled, upon the receiving Vessels; a greater Resistance in the Vessels to the Blood; a strong Compression of the Blood; a violent mutual Attrition of the Vessels and Blood; a strong mutual Attrition of the Parts of the Blood; a greater Heat in all the Parts of the Body; an Exiccation of the Blood, in consequence of the Dissipation of its most aqueous Parts; an inflammatory Viscidity of the Blood, by which it is easily disposed to Concretion; a Resolution of the Blood into Salts, and volatile and acrid Oils; an increased Largeness of the Vessels at their Beginnings; an Impulse of the thick Fluids into the minute Vessels, which produces in them Obstructions, De-

structions, Inflammations, Suppurations, Gangrenes, a Sphacelus, a Scirrhus, and the infinite Misfortunes which may succeed them.

In this Paragraph are considered those Effects on the Solids and Fluids of the human Body, which depend upon an increased Motion of the Blood.

As for the greater Force of the Blood propelled, upon the receiving Vessels; The Arteries are always full; when, therefore, the contracted Heart expels the Blood contained in its Cavities into the Arteries, these latter must be dilated; or such a Quantity of Blood ought to be expelled through the Extremities of the Arteries, as is forced from the Heart into the Arteries. But all the Arteries, except those known by the Name *Coronary*, are dilated in the very Moment at which the Heart is contracted. Hence almost the whole Action of the Heart is employed in dilating the Arteries; and by this Force the Sides of the Arteries are so pressed, that they recede from their Axis, and have all the Fibres constituting their Sides distracted. But as we have already shewn, that an increased Motion of the Blood is produced by a more strong and frequent Contraction of the Heart, 'tis obvious, that the Force by which the Sides of the Arteries are compelled to recede from their Axis, is then increased in a Proportion compounded of the increased Strength, and Frequency, of the Contractions of the Heart.

As for the greater Resistance of the Vessels to the Blood; The Arteries, when distended, are in a State of Violence. Hence, by the Elasticity and muscular Force of their Fibres, their Sides endeavour to approach nearer their Axis; by which Means they repress the distending Blood: For unless the Arteries contracted by their own Force, expelled the distending Blood, the Heart could not, in the following Systole, expel the whole Blood contained in its Cavities into the Arteries, as yet distended; the Blood would be gradually accumulated in the Cavities of the Heart, and the Circulation suffocated. The stronger, therefore, the Action of the Heart distending the Arteries is, the more strongly will that Force act by which the Arteries endeavour to contract their Cavities; and the oftner, in the same Space of Time, the Heart is contracted, the more frequently will the contracted Arteries re-act on the distending Blood.

As for the strong Compression of the Blood; The Blood contain'd in the Arteries is always, as it were, between two Presses; for when the Arteries are dilated, the Contraction of the Heart forces the Blood from the Base to the Apex of the Artery; whilst, in the mean time, the narrow Extremities of the Arteries make the greatest Resistance. When the Arteries are contracted, the Valves about the Basis of the Arteries in the Heart make a Resistance; and there is the same Resistance at the Extremities of the Arteries; hence in both Cases the Blood contained in the Arteries is compressed. But since the constituent Parts of the Blood are flexible, and capable of Compression, as we have already observed, if the compressing Causes, that is, the Action of the Heart and Arteries, are increased, it necessarily follows, that the Compression of the Blood must become stronger.

As for the strong mutual Attrition of the Vessels and Blood, and of the Parts of the Blood with each other; When the Blood is forced from the Heart, it acts upon the Sides of the incurvated Aorta; and this Direction of the Blood is resisted by the strong Sides of the Aorta, and the Blood contained in its Cavity. Hence no Particle of Blood expelled from the Heart into the Aorta, for two Moments, preserves that Direction of Motion which it had when it was expelled from the Heart. Besides, the Aorta is conical, or wider at the Base, but gradually becomes narrower. But since the Direction of the Blood expelled from the Heart into the Aorta, is in Lines perpendicular to the Basis of the Aorta, it must necessarily happen that the Particles of the Blood will strike against the Sides of this conical Canal; and in their Resilition thence, will meet other Parts moved in a different Direction. Hence there is a perpetual Attrition of the Parts of the Blood with each other, and with the Sides of the Vessels. Hence, also, as the Parts of the Blood are flexible, their most considerable Angles being destroyed by the perpetual Attrition, they acquire a spherical Figure. But by an increased Motion of the Blood through the Vessels, this Attrition is augmented in the same Proportion.

As for the greater Heat of the whole Body; From this mutual Attrition of the Parts, and on the Sides of the Vessels, arises Heat. This is sufficiently certain, because as soon as the Blood is in a State of Rest, all its Heat is lost, and the Body is gradually reduced to the same Degree of Coldness with the common Atmosphere. When the Motion of the Blood is increased by violent Exercise, or a Fever, the

the Heat is increased; but weak Persons, the Circulation of whose Blood is languid, are always cold.

Hence we see the Truth of that Assertion of *Hippocrates*, who, in the End of his Book *de Cordē*, informs us: "That the Blood is not naturally hot, but becomes so."

As for the *Exsiccation of the Blood, in consequence of the Dissipation of its most aqueous Parts*; An increased Heat always dissipates the most moveable Parts of any Fluid; but, as we have already shewn, a greater Heat is produced by an increased Motion of the Blood through the Vessels. The whole internal and external Surfaces of the Body have exhaling Vessels, which secrete from the Blood, and dissipate an highly subtile Liquor. An increased Application, therefore, of the Blood to these Organs, will produce a proportionably greater Secretion. Hence it is, that in all Diseases accompanied with an increased Heat, the Body is dried. Hence *Hippocrates*, in *Lib. 1. de Morbis*, informs us, that "They who die of burning Fevers, are taken off by Dryness."

As for the *inflammatory Viscidity of the Blood*; There is in the Blood of the soundest Person a natural Propensity to Cohesion, in consequence of which it is spontaneously concreted when taken from the Veins, and left in a State of Rest. This Cohesion is increased by the greater Heat; since by that Means the aqueous diluting Part is dissipated, and the Force compressing the Blood strengthened. We have already shewn, that by an increased Motion, the aqueous Part is dissipated, and the Heat in like Manner increased. But the Action of the Vessels on the Blood, is a true Compression of the Blood they contain. Hence, since, by an accelerated Motion of the Blood, the Action of the Vessels on the Blood is increased, it is obvious, that all those Causes concur to produce this increased Action of the Vessels on the Blood, which contribute to its Concretion. Then arises the *Phlegma Phlegmonodes*, which is entirely distinct from a languid, cold, and mucous Concretion. In this Case it is called an inflammatory Spissitude, arising from a strong Compression of the Principles of the Blood to each other. The Elements, or component Parts of the Blood, are observed to be spherical, or nearly so. Hence they touch one another in few Points. But when, by a too strong Pressure, their Figure is changed, and the thin aqueous Part, in which they floated, expressed, they come into more numerous Points of Contact, and are by that Means concreted. Hence arises that coriaceous Toughness observable in the Blood of pleuritic Patients.

As for the *Resolution of the Blood into Salts, and volatile and acrid Oils*; The State and Condition of the Salts and Oils of the human Blood, are best known from the Urine; which, as it is the true Lixivium of the Blood, washes off the already form'd Salts and Oils, which are of an acrid, and consequently an hurtful Nature. It evidently appears, that the Urine is the more acrid and fetid, the stronger the Circulation of the Blood is. In weak Persons the Urine is pale, almost without any Smell, and not very salt. Whereas, in robust Persons, habituated to Exercise, the Urine is redder, more fetid, and highly salt: An increased Motion, therefore, of the Blood through the Vessels, renders the Salts of the Blood more acrid and volatile; and its Oils more attenuated, but at the same time less mild. Hence again arise new Stimuluses increasing the Circulation, by the Increase of which they were originally produced; and thus the Effect of the Disease increases the Disease.

As for an *increased Largeness of the Vessels at their Beginnings*; The Force of the Heart expelling the Blood into the full Arteries, is the only Cause which dilates these Arteries. When, therefore, this Action of the Heart increases, the Dilatation of the Arteries will, in like manner, be augmented. But this Dilatation will be the greater, the nearer the Artery is to the Heart: Therefore the Beginnings of all the Arteries will be more dilated; whereas this dilating Force cannot with so great Efficacy be conveyed to their Extremities.

As for the *Impulse of the gross Fluids in the minute Vessels*; The coarsest Part of the Blood is observed to be a red Globule, which naturally can be only contained in the largest Vessels. The next largest Particle of the Blood may enter a smaller Vessel, which, in consequence of its Smallness, excludes the red Globules, but admits all such as are smaller. The same holds in the other Series of decreasing Vessels; and Health seems principally to consist in this, that proportional Fluids remain in their proper and respective Vessels. When, therefore, by an increased Motion of the Blood through the Vessels, the Beginnings of the Arteries of the next succeeding Series are too much distended, grosser Parts, which ought not naturally to be contained in these Vessels, may enter them. Thus, for instance, when the Beginning of a serous Artery, arising from an Artery containing red Blood, is di-

lated too much, the red Blood will enter this serous Artery. And that this really happens, is certain from Experience. If a sound Man runs violently, his whole Face will begin to grow tense, and an excessive Redness will appear in such Parts as were not naturally red. The whole Tunica Adnata of his Eye begins to have its Vessels filled with red Blood, whereas they never in a natural State contain red Blood. After violent Exercise, or Riding in a Chariot in rough and uneven Roads, the Blood passes through the dilated renal Vessels, and a Discharge of bloody Urine by that Means is produced, which, however, is easily cured by Rest alone.

As for *Obstructions and Destructions of the minute Vessels*; An Artery in its Course gradually becomes narrower and narrower, till at last it is almost only capable of transmitting one Molecule of Blood. This evidently appears upon Examining the Circulation of the Blood, in the pellucid Parts of Animals, by the Assistance of Microscopes. But in a particularly beautiful manner, when the Lungs of a live Lizard appearing through a Wound made on Purpose, are viewed with a Microscope. For in this Case it evidently appears, that about the Extremities, or narrowest Parts of the Arteries, all the Molecules of the circulating Fluid are changed into an oblong cylindrical Form, and so transpressed through the narrow Channels of the Arteries. When, therefore, for instance, a serous Artery, dilated at its Beginning, receives any Portion of red Blood, this Blood cannot pass through its most narrow Parts. Hence such an Artery will be obstructed; and since the Fluids propelled by the vital Motion, act upon the obstructed Part, such a tender Vessel must be easily destroyed.

As for *Inflammations, Suppurations, Gangrenes, a Sphacelus, a Scirrhus, and all their Consequences*; Whilst the red Blood stagnating in the minute Canals is compressed, and an Attrition of it produced by the Action of the Blood which succeeds, and is generally put into a violent Commotion by the concomitant Fever, the Disorder is called an Inflammation, which must, for this Reason, most frequently arise from gross Fluids, propelled into Vessels naturally too small for their Admission. But when an Inflammation is once produced, all its Effects succeed: For when the infarcted Vessels, together with the impacted Humour incapable of Circulation, are acted upon by the vital Force, and being dissolved, degenerate into a pinguinous, white and equable Humour called Pus, a Suppuration happens. If, in consequence of a sudden Rupture of the Vessels, the Circulation of the vital Humours through the Part affected is totally destroyed, a Gangrene, or Mortification of the Part is excited; and when this Disorder seizes the whole Substance to the Bone, it is called a Sphacelus. If about glandular Parts, an Inflammation arises, a hard Tumor without Pain, but not to be resolved without the greatest Difficulty, is produced, and distinguished by the Name *Scirrhus*.

From a due Consideration of these Circumstances, it evidently appears, that an increased Circulation of the Blood may produce numberless Disorders. All the Humours of the Body, by an increased Motion, and an augmented Heat arising from it, may be totally changed into a morbid State, by the stronger Pressure, the Coagulum induced by the greater Heat, and the augmented Acrimony. There is a greater Attrition, and often a Rupture of the solid Parts produced. The gross Humours, which cannot penetrate through the narrowest Parts of the Vessels, enter the dilated Vessels: and if we consider that all these Disorders may happen in all the Parts of the Body, 'tis obvious that numberless Diseases may arise from this single Cause.

An increased Circulation of the Blood may therefore be known from an acquaintance with its Causes and Effects already enumerated, but especially from the quickness and hardness of the Pulse; the velocity and difficulty of Respiration; and the intense Heat.

'Tis of great Importance in the Practice of Medicine, to know whether the Velocity of the Circulation is too great or not. If the Causes of an increased Circulation are present, and the Effects of a too violent Motion of the Humors observable, the State of the Patient is no longer dubious. There are, however, some infallible Signs which demonstrate the Excess of the Circulation, such as

The Velocity and Hardness of the Pulse. The Celerity of the Pulse is a Sign, that in the same Time the Heart is oftener contracted; and the Hardness of the Pulse denotes the plenitude of the Arteries, and is a Proof of a Blood highly compacted, dense, and in consequence of its inflammatory Viscidity, with Difficulty capable of passing thro' the Extremities of the Vessels. The Celerity of the Pulse alone without Hardness, denotes that the Heart is oftener tho' not

more strongly contracted; for near the Death of any Patient the Pulse is very quick, tho', at the same time, small. Whereas the Hardness of the Pulse alone without Celerity rather denotes a Suffocation of the Circulation, as is observable in highly plethoric Patients.

An Increased Circulation is also known from a quick and difficult Respiration. The whole Blood expell'd from the right Ventricle of the Heart must pass thro' the Lungs before it can come to the left Ventricle. But the right Ventricle of the Heart is not by its muscular Force alone able to propel the Blood thro' the narrowest Parts of the Pulmonary Artery, 'tis also requisite there should be a Dilatation of the Lungs by Inspiration, in order to make a quick Passage for the Blood expell'd from the right Ventricle. The more frequently and strongly, therefore, the right Ventricle contracts itself in the same Time, the more frequent and strong the Respiration will be. Hence, as soon as by Running or any other Exercise, the Motion of the Blood thro' the Vessels is increased, the Respiration is proportionably augmented and perform'd with greater Difficulty. Thus the Respiration is increased only by an augmented Velocity of the Blood passing thro' the Lungs. But when by this increased Motion an inflammatory Spiffitude begins to be produced, the Respiration will be far more laborious and quick; for the Incapacity of the Blood for circulating, first discovers itself in the Lungs. Hence 'tis that in acute inflammatory Disorders a quick and difficult Respiration is so bad a Sign.

An increased Circulation is also known by the excessive Heat of the Body. So long as there is a free Passage thro' all the Vessels, an increased Celerity of Motion in the Fluids also augments the Heat of the Body, as we have already shewn. But when Blood rendered incapable of Circulation cannot reach the Extremities of the Vessels, a Coldness of the Extremities is produced. But at that very Time there is a burning Heat about the vital Viscera, as happens in the worst burning Fevers. And this is by *Hippocrates*, in his *Prognostics*, and other Parts of his Works, generally reckoned among the Mortal Signs.

The Remedies, therefore, best calculated and most efficacious for allaying an excessive Circulation, are such as diminish the Frequency and Force of the Contraction of the Heart.

These simple Disorders are first to be consider'd in an abstracted Light; for which Reason 'tis here supposed, that nothing is changed in the Body, but only that the Circulation of the Blood is augmented. Every thing, therefore, is a Remedy for this Misfortune, which can remove the proximate Cause of the increased Motion of the Blood. But this Cause is a too quick and strong Contraction of the Heart, so that every thing is a Remedy which can produce a slower and weaker Motion of that Organ. But such a Remedy must act either on the Spirits which move the Heart, upon the venous and arterial Blood convey'd into it, or upon those stimulating Substances which by their Irritation produce a stronger and quicker Contraction of the Heart.

Some of these Remedies have an Influence on the Mind, and others on the Body.

We have already observed, that only a Change in the Disposition of Mind, may in the soundest Person so increase the Motion of the Heart, as to produce a violent Fever. And unless the Physician can then remove that Change of Disposition, other Remedies will be of no Service. But every thing which produces this Effect acts upon the Mind without inducing any change on the Body. Thus when a Man in a violent Passion is frightened, his Passion is removed without any Change induced on his Body, whilst only the State and Disposition of his Mind is altered. The other Causes removing the material Causes of an increased Circulation act only on the Body.

The former of these Remedies are such as allay violent Passions by Reasoning; excite the contrary Passion, or divert the Person under its unhappy Influence.

Violent Passions are sometimes removed by Reasoning. We are conscious to ourselves, not only that we think, but also that we think on Objects different from the Act of Thinking itself. And if these Objects are only perceived by an ordinary Perspicuity of Mind, they affect us but little, and only retain the Soul in a kind of simple Contemplation. This is sufficiently evinced in profound Mathematicians, who sometimes so spend their Lives in thinking upon Mathematical Subjects, that they are but little affected with other Objects. We have also a particular kind of Perception, which tho' we cannot communicate it to others, yet

makes as strong and ardent an Impression upon us as Truth itself. Thus upon tasting a delicious and grateful Wine, an Idea is excited in the Mind, which we can no otherwise explain, than by saying that it is pleasant. But that this Idea is pleasant, is so evident, and affects the Mind so strongly, that no Truth can make a greater Impression upon it. On the contrary, if any Person tastes a rotten Egg, he so abhors it that he would almost submit to any Thing rather than taste any more of it. Thus the Affections of the Mind, together with its Perception, almost by an absolute Necessity, carry the whole Mind along with them, so as to desire to render the pleasant Idea permanent, and to remove or destroy that of the displeasing Kind.

But this Pleasure or Disgust accompanying any Idea, not only differs from the Idea itself, and the Principle of Thought, but also disturbs the whole Train of Ideas, influences the Will, and as it were destroys Liberty. Since it necessarily determines us to like and dislike. This singular Phenomenon has induced Philosophers to call the Affections of the Mind Passions; and justly, because we are not their Masters, but their obsequious Slaves, since we often approve of what is good and laudable, and under an immediate Sense of its Worth pursue its fatal Opposite.

Philosophers have greatly erred in endeavouring to destroy this Pleasure or Disgust which accompanies the Perception of Ideas; for no more is requisite of Mankind, than that they should govern the Affections of their Minds by Reason. But this latter is often so weak, that it cannot subdue the former. Hence Resolution and Perseverance become necessary, that Reason fortified by an Habit of Opposition, may at last come off triumphant; for certainly the wisest and best of Men can hardly conquer the exorbitant Passions of their Minds, by the most refin'd and exalted Suggestions of Reason and Religion.

Violent Passions are also removed by exciting the opposite Affections. The wisest Legislators, conscious that human Society could not be govern'd by Reason alone, have proposed Rewards and Punishments. The Dread of Punishment is sufficient to stifle the dire Effects of Passion, when the most beautiful moral Precepts are of no Use. 'Tis, therefore, of great Importance to know the opposite Affections of the Mind; Anger is suppressed by violent Dread, whilst the most timorous Man is render'd bold by Anger. If we observe the Changes induc'd on the Body under these two contrary Passions, they will be found intirely opposite.

In an angry Person there forthwith arises a stronger and quicker Contraction of the Heart. The Pulse becomes fuller, stronger and quicker, and all the Parts, even in the most extenuate Persons, become tumid and expanded. A greater Heat arises in the whole Body. Almost all the Muscles become tense, the Eyes are stern, prominent, sparkling, and as it were cover'd with Blood, whilst Menaces and Reproaches are alternately pour'd forth. *Homer*, who every where paints Nature in her truest Light, in *Lib. I. Iliad.* compares the Eyes of *Agamemnon* when angry, to sparkling Fires. In the same Book, *Achilles*, when represented as enraged at the Loss of his beloved *Briseis*, is said to have his Eyes sparkling in such a manner as to strike Terror in all who beheld them. *Achilles*, in his Answer to *Ajax*, persuading him to take Arms, tells him that his Heart was become tumid with Anger. And *Achilles*, when viewing the Arms, brought by his Mother *Thetis*, is said to have immediately fallen in such a Passion, that his Eyes struck Terror, and appeared like Sun-Beams under his Eye-brows.

A Man suddenly struck with Terror, becomes pale and cold, whilst his whole Body is contracted, his Pulse is quick, but small and unequal; he is seized with a Palpitation of the Heart, and a violent Oppression about the Lungs, and a Sighing. The whole Strength of his Limbs is destroy'd, his whole Body trembles; and sometimes Persons in this Condition become stiff like Statues, whilst the trembling Accents die upon their fault'ring Tongues. Hence *Homer* gives the Epithets *cold* and *pale* to the Passion of Fear. And when *Alexander* flies from *Menelaus*, rushing in upon him, Trembling seized his Limbs and Paleness his Cheeks.

Hence it appears that contrary Affections of Mind produce opposite Effects in the Body, and consequently that one Affection of the Soul may be a Cure for another. The same might be demonstrated by comparing other opposite Affections.

Violent Passions may also be remov'd by diverting the Person under their Influence. The human Mind has a surprising Faculty of affixing the Ideas it forms to certain Signs merely arbitrary, whilst there is no manner of Similitude between these Signs and the Ideas, tho' afterwards upon seeing such Signs, the Idea before affixed to them is rendered present to the Mind. By a few Letters variously combin'd, Ideas are excited in our Minds, which we had some Years before,

before, though the Remembrance of these Ideas had been entirely lost, unless these arbitrary Signs had preserved them. The same holds true with respect to the Affections of the Mind. Thus *Eneas*, when beginning to yield to the Intreaties of vanquished *Turnus*, when he views the Belt of *Pallas*, whom that Warrior had killed, is transported with incredible Rage. This Accident is beautifully described by *Virgil*, in the twelfth Book of his *Æneid*.

— *furiis accensus, & ira*
Terribilis: Tunc hinc spoliis indute meorum
Eripere mihi! Pallas te hoc vulnere, Pallas
Inmolat, & poenam scelerato ex sanguine sumit.

When, therefore, this Pleasure or Disgust accompanies the Ideas renewed by these Signs, more intense Affections of Mind are excited, and may by this Means be, at last, rendered perpetual. Then the almost infinite Variety of the Thoughts of the Mind is destroyed, and all its Powers employed upon this one Subject. The Will, which before could chuse an infinite Number of Objects, is now intensely fixed upon one. This Species of Disorder is called a Delirium; but if it is very violent, 'tis called Fury. If it is accompanied with a Fever, and an Agitation of the Humours, it is called a Phrenitis. If these Symptoms are absent, it is called a *Mania*; and if the Disorder is attended with a Neglect of every Thing, it is called *Foolishness*.

Hence skilful Physicians, without the Knowledge of the Patient, remove all those corporeal Marks which renew such Ideas, whether by the Intervention of the Senses, or of the Memory. Other Objects presented to them, and capable of exciting other Ideas, which gradually lessen and diminish the too strong Impression made by a particular Object or Train of Ideas, are said to divert the Patient. For this it is sufficient, that the Thoughts be in such a manner chang'd, that the same Idea, by a long Continuance, may not afterwards possess the whole Mind, and become indelible.

But when violent Affections of the Mind disturb the whole Body, and irritate the whole nervous System, which frequently happens in hysterical Disorders, then we have recourse to such Medicines as soothe the Spirits, and, for a time, totally abolish the Action of the Brain. Such a Relief is principally afforded by the Juice of the Poppey, which, when exhibited in a small Quantity, induces the most pleasant Sensation imaginable; and, like the celebrated *Nepenthe* of *Helen*, creates a perfect Forgetfulness of all Misfortunes. A considerable Dose of it induces Sleep, and an excessive Quantity an Apoplexy. The Use of Wine, in a Person not much accustomed to it, produces the same Effects, excites uncommon Cheerfulness, allays violent Passions, and, at last, induces Sleep, which puts an agreeable temporary Period to all Misfortunes.

The other Medicines proper for allaying an excessive Circulation of the Blood, respect the Body, and act by a Rest of the Muscles, a Relaxation of the Veins, by correcting Acrimony, by diluting, by obtunding, and by removing the Causes of the Pain.

As for a Rest of the Muscles; One of the Causes of the Motion of the Heart, is the Influx of the venous Fluid into the Cavities of the Heart, as we have already observed. But the Motion of the venous Blood to the Heart is accelerated by the Motion of the Muscles; for most of the Veins situated on the Surface of the Body, lie upon the Muscles. Hence they are compressed by the Muscles, when become turgid in acting; by which means the Blood contained in the Veins is conveyed towards the Heart, because the Direction of the Motion of the venous Blood is from the Apex to the Base. Besides, when the Muscles act, they become pale; because all their Blood is expressed, and at that time is quickly conveyed through the Veins to the Heart. Hence the Circulation of the Blood is greatly increased by muscular Motion. Surgeons are sufficiently apprized of this, who, if upon opening a Vein, the Blood is slowly discharged, order the Patient to move his Fingers; upon which it is immediately more quickly and copiously discharged. Hence the ancient Physicians, though unacquainted with the Circulation of the Blood, in all Disorders accompanied with an excessive Motion of the Fluids, ordered the greatest Rest, removed all Objects capable of affecting the Senses strongly, and enjoined that the Patient should be lodged in a dark Room remote from all Noise.

As for a Relaxation of the Veins; In highly acute Disorders, in which there is the greatest Circulation of the Blood, it is always observable, that the greatest Quantity of Blood is lodged in the arterial Vessels, whilst a Depletion of the Veins is, by that Means, produced. On the contrary, in languid, slow Disorders, in which the Circulation is defective, the

Veins, and all the Cavities of the Body, are filled, whilst the Arteries are emptied; a Relaxation, therefore, and Impletion of the Veins, accompany a diminished Circulation of the Blood. Besides, the relaxed Veins being more easily distended by the Blood impelled from the Arteries, must also contain more Blood. A smaller Quantity of Blood will, therefore, return to the Heart, and by that means one of the principal Causes of the Motion of the Heart will be diminished. The Impetus of the Blood forced from the Arteries into the Veins, is, also, more retarded, because there is, in the Veins, a larger Quantity of Fluids to be moved; and for both these Reasons the Velocity of the Circulation is diminished.

But since, as is observed under the Article *FIBRA*, any Part of the Body may be relaxed, this End is best obtained by a Vapour-Bath applied to the Surface of the Body; whilst the same Intention is, also, pursued by proper Clysters, emollient Decoctions, and Aliments of a relaxing Quality. This Method was universally used by *Hippocrates* in acute Diseases.

As for a Correction of Acrimony; The Degrees of Acrimony, when known and reduced to their proper Classes, may be removed by Art, provided the Viscera are as yet sound. Thus an alkaline, acid, or aromatic Acrimony are pretty easily removed. But when such poisonous stimulating Particles, or contagious Miasmata, not to be discovered by the Senses, but only known from their Effects, are the Causes of an increased Circulation, then the healing Art becomes defective. When that highly-poisonous Animal, known by the Name of a Rattle-Snake, bit a sound Girl, as we are informed by *Louis Feuillée*, in *Journal des Observ. Physiques, Mathemat. et Botan.* soon after Death ensued, and though the Physician was present, he could afford her no Relief; and when, a few Hours only after her Death, they attempted to remove her Body, the putrid and corrupted Flesh was separated from the Bones. When the soundest Man is infected with the variolous Contagion, which is so subtle as to elude the Senses, all the Parts of his Body are disturbed, and a violent Fever is excited, which so surprizingly changes all the Humours of the Body, that within fourteen Days all the Parts of the Body, whether internal or external, are almost dissolved into a gangrenous Gore. If, in the Beginning of the Disorder, this Stimulus could be rendered inactive by a proper Antidote, no bad Symptoms would ensue. This is that *toû bîsot*, that preternatural and incomprehensible Quality in Diseases, which so frequently baffles the Efforts of Art, and is the Reason why so often Physicians cannot check the excessive Motion of the Fluids. All that Art can do in this Case, is to weaken the Principle of Life, by which alone Poisons are rendered active; since they produce no Effects upon a Carcase. Then the Poison is to be obtunded by the Exhibition of the most emollient Substances; and washed off by diluting Liquors drank in large Quantities.

As for removing the Cause of the Pain; In a Luxation of any Joint, the most violent Pain is produced. And this Pain brings on a Fever, not to be cured till the luxated Bone is reduced, and the Pain by that Means remov'd.

The Anodynes, Narcotics, and Hypnotics, proper for removing Pain in Disorders arising from an excessive Circulation, are specified under the Article *VULNUS*. *Van-Sweiten. Comment. in Aph. Boerhaave.*

SANGUIS DRACONIS, See *CALAMUS* and *DRACONIS SANGUIS*.

SANGUISORBA. A Name for the *PIMPINELLA*, which see.

SANGUISUGA. See *HIRUDO*.

SANGUISUGUM. A Disorder of the Heart, proceeding from an Accumulation of Blood, is thus called by some barbarous Authors.

SANICULA.

The Characters are;

The End of the Pedicle becomes a monopetalous, quinquefid Calyx, in which is contained a pentapetalous Flower, consisting of Petals closely contracted, and exactly covering two, three, or five Stamina; this is the Description of the Male Flower. The other Flowers are hermaphrodite, seated in a quinquefid Calyx, and having, also, five Petals, which are in like manner closely contracted, and accurately cover two, three, or five Stamina, placed about the Ovary, which consists of two lappaceous Ova, each furnished with an erect Tube. The Seeds are gibbous and echinated.

Boerhaave mentions but one Sort of *Sanicula*, which is, *Sanicula*; *Officinarum*. *C. B. P.* 319. *Boerh. Ind. A.* 73. *Tourn. Inst.* 326. *Sanicula five Diapensia*, *Ger.* 801. *Emac.* 948. *Raii Hist.* 1. 475. *Synop.* 3. 221. *Sanicula vulgaris, five Diapensia*, *Park. Theat.* 532. *Sanicula mas Fuchsii, five Diapensia*. *J. B.* 3. 639. **SANICLE**.

This Plant has a small, stringy, fibrous Root, from which spring the Leaves on long Foot-Stalks. They are five-corner'd, resembling somewhat those of the lesser Maple, and

are ferrated about the Edges, of a dark green Colour, smooth and shining. Its Stalks grow to be about a Foot high, bare of Leaves to the Top, on which grow little Umbels of five-leaved white Flowers, small and full of Stamina; each Flower being succeeded by two rough bur-like Seeds. It grows in Woods and Thickets, and flowers in May. The Leaves are used.

This is one of our prime vulnerary Plants, being frequently put in Wound-Drinks, and traumatic Apozems; and is good for Ruptures, inward Bruises, spitting of Blood, or any Hemorrhages, and for Wounds both inward or outward. *Miller's Bot. Off.*

By the Chymical Analysis, beside several acid Liquors, the Sanicle yields an urinous Spirit, and some concreted volatile Salt, and a good deal of Oil and Earth. It contains some Sal Ammoniac, Sulphur and terrestrial Parts. It is deterfive, vulnerary, and aperitive. It is used with the other Vulneraries in Broths, Pifans, and Potions for Losses of Blood, and to open and strengthen the Bowels. It is used after the manner of Tea. It is an Ingredient in vulnerary and deterfive Lotions, in Plaisters and Balsams for Wounds. *Martyn's Tournefort.*

It is called *Sanicula*, a *sanando*, "from Healing;" because of its sanative Virtue, which is so extraordinary, that the French have a Proverb,

*Qui ha du Bugle et du Sanicle
Fait aux Chirurgiens la Nicle.*

"He who has Bugle and Sanicle never wants a Surgeon." It has an Astringency with its Bitterness, as appears by its Taste. It is good, says *Lobel*, briefly summing up its Virtues and Uses, for internal and external Wounds, Hemorrhages, Dysenteries, Ruptures, and Lacerations, taken inwardly in Decoction, or outwardly applied.

For a Thickness and Protuberance of the Navel in Children, apply a Cataplasm of Sanicle boiled in Wine to the Part, and secure it with a pretty tight Bandage; and to the Back, opposite to the Region of the Navel, apply the bruised Root of Comfrey. This Prescription has been found successful in almost innumerable Instances. *Raii H. P.*

It is useful in consolidating Ulcers, Fistulas, Ruptures and Erosions. *Schroder.*

Sanicle is mightily commended by the French and Walloons, who eat it for Inflammations. It is good, also, in an Hæmoptoe. *Baubine* thinks it proper in hot Diseases of the Kidneys, but I see no Reason for it; but it is a useful Plant in a Languor and Decays from a Viscousness of the Humours. It is of a penetrating, balsamic Virtue; for it has an acrid Sort of a Fragrancy, in which consists its Virtue; and leaves an astringent Taste in the Mouth. The Leaves bruised, and applied to Wounds, cure them without Suppuration. They, also, remove external Tumors, and deterge Sordes. It is serviceable in Hernias and Hemorrhages, and in dissolving Tumors by Resolution or Diffipation; the Leaves being bruised and applied with Wine or Vinegar. The Decoction is taken inwardly to dissolve grumous Blood, and is good in Fractures, where Purgation and Absterfion are required. *Hist. Plant. Ascript. Boerhaave.*

SANICULA, is also a Name for several Sorts of SAXIFRAGA.

SANICULA ALPINA. A Name for the *Verbascum*; *humile*; *Alpinum*; *Villosum*, *Borraginis folio*, & *flore*.

SANICULA AMERICANA. A Name for the *Mitella*; *Americana*; *florum petalis fimbriatis*.

SANICULA FÆMINA. See *ASTRANTIA NIGRA*.

SANICULA MONTANA. A Name for the *CORTUSA*.

SANICULA MONTANA AMERICANA. A Name for the *Mitella*; *Americana*; *florum petalis integris*.

SANIES. The same as *ICHOR*.

SANIODES. *Zanodis*, from *ovis*. A Plank. Flat chested. *Galen.*

SANTAS. *Health*.

SAN-LUCIANUM LIGNUM. *Santa Lucia Wood*.

This is the Wood of a Tree named *Cerasus racemosa sylvestris*, *fructu non eduli*, C. B. P. It is brought from *Lorrain*. It is very tender, and has some Smell, but is little used in Physic. *Geoffroy.*

SAN MARTHANUM LIGNUM. This is a kind of red *Brazil* Wood, used in Dying, and which comes from *St. Martha*, near *Carthage*, in the *Spanish West Indies*. *Geoffroy.*

SANTALUM. *Sanders*.

There are three Sorts of Sanders, the white, red, and yellow. It is brought from *Siam*, and from the Islands of *Timor* and *Salor*; but Botanists are not agreed to what Tree it belongs. According to *Herman* it is called *Sircanda*, and bears Berries. The white Kind comes from the young Trees, the red and yellow from the old ones; the former

of these two being the outer Part of the Wood, the other that next the Pith. The Labourers who cut this Wood are often seized with malignant Fevers, and Deliria of a very singular Kind, the affected Person generally imitating the Actions of that Trade to which he was brought up; and they have also a *fames canina*, of a very terrible Kind. See *Bontius de Medicina Indorum*. The yellow Sanders is most proper for physical Uses. It is resinous, of an agreeable Smell, and excites sweating. The white has not so strong a Smell, and the red none at all; but it may be distinguished from *Brazil* Wood by its Roughness in the Mouth, when tasted, and accordingly it is a little astringent. All the Kinds, especially the yellow, enter into many Compositions; sudorific Decoctions are also made of them. *Geoffroy.*

The white and yellow Sanders of the Shops are produced by the same Tree, the cortical Part of which, according to many, is called white Sanders, and the medullary Part yellow Sanders: But *Garcias* informs us, that there is so great a Resemblance between the Trees which bear the white and yellow Sanders, that they cannot be distinguished except by the Inhabitants who sell them to the Merchants. *Dale.*

SANTALUM ALBUM. *Offic. Ger.* 1389. *Emac.* 1586. *Park. Theat.* 1605. J. B. 1. 486. C. B. P. 392. *Raii Hist.* 2. 1804. WHITE SANDERS.

The Part in Use is the Wood, which is hard, solid, ponderous, of a pale Colour, and of a Smell and Taste like that of the yellow Sanders; both Sorts are imported from the *East Indies*.

Both the white and yellow Sanders are refrigerating, drying and aperitive, hepatic and cordial. Their principal Use is in a Lipothymy, Palpitation of the Heart, and Obstructions of the Liver, and the like Disorders. Outwardly they are of Service in Catarrhs, Cephalalgia, Vomiting, and the like. *Schroder.*

SANTALUM CITRINUM. *Offic. Park. Theat.* 1604. J. B. 1. 486. *Raii Hist.* 2. 1804. *Santalum pallidum*, C. B. P. 392. *Ger.* 1389. *Emac.* 1586. YELLOW SANDERS.

The Heart or solid Marrow, is of a yellow Colour, a bitterish and aromatic Taste, and of a fragrant and grateful Smell.

Yellow Sanders is the Marrow of a certain Berry-bearing Tree called *Sarcante*, in the Island *Timor*, which, when separated from the Integuments, is solid, thick, and of a yellow Colour, of a bitterish aromatic Taste and fragrant Smell. This Commodity is brought from *China* and *Siam*, and the Tree itself is tall like a Walnut-tree, but bears Fruit resembling Cherries. The white Sanders is the paler Marrow of the same Tree, of a fainter Smell, and less aromatic Taste. When these Trees are dried, the Marrow alone is chosen; which, if it is not sufficiently odorous, is called white Sanders. Yellow Sanders derives its fragrant Smell and aromatic Taste from the tender Resin of which it consists, and which is easily extracted by infusing the Shavings of it in a sufficient Quantity of highly rectified Spirit of Wine. By Digestion a very yellow Tincture is extracted from it, which when inspissated over a gentle Fire, after the Spirit is abstracted, constitutes a liquid Balsam of a darkish Colour and grateful Taste, and which in Consistence and Colour almost approaches to *Peruvian* Balsam. And if this Balsam is again dissolved in highly rectified Spirit of Wine, it is a balsamic Essence of singular Virtue.

This Experiment excellently illustrates the Nature and Generation of the *Peruvian* Balsam, the Balsam of *Capivi*, and that of *Mecha*, which are nothing but liquid Resins; for if the resinous Principle of Sanders is dissolved in highly rectified Spirit of Wine, and the Solution inspissated, it assumes the Consistence of a Balsam, and is no more converted into a solid Resin, since some moist Particles have by this means intimately insinuated themselves into its Composition.

The Essence of yellow Sands is of the same analeptic and sedative Virtue with Amber, and is highly beneficial in Disorders arising from a Weakness and want of Tone in the nervous and membranous Parts; for which End, it may either be used by itself, or in Conjunction with the Essence of Aloes, Wood or Amber. *Hoffman.*

SANTALUM RUBRUM. *Offic. Ger.* 1389. *Emac.* 1586. *Park. Theat.* 1605. C. B. P. 392. J. B. 1. 489. *Raii Hist.* 2. 1805. RED SANDERS.

This is the Heart or middle Part of a Tree, that grows in the *East Indies*, upon the Coast of *Cormandel*. It is firm, hard, and ponderous, but of very little Smell or Taste; and is generally believed to belong to a Tree having papilionaceous Flowers.

The red Sanders is likewise accounted cooling and drying, and though of less Virtue is much more used than either of the former, especially to give a red Colour to Infusions, Tinctures, or Decoctions. It is, also, esteemed to be somewhat more restringent. *Miller's Bot. Off.*

It grows in the *East Indies*, beyond the River *Ganges*. The Part in Use is the Wood, or rather the Heart, or Matrix, separated from the outer Integuments, the Bark and Wood, and of a solid, dense, ponderous and red Substance.

This Species of Sanders is refrigerating and astringent. Whatever Virtues, therefore, are by the *Arabians* ascribed to the several Sorts of Sanders, against preternatural Heats, and the like kinds of Disorder, belong in a more especial manner to red Sanders. *Dale*.

From red Sanders, which is the solid, ponderous, and red Marrow of a filiquous and thorny Tree, which grows in *Malabar* and *Coromandel*, with Spirit of Wine, may be extracted a Tincture of a red Colour, as is sufficiently known. But 'tis a Circumstance new and unadverted to, that from this Wood may be prepared a Refin of a dark reddish Colour, a very small Quantity of which tinges a few Ounces of the Spirit of Wine of a beautiful Colour, resembling that of Blood. This Refin is prepared in the same manner with other Refins; for highly rectified and not common Spirit of Wine is to be poured upon the Shavings of the Wood. The Essence is to be extracted by a gentle Digestion; and when we obtain a large Quantity of it, the Spirit is to be extracted, and what remains liquid, is to be inspissated by a gentle Heat. Thus there remains a dark-coloured red Powder, a small Quantity of which dissolved in Spirit of Wine, tinges a large Quantity of the Spirit, of a beautiful and deep red Colour.

'Tis peculiar to this Refin, that it is so free from all Taste and Smell, that when it is kindled, there is no manner of Smell perceived; when kindled it burns, but froths greatly, and leaves a large Quantity of Earth. It tinges Spirit of Wine of a beautiful Colour, but produces no such Effect with any Oils, whether expressed or distilled: Nor is it dissolved by Oils, which sufficiently shews, that it rather consists of a subtle and earthy, than of a pinguious and oleous Substance. It may be used for tinging Medicines; and as it tinges the Spirit of Wine of a deep red Colour, it may by Anatomists be commodiously used for injecting the arterial Vessels of the Head.

SANTERNA. See BORAX.

SANTOLINA.

The Characters are;

The Root is fibrous; the Leaves are alternate, denticulated, crenated, and granulated. The Calyx is squamous, and as it were hemispherical. The Floscules are multifid, and separated from one another by imbricated Leaves. The Flowers grow single at the End of a Branch, and are larger than those of Absinthium or Abrotanum.

Boerhaave mentions twelve Sorts of *Santolina*, which are;

1. *Santolina*; foliis teretibus. See ABROTANUM FÆMINA.

2. *Santolina*; flore majore; foliis villosis, et incanis. T. 460. *Abrotanum fœmina*, flore majore foliis villosis & incanis. C. B. P. 137.

3. *Santolina*; foliis obscure; virentibus flore aureo. T. 461.

4. *Santolina*; foliis minus incanis. T. 461. *Abrotanum fœmina*, foliis minus incanis. C. B. P. 137.

5. *Santolina*; incana; Chamæmeli odore suaviore. *Abrotanum fœmina*, folio collecto, incano.

6. *Santolina*; Hispanica; foliis Chamæmeli. T. 461.

7. *Santolina*; Africana; Ericæ foliolis congestis; flosculis singularibus albis. *Campobrata*, *Africana*, *umbellata*, *frutescens Hermannii*. H. A. 2. 79.

8. *Santolina*; spinosa; foliis ægerati. *Bellis spinosa*. Alpin. Exot. 327.

9. *Santolina*; Africana; Coronopi folio; cauliculis procumbentibus. *Bellis*, *Africana*, *capitula aphylla*, *luteo*, *Coronopifolio*, *cauliculis procumbentibus*. H. L. Flor. 54.

10. *Santolina*; foliis Rorismarini; major. T. 461. *Abrotanum fœmina*; foliis Rorismarini, majus. C. B. P. 137.

11. *Santolina*; Hispanica; foliis vermiculatis.

12. *Santolina*; foliis Ericæ, vel Sabinæ. T. 460. *Abrotanum fœmina*, foliis Ericæ, vel Sabinæ. C. B. P. 137. *Boerh. Ind. Alt. Plant. Vol. 1.*

The first Species is thought by *Fabius Columno* to be the *Polium* of the Ancients, which is a very celebrated Herb, and he seems to be in the right. It is a Diaphoretic and Anticolic, whence it is an Ingredient in all alexipharmic Compositions. All the Species are alexipharmic and aromatic, like the *Eupatorium* and *Petasitis*. *Hist. Plant. Ascript. Boerhaave*.

SANTONICUM SEMEN. Worm-Seed, is a Grain used to destroy Worms generated in the human Body, and to which Children are especially subject. It is also called *Hagiospermas*, *Semen Sundum*, *Semen contra Vermes*, *Semen contra Semenzina*, *Santolina*, or *Xantolina*, and *Worm-Powder*. The Plant which produces this Grain, has Leaves so small, that they can hardly be distinguished from the Grain itself. It is pretended to be a Native of *Xaintogue*, [a Province of France]

whence it takes one of its Names; but what is sold by the Merchants who deal in Drugs, comes from *Persia*, and is imported by the *French*, *English*, and *Hollanders*, from *Aleppo*, *Alexandretta* and *Smyrna*. The Marks of its Goodness are, a full Body, a greenish Colour, a pretty strong Smell, and a bitter and pretty aromatic Taste; and we must be very careful that it be not coloured with an artificial Green, and that the Seed of *Abrotanum* be not substituted in its Room.

It contains much Oil, and essential or volatile Salt. Taken inwardly it is very good to kill Worms in the Body, and suppresses Vapours; the Dose is from half a Scruple to a Dram. *Lemery des Drogues*.

SAPA. See CARENUM, and DECOCTIO.

SAPERDA. *cavignon*. A Fish mentioned twice by *Hippocrates*, in his Treatise *de internis Affectionibus*. It should seem to have been preserved with Salt, or Pickle, like Anchovies. We learn from *Perseus*, that it was brought from the Black Sea.

SAPHADA. Small reddish Scales, which adhere to the Hairs. *Paracelsus*.

SAPHENA. A considerable Vein on the Inside of the Ankle is thus called. *Galen, de Curat. per Venaesectionem*, is of Opinion, that the opening this Vein is of great Service in exciting the *Menses*; for by means of the Orifice made, the Blood is more copiously derived, not only to that Vein on which the Operation is performed, but, also, to all the other Veins arising from the same Trunk, as *Ballini* has at large demonstrated, because there is less Resistance in those Parts where the Vein is opened, than in the other Parts of the Body. If, therefore, Blood is taken from the Ankle, there will, of Course, be a more copious Derivation of the Blood to the Uterine Vessels, which arise from the Vena Cava, as well as the Saphena. Consequently, since the Vessels are greatly distended by a large Quantity of Blood flowing into them, a Passage will be the more easily opened for the menstrual Blood. Thus *Mayer*, in his Treatise *de Morb. Intern. Cap. 22*, informs us, that he had seen speedy and surprising Effects produced by the Application of Leeches to the hemorrhoidal Veins. In like manner, when, without any viscid Quality, the redundant Blood is, through a Fault of the Vessels, retained, upon opening the Saphena, the Humours are not only more rarified, but, also, more copiously conveyed to the Uterus. For both these Reasons, the Momentum of the Blood will be increased, to the uterine Vessels, thro' which the *Menses* will of course be excited. Hence we may form a Judgment of the Doctrine of *Lindanus*, so much extolled by *Eittmüller*: For the former of these Authors distinguishes the Times in which Venaesection is to be used, as *Eittmüller* informs us in the following Words: "When the *Menses* are about to make an Eruption, but have not as yet appeared, a Vein is to be opened in the Arm; but after they have begun to flow, or are suddenly obstructed, the Saphena is to be opened; but in the Ankle a Vein is never to be opened, unless the *Menses* actually flow, or are suppressed." *Eittmüller* accounts for this Doctrine in the following Words: "When the *Menses* are about to make an Eruption, and the Blood in a State of Turgescence and Rarefaction, the Effort of Nature is to convey it downwards; for which Reason, if the Vessels are small, they cannot be forthwith opened, but being rather distended, in some measure retard the Discharge of the Blood. When, therefore, by opening the Saphena, the Impetus of the Blood is conveyed to the inferior Parts, the larger Quantity of it is conveyed to the Uterus, by which means the Disorder is increased; whereas, by opening a Vein of the Arm, some Quantity of it is solicited upwards, the Vessels are freed from Oppression, and the Blood circulates more freely. And an Opening of the Saphena will never provoke the *Menses*, except in Cases where (when actually flowing) they have been suppressed either by Cold or a Fright." In this Reasoning it is supposed, that the Blood is so turgid and rarified, that it might quickly enough pass through the Vessels, unless, in consequence of its being conveyed downwards, Plenitude should obstruct its Motion. But that the Vessels should yield the less easily, the more they are distended with Blood, is a Principle so far from being compatible with sound Philosophy, that it is inconsistent with common Sense. For if opening the Saphena promotes the *Menses*, when already flowing, and recalls them when suppressed, why should it not, at other times, recall their Discharge? Whence happens it, that in one Case it augments the Momentum of the Blood, and in another diminishes it; whilst, at the same time, the Blood is equally strongly conveyed to the Uterus? Since, by opening a Vein of the Arm, some Quantity of Blood is solicited upwards, the Passages of the Uterus are freed from Oppression; but the Impetus becoming languid, in consequence of the Diminution of the Plethora, the Vessels

Veins are not so easily opened, because they are not so much distended. *Etmuller* affirms, that *Riverius* gives us an Instance in Confirmation of this Doctrine of Plenitude, in which he tells us, "That, as often as the Vein in the Ankle was opened in a certain Woman, her Menfes were stopt, whilst they flowed copiously by opening a Vein of the Arm." As this Phænomenon seems contrary to the common Doctrine of Physicians, the Professors at *Montpelier* have explained it in the following Words. "Since this Woman was plethoric, and afflicted with a Suppression of the Menfes, in consequence of a Redundance of Blood, so distending the Vessels of the Uterus, that they could not be sufficiently compressed; the Blood being attracted to those Vessels, by opening the inferior Veins, the Obstruction was augmented. But when, by opening the superior Veins, there was a Revulsion from the Vessels of the Uterus; and when their Plenitude and Distension were lessened, they then more easily contracted themselves, in order to perform the natural and usual Expulsion made from the Uterus." There is a Distinction to be made between a Plethora when single, and when accompanied with a Lentor of the Blood; for by the former the Menfes cannot be suppressed, nor consequently the Opening of the Saphæna, which increases the Plethora to the uterine Vessels, prove hurtful to the Eruption of the Menfes. But in a Plethora, accompanied with a Lentor of the Blood, because there is an Obstruction in the Uterus, that is, because the viscid Blood stops in the capillary Vessels, the Humours being more copiously conveyed to the Uterus by opening the Saphæna, and the Blood flowing out more impetuously, there is a greater Adhesion of the viscid Parts to the Orifices of the Vessels. But this Danger in opening the Saphæna is not to be ascribed to the Plethora, but rather to the Lentor; so that the Caution of *Lindanus* only holds good in that Species of Plethora which is accompanied with a Lentor of the Blood. The Woman already mentioned from *Riverius* laboured under a Plethora of this Kind; for which Reason her Physicians justly made it their Intention of Cure to diminish the Plethora by liberal Venesection in the Arm; and afterwards, by opening the inferior Veins, to solicit the Blood to them, especially about the usual Time of Eruption. The Reason why it is of more Service to open a Vein in the Arm first, and afterwards the Saphæna, seems to be this. When the Quantity of Blood is diminished by Venesection in the Arm, the Velocity of the Remainder is increased; and when the Saphæna is afterwards opened, the Blood is propelled more forcibly to the inferior Parts; and thus the Plethora in the uterine Vessels is perpetually increased. Hence the Plethora and Velocity being both increased, the distending Force of the Blood on the uterine Vessels, is, for a double Reason, augmented, and in consequence of this, a due Evacuation is excited. *Freind's Emenologia*.

SAPHERA, or ZAPHERA. *Zaffer*, a bluish mineral Substance, made, according to *Lemery*, from the *Caput Mortuum* of Cobalt, left after the Sublimation of Arsenic, and twice the Quantity of powder'd Flint calcin'd together, so as to form a Sort of Stone. It is used by the Painters and Enamellers, but is possess'd of no medicinal Virtues.

SAPINDUS. The same as **ARBOR SAPONARIA**, which see.

SAPINUS, according to *Blancard*, is the Fir, or the inferior Part of the Fir without Knots.

SAPO. Soap. See **OFFA HELMONTIANA**.

SOAP FROM EXPRESSED OILS AND A FIXED ALALK.

Take a Quantity of expressed Oil-Olive in one Glass, and an equal Weight of Oil of Tartar in another, pour the Oil gently upon the Lixivium, and it will float thereon, and the two Liquors remain perfectly distinct. Shake the Vessel wherein they are both contained, and the Mixture will immediately appear white, opaque, thick, and somewhat viscous; and when suffered to stand in this State, it will continue for some time equally mixed, but at Length the Oil and the Lixivium will separate from each other; whence it appears, that expressed Oils, by Means of the Acid always lodged therein, are disposed to mix with Alkalies, even tho' diluted with Water; but that this Union is so weak as easily to be separated. Again, it seems probable, that the Acid is the Means of procuring this Combination; because Oils, deprived of their Acid, more difficultly unite with Alkalies. If this Mixture be gently boiled over a slow Fire, till the Water is gradually exhale, it comes into one consistent white Mass, of a nauseous oily Smell, and a sharp, alkaline, ungrateful, unctuous Taste, which will easily resolve in the Air; but if in the Boiling, a just Proportion

of the dissolved Alkali or Oil be added, or mixed therewith, so as that the Compound may perfectly dissolve in Water, without separating from its Oil, and yet manifest nothing alkaline to the Taste, and remain long in the Air without running, it is then called perfect Soap. It was afterwards found, by a successive Repetition of Experiments, that the stronger the Alkali, the more perfect the Soap; and as Quick-Lime wonderfully increases the Power and fiery Nature of Alkali, an Alkali prepared by means of the same, began to be used instead of the simple Kind, for the making of Soap; and because they also observed, that the Union was made more perfect by long continued Boiling, and that this Boiling required a larger Proportion of Water, they added Water more plentifully, and at length, by repeated Trial, they likewise found that a certain Proportion of Oil and Alkali was required; and thus by successive Degrees, the certain and determinate Way of making Soap was found.

They take the fixed, alkaline fiery Salt, prepared with Quick Lime; this they dissolve in such a Proportion of hot Water, that the Lie may support a new-laid Egg; and this the Soap-makers call their capital Lie. They afterwards dilute Part of it with more Water till a fresh Egg will sink therein; and this they call the weaker Lie. They afterwards mix their Oil-Olive with an equal Weight of this weaker Lie, by stirring them well together, till the whole becomes white, then boil the Mixture with a gentle Fire, keeping it continually stirring, till the Water being exhale, the Remainder begins to unite; at which time they throw in thrice the Weight of capital Lie, in Proportion to the Oil, and mix and boil till the Mass becomes so thick, that a little of it laid upon a cold Stone, appears to be of a due solid Consistence; and if now a Part of this cold Mass is dissolved in Water, it manifests no Signs of Oil, this shews that the Oil is well united with the Alkali; but if any Oil still appears, the Addition of a little more capital Lie is required, and the Boiling must then uniformly be continued, till the Soap will perfectly dissolve in Water. At this Time the Soap is tasted, and if it proves sharp and alkaline, it is a Sign that Alkali abounds too much therein. Therefore a little more Oil is added, and the Boiling continued, till at length a Mass is obtained, so hard as to cut in the cold, and that will perfectly dissolve in Water, and neither taste alkaline upon the Tongue, nor run spontaneously in the Air; and thus the Soap is perfected.

Instead of Oil-Olive any other fat Substance may be used, as the Fats of Animals and the Oils of Fish; thus black Soap is made from Train-Oil, or the boiled Blubber of Whales; but the purer the Alkali is, and more scentless, tasteless, and less ungrateful the Oil, the better the Soap, especially for medicinal Use.

REMARKS.

Here we see an intimate Combination of native Oil with fixed Alkali, by Means of Water and Fire, into a homogeneous Mass, which will perfectly dissolve in Water; whence it appears, that the Oil here loses its former fat Nature, and acquires another more agreeable to Water; and that this is brought about by the Means of sharp fixed Alkali. And therefore, where the Humours of the Body abound with Oil, Salts are generally useful, and consequently in this Case, a prudent Use of fixed alkaline Salt may be allowed. Hence also we are shewn a Way, whereby the Acrimony of Alkali may be entirely blunted, so as to grow soft and put off its corrosive Nature, by the means of Oils. Whence again, in such Cases, where the like sharp, saline Matter predominates, fresh expressed Oils, drank in plenty, will blunt it; and this has been often practised with good Success in the acutest Diseases, and the more pernicious Kind of Scurvy; again, when this Acrimony is spontaneously generated in a certain Place, as in the Kidneys or Bladder, where the Stone drinking in the Urine, turns it to this Kind of Acrimony: But in the Soap so produced, tho' the Tenacity of the Oil is abolished, yet the former Virtue of the lixivial Salt remains, whereby it deterges without Danger of corroding; for when mixed with Water, it makes a strong saponaceous Lie, which by Heat, Motion, and Trituration, dissolves Gums, Oils, Rosins, and gross Fats, rendering them also saponaceous, or soluble in Water; and thus it has a scouring, detergent, opening, cleaving Property. Hence it renders coagulating Humours fluid, opens old Obstructions, and thereby restores the lost Use of the Parts. It, also, has great Effects upon Concretions, consisting of gross Earth and Oil; it prevents Acids from coagulating the Chyle or Milk, and even resolves them after Coagulation. Whence it appears to be almost an universal Opener, Diluter, Resolver, and thinner in the Body, in the abovementioned Cases; being drank upon an empty Stomach, well

well diluted and at different Times, in a sufficiently large Quantity, and assisted by the Motion of the Body. It is likewise wonderfully serviceable, being externally applied in sinuous and fistulous Ulcers. It may be ting'd and disguised, by giving it a grateful Colour with Saffron, Turmeric, Cochineal, or other Pigments; and if it still proves disagreeable, on account of the nauseous Smell acquired by the Oil in boiling, it may be corrected by a little Balsam of Peru. But its Use is highly pernicious in those Distempers, where Life is in Danger from a Putrefaction, that dissolves and corrupts the Humours, as has frequently appeared in the Plague and other putrid Distempers, according to the just Observation of *Diermerbroeck*. Many other Particulars of chymical and medicinal Use may be easily deduced, concerning this noble Production, from what is above delivered. Soap effects what neither Water nor Oil could perform, does that with Safety which Alkalies do with Danger, and can perform what other Salts cannot.

SOAP FROM DISTILLED OILS AND FIXED AL-CALI

Chymists considering the Virtues, which by Experiment they found in distilled Oils, were concerned to find that these Oils, not mixing with Water, could not enter and act upon the Humours of the Body; and therefore observing that expressed Oils might be successfully united with fixed Alkali, they went upon trying the same with distilled Oils, but found that these lost their Virtue by boiling, and even could not thus be joined with the Alkali, and hence tried various Experiments to unite these different Bodies, till excited by the Directions and Promises of *Helmont*, some of them seemed to have found the Means of effecting the Thing. I myself, formerly made many tedious Experiments to this Purpose, and at length succeeded as I shall now relate. The Secret consists in this, that the Alkali should be perfectly sharp, pure and dry, and come in Contact with an Oil perfectly deprived of Water; all the rest is successfully performed by the Atmosphere; but if the least Water should enter, the Experiment will be frustrated.

Take the purest and strongest fixed Alkali, and grind it in a clean Iron Mortar, with an Iron Pestle, to fine Powder, the finer the better, while it remains thoroughly hot from the Fire, and almost ignited; then put it into an extremely dry and well heated Urinal, and set it in a hot and dry Place, on a clear and dry Day; and at the very Instant that the hot Salt is all collected at the Bottom of the Glass, let fall therein the true ætherial and pure Oil of Turpentine, so that one Drop may immediately follow another, and fall upon the middle of the hot Salt; the Oil itself having been first well heated; and thus the Oil will immediately, with a great Fume and hissing Noise, be attracted into the thirsty Salt, and diffuse itself intimately through the whole Mass. Continue to pour in the Oil quick, till enough is entered into the Salt, and floats above it, so as to prevent it from touching the external Air - which is always moist with Water, or from touching the Surface of the Salt. Set the Glass in a Cellar, where being covered with Paper, the Oil will soon disappear, and be united with the Alkaline Salt; then pour some more of the warm Oil thereon, and mix it with a Stick into the former Mass. Set the whole by, as before, and continue thus till near thrice the Quantity of the Oil is united with the Salt; the whole will be now a saponaceous and penetrating Mass, which, the more it is stirred, the sooner and better it is made, whence it may be expeditiously obtained, by putting it into a strong Glass, and suffering it to be carried daily, and shook in a Stage Coach, as Doctor *Grew* and *Bohn*, have formerly observed. The Experiment has always succeeded well, when I have observed the foregoing Circumstances; but never if the least of them were neglected. The Operation is known to be well performed if a little of the Soap will mix with Water without manifesting any Sign of Oil. If the Soap, thus prepared, be long kept in the Urinal, there usually rises, by degrees, along the Sides of the Glass, a certain white crystalline Salt, of no disagreeable Odour, and of a penetrating, mild, saline, but not alkaline, Taste; which is wonderfully insinuating, easily soluble, and affords an highly useful medicated Soap.

This Salt which is but little in Quantity, I suspect gave Origin to the Assertion, which perhaps is too free, that fixed Salt of Tartar was here rendered Volatile, by means of Oil added thereto, so as to become a Substitute for the Alcahest; but when I urged this Soap with Fire, after it was well prepared, I did not find the promised volatile Salt.

REMARKS.

This Experiment also shews us the thirsty Nature of pure fixed Alkali, whereby it drinks in and unites these Salts with itself, and again how a sharp fiery Alkali may be softened into a mild oily Salt. We have sufficiently spoke to the Virtue it has against acid, austere and viscous Coagulations, under the former Process; we must however observe, that all the Virtues there related, are here found more Noble and Active, and constantly somewhat heating. Hence we understand the Nature of distilled Oils, with regard to fixed Alkalies, or of fixed Alkalies with regard to them; and of the new Production by a proper Combination of the two. *George Starkey*, and his Followers, call this Soap Volatile; but I never could find it so, as I said above. This is the Soap which *Matthew*, an Empiric of London, made under the Title of *Matthew's Corrector*, wherewith he mixed Opium, and the Roots of Hellebore and Liquorice, and then digesting them together, he made general Pills thereof, that were diaphoretic, scarce emetic, or purgative, but anodyne, though they would often vomit the next Day. *Starkey* published a more correct Preparation of these Pills at the End of his *Pyrotechny*, where he boasts of their Virtue after the Manner of Chymists, unjustly pretending that the Virtue of the Hellebore remained entire, though deprived of its vomiting Quality. The excellent *M. Hemberg* observes that a strong Lixivium made of this Soap, mixed with a sharp Acid is strangely rendered turbid and changed; while the Alkali being attracted by the Acid, lets go the Oil. These Soaps being well dried and digested with pure Alcohol, are in some measure resolved into the less Elixir of the Philosophers, where the Sulphur and Spirit are united.

THE SOAP OF BALSAM OF SULPHUR.

1. Take the Balsam of Sulphur, as directed to be prepar'd with a Vegetable express'd Oil under the Article BALSAMUM. Dilute it with twice or thrice its Weight of the same Oil as was used in its Preparation, and herewith make a Soap. This will be the Soap required, which *Starkey* in his *Pyrotechny* so highly commends from *Helmont*.

2. Or take Balsam of Sulphur, with Turpentine as directed under the same Article, and therewith, instead of simple Oil of Turpentine, make a Soap: This Soap will be the sulphureous Soap of the Philosophers.

REMARKS.

These Processes shew the Ways whereby natural simple Sulphurs, as also such as closely adhere to Semi-Metals, as the Sulphur of Antimony, &c. may be joined to fixed Alkaline Salts, and thus become mixible with nearly all the Animal Juices, and exert their Virtue in all the Vessels of the Body. The followers of *Helmont* hence promised themselves wonderful medicinal Effects, not easily to be obtained by other Means; because in these Sulphurs, so opened, they find a great solutive Power, which is manifest by their disagreeable Odour, their ungrateful, and highly penetrating and heating Taste; but the same Effects may be had in the Soaps described above, without the disagreeable Odour and Rancidness. These Processes, however, have their Chymical Use.

THE BALSAM, OR SOAP OF SULPHUR, UNITED WITH ALCOHOL.

1. To the terebinthinated Balsam of Sulphur contained in a tall Bolt-Head, add six times its Weight of pure Alcohol, and make a Solution; which having stood for some Time, the Sulphur in part precipitates out of the Balsam, into sulphureous Crystals, and in part remains dissolved, so as to afford an alcoholized Balsam of Sulphur.

2. Or take the terebinthinated Soap of Sulphur, as describ'd in the preceding Process. N^o 2. digest it with Alkali, and this makes perfectly the same Solution, of a very penetrating Taste and Odour. *Boerhaave's Chymistry*.

SAPONARIA. A Name for the *Lycnis, Sylvestris, quæ Saponaria vulgo*.

SAPONEA. The Name of an Arteriacal, or Pectoral Medicine, made of Oil of sweet Almonds and Sugar dissolv'd in Water of Violets. *Castellus* from *Claudianus*.

SAPOR. Taste. See GUSTUS.

SAPOTA. The *Mammia Sapota*.

The Characters are ;

It hath a Rose shaped Flower, consisting of several Leaves, which are placed in a circular Order ; from whose Emplacement arises the Pointal, which afterwards becomes a large, oval, short, fleshy Fruit, inclosing an oblong pointed Stone or Fruit, which is finely polished, having a rough Fissure on one of the Edges, of an Ash Colour.

Miller mentions two Sorts of *Sapota*, which are ;

1. *Sapota fructu turbinato minori. Plum. Nov. Gen.*
2. *Sapota fructu ovato majori. Plum. Nov. Gen.*

The Name of *Sapota* is what these Fruit are called by the Natives of *America* ; to which some add the Appellation of *Mammæ*. But there is no other Name given to these Fruits by the *English*, since they have settled in the *West Indies*, so far as I can learn.

The first of these Trees is common about *Panama*, and some other Places in the *Spanish West Indies*, but is not to be found in any of the *English Settlements in America*. The second Sort is very common in *Jamaica*, *Barbadoes*, and most of the Islands in the *West Indies*, where the Trees are planted in Gardens for their Fruit, which is by many Persons greatly esteemed.

These Trees grow in *America*, to the Height of thirty-five or forty Foot, having a strait Trunk, covered with an Ash-coloured Bark. The Branches are produced on every Side, so as to form a regular Head. These are beset with Leaves, which are a Foot in Length, and near three Inches broad. The Flowers, which are produced from the Branches, are of a Cream Colour ; when these fall away, they are succeeded by large, oval, or top shaped Fruit, which are covered with a brownish Skin, under which is a thick Pulp of a Russet Colour, very luscious, called natural Marmelade, from its Likeness to Marmelade of Quinces. *Miller's Dictionary, Vol. 2.*

SAPON. The Name of a Wood used in dying, but of no medicinal Virtues.

SAPPHIRUS. Offic. Aldrov. Mus. Metall. 971. Geoff. Prælect. 80. Kentm. 48. Mont. Exot. 14. Calc. Mus. 223. Boet. 183. Worm. 104. Schröd. 320. Charlt. Foss. 38. De Laet. 30. *Sapphirusmas caruleus*, Schw. 391. *Lapis Sapphirus*, Matth. 1387. **THE SAPPHIRE.**

The Sapphire, called by some the Gem of Gems, is a hard Stone of a blue Colour like that of the clear Sky. It comes nearest the Diamond in Splendor, Transparency, and Hardness, and is of two Kinds ; one pale, called the Female Sapphire, the other of a deeper blue, called the Male. There is a third Sort, likewise, which has no Colour at all, and is sometimes made to pass for a Diamond, but is neither so hard nor so brilliant.

Sapphires are brought from different Parts of the *East Indies*, and thence called *oriental*. The rest are found in *Silesia* and *Bohemia*, called *occidental*. The Colour of Sapphire may be taken out by Fire, and then it looks like a Diamond ; for which Reason I believe this Colour to come from a small Mixture of fine Sulphur of Copper. Many are the inestimable Qualities superstitiously ascribed to this Stone ; but, besides these, we are told that it raises and exhilarates the Spirits, resists Poison, and cures Ulcers of the Intestines. *Geoffroy.*

It is of a cold and dry Quality, astringent, consolidating, alexipharmic, cordial, and ophthalmic. *Schroder.*

SAPRIAS. *σαπρία*. The same as **ANTHESMIAS**.

SAPURUS. The same as **SAPPHIRUS**.

SARAFFI, is explained by *Rulandus*. *Gypsa*.

SARAPOUS. *σαράπους*. A Person whose Toes are very distant from each other. *Galen. Exeges.*

SARCA, SAYRSA, or SARRA. Iron. *Rulandus*.

SARCION. *σαρκιον*. A Caruncle.

SARCOCELE. *σαρκοκήλη*. From *σάρξ*, Flesh, and *κύλη*, a Tumor. A Species of *Hernia*. See **HERNIA**, and **CATRATIO**.

SARCOCOLLA. Offic. C. B. P. 498. Park. Theat. 1544. Raii Hist. 2. 1847. Geoff. Tract. 364. *Sarcocolla Officinarum*, J. B. 1. 308. **SARCOCOL.**

This is a Gum which comes over in small whitish yellow Grains, with a few of a reddish Colour mixed among them, of a viscid and somewhat bitterish Taste, with a sweetish Relish. There is another Sort, which has been brought over lately in Lumps of a brownish yellow Colour, smelling and tasting somewhat resinous, very friable, and powdering of a whitish yellow Colour. It is said to come from *Persia*, but we have no Knowledge of the Tree which produces it.

It is of a refringent, consolidating, glutinous Nature, good to heal and cicatrize Wounds. It is serviceable against Dysenteries, Spitting of Blood, and Bleeding at the Nose ; and is frequently made use of in Distempers of the Eyes. It is put into *Trochisci albi Rhafis* and the *Emplastrum Opodeldoc*. *Miller's Bot. Off.*

To make it into a Collyrium, nothing is required but to dissolve it in Plantain Water. *Geoffroy.*

Chuse what is recent, of a Colour inclining to Paleness (for the old and stale is reddish) of a bitter Taste, a porous and glutinous Substance.

It is heating, drying, astringent, consolidating, conglutinating, digestive, and maturating. Its principal Uses are in extirgishing and consolidating Wounds, and inducing a Cicatrix over them, whence it has its Name. It is of excellent Service in Rheums, Albugo, or Films affecting the Eyes ; for which Purposes it is macerated five Days in Asses or Women's Milk ; and being mixed with Rose-Water, and (if you think fit) with a little Sugar, is applied to the Eye-lids. It is an Ingredient in *Anacollemas* for Hemorrhages of the Nose. *Dale.*

SARCOEPIPOCELE. A Kind of compound Rupture, consisting of a Descent of the *Epiploon*, and a *Sarcocele*. Or a Rupture of the indurated *Epiploon*, either umbilical or scrotal.

SARCOMA.

A Sarcoma is defined a fleshy Tumor, arising in any Part of the Body, from some Effusion of the nutritive Juices out of their Tubuli, as happens in Contusions, and by some other Accidents. This Tumor being certainly made up of the same Materials, and having the like manner of Accretion with that of other Parts, but with this Difference only, that the latter is restrained by the Course of the Vessels, to some certain Figure, and equal or irregular Dimensions, whilst the former is in Form, and under no certain Restriction or Limitation.

For when this precious Liquor, by Reason of some Obstacle, is perverted from its primary Use or Office of nourishing some certain Parts, rather than lie unactive, busy Nature will be still forming something thereof, however rude or unshaped, as well as useless it may prove.

The same *Lusus* or Aberration is daily seen in Plants, with the like Excursions of their Sap, analogous to the Blood of Animals, when by some Accident of Let or Stop in its more regular progressive Motion, it is forced to deviate or turn aside out of its Channels.

The Sarcoma is distinguished from encysted Tumors, in that it has no Cystis or proper containing Capsula like those, nor is it moveable as they are ; neither yet does it give way as the rest to any Pressure, having no Cavity, but is firm, compact, and more solid.

As to the Cure, whoever reflects upon the Nature and Matter of this Tumor, will easily apprehend it is to no Purpose to expect it should either be repelled or dissolved, and as little to hope for Suppuration ; since it is made up of Flesh itself, or the extravasated nutritious Juice here carnified, and turned to a solid Substance ; and if the Base or Foundation thereof be not small enough to allow of the Ligature, it can be no otherwise removed than by Knife or Fire, either actual or potential : By the first I mean, the hot Iron ; by the latter, the escharotic, or caustic Application.

It may, indeed, so happen as to want all three, not only to stay the Hemorrhage, or Flux of Blood, but to eradicate and consume the Basis ; which being done, and the Wound digested, you are to incarnate, if there be Occasion, or otherwise to dry up the Remains into a Cicatrix.

But before you enterprize any of these Operations, you are thoroughly to examine the Nature of the fleshy Body you are about to eradicate, either of these Ways : Thus, when of a mild Appearance, soft and tractable, of the natural Colour or kindly Aspect, attended with little Pain, situated free from the larger, or fed only by some capillary Blood-Vessels, clear also of the Nerves and Tendons, in a good Habit of Body, and a governable Patient, there will be greater Encouragement. On the contrary, when hard, livid, unequal, painful, seated in the Joints, or among the tendinous Parts, nourished by some large Artery, the Body cacochemical, and the Sick unruly, 'tis better not to meddle therewith.

Farthermore, observe in all Operations of this kind, and indeed in many others, though seemingly of less Moment, it will be requisite, that the Patient's Body should be prepared three or four Days before, by Phlebotomy, Clysters, or lenient Purgation, as also an abstemious Diet, which latter ought to be continued through the whole Course of the Cure, to prevent a Fever, with the consequent Symptoms. *Turner's Surgery.*

SARCOMPHALON, from *σάρξ*, Flesh, and *ὄμφαλος*, the Navel. A fleshy Excrecence at the Navel.

SARCOPHAGOS, *σαρκοφάγος*, from *σάρξ*, Flesh, and *φάγω*, to eat. A Name for the *Assius Lapis*. Cathartics are, also, thus called.

SARCOPHYIA, *σαρκοφύια*. A fleshy Excrecence, or **SARCOMA**.

SARCOPYODES, *σαρκοπώδης*. An Epithet of Spit resembling purulent Flesh, which is sometimes cough'd up in a Consumption.

SARCOSES,

SARCOSIS, *σαρκωσις*. The same as **SARCOMA**.

SARCOTHLASIS, *σαρκόθλασις*, or **SARCOTHLASMA**, *σαρκόθλασμα*. From *σαρξ*, Flesh, and *θλάω*, to confuse. Confused Flesh, or a Confusion of the Flesh. *Nonus*.

SARCOTICA. Sarcotics. That is, Medicines which generate Flesh in Wounds.

SARDA, or **SARDINA**. The Pilchard.

This is a small Fish found in the *Mediterranean*, which resembles the Anchovy, but is larger and thicker; and it is less than a young Snad. Sometimes they keep in the Middle of the Sea, and at other Times resort near the Shores.

This Fish is best when young, tender, well fed, fresh, and catch'd in March or April. It contains much Oil and volatile Salt. When fresh it is delicious Food, nourishing, opens the Body, produces good Juice, and is of a dissolving Nature, and may be advantageously applied, when pounded, to Swellings of the Gums and Legs.

When pickled, it loses some of its excellent Taste, heats much, causes Thirst, makes the Humours sharp and pungent, and produces nearly the same Inconveniencies with the Pickled Herring; but it has a much finer and more agreeable Taste, and may be reckoned among those Foods which are more pleasant than wholesome. When it is fresh, it is good in cold Weather, for any Age and Constitution; but when it is pickled, it ought to be eaten more moderately, especially by those who are young, and of a hot and bilious Constitution.

SARDA, is also a Name for the *Sardius Lapis*, Cornelian.

SARDONIUS RISUS. Sardonian Laughter, a convulsive and involuntary Laughter; it acquires this Name from the *Herba Sardonica*, or *Sardoa*, which is the *Ranunculus*; *palustris*; *apii folio*; *lævis*, and which is said to excite a Kind of Madness and Convulsions, by which the Cheeks are contracted in such a manner, as to resemble those of Persons under a Fit of Laughter. This Disorder, which has passed into a Proverb (in which Acceptation *Sardonius Risus* signifies a forced Laugh) is justly regarded as very dangerous, since it induces sudden and unexpected Death, under the Disguise of a false Laughter.

The Cure for those who are disordered by taking this Herb is first to vomit, and then to take a Draught of Hydromel and Milk, and to use Fomentations, Embrocations, and Inunction of the whole Body with hot Ointments. The Patient is, also, to bathe in Water and hot Oil, and after Bathing to be anointed, and very well rubbed. In general the Cure is to be managed in the same Manner as for Convulsions; Castor, also, may be taken, either alone, or in Passum, with other Medicines of the like Nature. *Actius, Tetrab. 4. Serm. 1. Cap. 66. copied verbatim by Paulus and Actuarius.*

SARDONYX, Offic. Boet. 233. Kentm. 49. Charlt. Foss. 34. De Laet. 70. Worm. 97. Calc. Mus. 241. *Sardonyx Indica*, Geoff. Prælect. 78. **THE SARDONYX**.

The *Sardonyx*, as the Name imports, is a precious Stone, of an Appearance betwixt the *Sardus* and *Onyx*. *Geoffroy* says, that the *Onyx*, or *Sardonyx* according to some, is different from the true *Sardus*. See **ONYX**.

The *Sardus*, or the Sardian Stone, is very rare, and not perfectly transparent. We meet with two kinds of it, one called *Oriental*, the other *Occidental* or *European*, the former of which is the hardest. Both these were by the Ancients termed *Sardonyx*. The second Sort is the *Indian* and *Arabian*, of which the former is pellucid, the other opaque.

The *Indian Sardonyx* resembled both the *Sardus* and *Onyx*, its Surface being like the *Onyx*, or human Nail; but its Root was white, like the *Sardus*, or of a Flesh Colour; and was mostly transparent, though some of them being opaque, were from thence called *Cæca*, or blind.

The *Arabic Sardonyx*, called by some *Memphitis*, was distinguished by a black or dark blue Substratum, surrounded by a white Circle, and by its Surface being more or less white. This, by Jewellers, is termed simply *Onyx*.

The Ancients were of Opinion that the *Sardus*, by a certain Irradiation, exhilarated the Mind, banished Fear, inspired with Courage, defended against the Power of Witchcraft and Poison. It is given in Powder to stop all bloody Fluxes; but is very little used at this time. *Geoffroy*.

SARDUS. See **CARNEOLUS**.

SARE. The same as **ESSERE**.

SARFAR. Iron. *Rulandus*.

SARGAZO. The *Vitis Marina*. See **FUCUS**.

This Plant covers a large and spacious Sea of the *Indies*, elevating itself a Hand's Breadth above the Surface. It shoots forth several fine, slender Stalks, interwoven one among another. The Leaves are long, thin, strait, serrated at the Edges, of a reddish Colour, and of a Taste like that of *Percepie*. The Fruit is a round Berry, as big as a Pepper-Corn, light, and empty. The Plant is very tender when first taken out of the Water, but becomes hard and brittle when it is dry'd. There is no Root to it as yet discovered, but only the

Mark where it has been broken off when taken out of the Sea; but it has, very probably, its Root in the Bottom of the Sea. This Herb, by its vast Abundance, renders the Navigation of that Sea very dangerous. It is eaten in Sallads. *Lemery des Drogues*.

Sargazo is very aperient, and good to provoke Urine, and break the Stone in the Kidneys and Bladder, for the nephritic Colic, and the Scurvy, being either eaten, or taken in Decoction.

Sargazo comes from *Sargasso*, which is the Name the Portuguese give that Extent of Sea which lies between the Islands of *Cape Verde* and the *Canaries*, and the main Land of *Africa*.

SARGUS, a bulky Fish, fleshy and thick, and found in the *Egyptian* Sea, on the Shores, and in the Sand. It has a large Body, covered with fine Scales, and is of a Colour inclining to a Violet. It has a capacious Belly, sharp Snout, and great Teeth resembling human Teeth. It has a black Spot towards the Tail, and its Body is often beautified with Streaks of the Colour of Gold and Silver. It is a Native of the *Adriatic* Sea, and is said to be so great a Lover of Goats, that if it smells them, or does but see their Shadow, it leaps and throws itself forward in order to get upon them. It commonly feeds on the Mud and Surf, that is found on the Sea-shore. It is good to eat, but its Flesh is hard.

The *Sargus* is esteemed good for the Dropsy, being taken in Broth. The Teeth worn about the Neck, are supposed to be a Preservative from the Tooth-Ach. *Lemery des Drogues*.

SARMATICA LUES, is the **PLICA POLONICA**.

SAROPUS. The same as **SARAPUS**.

SARRACENA. The Side-Saddle Flower.

The Characters are;

It hath a Flower consisting of several Leaves, which are placed circularly, and expand in Form of a Rose, and resting in a many-leaved Empalement. From the middle arises the Pointal, which is membranaceous, and shaped like a Hood, and afterwards becomes a roundish Fruit divided into five Cells, which contain oblong Seeds.

Miller mentions but one Species:

Saracena Canadensis foliis cavis et auritis. Inst. R. H.

This strange Plant is a Native of *New-England*, *Virginia*, and several Places in *North America*; where it grows on Bogs, and such Places where the Waters usually stand in Winter. The Leaves of this Plant arise from the Root every Spring, being eight or nine in Number, which are small at the Bottom, but swell larger towards the Top, and are hollow like a Pitcher, having a Sort of an Appendix at the Top, somewhat resembling a Flap, so that in these Leaves there is commonly a large Quantity of Water contained. Between the Leaves arises the Flower-Stem, which hath several rosaceous Flowers growing on the Top, which are succeeded by roundish Fruit.

The Name was given to this Plant by *Dr. Tournefort*, in honour of *Dr. Sarazin*, a curious Botanist, who sent the Plant from *Canada* to *Dr. Tournefort* at *Paris*. *Miller's Dictionary*.

SARRAMPIO. The same as **PICOTA**.

SARSAPARILLA. Offic. *Smilax aspera Peruviana*, Park. Theat. 173. *Smilax aspera Peruviana sive Salsaparilla*, C. B. P. 296. Raii Hist. 1. 656. *Smilax Peruviana Salsaparilla*, Ger. 709. Emac. 859. *Smilax affinis Salsaparilla*, J. B. 2. 117. *Ivapeçanga Brasiliensis*, *Sarsaparilla Hispanis*, Marcg. 11. *Macapatlil seu Zarca-parilla*, Hernand. 288. *An Carivillandi?* H. M. Part. 7. p. 59. T. 31. **SARSAPARILLA**.

This is a very long, slender Root, free from Knots, about as thick as a Goose-Quill, with a brown wrinkled Bark on the Outside, and white and somewhat mealy within, having a small, tough, stringy Pith in the Middle, of little Smell or Taste. A great many of those long Roots descend from one large Knot or Head. It grows in *Petu* and *Brazil*, and is described by *Piso* under the Name of *Ivapeçanga*, being a Species of *Smilax aspera*, having slender prickly Stalks, and long oval sharp-pointed Leaves, of a deep Green on the upper Side, and whiter underneath, with three large Veins and two Claspers set on by them. The Flowers grow in Bunches at the Ends of the Stalk, and are succeeded by small black Berries.

Sarsaparilla is heating, drying, attenuating and sudorific; and particularly useful for the French-Pox, for which it has been accounted a Specific, and much used in Diet-Drinks for that Distemper. It is likewise serviceable against the Gout, Rheumatism, Scurvy, and the King's-Evil, being accounted a Sweetner of the Blood. *Miller's Bot. Off.*

It is of fine Parts, and accounted a Specific for the Lues Venerea, Arthritis, Rheumatism, and the like Diseases. Whether *Sarsaparilla* be specifically different from *China-Root*, I will not, says *Dale*, taking upon me to determine.

Sarsaparilla is a very noted Root, which began to be very much celebrated about the same time with the Root of *China*, as appears from the Epistle of *Vesalius* [quoted under the Article *CHINA*.] It is inferior indeed to *Guaiacum*, but is generally supposed to be much superior in Virtue to *China* Root, and even to exceed *Guaiacum* itself, when after a Course of mercurial Inunctions, and drinking Decoctions of *Guaiacum*, the Patient is still molested with Ulcers, Rhagades about the Anus, Tophi, Nodes, Ganglia, and Gummata; but especially with Rheumatic Pains, either fixed or wandering, and owing their Original to the venereal Infection, in which latter Case it is esteemed a Specific.

It is imported from several Countries of *America*, and especially from *Peru*, *Mexico*, and *Brazil*, where it is said to grow spontaneously, and plentifully, even in the Hedges. It is generally believed to be the Root of a Plant, the same with the *Smilax Apera*, or very near akin to the *Smilax*. Hence it is called by the Spaniards *Sarsa-parilla*, or *Zarza-parilla* (that is, a small Vine resembling the Bramble) which is the Name they give the *Smilax Apera*, as we are told by *Andreas Lacuna*, because the *Smilax* in its Leaves, Branches, and Tendrils resembles the Vines, but in its Thorns and Prickles the Bramble; for *Zarza* in Spanish is a Bramble, and *Parilla* a little Vine. This Opinion is, also, favoured by Experience; for it is certain, that the Roots of our *Smilax Apera* very nearly resemble in Figure those of *Sarsa-parilla*, and almost equal them in Virtue, since we are assured by *Fallopianus*, *de Morbo Gallico*, that he made use of the Roots of the *Smilax Apera* gathered in *Italy*, with happy Success, and cured Multitudes of the Lues Venerea.

Sarsa-parilla is prepared in Decoction after the same manner as *China*, that is, by cutting two Ounces of the Root into small Bits, and macerating them a whole Day in six Pints of common Water, after which they boil them over a gentle Fire in a double Vessel well closed with a Lid, till one third, or half, be evaporated. Of this Decoction the Patient is to take a Glass, that will hold ten Ounces, very early in Bed; what remains serves during the rest of the Day for ordinary Drink, and this Course is continued for twenty or twenty-four Days. As to the rest, the Patient is allowed a somewhat greater Latitude in Diet, than under the Use of *Guaiacum*, and observes, in that Respect, the same Regimen as is prescribed to those who drink the Decoction of *China*. See *CHINA*. *Astruc de Morb. Ven.*

SARTORIUS.

This is the longest Muscle in the human Body. It is flat, and about two Fingers in Breadth, situated obliquely along the Inside of the Thigh.

It is fixed above by a very short Tendon, in the lower Part of the anterior Superior Spine of the Os Ilium, before the *Musculus Fascia latae*. The Beginning of its Body lies in the Notch between the two anterior Spines of that Bone.

From thence it runs down obliquely over the *Vastus Inter-nus*, and other Muscles that lie near it, all the Way to the Inside of the Knee, where it terminates in a small Tendon, which grows broader near its Extremity, and is inserted obliquely and a little transversely, in the fore Part of the Inside of the Head of the Tibia, near the Spine or Tuberosity of that Bone, immediately above the Insertion of the *Gracilis Interior*.

The fleshy Body of this Muscle is inclosed in a Vagina formed by an Expansion of the *Fascia Lata*. Its Fibres in general are longitudinal, and where its lower Tendon turns obliquely round toward the Head of the Tibia, it seems to be braced down and secured in its Place, by a tendinous Frænum or Vagina. A little before it is inserted, it detaches a distinct Aponeurosis or tendinous Branch, which runs obliquely downward on the Inside of the Tibia.

The *Sartorius* performs the Rotation of the Thigh from before outward, whether extended or bent; being an Antagonist to the *Musculus Fascia Latae*, and a Congener to the *Quadrifemini*.

If during this Rotation the Leg be extended, the Toes are turned outward; but if the Leg be bent, it is turned toward the other Leg, as when we lay it over the other Leg or Knee, in the manner that Tailors sit at Work, from whence this Muscle got the Name of *Sartorius*.

It, also, bends the Thigh, or raises it forward; it moves the Pelvis forward on the Os Femoris; and when the Pelvis rests on the two Tuberosities of the Ischium in sitting, it keeps it in that Situation. In this Action it is a Congener to the *Rectus Anterior*; but acts with much more Force, as having its Line of Direction further from the Center of Motion.

Lastly, it bends the Leg, whether it performs the Rotation of the Thigh at the same time or not. In this latter

Case it is directed by the Co-operation of some Congener, or counterbalanced by the Action of the *Musculus Fascia Latae*.

The Length and Obliquity of its fleshy Portion, the Passage of the inferior Tendon through the Aponeurotic Vagina, the particular Insertion of this Tendon, and the Extent of the Aponeurosis, which it sends over the Tibia, contribute very much to these different Uses.

Besides all these Uses, it may in some Cases assist the *Pso-pliteus*. *Winslow's Anatomy*.

SARX. *cæq.* Flesh.

SASSAF SYRORUM. A Species of Willow that grows in Syria and Egypt.

SASSAFRAS, Offic. Ger. 1341. Emac. 1525. Park. Theat. 1606. Raii Hist. 2. 1568. *Arbor sine Lignum Pavanum*, J. B. 1. 483. *Arbor ex Florida Ficulneo folio*, C. B. P. 431. *Comusmas odorata folio trifido, margine plano, Sassafras dicta*, Pluk. Almag. 120. *Anhuiba, sine Sassafras Brasiliensium*, Pison. 145. SASSAFRAS.

This is a large Tree, which grows in Virginia, and other Parts of the West Indies, arising to a good Height before it spreads into Branches. It has two Sorts of Leaves; those which grow on the lower Parts of the Twigs, are oval but sharp-pointed; and those which grow on the upper End are divided into three Sections, somewhat like the Maple. The Flowers are small and yellow, growing in Clusters, and are succeeded by small Berries. The Root is thick and large, covered with an iron-coloured Bark, under which is a light brown, not very hard Wood. It is of a very pleasant Smell, especially the Bark.

The Root with the Bark, which are only used, are heating and drying, and diaphoretic; helps the Scurvy, Gout and Dropsy, and are an usual Ingredient in Diet-Drinks for the Lues Venerea. A Tea made of the Shavings is mightily commended by some against catarrhus Defluxions, and for Shortness of Breath.

Official Preparations are the *Electuarium e Sassafras*, and the chymical Oil. *Miller's Bot. Off.*

It is principally of Use in removing Obstructions, and strengthening the internal Parts, in causing Fertility, and curing the Lues Venerea. It is accounted a Panacea, or sovereign Remedy for Catarrhs. *Dale*.

Much about the same time with the other anti-venereal Woods and Roots, was imported the Wood called *Sassafras*, from several Parts of *America*, but principally from *Florida*, where the Natives call it *Pabamue*, as we are told by *F. Coreal, Voy. aux Ind. Occid.* *Sassafras* is of a reddish Colour inclining to white, ligneous, of a light and rare Substance, contained under a thin Bark, which is ash-coloured without, and sanguineous within, of an acrimonious, sweetish and aromatic Taste, and of a fragrant Smell, whence it is usually called *Lignum Fœniculi*, or *Fœniculatum*, Fennel-Wood.

There was prepared and used a Decoction of *Sassafras*, after the same manner as the Decoctions of *China* and *Sarsa-parilla*; but as *Sassafras* comes next to *China* in the Virtue of curing the Symptoms of the venereal Disease, so it is very much inferior in that respect to *Guaiacum* and *Sarsa-parilla*.

It has been the Custom for a long time past to take the two Woods, *Guaiacum* and *Sassafras*, with the two Roots *China* and *Sarsa-parilla*, which are all of a like Nature and Virtue, and boil them together, generally without any Cathartic, but sometimes with Leaves of Senna, which was the Fashion since the Year 1550, as we are informed by *Brassavolus, de Radicis Chinae Usu*. Of these Drugs in Conjunction then were prepared Decoctions and Bochets, [See *BOCHETUM*] which were sometimes only diaphoretic and diuretic, but sometimes Cathartico-diuretic, and very commonly known by the Names of *Ptisana sudorifera*, or *Ptisana e Lignis sudorificis*.

The Proportions of the Ingredients were various, according to the different Intentions which were to be answered. Generally they take two Ounces of Lignum *Guaiacum* in Dust or small Chips, or many Ounces of Wood of *Sassafras*, cut likewise very small, and the like Weight of the Roots of *China* and *Sarsa-parilla* each, cut into very small Bits, and infuse them warm in ten or twelve Pints of common Water, for twenty-four Hours. After this they add thereto, if it shall be thought requisite, two Ounces of crude Antimony, grossly bruised, and loosely tied up in a Nodule, and boil the whole over a gentle Fire, in a Vessel covered with a Lid, to the Consumption of a third Part; after which they add thereto an Ounce of Scrapings of Liguorice, and, if they would have it purge, half an Ounce of the Leaves of Oriental Senna, which are to boil a Moment. This done, when warm, they strain the Decoction, and set it aside in Glass-Bottles well stopped for Use.

The Custom is to take three Draughts of this Decoction every Day, for twelve or fifteen Days together; the first in the Morning fasting, the next four or five Hours after Dinner, and the last going to Bed; or at least two Draughts, that

that is to say, in the Morning and Evening, omitting the Afternoon's Draught, if it shall be thought proper. During the Time of taking it, the Patient is to be kept to a sparing Diet, and to confine himself at Home, if the Season of the Year requires it. *Astruc de Morb. Ven.*

SASSIFICA. A Name for the *Tragopogon*; *purpureo-cæruleum, porri folio, quod Artifi vulgo.*

SATHE. *sat.* The PENIS.

SATURANTIA. Absorbents are sometimes thus call'd, because they saturate the Acid residing in the first Passages.

SATURATIO. Saturation; in Chymistry it is the perfect Impregnation of an Alkali with an Acid; or of an Acid with an Alkali, so as to render the Mixture entirely neutral.

SATUREIA.

The Characters are;

The Leaves are oblong and narrow; the Calyces are small, sharp, several on one Pedicle, and a Pedicle on each Side. The Galea is erect, and bifid; the Beard trifid, and the middle segment crenated. The Flowers are dispersed in the Wings of the Leaves, and not collected into Heads, nor disposed in Whorles, nor growing on ramous Pedicles.

Boerhaave mentions nine Sorts of *Satureia*, which are;

1. *Satureia*; *Sativa*. *J. B. 3. 272. Boerhaave Ind. A. 161. Tourn. Inst. 197. Satureia*; *Offic. Satureia hortensis*, *Park. Theat. 4. Raii Hist. 1. 518. Satureia Æstiva hortensis*, *Ger. 461. Emac. 575. Satureia hortensis sive Cunila Sativa Plinii*, *C. B. P. 218. SUMMER SAVORY.*

This Savoury has small stringy Roots, from which spring a great many woody Branches, eight or nine Inches high, a little hairy, and having two long narrow Leaves at a Joint, narrowest next the Stalk; the Flowers grow toward the Tops in small Whorles of a whitish Colour with a bluish of Red, galeated and labiated, set in five pointed Calyces containing four small dark brown Seeds; it is sown in Gardens, and Flowers in June, the Leaves and Tops are used; *Miller's Bot. Off.*

It is one of those hot and acrimonious Herbs which provoke Urine and the Menfes, and, supposed to have much the same Virtues with Thyme and Hyssop. *Dale from Ray.*

2. *Satureia*; *montana*; *durior*; flore in pediculis ramosis exilis foliorum. *Boerb. Ind. A. 161. Thymbra*, *Offic. Satureia hortensis*, *Ger. 461. Emac. 575. Satureia vulgaris*, *Park. Theat. 4. Satureia montana*, *C. B. P. 218. Satureia durior*, *J. B. 3. 272. Raii Hist. 1. 518. Calamintha frutescens*, *Satureia folio, facie & odore.* *Tourn. Inst. 194. WINTER SAVORY.*

This is more woody and shrubby than the former, having the Leaves more like Hyssop, stiffer and harder, and seemingly pierced full of Holes, and ending in Spinulæ: The Flowers are of the Colour of the former, and the Seed much alike. This is likewise cultivated in Gardens, and Flowers at the same Time.

They are both much of a Nature, being heating, drying, and carminative, expelling Wind from the Stomach and Bowels, and are good for the *Asthma*, and other Affections of the Breast: They open Obstructions of the Womb, and promote the menstrual Evacuations. The Winter-savoury is much used in the Kitchen. *Miller's Bot. Off.*

3. *Satureia*; *Cretica*; folio rigido, brevi, crasso. *Boerb. Ind. A. 161. Thymbra vera*, *Offic. Thymbra legitima*, *Tourn. Cor. 13. Thymbra Græca* *I. B. 3. 373. Thymbra sive Satureia Cretica legitima*, *Park. Theat. 4. Satureia Cretica*, *C. B. P. 218. Ger. Emac. 576. Raii Hist. 1. 519. Tragoriganum*, *Alpin. Exot. 78. An Hyssopum montanum Cilicium quibusdam*, *J. B. 3. 277? TRUE SAVORY.*

There are two Species of *Tragoriganum* growing in *Crete* (or *Candy*) one with larger and thicker Leaves and Branches, and rougher Leaves; the other is less, and more slender: Both of them produce from one Root many hard, woody, somewhat rough and slender Stalks, which shoot forth here and there into several small, strait, round and slender Branches, situated at Intervals on each Side of the Stalk; and thick set with small, blackish Leaves, broader than those of Thyme, and generally dispos'd on each Side by Pairs, one Leaf larger than another. The Branches which bear the Flowers are furnished with Leaves, which stand three or more in opposite Order. The Leaves of the greater Species are larger and rougher, being furnished on every Side with rough and somewhat stiff Hairs. The Flowers are dispos'd round the Extremities of the Stalk, and collected into Tufts, as in the *Marrubium*: They are small, of a Sky-blue colour, and have a pleasant Smell, and produce a very small Seed. The Root is small, slender, woody, and divided into other smaller Roots. The whole Plant has a sweet Smell, and is considerably heating and acrimonious to the Taste. *Honorius Belius* believed this Plant to be the *Thymbra*.

It is hot and dry beyond the second Degree. Both the Leaves and Flowers revive the languishing Heat of the Sto-

mach, and corroborate the same, being in some Measure astringent. A Dram of the Flowers or Leaves taken in Wine, or any other Liqueur, are an effectual Remedy against cold Diseases. The Plant taken in Wine, or its Decoction drank, effectually promote the Menfes, heat a cold Uterus, and digest Flatulences. The Leaves boiled in Vinegar, and taken for several Days together, are very successfully used for an obstructed and indurated Spleen. The Decoction of the tender Buds, besides being useful for the Purpose aforesaid, has also, as *Dioscorides* observes, a cathartic Virtue, by which it purges yellow Bile by Stool. *Prosper Alpinus de Plantis exoticis.*

4. *Satureia*; *Cretica*; folio rigido, crassiore majore. *Tragoriganum*, *Creticum*, folio & ramo majori crassiorique, foliis asperioribus. *Alpin. Exot. 79.*

5. *Satureia*; *spicata*. *Offic. C. B. P. 218. Boerb. Ind. A. 161. Satureia Sti. Juliani*, *Ger. 461. Emac. 576. Raii Hist. 1. 518. Satureia spicata Sti. Juliani*, *Park. Theat. 4. Satureia foliis tenuibus, sive tenuifolia Sti. Juliani quorundam*, *I. B. 3. 273. Satureia tenuifolia Sti. Juliani quorundam*, *Thymbra vera, sive genuina aliis*, *Chab. 423. Thymbra Sti. Juliani, sive Satureia vera Lobelio*. *Tourn. Inst. 198. ROCK SAVORY.*

It grows on Hills and Walls, flowers in Summer, and agrees in Virtues with the rest of the Savories. *C. Baubine* takes this for the *Saxifraga prima Matthioli*, but *Parkinson* makes it a different Plant.

6. *Satureia*; *Cretica*; angusto, oblongo folio, in pediculis ramosis exilis foliorum. *Calamintha*, *Cretica*, angusto, oblongo folio. *T. 194. Clinopodium Creticum*. *Alpin. Exot. 265.*

This Plant shoots up with six, or perhaps more or fewer, strait, round, slender Stalks, to the Height of a Span, and thick set with Leaves, in Size, Figure, and Odour resembling those of *Serpyllum*, and disposed in opposite Pairs, at very small Intervals. Between the Leaves and the Stalks are produced the Flower, two or three together, of a vinaceous Colour, from which proceed every minute Seeds. The whole Plant has the Smell of *Serpyllum*, only sweeter, and has a hot Taste. The Root is long, slender, and woody, and without Smell or Taste. They who sent us the Seeds of this Plant from *Crete*, call'd it by the Name of *Saxifraga*; because it is celebrated for its extraordinary Virtue in breaking the Stone in the Kidneys and Bladder. But it seems to us to agree well enough with the Characters of the *Clinopodium* of the Antients, which is described by *Dioscorides* to be a shrubby Plant, with Leaves like those of *Serpyllum*, ramous, two Spans in Height, and growing in rocky Places. The Flowers, which grow at Intervals like those of *Marrubium*, by their Disposition resemble in some measure the Feet of a Bed. From the Description, we are persuaded that this Plant of ours is most like *Clinopodium*, especially on Account of the Likeness of its Leaves to those of *Serpyllum*; but if it had Flowers, also, like those of that Plant, and trailed on the Ground, we should have made it a Species of *Serpyllum*.

This Plant, from its Taste and Smell, appears to us to be of a heating and drying Quality, beyond at least the first Degree, which is farther evident from the Fineness of its Parts, with some slight Measure of Astringency. We may therefore rationally suppose it to be of good Service to the Stone and Gravel, and other nephritic Disorders, though as yet we are unacquainted with its true Uses in Medicine. *Prosper Alpinus de Plantis Exoticis.*

7. *Satureia*; *Virginiana*; *Par. Bat. Thymus, cephalotes, autumnalis, longiore folio*. *T. 196. Serpentaria Virginiana*. *Bocc. Mus. P. 2. 161. Tab. 108. 115.*

8. *Satureia*; *major*; *frutescens*; *verticillis densissimis. Tragorigani secundi altera Species*. *Clus. H. 355.*

9. *Satureia*; *an Cretica*; *spicata. Sberard. H. Mauror? Boerb. Ind. Alt. Plant. Vol. I.*

Savory is of a very hot, penetrating, and aromatic Taste, whence it is of Service in all Diseases in which Water and an inert Phlegm are predominant; as also in Expulsion of Humour, and corroborating the Parts. It has a mighty Influence in moving the Nerves, stimulates to Venery, excites Thirst, prevents Sleep, and causes long Watchings. It is of service in Obstructions of the Menfes, and an Ichury, or Retention of Urine. It is to be observ'd, however, that the too free Use of it excites bloody Urine, which is succeeded by an Hemoptoe; it is therefore very pernicious in all Hemorrhages, but is excellent Seasoning for farinaceous Foods, as Beans, and the like; and is accounted one of the best Antiscorbutics, and highly commended against pituitous Diseases, and the Dropsy. It is a very serviceable Plant in Affections of the Stomach, or Crudities and loss of Appetite, and sharpens the Sight. Externally, it eases Pains of the Ears, dissolves Cold Tumours, and strewed in Beds, is said to kill the Fleas. *Hist. Plant. ascript. Boerhaave.*

SATURNUS, Lead. See PLUMBUM.

SATYRIACE, *σατυριακή*. The Name of an Antidote described by Paulus Aegineta. L. 7. C. 11.

SATYRIASIS, *σατυρίασις*. Is a violent Desire of Venery, attended with a Tension and Rigidity of the Pudendum, occasioned by a morbid Disposition of the Body. It takes its Name, as some will have it, from the Relation it bears to *Satyrus*, who, according to the Report of Fable, and the Talk of the common People, are a Kind of Demons extremely addicted to Wine and Venery; or, as others say, from the Herb *Satyrion*, which has an extraordinary Virtue of exciting venereal Desires, accompanied with a Rigidity of the genital Parts.

Antecedent Causes of this Disorder are, Medicines taken as Provocatives to Venery; these are called *Satyrice* [according to the former Etymology] or *ἐντατικά* (*entatica*. See ENTASIS.) which are acrimonious, incentive, and prejudicial to the Nerves. Or the Disease may be occasioned by an intemperate and unseasonable Use of Venery.

The *Satyrasis* is an Affection common to both Sexes, and mostly incident to the Young and Middle-aged; for the Vigor of Age is continually prompting to venereal Exercises.

The Patient under this Disorder is affected with a vehement Tension and Rigidity of the Pudenda, attended with a Pain, a burning Heat, and an immoderate and urgent Itching and Stimulation to Venery; besides a Depravation of Reason, a quick Pulse, very short Breath, Despondency, want of Sleep, Deliriousness, Thirst, loathing of Food, difficult Evacuation of the Urine, so as generally to occasion a Retention of the Fæces, and sometimes a Fever. There is in all universally a Contraction of the Nerves, which the Greeks call *σπασμός*, *Spasmus* [Convulsion] and involuntary Ejection of the Semen. At first they fancy themselves in some measure relieved by the Use of Venery, and the Discharge of Semen; but soon after they are afflicted with a more violent Extension of the Parts, for they are much incommoded and injur'd by this short Gratification, tho' they fancy themselves relieved for a short Space of Time, in the same Manner as those who are affected with the Itch or Soreness of the Eyes would frequently be rubbing the Parts, and imagine they find some Ease, though but for a Moment, in what the Greeks call *χειραψία* (*Chirapsia*, from *χρῆ*, the Hand, and *ἅπτω*, to touch) "the Touch of the Hand." In the Decline of the Disorder, all the beforemention'd, by the Greeks called *συμπτώματα* (*Symptomata*) Symptoms, and by us *Accidentia Passiois*, "the Accidents of the Disease," are abated.

All the abovementioned Symptoms are, also, incident to Women labouring under this Disorder; but in them the *Pruritus* is more prevalent by Nature, and to such a Degree, that without any Sense of Shame they apply their Hands to the Parts, and beg of every Man who approaches to gratify their Inclination.

A *Satyrasis* is different from a *Gonorrhœa*, which we call *Semini Lapsus*, "a Flux of the Semen;" for this latter is an involuntary and continual Efflux of the Semen, without a Tension of the Pudendum. Neither is a *Satyrasis* one of those slow Diseases which the Greeks call *χρόνια*, *chronia*, chronic, nor in any respect like what the Greeks call *πριαπισμός*, *Priapismus*, a Disorder mentioned by *Demetrius Aitaleus* in his Book of Signs, who relates that he observ'd it in an old Man, who labouring at Masturbation, could perform nothing, and was affected with an excessive and somewhat painful Tension of the Pudendum, so as to pass for a Horn, in which State it continued for many Months, without yielding to Medicines, but was by Length of Time, and slow Degrees, reduced to its primitive and natural State. But a *Satyrasis* is an acute Disease, and continues not long upon the Patient; but consists, as I said, in a Convulsion of the Nerves, and an ardent and stimulating Desire of venereal Pleasure. It is therefore a Disease of Stricture, and of an acute and vehement Nature; for the whole Frame of the Nerves is affected, as we may judge by the disorder'd State of the Mind, and the Convulsions of the Members: But the Parts which seem to be principally affected, are the femoral Passages, or Ducts, called by the Greeks *πόροι σπέρματικοί*, (*Pori spermatici*), and those which are more immediately concern'd in the Act of Coition.

In our Method of Cure we order the Patient to live in a warm Place, silent, and free from Noise, with his Buttocks and Pudenda, as far as the Pubes, which the Greeks call *ἤσπον*, (*etron*) wrapped in fine Wool, forbidding all Visits, especially of young Women; for the Sight of a fair Visitant proves an Incentive to the Sick, who perhaps could not when in his right State of Health converse with such desirable Objects without unchaste Emotions. At the Approach of the Fit, it will be proper to take some Hold of the Patient by the Joints, and to keep off his Hands from the affected Parts. When the Fit is come to its Height, we apply Wool

expressed out of sweet and hot Oil, or a Decoction of Fenugreek, Linseed, or Marshmallows. After the Remission of the Fit, we think it convenient to use Phlebotomy, on account of the Violence of the Symptoms, and that within the *Diatrias*, [see that Word] if there be a Necessity for it, or on the *Diatrias*, if there be no such urgent Occasion. By Remission of the Fit we understand, if there be a Fever accompanying the Disorder, the Remission and Abatement of the Fever. For it is necessary, in such a Case, that when the Disease is exasperated, the Fever should be increased; and when that is mitigated, this also should be diminished. But when there is no Fever, we judge of that Remission by the Mitigation of those other Accidents, called by the Greeks *συμπτώματα*, Symptoms, as Redness, Heat, Itching, or venereal Longings, or the rigid Tension of the Pudenda; or the like. After Phlebotomy, we anoint the Body all over; and having washed out the Mouth and Fauces, we give the Patient *Halica* (*Alica*) in Honey, or Bread sop'd in Water, and poach'd Eggs. On other Days, to those Parts which we had covered with Wool, we apply a Cataplasm prepar'd of the Seeds of Fenugreek and Linseed, or Flour soak'd in Water, which the Greeks call *ἀμυγδαλέου*, (*amen lusi*, a crude Solution) or in Water and Honey. At the same Time we apply Cupping-Glasses, in the Time of the Fit, without Scarification; but at Intermittions we scarify the Buttocks, and the Pudenda to the Pubes, shaving off the Hairs. We apply also Leeches, and use Vaporation with Sponges, having first boiled some Laxatives in the Water. We administer also a Clyster of warm Oil, or warm Water and Oil, and then renew the Cataplasm before Meat. Besides these Means we also make Use of an Encathisma, (*Semiciupium*) sometimes prepared of Oil, or of warm Water and Oil, and sometimes of lenient and laxative Decoctions. For Women we prescribe a Pessary to be dipped in warm Oil, and to be gradually introduced into the Vagina by the Hands of some experienced Person of the Female Sex, and cover the whole Breadth of the external Parts with Wool, or a Cataplasm, and apply Cupping-Glasses to both Alæ of the Pudendum. In the Decline of the Disease we advise Gestation, and bathing in Oil or warm Water, in a Tub or Vessel for that Purpose, with the frequent Use of the Bagnio, and a proper Diet, consisting of Variety of Foods of good Juices, prohibiting acrimonious Things, strong Broths and Wine for a considerable Time; we also apply Cerates to the Parts affected. For the Female Sex we order more liquid Compositions, and inject them by Way of Clyster, with the Use of Pessaries, composed of Fats, Marrow, Melilot, or the like, of which we shall treat more at large in the Book we design to write on the Diseases of Women.

None of the Physicians, except *Themison*, have treated of this Disease, though it does not only happen very frequently, but has been known to be very common. *Themison* informs us, that in *Crete* many Persons died of the *Satyrasis*, which we may suppose to be occasioned by an Error in Diet, and their too frequent and plentiful eating of the Herb *Satyrion*. He tells us farther, that at *Milan* he saw a young Woman, modest in all other Respects, and Wife to a Person of Quality, destroyed with a *Satyrasis*. And in the second Book of his Epistles to *Asilius*, he proposes a Method of Cure, in which he prescribes Phlebotomy, Fomentations, and refrigerating Cataplasms, in order to extinguish venereal Desires; he advises, also, drinking cold Liquors; all which Directions are incongruous, and inconsistent with one another. For that Relaxation and Remission, which are effected in the Body by Phlebotomy, are contrary to the Constriction and Condensation of the Parts which are procured by the Cataplasms and Fomentations with cold Liquors. Since, therefore, the Desire and Delights of venereal Pleasures are owing to an Inflammation [*Tumor* in the Language of *Cælius* and the *Methodici*] of the Pudenda, as well as the Disorder of Reason to an Inflammation of the Membranes of the Brain, the Inclinations to those Pleasures must be heighten'd, and even doubled, by the Use of Coolers and Constringents. *Cal. Aurelianus* L. 3. C. 18. *Acut.*

The same Author, *Chron.* L. 5. C. 11. gives us the following Account of a Priapism.

An Erection of the Penis, without any concomitant Pain, or the Consent of other Parts, is called a Priapism; because the Penis, in this erected State, resembles that of the lewd and infamous God *Priapus*. *Demetrius Apameus* makes mention of this Disorder, in his Book concerning the Signs of Diseases; for he informs us, that a certain old Man used the unnatural Practice of Masturbation, without ever being able to procure an Emission of Semen; whilst, at the same time, the Erection, which was accompanied with a small Pain, and continued for several Months, was so great, that the Penis resembled a Horn. This Man's Misfortune would yield to no Medicines, but ceased slowly, and after a long Time; a Circum-

Circumstance which sufficiently distinguishes a Satyriasis from a Priapism, since the former is quickly over, and does not long afflict the Patient, because it is produced by a Distension of the Nerves, and a violent Desire or Stimulus to Venery. Whereas a Priapism may be conceived to be a Palsy of the femoral Vessels and other Nerves, distributed to the Parts about the Penis, by the Distension of which the Patient is subjected to this Misfortune. *Cælius Aurelianus Morb. Chronic. Lib. 5. Cap. 9.*

Doctor Cheyne, in his Treatise concerning the Nature of a Fibre, describes a certain Species of the Satyriasis in the following manner.

Among convulsive Disorders, says he, there is one so rare and uncommon, that I don't remember to have read any thing remarkable about it; and I never saw but three Persons afflicted with it. Those who are fond of reducing Diseases to certain Classes, refer it to a Satyriasis, a Disorder treated of by all who have wrote Systems of Physic. But from the Descriptions given by these Authors, a Satyriasis, though not of the venereal Kind, appears to be among the Number of inflammatory Disorders; and to be incident to young and vigorous Persons, especially those of a lascivious Turn, and such as have wantonly indulged themselves in the Gratification of their Lust. Whereas the Disorder of which I treat is incident to the Infirm, to Persons of weak and lax Fibres, to such as digest their Aliments slowly and imperfectly, to the Hypochondriac, to such as are distended with acrid Flatulences, and those who are sad and dejected. This Disorder is rarely troublesome to the Patient in the Day-time, but principally in the Night, especially after the Person becomes first warm in Bed, at which time he is seized with a violent Inflation and Tension of the Penis, as if an Attempt was made to pull it off; though, at the same time, he is not stimulated to lust, because the intense Pain is more than a Balance for every lascivious Idea, which is so far from being grateful, that it is rather observed to be disagreeable to him. In this Case the only Circumstance which procures an Alleviation of the Pain, is to get out of Bed, and expose one's self to the cool Air, by which means the Inflation immediately subsides; for which Reason the Disorder to me seems to be of the convulsive kind, and not to be different from the Spasms of other Members, which are pretty frequent and well known. But in such Patients this Member is (perhaps) principally seized with Spasms, either because its Fibres are more easily irritated, or through some Fault or Piece of Imprudence in the Patients themselves. Besides the Pain arising from the Convulsions, there is another Circumstance highly detrimental to the Constitution, which is that the Paroxysm of the Disorder happens principally at that Time, when the Patient being moderately warm in Bed, begins to be inclined to sleep, which is interrupted by his being forthwith obliged to get out of Bed; so that he is not sufficiently recruited by Rest, but his Appetite and Digestion becoming languid, and he himself being in a few Weeks rendered more like a Spectre than a Man, is ready to do or suffer any Thing for the Sake of Sleep, which in this Case is not easily procured, since both Opiates and all hot and cardiac Medicines increase the Disorder. Every Time it has occur'd to me in Practice, I have attempted its Cure in the same manner with other convulsive Disorders, by a Repetition of gentle Emetics according to the State of the Patient; when the Disease began to return, by persisting for six Months in the Use of Milk of Sulphur, Æthiops Mineral, and Cinnabar of Antimony; by a shorter and scanty Use of volatile Medicines; such as Flowers of Benjamin, and Salt of Harts-Horn; by a slender Diet long protracted, three or four Ounces of Flesh, for instance, each Day; a small Quantity of red Wine mixed with Bristol-Water; and, lastly, by the Peruvian Bark, and the exterior Part of Orange Peel, and a few Grains of the Vitriol of Mars. By these Medicines, and this Regimen, by moderate Exercise, and frequent Immersions in cold Water, in two Years time, I perfectly cured two of the Patients I found afflicted with this Disease. The third, who, as he was advanced in Years, would not submit to the Labour and Length of a Cure, tho' he generally lives free from the most troublesome Symptom of his Disorder, is nevertheless subject to a Relapse, if he at any time indulges himself in high Living. See PENIS.

SATYRION. A Name for several Species of ORCHIS, which see.

SAVICH. An Arabic Word, importing a subtle Meal, or Powder. *Castellus from Valescus de Tarenta.*

SAUNIA. The Name of a Composition made into a Mass like a Leaf, of Sweet-Almonds and Sugar, each one Pound; of Amylum, half a Pound, and of Oil of Sweet-Almonds, an Ounce and a half; this Mass was made into small oblong Leaves, of an Ounce Weight each. *Castellus from Clementinus Clementius.*

SAVONEA. The Name of an Arteriacal or Bechical Confection in *Forestus.*

SAURE, according to *Blancard*, is the **NASTURTIIUM.**

SAURURUS. *Lizard's Tail.*

The Characters are;

The Leaves are like those of the *Arioides.* The Flower is apetalous, furnished with two Stamina, and hermaphrodite. The Ovary is of an oval Form, soft, monospermous, and furnished with a trifid Tube. The Flowers and Fruit are disposed in long, slender Spikes.

Boerhaave mentions four Sorts of *Saururus*, which are;

1. *Saururus*; arborescens; fructu adunco. *Plum. Pl. Am. 58. Fig. 77.*

2. *Saururus*; frutescens; foliis Plantagineis; fructu breviori. *Plum. Pl. Am. Fig. 76.*

3. An *Saururus hederaceus*; cauliculis maculosis; major. *Plum. Pl. Am. 50. Fig. 66?*

4. An *Saururus hederaceus*; cauliculis maculosis; minor. *Plum. Pl. Am. 5. Fig. 67? Boerb. Ind. Alt. Plant. Vol. 2.*

The Name *Saururus* is from *σαῦρα*, (*Saura*) a Lizard, and *οὐρα* (*Ura*) a Tail. Its Virtues are the same with those of the *Arium* and *Arioides.* *Hist. Plant. Ascript. Boerhaave.*

SAXIFRAGA.

The Characters are;

The End of the Peduncle becomes a tubulated Calyx, which has deep Incisures in the Saxifrage, but less deep in the *Geum*, and is quinquefid. The Flower is roseaceous and pentapetalous, arising from the Circumference of the Ovary, and furnished with eight or ten Stamina. The Fruit is roundish, horned, bicipular, and full of small Seeds. In the Saxifrage it grows together with the Calyx, but in the *Geum* is supported thereby.

Boerhaave mentions thirteen Species of *Saxifraga*, which are, first, those with a roundish, crenated, and tender Leaf.

1. *Saxifraga*; rotundifolia alba: C. B. P. 309. *Raii Synop. 3. 354. Tourn. Inst. 252. Boerb. Ind. A. 222. Saxifraga alba*, Offic. Ger. 693. Emac. 841. *Raii Hist. 1048. Saxifraga alba vulgaris*, Park. Theat. 424. *Saxifraga alba radice granulosa*, J. B. 3. 706. *Sedum bicornis*, album, rotundifolium, erectum, radice granulosa, Hist. Oxon. 3. 473. *Sanicula radice granulosa, flore albo*, Herm. Cat. Hort. Lugd. Bat. 535. **WHITE SAXIFRAGE.**

The Roots of White Saxifrage consist of several small, reddish, round Grains, with a few small Fibres mixed among them; from which spring thick, hairy, half-round, whitish, green Leaves, set on very long foot Stalks, and crenated about the Edges. The Stalks grow to be a Foot or more high, somewhat hairy, and branched at the Top; on which grow Spikes of white five-leaved Flowers, with several white Apices. The Seed is very small, included in two-horned and roundish Seed-Vessels. It grows in Meadows, and flowers in April and May. The Herb and the granulated Root is used.

This Plant has its Name from its supposed Virtues, being diuretic and lithontriptic, good for the Stone and Gravel, and Stoppage of Urine.

The only Official Preparation is the simple Water. *Mil-ler's Bot. Off.*

This Plant is esteemed a great Diuretic. Its Roots may be either used in White Wine, or a Decoction may be made of them in common Water. *Fuchsius* affirms, that it provokes the Terms, and attenuates the dense gross Lymph, which hinders the ordinary Motions of the Lungs. *Martyn's Tournefort.*

It is said to be good in Obstructions of the Menfes.

2. *Saxifraga*; rotundifolia; alba; flore pleno.

3. *Geum*; rotundifolium; majus. T. 251. *Sanicula, montana, rotundifolia, major*: C. B. P. 243. *Sedum bicornis, montanum, serratum, hederaceo folio, majus, guttato flore*, M. H. 3. 476.

4. *Geum*; folio circinato; pistillo floris pallido. T. 251. *Sanicula Alpina, Cotyledonis folio rotundo, umbilico pallido*, Flor. 2. 97.

5. *Geum*; folio subrotundo, minori; pistillo floris rubro. T. 251.

6. *Geum*; folio oblongo, crenato; fructu & cauliculis ruberrimis; flore pallidulo, rubris guttulis adsperso.

The three following have oblong serrated Leaves, resembling those of the *Aizoides*.

7. *Saxifraga*; sedifolio; flore albo; multiflora. T. 252. *Sedum, serratum, flore albo, multiflorum*. Ac. Reg. 113. *Sanicula, Pyrenaica, longifolia, multiflora, elegantissima*.

8. *Saxifraga*; sedifolio, angustiore, serrato. *Tourn. Inst. 252. Boerb. Ind. A. 222. Umbilicus Veneris alter*, Offic. *Umbilicus Veneris minor*, Ger. Emac. 529. *Cotyledon altera minor*, Park. Parad. 232. *Cotyledon media foliis oblongis serratis*,

C. B. P. 285. *Sedum ferratum*, I. B. 3. 689. Raii Hist. 2. 1045. SMALL NAVEL-WORT.

This Plant is found in the Mountains of Germany, and flowers in Summer: It agrees in Virtues with the *Sedum majus vulgare*.

9. Saxifraga; foliis subrotundis, ferratis. T. 252. *Colyledon, minor, foliis subrotundis, ferratis*. C. B. P. 285. Prodr. 132. I. B. 3. 690.

10. Saxifraga; muscosa; trifido folio. T. 252. *Sedum, Alpinum, trifido folio*. C. B. P. 284.

11. Saxifraga; alba; petraea; Ponæ. in Fol. 337. T. 252. *Trydaetylites Alpina*. I. B. 3. 762. *Sedum, tridaetylites, majus album*. C. B. P. 284. M. H. 3. 479.

12. Saxifraga; tridaetylites; Alpina; pallidè lutea. T. 252. *Sedum, tridaetylites, Alpinum, pallidè luteum*. C. B. P. 284.

13. Saxifraga; verna; annua; humilior. Tourn. Inst. 252. Raii Synop. 3. 354. Boerb. Ind. A. 223. *Paronychia rutaceo folio*. Offic. Ger. 499. Emac. 624. *Paronychia foliis incisiss*, Park. Theat. 556. *Tridaetylites testorum flore albo*, I. B. 3. 762. *Sedum Tridaetylites testorum*, C. P. B. 285. *Alpine Tridaetylites testorum*, Herm. Hort. Lugd. Bat. 20. *Sanicula aizoides Tridaetylites murorum*. Pluk. Almag. 331. RUE WHITLOW GRASS.

This is a small, low Plant, seldom above three or four Inches high, usually of a reddish Colour: The Leaves are thick, fat, and somewhat clammy, divided into three Parts at the End, whereof the Middlemost is largest: They are hairy as well as the Stalks, which are a little branched, having on their Tops small, white, five-leaved Flowers. The Seed-Vessels are round and swelling, and contain very minute Seeds. The Root is small and fibrous. It grows on the Tops of Walls, and low Houses, flowering in April, and perishing by the Summer's Heat, arising yearly from the scatter'd Seed.

This Plant is accounted a specific against the King's-Evil being very much commended by Mr. Boyle for that Distemper: And Sir John Colebatch, in his Essay upon Acids and Alcalies makes mention of a poor Girl at Worcester afflicted with scrophulous Ulcers, who received great Benefit from it. *Miller's Bot. Off.*

I myself, says Boyle, have often gathered an unpromising Plant, called *Rue leaved Whitlow-Grass*, which slightly infused in Beer, to my Knowledge, lately, without Pain, and in few Days, cured a Kinsman of Sir Kenelm Digby of the King's-Evil: Yet I dont find any Botanist recommend it for that Distemper.

A Physician, says Boyle, whom I knew, was sent for to a scrophulous Patient, in whose Throat he found a Tumour so large, and so unluckily seated, that greatly compressing the Oesophagus, it render'd Deglutition exceedingly difficult; the Tumour was, also, hard and stubborn, as not to be discuss'd nor brought to a Suppuration; whence the Patient was put in imminent Danger of being starv'd. In this Strait, the Physician remembering the Character I had given of Whitlow-Grass, sent about the Country to get all that could be procured, and first gave a little of it, in the Form of Infusion, in such liquid Aliments as the Patient was able, though with great Difficulty, to get down; and having by this Means, after some Time, gradually made the Deglutition more easy, he gave the Remedy in greater Plenty, to impregnate the whole Mass of Blood and Juices of the Body with the Virtue of the Herb, whereby the Tumour was at length dissolved, and the Patient cured.

The first, seventh, and eighth are possess'd of a nitrous, balsamic, and saponaceous Quality. *Hist. Plant. Boerb. ascript.*

SAXIFRAGA, is also a Name for several Sorts of TRAGOSELINUM, which see.

SAXIFRAGA MONTANA. A Name for the *Fœniculum*; *tortuosum*; and for several Sorts of *Seseli*.

SAXIFRAGA, ROTUNDIFOLIA, AUREA. A Name for the *Chrysosplenium*; *foliis amplioribus, auriculatis*; and for the *Chrysosplenium*; *foliis minoribus, subrotundis*.

Besides the foregoing Sorts of Saxifraga, Dale mentions the two following.

1. Saxifraga antiquorum. Offic. Saxifraga antiquorum quibusdam, I. B. 3. 338. Raii Hist. 2. 1033. Saxifraga antiquorum quibusdam, Gypsophyton, & Symphytum petraeum, Chab. 443. Saxifraga magna Matthioli, Ger. Emac. 605. Saxifraga major Italorum Matthioli, Park. Theat. 426. Caryophyllus Saxifragus, C. B. P. 211. Lychnis minor Saxifraga, Tourn. Inst. 338. THE GREAT SAXIFRAGE OF MATTHIOLUS.

It grows on the Top of Mount Lups, and flowers in June. The whole Plant is admirably endu'd, as Matthioli says, with the Virtue of breaking and expelling the Stone.

Dioscorides describes his Saxifraga to be a ramous, shrubby Plant, growing in rocky and rugged Places, and like Epi-

thymum; which is so short a Description as to give Occasion for much Controversy among Authors, and for many Plants of quite different Kinds to be taken for it, or to be call'd by its Name. In our English Shops there are two Sorts of Plants known by the Name of Saxifrage, and used accordingly. These are the *Pimpinella Saxifraga*, or *Burnet Saxifrage*, and the *Saxifraga vulgaris*, or *Meadow Saxifrage*; but neither of them agrees with the Description of *Dioscorides*, though the same Virtues are ascribed to them by Authors. But we are to enquire what Plant was the true Saxifrage of the Antients. *Matthioli* and *Lugdunensis* will have it to be a Species of *Savory*, which *C. Baubine* takes to be the same as the *Thymbra S. Juliani Lobeliana*. Our *Parkinson* proves, that the *Saxifraga vera* of *Matthioli*, and the *Thymbra S. Juliani* of *Lobel*, are very different; and therefore censures *C. Baubine* as mistaken in making both of them synonymous, or the same, with his *Satureia spicata*; and assures us, that the Plant which he saw and tasted (for the *Saxifraga vera Matthioli*) did not at all agree, either in Smell or Taste, with the *Satureia* or *Thymus*, but came nearer to his (*Baubine's*) *Thymum inodorum*. *Dodonæus* and *Gerard* take the *Serpyllum vulgare* for the Saxifrage of *Dioscorides*; but *Parkinson* supposes them all mistaken, and I should think he was in the right for rejecting the Judgment of the forementioned Authors, did he not pertinaciously adhere to the *Saxifraga vera* of *Matthioli*, since there is another Plant in the same Author, which is more likely to be the Saxifrage of *Dioscorides*, for which Reason we have exhibited it above as such. For its admirable Virtue in breaking and expelling the Stone, the Reader may consult *Matthioli* himself, who was convinced of the same not only by his own Experience, but also by the Testimony of *Calceolarius*, an Apothecary of *Verona*, who first communicated it to him. Dale.

2. Saxifraga Dioscoridis, Matth. fol. 976. Saxifraga vera Dioscoridis, C. B. Meth. 693. Lugd. 4. Saxifraga, Matth. Comp. 642. Cam. Epit. 716. Saxifraga vera Dioscoridis Matthioli, Park. Theat. 426. THE TRUE SAXIFRAGE OF DIOSCORIDES ACCORDING TO MATTHIOLUS.

It grows on Rocks and stony Places. The Herb boiled in Wine is good in feverish Disorders; it is, also, serviceable in the Strangury, cures the Hiccough, breaks the Stone in the Bladder, and provokes Urine.

These are the Virtues which *Dioscorides* ascribes to his Saxifrage; but in my Opinion they were not intended for this Plant, and therefore we have only followed *Matthioli* in ascribing them to this above. What was the true Saxifrage of the Antients I have endeavoured to shew under the SAXIFRAGA ANTIQUORUM, and suppose the Virtues abovementioned to belong to that Plant. Many Botanists are not satisfy'd as to the Plant we have given above, nor know where to fix the Name, and some suspect it. Dale.

SAXIFRAGA. Medicines which have the Power of dissolving, or breaking the Stone. The same as Lithontriptics.

SAXONICUS PULVIS. This Powder is prepared in the following Manner. Take of the Roots of recent Garden Angelica four Ounces; of the Roots of wild Angelica, Marsh-mallows, and Polypody of the Oak, each two Ounces; of the Roots of common Nettle and Swallow-wort, each one Ounce; of Valerian Root half an Ounce; and of the Bark of the Root of German Mezerion an Ounce and an half.

These when cut down are to be put into a glaz'd Vessel, and such a Quantity of strong Vinegar is to be poured upon them as to rise two Inches above them: Then the Vessel is to be close stopp'd, and the whole boil'd over a gentle Fire: Then the Vessel is to be open'd, the remaining Vinegar thrown away, and the Roots dried till they can be reduced a Powder, to which are to be added twenty-four of the Berries of the Herba Paris, also pulveriz'd.

This Medicine is highly esteem'd against Poisons, the Plague, and other malignant Disorders. It purges violently on account of the Bark of the Root of the Mezerion. The Dose is from half a Scruple to two Scruples, or a Drachm.

In this Preparation, it seems sufficient to correct the Bark of the Root of the Mezerion, and in some measure deprive it of its corrosive Acrimony, by boiling it in Vinegar; but as the other Roots have nothing of a malignant Nature, their most volatile and essential Parts are carried off by boiling; so that by impregnating them with the Acid of the Vinegar, the remaining Part of their volatile Principles is fix'd; for which Reason 'tis sufficient to dry them in the ordinary Manner. The Quantities of Ingredients, and the Manners of preparing this Powder, are different in different Authors. It borrows the Epithet *Saxonicus*, from *Saxony*, where it was first invented; but it is only used in Germany,

Germany, since it would be too violent for Persons of a less robust and hardy Make. *Lemery. Pharmacop. Universelle.*

SBESTEN. Quick Lime. *Ralandus.*

SCABIES. The Itch. See LEPROA.

SCABIOSA.

The Characters are;

The Calyx is expanded in Manner of a Star, deeply jagged, and consists of a double or tripple Order of Scales lying one upon another. The exterior Order of Floscules consists of larger Floscules than the rest, and those generally bilabiated; but those which are contained in the Middle, within the others, are quadrifid or quinquifid. The Top of the Ovary has a hairy, foliaceous, or acculeated Crown, in Manner of a Calyx, surrounding the Flower, which grows in the Apex. The lower Part of the Ovary grows in a globous Placenta.

Boerhaave mentions forty eight Species of *Scabiosa*, which are;

1. *Scabiosa*; *Africana*; *frutescens*. *Par. Bat. Ic.* 219.
2. *Scabiosa*; *Africana*; *frutescens*; *maxima*, *foliis rugosis & crenatis minor*. *Par. Bat. Descr.* 220.
3. *Scabiosa*; *Africana*; *frutescens*; *maxima*; *foliis tenuissimis incisiss.*
4. *Scabiosa*; *Alpina*; *folio Centaurii majoris*. *C. B. P.* 270.

I received as a Present from *Naples* a Plant, which I took for a Species of the *Centaurium majus*, which it very much resembles in Leaves; for it sends forth from its Root many large and blackish Leaves, so like those of the *Centaurium majus*, that every one took it for that Plant the first Year: But in the second Year it produced several naked, slender, round, rushy, strait Stalks, two Cubits in Height, or more, bearing on the Top round Heads, very like those of *Scabious*, as are also the Flowers, which are of a yellow Colour; and the Seeds, which are long and black, no less resembling those of that Plant. The Root consists of a Multitude of long, slender Fibres, proceeding from one Origin. From the Heads, Flowers, and Seeds, we thought we had Reason to reckon this Plant a Species of *Scabious*, and accordingly distinguish'd it by the Name of *Scabiosa Centauroides*, on account of the Resemblance of its Leaves to those of the *Centaurium majus*. The Seeds are intensely bitter, from which Quality the Moderns have generally infer'd of the several Species of their *Scabiosa*, that they are of a heating Properties. Hence it appears that this, as well as the other Sorts of *Scabious*, are heating and drying to a considerable Degree; and cut and deterge gross Humours, by which Means they are very effectual in opening Obstructions of the Viscera. For these Purposes some exhibit a Decoction of the Seeds, or of the Roots, in Water; and also, for the Scabies, or Itch, and for the French Pox. Some have bestowed high Commendation on the expressed Juice of the Leaves or Roots, or the Decoction of the Roots, or the Powder of the Seeds with a little old Theriaca, as Sudorifics in pestilential Fevers; of all which Properties and Virtues we suppose our *Centauroides*, since it is endu'd with the same Bitterness, to be possess'd. This Plant endures the Frosts in *Italy*, and is perennial. *Prosper Alpinus de Plantis Exoticis.*

5. *Scabiosa*; *pratensis*; *hirsuta*; *quæ Officinarum*. *C. B. P.* 269. *Tourn. Inst.* 464. *Boerb. Ind. A.* 129. *Scabiosa*, *Offic. Scabiosa major vulgaris*, *Ger.* 582. *Emac.* 719. *Scabiosa vulgaris pratensis*, *Park.* 484. *Scabiosa major communior hirsuta, folio laciniato*. *I. B. 3. 2. Raii Hist.* 1. 374. *Synop.* 3. 191. SCABIOUS.

The lower Leaves of *Scabious* are rough and hairy; four or five Inches long, an Inch or more in Breadth, sometimes deeply cut in, and often almost whole, and without any Incisions, upon breaking asunder, drawing out into long Threads, the Stalks grow to be two or three Foot high, round and hairy, having two smaller and more finely cut Leaves set at a Joint; and on their Tops round, flattish, blue Flowers, whose middle Part is compos'd of several smaller hollow Flosculi, each set in its particular Calyx, but having an outer Row larger and more showy: Each Flower is made of one Leaf cut into five unequal Parts. When the Flowers are fallen, the Heads grow round by the enlarging of the Calyces into hairy, flattish Seed; the Root runs down deep into the Ground: It grows in Fields and Meadows, and flowers in June. The Leaves are used.

They are accounted cordial, alexipharmic, sudorific, and pectoral; and good for all Distempers of the Lungs; as Coughs, Shortness of Breath, and as also for sore Throats and Quinsies. Outwardly, they are serviceable against the Itch, whence it takes its Name of *Scabiosa*; scabby Sores, Tettors, and other cutaneous Distempers; and takes black and blue Marks out of the Skin.

Officinal Preparations from *Scabious*, are the *Syrupus Scabiosæ Comp.* and the *Valentia Scabiosæ*. *Miller's Bot. Off.*

Scabious is bitter, and gives a faint Tincture of red to the blue Paper, which gives us Reason to believe, that it contains a Salt resembling the *Sal Ammoniac*, and joined with a great Quantity of fetid Oil, and Earth; for,

By the chymical Analysis, beside several acid Liquors, a great deal of Sulphur and Earth, and a little urinous Spirit, and volatile concrete Salt are obtained from it. The *Scabious* is alexipharmic, sudorific, aperitive, deterfive, vulnerary, and good to promote Expectoration when the Bronchia and Vesicles of the Lungs are stuffed with a glutinous and condensed Phlegm, the Juice of this Plant, from three to six Ounces, in which one Dram of Treacle and ten Grains of Camphire are dissolved, may be given for a Sudorific: This is a good Remedy in malignant Fevers, Small-pox, Measles, and in the Pleurisy, after the Use of antimonial Medicines. *Scabious* and *Carduus Benedictus* Water are mixed in expectorating and diaphoretic Ju-
leps. A Syrup of the Juice of this Plant is very good for cutaneous Diseases; but the outward Parts must be bathed at the same Time with the Decoction of *Scabious*: Take a Pint of this Decoction; three Spoonfuls of well camphorated Brandy, separate what of the Camphire remains upon the Surface of the Decoction, by passing it through a Linnen Cloth, and give it by Spoonfuls for the Vapours; bathe for the Tettors for about the space of a Month, and continue the Use of the Syrup for the whole Time. The same Decoction may be given to those who make purulent Urine, and those that have Ulcers in their inward Parts. It is used also to wash Wounds. *Tabernaemontanus* says, that the Juice of *Scabious* mix'd with a little Borax and Camphire takes away the white Spots that are often seen upon the Horn of the Eye. *Martyn's Tournesort.*

It is an Alexipharmic and Pulmonic, and is of principal Use in Imposthumes, a Pleurisy, Quinsy, Cough, Asthma, the Pestilence, and fistulous Ulcers. Outwardly, it is used in the Scabies, Pruritus, Impetigo, and the like cutaneous Distempers. *Dale from Schroder.*

6. *Scabiosa*; *Alpina*; *vulgari similis*; *folio viridiori, magis laciniato*; *flore purpureo*.

7. *Scabiosa*; *major*; *communior*; *hirsuta*; *folio non laciniato*. *I. B. 3. 2.*

8. *Scabiosa*; *integrifolia*; *glabra*; *radice præmorsa*. *Boerb. Ind. A.* 129. *Morsus Diaboli, & Succisa, Offic. Morsus Diaboli, Ger.* 587. *Emac.* 726. *Morsus Diaboli vulgaris flore purpureo*, *Park.* 491. *Succisa glabra, C. B. P.* 269. *Succisa five Morsus Diaboli, I. B. 3. 11. Raii Hist.* 1. 380. *Scabiosa radice succisæ flore globosa*; *Raii Synop.* 3. 191. *Scabiosa folio integro glabro, flore cærulea*. *Tourn. Inst.* 466. DEVIL'S BIT.

The Root of Devil's Bit is thick and short, at the Head shooting out strings, or large Fibres on every Side, but seeming as it were cut off in the Middle, whence it takes its Name *Succisa*. The Leaves are long, and somewhat broad, and pointed at the Ends, rough and hairy, standing on long foot Stalks, little or nothing ferrated about the Edges. The Stalks arise to be a Foot high, or more, and round and hairy, having two smaller Leaves set at a Joint, and on their Tops Flowers, like those of *Scabious*, but in rounder Heads, and all of a Bigness, each made of a short Tube, cut into five Segments, set in its proper Calyx, and followed by a round striated Seed. It grows in Meadows and Pasture Grounds, but flowers not till the End of Summer: The Leaves are used.

They are accounted alexipharmic, and useful in malignant Fevers and pestilential Distempers, and against the Bites of venomous Creatures. They are good to dissolve congeal'd Blood, and therefore serviceable against the ill Effects of Falls and Contusions; and being applied as a Cataplasim, take away the black and blue Marks in the Skin arising from them. Our Herb-Women generally sell the Leaves of this Plant for those of common *Scabious*. *Miller's Bot. Off.*

The Leaves of the *Succisa*, which they call (in English) Devil's-bit, are bitter, and stain the blue Paper with a deep red Colour. The Root, which is bitter and stiptic, stains it with a deeper. The same Virtues are attributed to this Plant that are to the *Scabious*. *Martyn's Tournesort.*

9. *Scabiosa*; *folio integro*; *flore albo*. *T. 466. Succisa; glabra, floribus albis. C. B. P.* 269.

10. *Scabiosa*; *folio integro*; *flore incarnato*. *T. 466. Succisa, glabra, floribus incarnatis. C. B. P.* 269.

11. *Scabiosa*; *Africana*; *frutescens*; *folio rigido, splendente, ferrato*; *flore albicante*. *H. A. 2. 185.*

12. *Scabiosa*; *Syriaca*; *annua*; *flore cæruleo*; *Sylvan ex Syria dicta*. *H. Maurocen.* 157.

13. *Scabiosa*; *altissima*; *annua*; *foliis Agrimonie non nihil similibus*. *H. L.* 539.

14. *Scabiosa*; *Orientalis*; *argentea*; *foliis inferioribus incisiss.* *T. Cor.* 34.

15. *Scabiosa*;

15. Scabiosa; Stellata; folio laciniato; major. C. B. P. 271.

16. Scabiosa; Stellata; folio non deflexo. C. B. P. 271. *Scabiosa Arborescens*. Alpin. Exot. 34.

The Plant which I call *Scabiosa Arborescens* has a whitish, thick Trunk, a Span high, springing from a small Root, which runs into many long, slender Fibres, spreading obliquely under Ground. From the Trunk spring many long, slender Stalks, which rise obliquely upwards, and are adorned at just Intervals with five, six, seven, eight, or perhaps nine hoary, whitish Leaves; in Shape and Size resembling those of the Aizoon, or Sempervive. The Flowers are large, of a Carnation Colour, inclining to white, of the Size and Shape of those of the common Scabious, and grow two or three on a Stalk, hanging by long Pedicles, into which the Stalk is divided. These Flowers consist of Floccules closely collected into a round Head, of the Size of a Cherry, from whence are produced small round Seeds. The whole Plant has a white, hoary, and very beautiful Aspect, and grows to the Height of two Cubits, or more. It is destitute, especially the Flowers, of Smell; but has a bitterish and somewhat astringent Taste, whence it appears to be of a deterfive and aperient Quality, and somewhat hot and dry, and therefore serviceable in conglutinating and incarning Ulcers. *Prosper Alpinus de Plantis exoticis.*

48. Scabiosa; annua; parva; ramosa; flore parvo, pallidè cœruleo. Boerb. Ind. Alt. Plant. Vol. I.

It takes its Name from the *Scabies*, which it is said to cure. These Plants are very serviceable in Diseases of the Breast, whenever a gross tenacious Matter requires to be attenuated and lubricated; and it is of most Virtue when taken in a Decoction with Honey in hot Countries. The Seed is exhibited in all violent Fevers, for it is demulcent and attenuating. For Contusions and Wounds, and especially for the Pestilence and French Pox, it is said to be more effectual than Sarsaparilla, or Lignum Guaiacum. The fifth and seventh Species are proper for cutaneous Diseases, and take their Name more particularly from the *Scabies*; and their Infusion, Decoction, or expressed Juice, may very safely be used against the Pleurisy or Peripneumony; for the Juice is somewhat viscid, and the Herb is maturing, and promotes Expectoration in acute Diseases. The same, you will say, has been affirmed of *Savory*; but this is sometimes too stimulating, and provokes to Stool; whereas *Scabious* is a very gentle Plant,

and no way heating. The eighth and tenth Species go by the Name of *Devil's-bit*, because their fibrous Roots are cut off in the Middle, and by their Section represent a Crown. The Antients say, that the Devil, in spite to Mankind, bit off a Piece of the Root in Paradise, as knowing how beneficial it would be to the Human Race. The Root perishes yearly, and is renew'd in Autumn. The distilled Water of the fifth Species is much commended; but I believe it to be of no more Virtue than Rain-water. The ninth is especially recommended for the Pestilence. They are all aperient and sudorific, and therefore of Use in the Small-Pox, Quinsy, Cough, Asthma, and Fistula's, or running Ulcers of the Breasts and Legs. Outwardly, they are effectual in the Pruritus, Tinea of the Head, Impetigo, Pains of the Hæmorrhoids, and Pimples in the Face. *Hist. Plant. ascript: Boerhaave.*

SCABRUS, in *Paracelsus*, is a Disorder of the Ear, consisting in a Pain, or Asperity, of that Organ.

SCACURCULA. The Spirit of the Bone of a Stag's Heart. *Rulandus.*

SCADIDA CALLI. A Name for the *Euphorbium verum antiquorum.*

SCALA. A Ladder, us'd sometimes as a surgical Instrument, for reducing a Luxation of the *Humerus*.

SCALENI MUSCULI.

These are compound Muscles, irregularly triangular, and from this Figure the ancient *Greeks* gave them their Name. They reckoned them to be only two in Number, situated laterally on the Vertebrae of the Neck, all the way down to the first and second true Ribs. Afterwards they were divided into six, three lying on each Side; but I have commonly found no more than two on each Side, one lying upon the other; the first of which I name *Scalenus Primus*, or *Primæ Costæ*; the other, *Scalenus Secundus*, or *Secundæ Costæ*.

The *Scalenus Primus* is fixed to the upper Part of the Outside of the first Rib, by two distinct Portions, called commonly Branches, one anterior, the other posterior. The anterior Branch is fixed to the middle Portion of the Rib, about an Inch from the Cartilage. From thence it runs obliquely upwards, and is inserted in the transverse Apophysis of the sixth, fifth, and sometimes third Vertebra of the Neck.

The posterior Branch is fixed more backward in the first Rib, an Interstice of about an Inch; but being left between it and the other Branch, through which the Axillary Artery and Brachial Nerves are transmitted. From thence it runs up obliquely behind the former, and is inserted in all the transverse Apophyses of the Neck.

The *Scalenus Secundus* is fixed a little more backward in the external Labium of the upper Edge of the second Rib, sometimes by two separate Portions, and sometimes without any Division. The anterior Portion is fixed immediately under the posterior Portion of the first *Scalenus*, by a short flat Tendon, united a little with the first intercostal Muscle. From thence it runs up over the posterior Portion of the first *Scalenus*, communicating also with that Muscle, and is fixed by Insertions, partly tendinous and partly fleshy, in the transverse Apophyses of the four first Vertebrae of the Neck.

The posterior Portion is fixed in the second Rib, more backward than the other. From thence it runs up, being divided into two Portions, whereof one is inserted in the transverse Apophyses of the three first Vertebrae of the Neck, behind the *Scalenus Primus*. The other Portion runs up behind the former, and is inserted in the transverse Apophyses of the two first Vertebrae.

The vertebral Insertions of both *Scaleni* vary, they being sometimes confounded with each other, and sometimes with those of the neighbouring Muscles. Behind the *Scalenus Secundus*, there is a small fleshy Plane inserted in the transverse Apophyses of the last Vertebrae of the Neck, and in the second Rib. This does not belong to the *Scaleni*, but is the first of the *Musculi Supra Costales*, or *Levatores Costarum*, as they are commonly called.

In dissecting the anterior Portion of the second *Scalenus*, I have observed a small Muscle fixed to the Extremity of the transverse Apophyses of the last Vertebra of the Neck, which having run down from thence to the inner and lower Part of the first true Rib, was slightly inserted there, and seemed to continue its Course to the convex Side of the Pleura. I have also seen all the *Scaleni* inserted in the first Rib.

The *Scaleni* seem better fitted for the Motions of the Neck, than for those of Respiration; and I frankly acknowledge, says *Winflow*, that in reflecting on this, I began to doubt of this latter Use; especially when I called to Mind what I said about the Uses of the *Subclavius*, (See *SUBCLAVIUS*) which

which is, that I could not believe this Muscle to be employed in Respiration, because of its Insertion in the cartilaginous Portion of the first Rib, which is immovably fixed to the Sternum, and also much shorter, much broader, and consequently much less flexible than the Cartilages of the other Ribs.

Moreover, the Neck, in many Situations, cannot serve as a fixed Point to the *Scaleni* for the Motion of the Ribs; as for Instance, when it is bent forward over the Sternum, or inclined very much to either Shoulder; and yet we find that none of these Situations do in the least hinder the Motions of Respiration.

From this Time, therefore, I shall rank the *Scaleni* among the Muscles which move the *Vertebrae* of the Neck, because the Articulation of the first Rib on both Sides, with the first Vertebra of the Back, seems to serve only for the Motion of that Vertebra on the Rib, and not of the Rib on the Vertebra. In this manner ought Truth to be embraced wherever it presents itself. *Winflow's Anatomy.*

SCALPRUM. A Lenticular, or Raspatory. *Blancard* explains *Scalprum*, a Chisel for Amputations; or a Launcet.

SCAMMA. *σκάμμα*, in *Caelius Aurelianus, Morb. Chronic. Lib. 2. Cap. 1.* was the Limit, or Bound of the Space, or Plot of Ground, allotted for the Use of those who exercised themselves in Leaping, and mark'd by laying along a Rail, or drawing a Trench. The same Author uses the Word to signify the Rails, or Posts, which marked out the Area, or Space of Ground, design'd for Walking. *Scamma* was, also, the Pit in the Stage where the Wrestlers played their Prizes.

SCAMMONIA. *σκαμμωνία*. Scammony. A Plant, which from one Root shoots up a Multitude of fat, and somewhat hairy Stalks, to the Height of three Cubits, with hairy Leaves, resembling those of the Helxine, or Ivy, but softer and triangular. The Flowers are white, round, concave in manner of Baskets, and of a strong Smell. The Root is very long, as thick as a Man's Arm, white, of a strong Smell, and full of Juice, which is collected in the following manner: They separate the Root from the Head, and with a Knife excavate it in Form of a Cupola; into this Cavity from all Parts runs the Juice, which is taken out in Shells. Others dig a Cavity of the same Form in the Ground, and strewing the same with Walnut-Leaves, let the Juice run into it, and there suffer it to dry before they remove it.

The best Scammony is pellucid, light, rare, of the Colour of Bull's Glue, with small fistulous Perforations, and fungous; such is what is imported from *Myfia in Asia*. In trying the Goodness of it, it is not sufficient that it turns white when touched with the Tongue, for so it will do when mixed with the Juice of the *Tithymalus*, but Regard is to be had to the forementioned Characters; and, also, that it is not over-heating or burning upon the Tongue, as it is when mixed with the *Tithymalus*. What is made in *Syria* and *Judea* is the worst, being ponderous, dense, and adulterated with the *Tithymalus* and Flower of Vetches.

A Dram, or four Oboli of the Juice taken in Hydromel, or Water, purges downwards Bile and Phlegm. Two Oboli with Sefamum, or some other Seed, are sufficient for loosening the Belly. But where stronger and more efficacious Purg- ing is required, the Dose may be three Oboli of the Juice, with two Oboli of black Hellebore, and a Dram of Aloes. A purging Salt is, also, prepared by mixing twenty Drams of the Juice of Scammony with six Cyathi of Salts: This is exhibited in Proportion to the Strength, the full Dose being three Cochlearia, the middle two, and the least one. A Dram or two of the Root, mixed with the before-mentioned, serves also for a Purge; and some drink the Decoction of it. The same boiled in Vinegar, and then triturated with Barley-Flower, makes a useful Cataplasm for the Sciatica. The Juice applied in a Pessary with Wool, destroys the Embryo; made in a Litus, with Oil or Honey, discusses a Phyma; boiled in Vinegar, cures the Leprosy, rubbed on the Parts affected; and mixed with Vinegar and Oil of Roses, is good to wash the Head affected with an inveterate Cephalagia. *Dioscorides, Lib. 4. Cap. 171.*

SCAMMONITES. *σκαμμωνίτης*. Scammonites, or Wine of Scammony, is prepared by taking fifteen Drams of the Root of Scammony, digged in the Time of Harvest, and putting them, bruised and tied up in a Linnen-Cloth, into a Congius of Must. It purges the Belly, and evacuates Bile and Phlegm. *Dioscorides, Lib. 5. Cap. 83.*

SCAMMONIUM.

We have two Sorts of Scammony in the Shops, that of *Alep- po*, and that of *Smirna*. The first is the best and most pur- gative; and is got from a Plant named *Scammonia Syriaca*, *C. B. P.* which is a Species of *Convolvulus*; it is a very strong Cathartic, but causes great irritation, and even Inflammations in weak Habits. It is given, in Substance, from two to twelve Grains; but ought never to be used when there is the least

Suspicion of Inflammations in any part of the Abdomen. It is likewise a very ticklish, uncertain Purge; sometimes it has no Effect at all; sometimes it causes fatal Super-purgations; and, which is most remarkable, it sometimes does not operate at all the first Day, but brings on an insupportable Tenes- mus and Hypercatharsis the next. It is very proper to dilute it with some oily, viscid Substance; such as the Yolk of an Egg, or an Emulsion made with Sweet-almonds, and the cold Seeds. Prepared Scammony, or Diagridium, is a very proper Ingredient in the *Pulvis Cornachini*, which purges without any of the bad Effects of Scammony. *Madam Grimald's* Powder seems to be nothing but the *Pulvis Cornachini* dis- guised. Scammony is the Basis of many purgative Composi- tions, such as the *Diaphanicum*, the *Diaprunum*, *Confectio Hamelch*, and others. *Geoffroy.*

PREPARATIONS OF SCAMMONY.

There are various Ways which Authors have contrived to prepare Scammony, and all with a View to make it a milder and safer Cathartic. Most agree in doing this with Acids; to which purpose some bake or roast it, inclosed in the Fruit of a Quince, and then it is called *Diagridium*; others wash it with the Juice of Lemons, Citrons, and with distilled Vi- negar; but the following Preparation is most preferred.

SCAMMONIUM CUM SULPHURE PRÆPARATUM.

Scammony prepared with Sulphur.

Lay the Powder of Scammony upon thick, strong Paper; then hold it over Coals, upon which Sulphur is to be burned, until it turns white and melts. Afterwards rub it in a Mortar, a little greased, to a fine Powder for Use.

This is prescribed from three Grains, to eight or ten Grains, and has the Virtues of the Scammony itself, being little altered by this Preparation.

RESINA SCAMMONII.

Resin of Scammony.

Take any Quantity of Scammony, and dissolve it in a suf- ficient Quantity of Spirit of Wine; decant it, and put to it common Water, which will occasion it to turn mil- ky, and let the Resin fall to the Bottom; or put it into a Retort, and gently draw off the Spirit.

This is somewhat stronger and rougher in Operation than the Resin of Jalap. Its Dose is from two Grains, to six or seven. *Quincy.*

TINCTURE OF SCAMMONY.

The milky, unctuous, thick Juices, which spontaneously distil in plenty from wounded Plants, usually appear Resinous, when inspissated by the Heat of the Air, or Sun; such Juices are particularly those of the Hawk-weeds, Sow-thistles, Goats- beard, Succory, Spurge, Euphorbium, Poppy, or the like; and these Juices, when reduced to a dry Form, and ground to Powder, and boiled once or twice with Spirit of Wine, dis- solve in great measure, leaving only a little earthy Fæces be- hind; and this is particularly the Case of Scammony.

R E M A R K S.

The Tincture of Scammony, so prepared, purges in a small Dose, or in the Quantity of two Drams, if mixed in three or four times its Weight of the Syrup of Damask Roses. This Process principally shews, the Action of pure Spirit of Wine upon vegetable Compounds, according to this ancient chymical Rule, that Spirit dissolves its like. For Alcohol, when perfectly pure, scarce extracts any thing more from well-dried compounded Vegetables, than the inflammable Parts, Spirit, Balsam, Oil, Colophony, Rosin, and resinous Gum, and what is merely saponaceous; leaving a pure, dry Salt and Earth behind. If, therefore, the Artist knows that all the particular Virtue required presides in these Parts, then the Operation must be perform'd with pure Alcohol alone; but when the Virtue required lies in a mixture of the oily, resinous, saline, and saponaceous Parts together, it is better to use the common rectified Spirit, than Alcohol; because that Spirit acts, by its aqueous Part, upon what is saline and sapo- naceous; and by its Alcohol, upon what is balsamic, oily and resinous; so that by this Means, the united Virtues may be obtained

obtained in the Tincture. This is evident in the Roots of Hellebore, Hermodactyls, Jalap, Mechoacan, and Turbith; because the Tinctures drawn from them with a Spirit only once rectified, purge much better than those extracted by pure Alcohol. For if a refinous Tincture be drawn by Alcohol from Jalap, it purges less; while the Remainder, being boiled in Water, communicates a purging Virtue thereto. But if the Tincture be extracted with common Spirit, it proves highly purgative; and the Remains contain scarce any thing worth the extracting. Hence we learn, that a fixed alkaline Salt is not required in the making of many Tinctures, because it would either destroy, or change their particular Virtues; and that they are not always to be made with Alcohol; but we are first to consider what Spirit should be used. All the Tinctures prepared with pure Alcohol, will burn entirely away, almost like pure Alcohol itself; whence it is manifest, that this Menstruum extracts only the inflammable Part from the Compound, and leaves the rest behind. If, therefore, the Virtue of a Plant entirely resides in the saline, saponaceous Part, to boil it with Water is better than Alcohol. The Opium dissolved in Water is the best, the next is that dissolved in Wine, and the next in Spirit of Wine; but always the worse, the better the Spirit.

A PURGING POTION.

If two Drams of the Tincture of Scammony, prepared, as above, with rectified Spirit of Wine, be mixed with thrice its Weight of a proper purging Syrup, as that of Rhubarb, and this Dose be taken upon an empty Stomach, in a Distemper, Constitution, and Age, that requires so strong a Purge, it commonly has the desired Operation in purging the Bile.

R E M A R K S.

Many Virtues of Vegetables usually reside in their Rosins, which are generally tough and ready, by their Tenacity, to stick to one Part of the Body, and thus their Virtues are either retarded or hindered; but when dissolved in a spirituous, vegetable Menstruum, they operate quicker, and in a much less Dose. Rosins dissolved in Spirits are so sharp, that they cannot be drank alone; and if diluted with Water to render them potable, they are presently precipitated into a tenacious Mass; whence nothing seems more proper than to mix them with a thick Syrup, where they cannot be precipitated, but are mitigated by the saccharine Part; which, by its extraordinary simplicity, does not, at the same time, change or impair their Virtue. *Boerhaave's Chymistry.*

SCAMNUM HIPPOCRATIS. See BATHRON.

SCAMPIUZA, *σκამπιούζα*, A Name for the Tussilago or Coltsfoot. *Fuchsius in notis ad Nicolaum Myrepsum*, Sect. 1. Cap. 505.

SCANDELLA. The same as GYMNOCRITHON.

SCANDIX, called also ANTHRISCUS.

The Characters are;

The Root is annual and fibrous, and the Seeds resemble a long Needle.

Boerhaave mentions three Sorts of *Scandix*, which are;

1. *Scandix*; femine rostrato; vulgaris. *C. B. P.* 132. *Tourn. Instit.* 326. *Boerb. Ind. A.* 70. *Raii Synop.* 3. 207. *Scandix*, Offic. *Scandix vulgaris*, seu *Pecten Veneris*, Park. *Theat.* 207. *Pecten Veneris*, *J. B.* 3. 71. *Raii Hist.* 1. 428. *Pecten Veneris*, seu *Scandix*, *Ger.* 884. *Emac.* 1041. *SHEPHERD'S NEEDLE, OR VENUS'S COMB.*

It grows frequently among the Corn, and flowers in May and June.

Scandix is reckoned among wild oleraceous Plants, or Greens, and is friendly to the Belly and Stomach, whether it be eaten raw or boiled. The Decoction drank is good for the Bladder, Kidneys and Liver. *Dioscorides, Lib. 2. Cap.* 168. Some say, that the Root hereof bruised with Malloes draws out all manner of Splinters, or other Things, infixed in the Body. *Buxb.*

2. *Scandix*; Cretica; minor. *C. B. P.* 152. *Prodr.* 79. *Pecten Veneris, foliis tenuissimis dissectis, Anthriscus Casabonæ.* *J. B.* 3. 273. *Anisomarathrum*, *Col.* 1. 180.

3. *Scandix*; Orientalis; flore maximo. *T. C. Boer. Ind. Alt. Plant. Vol. 1.*

SCANTON. The fetid Smell of Urine. *Rulandus.*

SCAPELLATUM. Uncovered, it is used with respect to the Retraction of the Prepuce in a *Paraphimosis*.

SCAPHA, *σκάφη*. A Bathing Tub, or Cistern. *Scapha*, in Anatomy, is the external Circumference of the Ear, opposite to the Helix. *Castellus*. It is, also, the Name of a Species of Bandage for the Head. *Galen, de Fasciis.*

SCAPHION. *σκαπίον*. A small Bathing Tub. Or that Part of the Head which is covered with Hairs. Or the *Acetabulum*. *Scaphia* are the Buttocks.

SCAPHIS. *σκαψίς*. A small Bathing-Tub; or a Milk-pail, or a hollow oblong Vessel, in which Barley was

bruised. In *Hippocrates* it sometimes imports the oblong, hollow Shell of the Sea-Muscle; or a Measure, the same as *Concha*.

SCAPHOIDES OS. The same as *Os Naviculare*. See *CRUS*.

SCAPULA. The Scapula is the triangular Bone situated on the Outside of the Ribs, and extended commonly from the second to the seventh true Rib; its superior posterior Angle, when it is in the least straining Position, being about three Inches from the spinal Processes of the Vertebrae, while the long Side between that Angle and the inferior one is stretched obliquely forward as it descends, having nothing between it and the Ribs, except the thin Extremities of some Muscles; but as the Scapula advances forwards to its Articulation with the Arm Bone, its Distance from the Ribs increases.

The Sides and Angles of the Scapula are all unequal; for the posterior Side or Base is the longest, the inferior Costa is the second in Length, and the superior Costa is about as much proportionally shorter than the inferior, as this is than the Base. The inferior Angle is very acute, the superior is near to a right Angle; and what is called the Anterior, does not deserve the Name; for the two Sides do not meet to form an Angle. The Body of this Bone is concave towards the Ribs, and convex behind, where it has the Name of *Dorsum*. Three Processes are generally reckoned to proceed from the Scapula. The first is the large Spine that rises from the posterior convex Surface, and divides it unequally. The second Process stands out from the anterior Extremity of the superior Costa; and from its imaginary Resemblance to a Crow's Beak, is termed *Coracoides*. The third Process is the whole anterior thick bulbous Part of the Bone.

After thus naming the several constituent Parts of the Scapula, the particular Description will be more easily understood.

The Base, which is tipped with Cartilage in a young Subject, is not all strait: For above the Spine, this Side runs obliquely forwards to the superior Angle; in which oblique Space the *Musculus patientia* is inserted. At the Root of the Spine, on the Back-part of the Base, a triangular plain distinct Surface is formed by the lower Fibres of the *Trapezius*. Below this the posterior Edge of the Scapula is scabrous and rough for the Insertion of the *Serratus major anticus* and rhomboid Muscles. The inferior Angle is made smooth on its posterior Surface, by the *latissimus dorsi* passing over it. From this forwards the inferior Costa, by the Action of that same Muscle, is for some Way brought to a more direct Course; and so far the posterior Surface is flattened by the Origin of the *Teres major*. As this inferior Costa runs forwards from this, it is of a considerable Thickness; and on its posterior Surface is slightly hollowed, and made smooth by the *Teres minor*; while it has a Fossa formed into it below by the *Teres major*; and between the two a Ridge with a small Depression appears, where the *longus extensor Cubiti* has its Origin. The superior Costa is very thin, and near its anterior Extremity has a semilunar Cavity formed in it; cross the Extremities of which a strong Ligament is stretched, and sometimes the Bone is continued, to form a Hole for the Passage of Blood-Vessels and Nerves. Immediately behind this Cavity the *Musculus coraco-hyoideus* has its Rise; and from it to the Termination of the Fossa for the *Teres minor*, the Scapula is narrower than any where else, and supports the third Process. This Part has got the Name of *Cervix*.

The whole *Dorsum* is always said to be convex; but by reason of the raised Edges that surround it, it is divided into two Cavities by the Spine, which is stretched from behind forwards, much nearer to the superior Costa than to the inferior. The *Cavitas suprascapularis* is really concave where the Muscle of the same Name is lodged; while the Surface of this Bone below the Spine is convex, except a Fossa that runs at the Side of the inferior Costa; and on this Surface the *Musculus infraspinatus* is placed. The internal or anterior Surface of this Bone is hollow, except in the Part above the Spine which is convex. In the Hollow the *subscapularis* Muscle is contained. When this Muscle is removed, several Ridges and intermediate Depressions appear, that at first View would seem to be adapted to the Ribs; but the Scapula is situated too obliquely for allowing the Ribs to make these Impressions in such a Direction; and they point out the Interstices of the Bundles of Fibres of which the *subscapularis* Muscle is composed, as *Winslow* justly observes.

The Spine rises small at the Base of the Scapula, and becomes higher and broader as it advances forwards. On the Sides it is unequally hollowed and crooked by the Actions of the adjacent Muscles. Its Ridge is divided into two rough flat Surfaces: Into the superior the *Trapezius* Muscle is inserted; and from the inferior, Part of the *Deltoid* has its Origin. The Extremity of the Spine becomes very broad and flat, and is well known by the Name of the *Acromion*, or

Top of the Shoulder. This in Children is an *Epiphysis*; and in some old Subjects I have seen it only joined by a Cartilage to the Spine. The interior Edge of the *Acromion* is flat, smooth, and covered with a Cartilage, for its Articulation with the external Extremity of the Clavicle; and its inferior Surface is hollowed, to allow a Passage for the *infra- and supra-spinati* Muscles, and free Motion to the *Os humeri*.

The coracoid Process is not straight, but a little crooked, with its Point inclining forwards; so that a Hollow is left at its inferior Root, for the Passage of the *infra-scapularis* Muscle. The Extremity of this Process is marked with three plain Surfaces: Into the internal, the *Serratus minor anticus* is inserted: From the external, one Head of the *Biceps flexor cubiti* rises; and from the inferior, the *Coracobrachialis* has its Origin. At the superior Root of this Process, immediately before the *Cavitas semilunaris*, a plain or rather somewhat hollowed Surface is made by the Origin of the other Head of the *Biceps flexor cubiti*; and from a rough scabrous Surface on the upper Part of the coracoid Apophysis, strong Ligaments go out, to connect it to the Clavicle and *Acromion*.

From the *Cervix scapulae* the third Process is produced. This is superficially hollowed on the anterior Part by a glenoid Cavity, which is somewhat elliptical; but has an obtuse Extremity below, and an acute one above; therefore, resembles much the Shape of the longitudinal Section of an Egg. Between the posterior Brims of this *Glenae*, and the anterior Root of the Spine, a large Sinuosity is left, for the Transmission of the *supra- and infra-spinati* Muscles. The Root of the *Supercilia* is surrounded by a rough Circle, for the firmer Adhesion of the circular Ligament of the Articulation, and of the Cartilage which is placed on these Brims, where it is very thick, but becomes very thin as it is continued towards the Middle of the Cavity, which it lines all over. The medullary Vessels enter the *Scapula* near the Base of the Spine.

The Substance of the *Scapula* is, as in all other broad flat Bones, cellular, but of a very unequal Thickness; for the Neck and third Process are very big and strong; the inferior Costa, Spine and coracoid Process, are of a middle Thickness; and the Body is so pressed by the Muscles, as to become diaphanous.

The *Scapula* and Clavicle are joined by plain Surfaces, tipped with Cartilage, to which Sort of Articulation I applied the technical Name *Arthrodia*, by which neither Bone is allowed any considerable Motion, being tightly tied down by the common circular Ligament, and the proper one that proceeds from the coracoid Process; otherwise their Surface of Contact is so narrow, that they would be frequently dislocated: A small Flexion however is necessary; and therefore they are not united, into one Bone. Sometimes a movable ligamentous Cartilage is found in this Joint, sometimes such a Cartilage is only interposed at the anterior Half of it, and in some old Subjects I have found a sesamoid Bone here. The *Scapula* is connected by *Synsarcosis* to the Head, *Os hyoides*, *Vertebrae*, Ribs and Arm-bone; and by Means of the Muscles, that have one Extremity fastened to these Bones, and the other to the *Scapula*, it is moved upwards, downwards, backwards or forwards, and can turn in its own Plain, carrying always the exterior Extremity of the Clavicle and the Arm along with it, which Motions are at great Length explained by *Winslow*. The glenoid Cavity of this Bone receives the *Os humeri* by *Enarthrosis*.

The Use of the *Scapula* is to serve as a *Fulcrum* to the Arm; and, by altering its Position on different Occasions, to allow always the Head of the *Os Humeri* a right-situated Socket to move in, and thereby to assist and enlarge the Motions of the superior Extremity, and to afford the Muscles which rise from it more advantageous Actions, by altering their Directions to the Bone they are to move. This Bone, also, serves to defend the Back-part of the Thorax, and is often employed to sustain Weights; or resist Forces too great for the Arm to bear.

The Base, *Acromion*, coracoid Process and Head of the *Scapula*, are all in a cartilaginous State at the Birth; and the three first are joined as *Epiphyses*; while the Head, with the glenoid Cavity, is not formed into a distinct separate Bone, but is gradually produced by the Ossification of the Body of this Bone being continued forwards. *Monro's Osteology*.

The *Scapula* in many Subjects has a small cartilaginous Border along its whole Basis, which in Children is remarkable enough, but in full-grown Persons it disappears.

The Glenoid Cavity of this Bone is covered with a Cartilage, which is thicker toward the Circumference than the Middle, and a little raised above the Edge of the Bone. This Thickness of the cartilaginous Circumference makes the Cavity greater than it appears in the Skeleton; and sometimes in place thereof there is an additional Border, which is thick at the Circumference of the Cavity, thin towards the Bottom, and very narrow. It is of a pliable slippery Substance, yet some-

thing different from that of a Cartilage, resembling in some measure the Border of the Cotyloid Cavity of the *Os Innominatum*.

The small cartilaginous Surface of the *Acromion*, is thicker in the natural State, and very little convex.

The small triangular Surface, at the Extremity of the Spine of the *Scapula*, near the Basis, is covered with a very thin smooth cartilaginous Lamina; but being transparent, it does not appear very white. There are no other Cartilages commonly found in the *Scapula*; though we sometimes observe in dry Bones several Places which seem to have been cartilaginous; but this is owing to the dried Remains of Ligaments and Tendons.

The Neck of the *Scapula*, at a small Distance from the Edge of the Glenoid Cavity, gives Insertion to the capsular Ligament or mucilaginous Bag, and to the articular Ligaments of the Joint of the *Scapula* and *Os Humeri*.

Besides these articular Ligaments of the *Scapula*, there are three ligamentary Cords fixed to the Tuberosity of the Coracoid Apophysis, two of which, by their other Extremities, are inserted in the oblique Eminence on the lower Side of the Humeral Extremity of the Clavicle, the third under the *Acromion*. There is also a thin flat broad Ligament, which reaches between the Crista of the Spine of the *Scapula* and the Edge of the inferior Costa. *Winslow's Anatomy*,

See FASCIA, for the Bandages recommended for Disorders of the *Scapula*.

SCARABÆUS CORNUTUS. Schrod. 5. 345. *Scarabæus maximus Platyceros, Taurus nonnullis, aliis Cervus volans, Raii Insect. 74. Scarabæus Cervus volans dictus, Mer. Pin. 201. Scarabæus major cornutus, Mouff. Insect. 148. Jonf. de Insect. 67. Cervus volans, Aldrov. de Insect. 451. Charlt. Exer. 46. THE STAG-FLY.*

This Insect is, as I take it, what is usually called the Cock-Chaffer. It is recommended as an Amulet for an Ague, or Pains and Contractions of the Tendons, if applied to the Part affected. *Schroder* reports, that if tied about the Necks of Children, it enables them to retain their Urine. An Oil prepared by Infusion of these Insects, is recommended by the same Author in Pains of the Ears, if dropped into them.

SCARABÆUS PILULARIS. Schrod. 5. 345. *Jonf. de Insect. 70. Raii Insect. 105. Charlt. Exer. 47. Aldrov. de Insect. 449. Mouff. Insect. 153. Scarabæus Pilularis Melanocyanus, Mer. Pin. 201. THE COMMON BEETLE.*

The Powder of this Insect sprinkled upon a protuberating Eye, or prolapsed Anus, is said to afford singular Relief. In order to reduce them to Powder, they are first to be exposed to the Sun in a Glass-Vessel stoppt, that they may be dried.

An Oil is directed to be prepared of these Insects, boiled in Oil till they are consumed, which applied to the blind Hemorrhoids, by means of a Piece of Cotton, is said to mitigate the Pains thereof. *Schroder*.

Schroder takes notice of another Species of *Scarabæus*, which he calls,

SCARABÆUS UNCTUOSUS. This Insect is found in May and June by the Sides of Paths, in Woods; and, when touched, tinges the Hands with a pinguious yellowish Liqueur. They are somewhat of the Nature of *Cantharides*, and are recommended by *Wierus*, in the irregular and wandering Gout, if taken in Powder. The Liqueur abovementioned, is said to be a good Topic for Wounds. The Insect is an Ingredient in some Plaisters for Bubos, and Carbuncles; and in some Antidotes; and an Oil is prepared from them, by boiling them in Olive-Oil, which is said to be good against the Bites of Scorpions.

SCARABELAPHUS. A Name for the *SCARABÆUS CORNUTUS*.

SCARDULA. A Fresh-Water Fish, called, also, *Brama*, and *Cyprinus Latus*, the Bream. It is a Fish resembling a Carp in many Respects. It lives in the same Places, upon the same Food, and also very long; and its Flesh produces nearly the same Effects: Its Shape too is like the Carp; but it is soft, tender, and better tasted than the Carp. Most Authors, who have treated of it, say that this Fish contains gross and excrementitious Juices, and that its Taste is more pleasant than wholesome. However, we have not found it has produced many ill Effects. *Lemery on Foods*.

SCARIFICATIO. [Scarification. See CUCURBITULÆ. *Oribasius*, either from *Apollonius* or himself, speaks very fully of the good Effects of Bleeding by way of Scarification, a thing little taken notice of by former Writers; and assures us, from his own Experience, how successful he had found it in a Suppression of the Menfes, Defluxions of the Eyes, Head-ach, and Straitness of Breathing, even when the Person was extremely old.

When he himself was taken ill of the Plague, the second Day he scarified his Thigh, and took away two Pounds of Blood;

Blood; by which Method he entirely recovered, as did several others, who used it. This Manner of Scarifying was different from that of Cupping. The *Arabians* seem to have a Notion of the latter only. But from this Place, as well as from some Passages in *Galen*, it is plain that the Ancients made deep Incisions into the Skin by the Knife. The *Egyptians* practise it to this Day, and *Prosper Alpinus* describes at large the Apparatus: They first make a strait Ligature under the Ham, then rubb the Leg, and put it into warm Water, and beat it with Reeds to make it swell, and so scarify. In the Cure of Giddiness, *Oribasius* himself speaks of them as two distinct Operations. *Freind's History of Physic*.

SCARIFICATORIUM, or SCARIFICATOR. A Chirurgical Instrument, used for making Scarifications. See *CURBITULA*.

SCARIOLA. A Name for the *Cichorium*; *latifolium*; *sive Endivia vulgaris*.

SCARLATINA FEBRIS.

1. Tho' the Scarlet-Fever may happen at any time, yet it generally comes at the Close of Summer, when it seizes whole Families, but especially Children. (1.) A Chills and Shivering come at the Beginning, as in other Fevers, but without great Sickness. (2.) Afterwards the whole Skin is covered with small red Spots, which are more numerous, larger and redder, but not so uniform as those which constitute the Measles. (3.) They continue two or three Days, and after they are vanished, and the Skin is scaled off, there remains a kind of branny Scales, dispersed over the Body, which fall off, and come again for twice or thrice successively.

2. As this Disease seems to me to be nothing more than a moderate Effervescence of the Blood, occasioned by the Heat of the preceding Summer, or some other way, I do nothing that may prevent the Despumation of the Blood, and the Expulsion of the peccant Matter through the Pores, which is quickly enough performed. Accordingly I refrain from Bleeding, and the Use of Clysters, which make a Revulsion, whereby I conceive the noxious Particles are more intimately mixed with the Blood, and the Motion which is more agreeable to Nature is checked. On the other hand, I forbear Cardiacs, by the Heat of which the Blood may perhaps be put into a violent Motion, than so gentle and mild a Separation as effects the Cure requires; and besides, by this means a high Fever may be occasioned. I judge it sufficient for the Patient to refrain wholly from Flesh, and all Kinds of spirituous Liquors, and to keep his Room, without lying always in Bed. When the Skin is entirely peeled off, and the Symptoms vanished, it is proper to give a gentle Purge, suited to the Age and Strength of the Patient. By this plain and manifestly natural Method, this Disease in Name only (for 'tis little more) is easily cured, without Trouble or Danger: Whereas, on the contrary, if we add to the Patient's Evils, either by confining him continually in his Bed, or exhibiting Abundance of Cardiacs and other superfluous Remedies, the Disease is immediately augmented, and he frequently falls a Victim to the the Over-officiousness of the Physician.

3. But it should here be observed, that when epileptic Convulsions, or a Coma, arise in this Disease at the Beginning of the Eruption, which sometimes happen to Children and young Persons; 'tis highly proper to apply a large and strong Epispastic to the Neck, and immediately exhibit a Purgative of Syrup of White Poppies, which is to be repeated every Evening during the Illness; and he must be directed to make use of Milk boiled with thrice its Quantity of Water, for his ordinary Drink, and to refrain from Flesh. *Sydenham*.

SCARLEA. The same as **SCLAREA**. *Clary*.

SCAROLACHANUM. A Plant mentioned by *Nicolaus Myrepsus*, Sect. 8. C. 71. which *Fuschius* takes to be the **SCARIOLA**.

SCARUS. This is a large Fish, which is said to be of the ruminating Kind, and lives upon Herbs and Sea-wreck, without eating any other Fishes. It is found among the Rocks in *Sicily*, *Asia*, and *Greece*. It is esteemed good Food, because its Flesh is tender, friable, and of easy Digestion. Its Liver, when eaten, or when dried, reduced to a Powder, and taken in White Wine, is said to be good against the Jaundice, and proper for removing Obstructions. *Lemery des Drogues*.

SCATEA, in *Paracelsus*, is the second Species of tartareous Urine.

SCAURUS. The same as **SARAPUS**.

SCEILEN. A Name for the **SALVATELLA**.

SCELERATA HERBA. A Name for the *Ranunculus palustris*; *Apii folio*; *lavis*.

SCELETON.

All the Bone of an Animal, freed from the Teguments, Muscles, Vessels, Glands and Viscera, and orderly connected, have the general Designation *Skeleton*. This Term might indeed be applied to any dry Preparation, but is now, by the

common Consent of Anatomists, restrained to this Preparation of the Bones.

Of the two *Skeletons* there are two Sorts; one natural, when the Bones are kept together by their own Ligaments; the other artificial, when they are joined with Wire, or any other Substance which is not Part of the Creature to which the Bones belonged. Small Subjects, and such whose Bones are not fully ossified, are commonly prepared the first Way; because were all their Parts divided, the nicest Artist could not rejoin them, by reason of their Smallness, and of the Separation of the unossified Parts; whereas the Bones of large adult Animals are soonest and most conveniently cleaned when single; and there is no great Difficulty in restoring them to, and keeping them firm in their former natural Situation.

Sometimes we prepare the *Skeletons* of the same Animal in both these Ways; that is, we leave the smaller Bones joined by their natural Ligaments, and separate the larger ones till they are cleaned, when they are again connected by Wires, or some such Substances.

'Tis worth while to remark, that when the Bones are brought to their natural Situation, scarce any one of them is so placed as to be in a perpendicular Bearing to another; tho' the Fabric composed of them is so contrived, that in an erect Posture, a perpendicular Line, from their common Center of Gravity, falls in the middle of their common Base. By this Contrivance we can support ourselves as firmly, as if the Axis of all the Bones had been a strait Line perpendicular to the Horizon; and we have, at the same time, a much greater Facility and Strength in several of the most necessary Motions we perform. It is true indeed, that wherever the Bones, on which any Part of our Body is sustained, decline from a strait Line, the Force required in the Muscles to counteract the Gravity of that Part, is greater than otherwise it needed to have been; but then this is effectually provided for in such Places, by the Number and Strength of the Muscles. As long therefore, as we remain in the same Posture, a considerable Number of Muscles must be in a constant State of Contraction; which we know, both from Reason and Experience, must soon create an uneasy Sensation. This we call being weary of one Posture: An Inconvenience that we would not have had in standing erect, if the Bearing of all the Bones to each other had been perpendicular; but 'tis sufficiently compensated by the Quickness, Ease and Strength of a great Variety of other Motions, as was above hinted.

The Bones of Women are smaller, in Proportion to their Length, than those of Men, because the Force of their Muscles is not so great, nor is such strong external Force applied to them, to prevent their stretching out in Length.

The Depressions, Ridges, scabrous Surfaces, and other Inequalities made by the Muscles, are not so conspicuous in them, because their Muscles are neither so thick or strong, or so much employed, to make so strong Prints on their Bones.

Their *Os Frontis* is more frequently divided by a Continuation of the sagittal Suture, which depends on the first and second general Causes assigned above for the Specialities in their Bones, as will appear after reflecting on the Account given formerly of the middle, internal Spine of this Bone.

Their Clavicles are less crooked, because their Arms have been less forcibly pull'd forwards; which in our European Women, especially those of Distinction, is more hindered by their Garb.

Their Sternum is more raised by long Cartilages below, that the Thorax might be there widened, in some Proportion, to what it is shortened by the Pressure upon the Diaphragm when they are with Child.

The Defect of Bone, or the Hole in the Middle of the Sternum, is oftenest found in them, to allow the Passage of the mammary Vessels, say some; but, in my Opinion, this is owing to a lax Constitution, by which the Ossification is not so soon completed, as where the Action of the Solids is vigorous, and the Circulation of the Fluids is brisk; for a much smaller Hole might have served this Purpose; and the Branches of the internal mammary Vessels, which are sent to the exterior Parts of the Thorax, pass out between the Cartilages of the Ribs before these are joined to the Sternum.

The *Cartilago Xiphoides* is oftner bifurcated in Women than Men; for the Reason assigned in the preceding Paragraph, a less forcible Power of Ossification.

The superior Cartilages of the Ribs sooner ossify, to support the Weight of the Mamma.

The middle Cartilages are more flat and broad, by the Weight of the Breasts.

The inferior Cartilages are longer for enlarging the Chest. The *Os Sacrum* is more turned outwards for enlarging the Pelvis.

Weakly Women, who have born many Children when young, often have the Vertebrae of their Back bended forwards,

wards, and their Sternum depressed; or become, as *Chefelden* justly observes, round-shouldered and flat-breasted, by the Pressure and Weight of the impregnated Uterus, and by the strong Action of the abdominal Muscles.

The Os Coccygis is more moveable and less bended forwards, to facilitate the Birth.

The Os Ilium are more hollow and more reflected outwards, and consequently farther removed from each other, in order to widen the inferior Part of their Abdomen, and to support better the impregnated Uterus.

The Ridge on the upper Part of the Os Pubis is larger in such Women as have born Children, being extended by the strong Action of the Musculi recti Abdominis.

The Cartilage between the two Os Pubis is thicker, by which the Pelvis is more capacious.

The conjoined Surfaces of the Os Pubis, and of the Os Innominata and Sacrum are less, that with the straiter Os Sacrum, a larger Passage might be left for the Exculsion of the Child in Birth.

The great Tuberosity of the Os Ilium is flatter in Women than Men; because it is more pressed upon in the sedentary Life which Females enjoy.

In Consequence of the Pelvis of Women being wider, the Articulation of their Thigh Bones must be farther removed from each other; and therefore, as *Albinus* very well remarks, a larger Space is left for the Procreation and Birth of Children; which Distance of the Thighs, may be one Reason why Women, in running, generally shuffle more from one Side to the other than Men, to preserve the Center of Gravity of their Bodies from falling too far to a Side of the Joint of the Thigh that supports them when the other is raised, which would endanger their tumbling to the Ground. *Monro's Osteology.*

SCELETYRBE. See **SCELOTYRBE.**

SCELOS. *σχίλος.* The Leg. See **CRUS.**

SCELOTYRBE. From *σχίλος*, the Leg, and *τύβη*, Tumult. A violent Pain in the Legs, proceeding from the Survey.

SCEMPSIS. *σχέμψις.* The same as **APÓSCEPSIS**, which see.

SCENOS. *σχίνος*, in *Hippocrates*, signifies the whole Body.

SCEPARNOS. *σκηπαρνος.* See **ASCIA.**

SCEPAstra. *σκηπάστρα.* A Species of Bandage for the Head. *Galen, de Fasciis.*

SCEPE. *σκήπη.* A Covering. In *Hippocrates, Epidem. L. 6.* it seems to import the surrounding Air.

SCHAGRI-COTTAM. A Species of Cornel-Tree, which grows in *Malabar*. The expressed Juice of the Fruit mixed with Sugar, and drank, is esteemed very cooling; a Decoction thereof is recommended as a good Lotion for the Uvula when relaxed. The Juice of the Leaves taken with Sugar is good in an hepatic Flux, and Diarrhæa; and, as a Lotion, for Pustules in the Mouth. Of the same Juice, mixed with Vinegar, a Gargarism is made, which is said to relieve in a Quinsey.

SCHASIS. *σχάσις.* Scarification.

SCHENDINIGI. Hemp, or Hempseed. *Rulandus.*

SCHEMA. *σχῆμα.* The Figure of a Part of the Body; or the Form and Type of a Disease.

SCHEM-PARITĪ. The Name of an Indian Species of *Alcea*, to which I find no medicinal Virtues ascribed.

SCHERBET, or SERBET. A Turkish Liquor, prepared of the acid Juices of Fruits and Sugar.

SCHERUNAM COTTAM. H. M. The Name of a bacciferous Shrub, which grows in the *East Indies*. The Vapour of a Decoction of the Leaves eases the Tooth-Ach, and kills Worms bred in the Teeth. *Raii Hist. Plant.*

SCHERUS-CHUNDA. A Name for the *Solanum*; fruticosum; Indicum; Fructu rubro.

SCHESIS. *σχίσις.* From *σχίω*, to have, hold, retain, signifies such a Disposition of the Body as is easily induced or removed, and is called *διάθεσις* (*Diathefis*), as *ἥξις* (*Hexis*) is, on the contrary, a settled Disposition, or Habit. *Σχίσις* is, also, the same as *ἰσχύσις*, a Retention or Suppression; thus *σχίσις τῆς οὔρου*, 6 *Epid. Sect. 1: Aph. 2.* are Suppressions of Urine.

SCHETÆA. *σχετᾶνα.* This Word occurs in *Hippocrates, de Morbis Mulierum, L. 2.* The Phrase is *σχῆτᾶνα δεῖναι*, which the Interpreters explain, *They do Things which ought to be refrained from*, that is, throw up indecently their Aliment by Vomit.

SCHETICOS. *σχετικός.* An Epithet for Diseases, importing their being not so fixed and rooted in the Constitution, but that they may be readily cured. *Galen.*

SCHETTI. H. M. The Name of a bacciferous Shrub, which grows in *Malabar*. The Root bruised and taken in cold Water, is said to be cooling in feverish Burnings, and Heats of the Hands, and to be good for spitting of Blood.

It is, also, recommended for easing Pains of the Head, if that Part is washed therewith. Taken in Milk, it is said to cool the Kidneys, and to be good in a Gonorrhæa.

There is another Plant much like this which is called *Bem Schetti*; the Fruit of which is eatable, and of a sweetish farinaceous Taste.

SCHIAS. The same as **ISCHIAS.**

SCHIDACEDON. A Bone is said to be broken *σχιδάκεται*, *Schidacedon*, when it is fractured lengthways. It is derived from *σχίζω*, to cleave.

SCHINDALMOS. *σχινδαλμός.* A Fissure.

SCHINELÆON. *σχινελαιον.* Oil of Mastich. *Dioscorides, L. 1. C. 50.*

SCHISMA. *σχίσμα.* A Fissure.

SCHISTUS LAPIS. *Offic. Charlt. Foss. 24. Matth. 1382. Schistus Calc. Mus. 274. Worm. 64. Aldrov. Mus. Metall. 655. De Laet. 123. Schistus, seu Scissilis Lapis, Boet. 392. THE CLEAVING STONE.*

It is exported from *Germany*. The best is of a metallic Substance, and of the Colour of Saffron; the others, which are not so good, are blackish, and consist of thin, shining, and transparent Laminæ, which stick to one another. The Virtues are the same with those of the *Hæmatites*, only weaker in every Respect. *Boetius* thinks it a Species of Talc; and *Agricola* perceives no Difference between it and the *Hæmatites* except in the Figure.

Dioscorides says that it fills up a *Cœloma* of the Eyes, [See **COELOMA.**] being diluted with Woman's Milk; and is, also, very effectual for a Rupture, or falling out of the same Part, for Thickness of the Eyelids, and a Staphyloma. *Dioscorides, Lib. 5. Cap. 145.*

SCHCENANTHUS. *Juncus odoratus*, *Offic. Schœnanthum, Ger. 39. Emac. 43. Schœnanthus, seu Juncus odoratus, J. B. 2. 515. Raii Hist. 2. 1310. Juncus odoratus seu aromaticus, C. B. P. 11. Juncus rotundus aromaticus, C. B. Theat. 163. Juncus odoratus tenuior, Park. Theat. 144. Gramen dactylon aromaticum, multiplici paniculâ, spicis brevibus, tomento candicantibus ex eodem pediculo binis, Pluk. Phytog. Tab. 190. Fig. 1. Gramen ad Juncum accedens aromaticum majus Syriacum, Hist. Oxon. 3. 229. CAMELS HAY.*

Though this is commonly called a Rush, yet it is not one, but a Species of Grass, whose Leaves grow thick together, inclosing or inccompassing one another, having a small fibrous Root. They are long and narrow, of a pleasant sweet Smell. The Stalks grow to be a Foot or more high, bearing Panicles of short woolly Spikes, set opposite to one another. It grows in *Arabia*, and other Eastern Countries. The Leaves only are used.

Camels Hay is heating and drying, opening Obstructions of the Liver and Spleen, and provoking the Catamenia. It eases the Pain of the Womb after Child-Bearing, provokes Urine, cleanses the Reins, and helps the Hiccough, occasioned by Wind in the Stomach. It is an Ingredient in the two great Compositions, *Theriaca Andromachi*, and *Mithridate*. *Miller's Bot. Off.*

The Leaves and Stalks are used, and are of an acrid, bitterish, and pleasant Taste, and a very fragrant Smell. It is heating, somewhat astringent, discutient, and of fine Parts. It is principally of Use in Obstructions of the Menfes, Liver and Spleen; in Inflations of the Stomach, Vomiting, and Hiccough; Difficulty of Urine, and Pains of the Kidneys, Bladder and Reins. *Dale from Schroder.*

SCHCENOBATA. *σχενόβατα*, from *σχίσις*, a Rope, and *βαίνειν*, to go. Walking or Dancing on a Rope. It occurs in *Hippocrates, de Victus Ratione, L. 3.* Some think it should be read *κονόβατα*, Walking in the Dust; others read it *κονόβατα*, Running a Sort of Race.

SCHOENOPRASSUM. See **CEPA.**

SCHORIGERIAM. A Species of Nettle which grows in *Malabar*, is called *Batti Schorigeriam*.

SCHULLI. There are two prickly Shrubs which grow in *Malabar*, which are thus called; one is the *Paina Schulli*, to which I find no medicinal Virtues ascribed. The other is the *Nir Schulli*, the Leaves of which powdered, and mixed with the Oil of the *Ficus Infernalis*, [See **GLAUCIUM.**] is said to dissipate Tumors on any Part of the Body, but especially of the Male *Pudenda*.

SCHUNDA-PANA. The Name of a Palm-Tree, which grows in *Malabar*. See **PALMA.**

SCIÆNA. The Grunter, or Shadow-Fish. See **UMBRA.**

SCIAMACHIA, or SCHIOMACHIA. From *σχιδ*, a Shadow, and *μαχουαι*, to fight. A Sort of Exercise among the Ancients, which consisted in Agitations of the Arms, as if a Person was fighting with his Shadow.

SCIATICA.

The Sciatica or Hip-Gout is a continual, heavy, dull, gnawing Pain, in or about the Hip-Joint and the Parts adjacent. [* F f]

cent. This Disorder may arise from the same Cause with that which produces the Gout; but is most generally the Effect of catching Cold, or being exposed to the open Air. It may also be occasioned by Contusions and venereal Disorders.

As for the Diagnostics of a Sciatica, it frequently seizes those who have had the Thigh-bone dislocated, especially in a Change of Weather from hot to cold, and sometimes continues during the whole Winter. Men and Women, young and old Persons, are equally subject to this Disorder, in which an external Tumor or Inflammation seldom appears; neither is the Pain so acute as in other Kinds of the Gout; and tho' it has Remissions, yet 'tis generally continual, and increased by walking, or sitting long in the same Posture. When the Sciatica is inveterate, and of long Standing, especially in Persons of tender, lax, or corpulent Habits, there sometimes happens a Relaxation of the Ligaments, which produces a Lameness and a Pain in Motion, and when increased, a partial Dislocation. Sometimes also the Sciatica is produced in old Persons, by any Cause which relaxes, contracts, or obstructs the Nerves of the Thighs, Legs and Feet; and if this Relaxation, Contraction, or Obstruction are violent or long-continued, they bring on a Palsy, and afterwards an Atrophy of the Parts.

The Sciatica is rarely mortal, and seldom dangerous, but often long protracted; and if it proceeds from Blows, Falls, venereal Disorders, or Old-Age, the Patient often relapses in cold Weather, and continues ill for the most part of the Winter. A Palsy and Atrophy of the Parts are very bad Symptoms.

In Sciaticas proceeding from an internal Cause, a proper Regimen must be observed; and in those arising from Old-Age, a nourishing and balsamic Diet should be prescribed. But in other Cases a moderate Diet is to be used. The Patient should, also, be kept in a warm Air, and use proper Exercise.

In the Cure of a Sciatica, Bleeding is beneficial, except in Persons extremely weak or old; on the Day after Venesection an Emetic of Ipecacuana is to be given, and afterwards a pargoric Draught, if necessary; which may be prepared in the following Manner.

Take of the Pilulæ Matthæi, half a Scruple; of compound Raddish-Water, two Drams; of epidemic Water, half an Ounce; of alexiterial Milk-water, and black Cherry-water, each one Ounce; and of the Syrupus de Mecconio, half a Dram: Make into a Draught to be taken at Bed-time.

This Draught may be repeated, if the Pain should be very violent, and the Patient restless; otherwise it is better to omit it.

In a Sciatica, Emetics of Turpeth-Mineral are highly commended; and may be commodiously exhibited in the following Manner.

Take of Turpeth-Mineral six Grains; of the Powder of Ipecacuana, fifteen Grains; and of the Conserve of Rosemary, a Quantity sufficient for making a Bolus.

After the Operation exhibit the following Medicine.

Take of the volatile Salt of Amber and Castor, each six Grains; of London Laudanum, one Grain; of the Conserve of Wood-Sorrel, half an Ounce; of the Oil of Rosemary, one Drop; and of the Syrup of Clove Gilly-Flowers, a Quantity sufficient for making a Bolus, to be taken with the following Draught.

Take of alexiterial Milk-water, two Ounces; of Treacle-water, one Ounce; of the Syrup of Saffron, half an Ounce; and of the compound Spirit of Lavander, half an Ounce: Mix for a Draught.

After the Exhibition of an Emetic, Purgatives are generally used, and operate best, if Calomel is added to them thus.

Take of the Powder of Jalap, two Scruples; of Calomel, half a Scruple; of the Oil of Sassafras, half a Drop; and of the Syrup of Rhubarb, a Quantity sufficient for making a Bolus, to be taken in the Morning with a proper Regimen, and repeated twice a Week for six Times.

But for such as are old or weak, lenient Purgatives are most proper, exhibiting at proper Intervals a Dose of Calomel, to be purged off and repeated alternately for some time. If the Cathartics operate briskly, and the Pain increases upon using them, a Pargoric is to be used. As the Pilulæ Matthæi are an Opiate both of a diaphoretic and diuretic Nature, so

they seem well-fitted for this purpose.

On the intermediate Days of Purging, but especially after the Course of it is finished, Preparations of the Woods are of Use, thus:

Take of the Bark of Guajacum and Sassafras-Wood, each four Ounces; and of ston'd Raisins, four Ounces; boil in Spring-Water in a close Vessel for ten Hours; so that there may be eight Pints of the Liquor; which, when strained, is to be used as ordinary Drink.

This Course ought to be continued at least for five or six Weeks, and the following Bolus exhibited during that time, when the Patient goes to Bed.

Take of the Cinnabar of Antimony, one Scruple; of Gum Guajacum and Camphire, each five Grains; of the volatile Salt of Amber, four Grains; of the Oil of Sassafras, one Drop; of the Conserve of Wood-Sorrel, half an Ounce; and of the Balsamic Syrup, a Quantity sufficient for making a Bolus.

For Patients of thin; hectic and weak Constitutions, Balsamics may be mixed with the Medicines already prescribed, such as Sperma-Ceti, Peruvian Balsam, and Balsam of Tolu. Warm Baths of Milk are beneficial, as cold Baths are serviceable for those whose Solids are too much relaxed.

Neither are Externals to be neglected when the Part is relaxed. Thus:

Take of Oxycroceum and Paracelsus's Plaister for Ruptures, each an Ounce; of Camphire, two Drams; of the Oil of Amber, one Dram and an half: Make into a Plaister, to be spread upon Leather, and applied to the Part affected.

But when the Part is contracted, the following Topic is to be used.

Take of Diachylon, with the Gums, two Parts; and of the Ammoniac and Cumin Plaister, each one Part: Mix and apply by way of Plaister to the Part.

When the Blood is poor, and its Circulation languid, a Course of Chalybeate Waters may be beneficial; but in the opposite Extreme, a Milk Regimen, with the testaceous Powders, are to be used.

Sometimes the Gout seizes the Os Ischium, or the Os Coccydicis, where it produces the same Symptoms with those observed in the Sciatica, Allowance being made for the Difference of the Parts. Such a Disorder is generally very painful and hard to be cured. And if, as it sometimes happens, the Part should come to a Suppuration, it is very dangerous; the Ulcer always discharging a sanious Ichor, which shews it to be of a phagedenic Nature. Sometimes, also, a sharp and corrosive Humour occasions a Luxation of the Bone, which is a Case still more dangerous, and requires the Assistance of a Surgeon. But in other Respects the Cure does not materially differ from that of a Sciatica.

Ætherial Oil of Turpentine, taken in the Quantity of eighty or a hundred Drops, in Honey, or any proper Vehicle, at Night, going to Bed, and repeated at due Intervals, is said to be a sovereign Remedy in this Distemper.

SCIDEN. Cerufe. *Rulandus*.

SCILLA.

The Characters are;

The Root is bulbous, very large, capaceous, or Onion-like, and acrimonious. The Leaves are broad; and the Flowers are like those of the *Ornithogalus*, or *Hyacinthus Stellaris*, and grow in a Spike before the Leaves appear.

Boerhaave mentions three Sorts of Scilla, which are;

1. Scilla; vulgaris; radice rubra. *C. B. P. 73. Raii Hist. 2. 1164. Boerb. Ind. A. 2. 143. Scilla, Offic. Scilla rubra, magna, vulgaris, J. B. 2. 615. Scilla rubra, seu Pancratium verum, Park. Parad. 133. Pancratium Clusii, Ger. 136. Emac. 172. Ornithogalum maritimum, seu Scilla radice rubra, Tourn. Inst. 381. Cepa maris, & Squilla, Offic. Germ. SQUILL, or SEA-ONION.*

This differs from the White only in the Colour of the Root, which is red, and having its Leaves growing more erect. They are both much of a Nature; but the White is preferred.

They are of a hot bitterish Taste, opening and attenuating; good to cleanse the Lungs of tough viscid Phlegm; and of great Service in Asthmas and Difficulty of Breathing, and are often used as a Vomit, to clear the Stomach, and help the Jaundice and Dropsy. They likewise provoke Urine and the Catamenia.

Official Preparations are the *Acetum*, the *Vinum*, the *Oxymel Scilliticum*, and the *Trochisci de Scilla*. *Miller's Bot. Off.*
 It flowers in September, and the Root, which is the Part used, is imported to us from Spain. It is of an acrid and bitter Taste, attenuant, aperient, discutient, and diuretic; and is principally used in Obstructions of the Liver, Spleen, Biliary Duct, Menfes, and Urine; in mucous Disorders of the Lungs, Coughs, and other like Disorders. *Dale from Schroder.*
OXYMEL SCILLITICUM. See **ACETUM**.

TROCHISCI DE SCILLA AD THERIACAM.

Troches of Squills for the Theriaca.

Take Squills gathered about the Beginning of June, after the Stalk and Leaves are grown dry, of a middle Size, plump, white, with the exterior Part peeled off, and the harder Part, whereunto the Roots grow, cut away, and cover it with a Paste of Wheat-Flower, to be baked in an Oven, until the Crust is well dried; then make an Hole into it with a wooden Scurer, to try whether the Squill is thoroughly tender. When it is so, beat it well in a Mortar, and mix with it the Flowers of white Orobanch, or red Cicers sifted fine, eight Ounces of every one Pound of Squills; then form them into Troches of about two Drams each, with Hands rubbed over with Oil of Roses, and dry them in the Shade.

This Process is the same very nearly as directed in the *Augustin* and first *London Dispensatory*: Its first Contrivance is ascribed to *Galen*, who describes it *de Antidotis*, and in the *Theriaca ad Pisonem*; for it was originally designed; but *Zwelfer* finds great fault with it on many Accounts, with relation to the Virtues of Squills; but let that be as it will, he says in the Troches there is so little as to avail hardly any thing, reckoning that not above nine Ounces at most of the Troches can be made out of this Quantity; whereas it is certain that eight Ounces is owing to the Cicer-Flowers.

VINUM SCILLITICUM.

Wine of Squills.

Take Squills dried, one Pound; infuse them in eight Pints of White Wine fourteen Days; and then strain out the Squills, and keep the Wine for Use.

This is as gentle an Emetic as the Vinegar of Squills; but it is more agreeable to cold weak Stomachs. After some time using this Medicine, it will not vomit, but irritates just enough to squeeze out some slimy Water from the Glands, and thereby greatly contributes to render them ready in the Discharge of their proper Offices; inasmuch that there is hardly any one Medicine that better guards against those Inundations of Rheums, which drown Old-Age, or are the Consequences of Decays from frequent Debauches, than this does; although, indeed it is not very pleasant. From one to four Spoonfuls may be taken every Morning.

2. Scilla; radice alba. *C. B. P.* 73. *Raii Hist.* 2. 1164. *Boerb. Ind. A.* 2. 143. *Scilla alba*, Park. Parad. 133. *Scilla Hispanica vulgaris*, Ger. Emac. 171. *Scilla magna alba*, J. B. 2. 618. *Ornithogalum maritimum*, seu *Scilla radice alba*, Tourn. Inst. 381. **THE WHITE SQUILL.**

The white Squill, has a large, round, somewhat Pear-shaped Root, compos'd of a great Number of Coats, inclosing one another with several Fibres at the Bottom, from the Middle of which rise a few large, shining, green Leaves, rather bigger than those of the Lilly, with a remarkable Rib in the Middle; these continue all Winter, and withering away, there arises in the Spring a thick, round Stalk, a Foot and a Half high, having a long, and large Spike of six-leaved white Flowers, succeeded by large Seed-Vessels. It grows by the Sea Side in all the warmer Countries. The Roots are used. *Miller's Bot. Off.*

3. Scilla; Africana; flore parvo, viridi; bulbo amplissimo, lanuginoso. *H. A.* 2. 187. *Boer. Ind. Alt. Plant.*

The Squill, besides its Acrimony, which it holds in common with *Arum*, has an ungrateful and somewhat nauseous Taste; hence, besides the Virtues it has in common with *Arum*, it excites Vomiting, and provokes to Stool, and is no less effectual than *Arum* in pituitous Affections. While crude it is very acrimonious, and burns the Fauces. For this Reason they do it in Ovens, or the Sun, and prepare it as *Arum*. It is never given in Substance, but affords Matter for the celebrated Preparation of the *Oxymel Scilliticum*, so justly commended for dissolving of Phlegm. *Hist. Plant. ascript. Boerhaave.*

SCILLITICUM ACETUM. Vinegar of Squills. See **ACETUM**.

SCINCUS. *Offic. Schroder.* 5. 346. *Jons. de Quad.* 138. *Aldrov. de Quad. Ovip.* 658. *Beillon. de Aquat.* 47. *Rondelet. de Pisc.* 2. 231. *Scincus seu Crocodilus terrestris* *Raii Synop. A.* 271. *Scincus, quem & Crocodilum terrestrem vocant.* *Gesn. de Quad. Ovip.* 24. *Scincus marinus*, *Mont. Exot.* 6. *Scincus Lacerti Species*, *Ind. Med.* 107. **THE SCINK.**

It is an aquatic Animal, cover'd with ash-colour'd Scales, and mark'd with a sky-colour'd List, which reaches from the Head to the Tail. It is an Alexipharmic, and Provocative to Venery. *Schroder.* For the first of these Qualities, says the famous *Annan*, it is received as an Ingredient in *Mithridate*; and for the other, into the *Electuarium Diasatyrion*, tho' indeed in different Parts; for in the *Diasatyrion*, the Belly and Loins only are used, perhaps for the Sake of an Hypothesis relating to the Situation of the Reins and spermatic Vessels: But *Mithridate* receives only the Belly of the Animal; whence you may infer, says *Hoffman*, that different Parts work different Effects. But since *Dioscorides* commends the Flesh about the Kidneys, *Galen, lib. 1. Simpl.* the Kidneys themselves, and *Pliny, lib. 28. cap. 28.* the Snout and Feet, as Incentives to Venery; these and other Hypotheses relating to the *Scincus* are by *Hoffman* justly rejected. *Dale.*

SCINTILLA VENERIS, in *Paracelsus*, is a Resolution of the Limbs, or Deprivation of Motion from a venereal Cause.

SCIRONA. Autumnal Dew. *Rulandus.*

SCIRPUS. A Name for the *Juncus*; aquaticus; maximus.

SCIRRHONES. Small subcutaneous Lice.

SCIRRHOSIS. A Disorder of the Eye, arising from the Violence of a long continued Inflammation, when the Flesh increases in Bulk, and assumes a somewhat livid Colour.

SCIRRHUS.

A Scirrhus may be produced by whatever is capable of coagulating, inspissating, or drying the Liquids in the Glands; the Seat therefore of a Scirrhus may be any of the Glands, but especially such as contain an easily inspissated Liquor, or from their Situation dispose their Contents to a Stagnation. Hence a Scyrrhus frequently happens in the Eyes, the Nostriis, the Mouth, the Breasts, the Axillæ, the Groin, the Pancreas, the Mesentery, and the Uterus.

A Scirrhus is one of the general Methods in which an Inflammation terminates; when, for Instance, the Inflammation is neither resolv'd, nor yet that Part separated from the sound adjacent Parts, which had been rendered unfit for carrying on the vital Circulation of the Humours according to the Laws of Health, both in the fluid and solid Parts: But as in the Article *Gangrena* that Species of Gangrene is not only considered which arises after violent Inflammations, but also all Gangrenes proceeding from whatever Cause, so in this Article the general History and Cure of a Scirrhus is describ'd.

Galen, when treating of the Difference of Tumors, in *Comment in Aphor.* 34. *Seet* 4. informs us, that hard Tumors without Pain are called *Scirrhus*. This Definition of a Scirrhus he also gives in various other Places, and this seems to have been the general Notion of this Species of Tumor. In some Passages, however, he gives a somewhat different Description of a Scirrhus; for in his *Method Medend. ad Glaucon, lib. 3. cap. 6.* he speaks in the following Manner: "A legitimate Scirrhus is a preternatural Tumour, hard, and without Sensation; but a spurious Scirrhus is not totally depriv'd of Sensation, though it with some Difficulty perceives the Action of Objects upon it; that Species therefore, which is deprived of Sensation, is incurable; whereas that which retains a languid Sensation is not absolutely incurable, though, at the same time, it is not to be removed without great Difficulty". But that *Galen* did not in this Passage use the Word *ἀναισθητός* in the same Sense in which the Word *ἀναισθητός* is generally taken, is obvious from a Passage of his *Method. Medend. lib. 14. cap. 6.* where he speaks thus: "We call a Scirrhus a hard Tumor without Pain, though not absolutely without Sensation; for this latter Species of Tumor is not curable." From all which 'tis obvious, that in all Scirrhuses there is Hardness without Pain, and, according to *Galen*, total Insensibility in those of the worst and incurable Kind.

But *Galen* has described Scirrhuses not only in the glandular, but also in the other Parts of the Body: For when treating of the Cure of a Scirrhus, in the fifth Chap. of the last-quoted Book, he recommends the Virtues of Vinegar as effectual and safe when the fleshy Parts of the Muscles are become scirrhus; but he orders it to be used with greater Caution, if the Ligaments or Tendons are affected with the like Misfortune. And in his *Method. Medend. ad Glaucon, lib. 2. cap. 6.* he informs us, that in a Boy labouring

labouring under an Erysipelas, when his Skin was constricted by Refrigeration, there was a scirrhus Tumor left in his whole Thigh: For it is not to be denied, that preternatural hard Tumors, without Pain, are also found in other Parts of the Body besides the Glands; which, therefore, according to the general Definition of *Galen*, ought to be call'd Scirrhus. But since these Tumors often terminate in a different Method from a Scirrhus, and do not so readily degenerate into a Cancer, I think it would be expedient for the Sake of Distinction to call them scirrhus Tumors.

The Seat of a Scirrhus, properly so call'd, seems to be a Gland, or hollow Follicule, whose Sides consist of all Kinds of small Vessels, and into whose Cavity the opening Mouths of the small Arteries discharge a peculiar Liquor, by the Fabric of the Arteries secreted from the Blood convey'd to the Gland; then the Liquid collected in the Cavity of the Gland is conveyed through its Emunctory, and for various Purposes distributed to different Parts of the Body. There are many simple Glands of this Kind which discharge the Liquid contained in their Cavities either on the Surfaces of the Membranes, or towards the Skin, or the Cavities of the Nostrils, Mouth, Fauces, Aspera Arteria, and Oesophagus. If many of these simple Follicules are conceiv'd united, and their Emunctories terminating in one large common Canal, which conveys the Liquid thus collected for its peculiar Uses, then the Congeries of these Glands contain'd in one common Membrane, and terminating in one common Emunctory, is, by Anatomists, call'd a Compound, or conglomerate Gland. The parotid and other Glands, for Instance, which secrete the Saliva from the Blood, and convey it through one Emunctory into the Cavity of the Mouth, are call'd conglomerate Glands.

Every thing, therefore, which by Coagulation, Inspissation, or Exsiccation, can render the Juice secreted by the Fabric of the Glands, and collected in their Cavities, incapable of passing through their Emunctories, will lay a Foundation for a Scirrhus. The same Effect will, also, be produced by every Cause which by external Compression so straitens the Emunctories of the Glands, that the Discharge of the Liquid secreted into their Cavities is hindered; then the Follicule, or Gland, will be distended by the retain'd Liquid, and only the thinnest Parts will be resorb'd by the Mouths of the Veins which open unto the Glands, or be discharg'd through the straiten'd Emunctories; whilst the grosser Part being retain'd and accumulated, will distend the Follicule of the Gland, and compress the Vessel's running thro' its Membrane; hence will arise a Tumour and Hardness, from an Infarction of the Vessels by Means of the coagulated, inspissated, or dried Fluids. An Absence of Pain will, also, arise from a Compression of the Nerves distributed through the Fabric of the Glands. And in an incurable Scirrhus, as *Galen* calls it, a perfect Insensibility will be produc'd by the same Cause. In other Parts of the Body, also, in which by the arterial Fabric, without the Interposition of such Follicules, the secreted Humours is collected in a certain common Receptacle, the like Misfortunes may happen: Thus, for Instance, in the Testes, the Artery conveying the Blood communicates red Blood to its corresponding Vein, then being divided into numberless Ramifications, which constitutes almost the whole Substance of the Testes, it from its small Mouths discharges into a common Receptacle a peculiar Liquor, by this surprizing Fabric secreted from the Blood. Now, if by any Cause the free Discharge of this Liquid collected in the common Receptacle, is hinder'd, all the same Misfortunes will happen with those already mentioned as incident to the Glands, and the Testis will be distended into a hard Tumor without Pain, that is, will become a Scirrhus. This is evinced by frequent Instances which occur in Practice, and from which 'tis certain, that in this Place, as well as in other Scirrhuses, the Cure is very difficult, and that such Indurations of the Testes are, also, converted into Cancers. The same may also happen in some of the Viscera; for in the Liver the hepatic Bile is secreted from the Blood of the Vena Portæ, and this Bile being receiv'd into the minute Ramifications distributed through the whole Substance of the Liver, is at last poured into one common large Duct, call'd the hepatic Duct, through which it is convey'd to the Intestines. Now if the hepatic Duct is obstructed, or the small Ramifications conveying the Bile, secreted by the Fabric of the Liver into it, by any Cause block'd up, such as a Stagnation, Coagulation, Inspissation, or Exsiccation of the Humours, the whole Liver, or some Part of it, may be distended into a scirrhus Tumor. The Production of this Misfortune is greatly favoured by the slow Motion of the Blood of the Vena Portæ, since being now become venous, it ought again to be forced through the narrow Channels of the converging Ca-

nals, and by the easy Degeneration of the Humour into a State of Toughness, which renders it incapable of circulating. Hence, though according to the Opinion of some Anatomists, there were not in the conglomerate Glands, such as those called the Parotid, and others of a similar Nature, such Follicules collecting the Liquid secreted by the Arteries, and conveying it through their small Emunctories into the common excretory Duct; and though the secretory Ramifications derived from the Arteries, without the Interposition of any Follicules, should convey the secreted Liquid directly into the excretory Duct; yet a Scirrhus would be produced by the same Causes. Thus, for instance, if the Juice thus secreted from the arterial Blood, being coagulated, inspissated, or dried, should obstruct the common excretory Duct, or the small secretory Ramifications which convey this Liquid into this common Receptacle, a Scirrhus will be produced: For the great Difficulty of curing a Scirrhus seated in the Glands, properly so called, principally consists in this, that the Matter being collected in these Follicules, and placed, as it were, without the Bounds and Influence of the Circulation, the Impetus of the arterial Blood, propelled by the Force of the Heart and Vessels, cannot act directly on these Parts. But if the parotid Gland consists of minute Arteries, wrapt up in a Clew, and by their small Emunctories conveying the secreted Liquor into the common excretory Duct, the Impetus of the arterial Fluid will reach the small Mouths of these Arteries, infarcted with an inspissated Fluid, with a Force too small to remove that Obstruction, or by a benign Suppuration to separate these minute Vessels, with their obstructing Humour, from the other Vessels to which they adhere. The Person who duly considers these Circumstances, must be convinced, that scirrhus Tumors are not to be cured without the greatest Difficulty; and the Truth of this is sufficiently evinced from the long-continued Indurations of the Testes, in which, however, the Secretion seems to be made without the Interposition of Follicules.

'Tis therefore probable, that the Cure of a Scirrhus is the more difficult, the more compound the Glands it affects, are; for when these simple Follicules, which in the Surface of the Body collect a pinguous kind of Liquid and evacuate it by their Emunctories, are obstructed, the secreted Humour is accumulated, the Follicule distended, and a Tumor produced; which, according to the various Consistence of the Matter it contains, receives different Denominations, such as *Meliceris*, *Atheroma*, and *Steatoma*, which see under their respective Articles; for such Tumors seems justly to be referr'd to this Class, especially if they contain an hard Matter, as happens in *Steatoma's*, for then they are contained in the general Definition of a Scirrhus. But Surgeons boldly make Incisions in such prominent, inflated Tumors, express their contained Matter, and often happily consume the Cavity of the Follicule by strong Suppuratives, or, sometimes, by Corrosives; for such Tumors rarely degenerate to the Malignity of a Cancer, tho', in external Appearance, they resemble a malignant Scirrhus. Of this I had an Opportunity of seeing a memorable Instance. A Man of sixty Years of Age had, for several Years, been afflicted with an hard Tumor, which was gradually augmented, till it, at last, equal'd the Bulk of an ordinary Fist. It was situated in the inferior left Part of the Face, near the Angle of the inferior Jaw-Bone. Its Basis was broad, but being moveable it could be elevated with the Skin, nor did it adhere to the subjacent Muscles. This Tumor began to be gradually more raised to a Point: The Skin appeared red, or rather almost livid, in the Apex of the Tumor. There first arose an Itching, and then a Pain in the distended Skin; and when his Friends dreaded the worst, because he would apply nothing to it, the Apex or Top broke, spontaneously, and a hard, granulated Matter was discharged. Upon this, the Tumor subsided so far as hardly to leave any Marks of it, and the Patient, for some Years after, enjoyed as good Health as his Age would permit. But in conglomerate Glands, when become scirrhus, this inspissated Liquor is not lodg'd in one Cavity, but is dispersed through several Bags or Vessels. Hence 'tis obvious that the Cure must be far more difficult. Besides, when a conglomerate Gland becomes scirrhus, the Difference of the Vessels, in which the Obstruction of such a Gland happens, is a Circumstance of great Importance; for in every conglomerate Gland there are Vessels which convey to it the arterial Blood, from which, by the Fabric of the Gland, a peculiar Liquid is secreted. In such Glands there are, also, Vessels which secrete this Liquid from the Blood, Vessels which contain it when secreted, and other Vessels which eliminate and carry it off. If the Vessels which convey the Blood to such a Gland are obstructed, the Impetus of the vital Humours seems capable of acting upon these Parts with such a Force, as, by means of a Suppuration, is sufficient to produce a Separation of the obstructed from the other

other Parts; perhaps this happens when, in some Diseases, the parotid Glands so often becoming tumid, fall into a benign Suppuration. But when an Obstruction happens in the secreting Vessels, 'tis sufficiently obvious, that the vital Humours must act upon these Parts with a smaller Impetus; but when this Liquid is concreted and becomes stagnant in the Vessels, containing and collecting the secreted Humour, this Humour, placed without the Limits and Influence of the Circulation, will not yield to the Efficacy of the best Medicines. An Obstruction of the excretory Ducts produces the same Misfortune; unless when their Situation is such, that such Remedies as resolve and attenuate the concreted Humour, may with Success be applied to them; or when there is some Cause lodged about the extreme Orifice of the excretory Duct, which by obstructing or compressing it, hinders the Discharge of the Liquid to be excreted. Thus if the excretory Duct of the parotid Gland is infarcted with any Humour, the whole Fabric of this Gland may be converted into a Scirrhus: But the Situation of this Duct lays a Foundation for hoping, that by Fomentations and Frictions, the beginning Disorder may as yet be surmounted; especially if the obstructing Cause is lodged about the Aperture of this Duct, by which it discharges the secreted Humour into the Mouth, or if any Tumor arising contiguous to this Aperture compresses it. This Doctrine is confirmed by what happens in Diseases of the Genitals; for if by a Gonorrhœa, or any other Cause, a Tumor is produced about that Part of the Urethra where the common Emunctories of the Vesiculæ Seminales, and the Vasa Deferentia open, the Excretion of the Liquid secreted, sometimes in both, but oftener in one of the Testes, is hindered; in which Case, a little after the Vas Deferens and Epididymis, and last of all, the Substance of the Testis, properly so called, begin to swell, I have, in this Case, always observed, that the Epididymis swells first, and often becomes pretty hard, and that the Testis is afterwards distended to a larger Bulk, but remains softer to the Touch than the distended Epididymus. And in this Case the Disorder is generally happily cured, because the Cause is not lodg'd in the Substance of the Testis, but about the End of the excretory Duct: For as soon as the Tumor in the Urethra is diminished, the Epididymus gradually decreases, and by gentle Frictions, is restored to its former Bulk and Softness, whilst the Tumor of the Testis totally disappears. But when the Substance of the Testis is raised into a hard Tumor, without any previous Disorder observable in the Epididymus, the Disease is far more obstinate, since such a Scirrhus is rarely or ever resolved; for in this Case the Disorder is seated in the minute secreting Vessels, or such as contain the secreted Liquid, which are here, with surprising Order, disposed in so many Circumvolutions, that the Impetus of the vital Fluid conveyed through so small a spermatic Artery, must be scarcely any, or at most very small on the obstructed Parts. Scarcely any thing can, in this Case, be expected from external Medicines, since the intricate Substance of the Testis is defended by so many Coverings.

Since, therefore, a Scirrhus arises from a Coagulation, Infissation, or Exsiccation of the glandular Juice, it is obvious, that this Misfortune must happen most frequently in those Parts where, by the Fabric of the Glands, a viscid Humour is secreted, or such a Liquid as though not tough when secreted, yet acquires such a Quality immediately after. The whole internal Part of the Mouth, especially the Fauces, the Oesophagus, the Aspera Arteria, and the Bronchia of the Lungs, have such small mucous Repositories, in which a tough Mucus, for lubricating and defending these Parts, is deposited. 'Tis not, therefore, to be wondered at, if Scirrhuses should be frequently produced in these Parts.

As for the Eyes; 'Tis sufficiently certain from Experience, that the sebaceous Glands, situated in the Edges of the Eyelids, and which prepare the unctuous Matter which anoints the Eyelids, and defends them from mutual Attrition, may, when their Emunctories are obstructed, become tumid, and subject to scirrhous Tumors. The Glandula Innominata is, also, situated here, and obnoxious to the same Misfortune. The Caruncle, also, situated in the larger Angle of the Eye, sometimes becomes scirrhous, and is raised to a great Bulk. *Hildanus, in Observat. Chirurg. Cent. 1. Observ. 2.* informs us, that he happily removed such a scirrhous Tumor, as large as a Chestnut, formed in the larger Canthus of the left Eye; and in three Weeks Time made so complete a Cure, that the Patient's Sight was not injured. The same Author, in *Obs. 1.* gives us an Account of a more terrible Case, in which a hard livid Scirrhus, as large as a Goose's Egg, and beginning to grow cancerous, hung out without the Eyelids, and afterwards became terrible by an excessive Hemorrhage. But *Hildanus* dexterously extirpated this whole Tumor, together with the Eye from its Orbit, and by that means preserved the Patient.

As for the Nostrils; *Ruyfch, in Epist. 9. Tab. 9. Fig. 7.* has demonstrated, and shewn by a Figure, that the mucous Membrane lining the Cavities of the Nostrils, abounds with small glandular Bodies. But since the Liquor secreted in these Glands is easily inspissated, hence Scirrhuses are often formed in these Parts. *Hippocrates, in his Treatise de Morbis, Lib. 2. Cap. 11.* seems to have described Scirrhuses formed in these Parts, when treating of Polypuses; of which he enumerates five Species; concerning the second of which he speaks thus: "The Nose is filled with Flesh, which appears hard to the Touch." This Flesh he orders to be burned by the actual Caustery. The fourth Species of Polypus he thus describes: "Within the Nose, about the Cartilage, something hard is produced by some particular Cause, and seems to be Flesh; but when it is touched, it appears like a Stone." After dividing the Nose with a Knife, he, also, orders this Species of Tumor to be cauterized in the same manner with the former. And in describing the fifth Species of Polypus, he affirms, "That in the superior Part of the Cartilage of the Nose, small Cancers arise in a kind of oblique manner." These he also orders to be cauterized.

As for the Mouth; 'Tis at present sufficiently known, that almost all the internal Parts of the Mouth are furnished with mucous Repositories or Receptacles. The callous Membrane covering the Palate is furnished with them. The Uvula, the pendulous Veil of the Palate, and the Tonsils, which consist of a mucous Membrane, folded up into sinous Wreaths, have an inconceivable Number of such mucous Follicles, which, from their open Mouths, discharge a large Quantity of frothy Mucus. The remotest Part of the Fauces is furnished with a large Number of such mucous Follicles, which resemble small Ulcers so much, that they are often, by the Ignorant, taken for such. 'Tis not, therefore, to be wondered at, that scirrhous Tumors should so often be observed in these Parts. After an ill-cured Inflammation of the Fauces, I have often seen them become scirrhous. *Hildanus, in Observ. Chirurg. Cent. 1. Obs. 19.* observed the Uvula scirrhous, hard, livid, unequal, and so large as almost to fill the whole Cavity of the Mouth, and reach to the Fore-Teeth. The same Author, in *Cent. 1. Obs. 20.* about the Root of the Uvula, saw an hard unequal Tumor as large as an Hen's Egg; by which means the Patient's Respiration was hinder'd, and the Deglutition of Aliments, especially of Drink, render'd highly difficult.

As for the Breasts; Though *Ruyfch, in Epist. Problem 15.* and some other Places, denies that the Breasts are glandular; yet such is their Fabric, and such the Nature of the Milk secreted from the Blood, that scirrhous Tumors are often formed in them, as we are assured from daily Experience: For without the Interposition of any Follicles, the lactiferous Tubes arising from the Arteries, unite with their adjacent Vessels into large Ramifications, and, at last, form the larger Milk-Vessels, which are again contracted, and in small Ducts terminate in the Nipple. But as the Milk collected in the Breasts, and distending the lactiferous Vessels, may again return into the Vessels whence it comes, and as without the Discharge of a single Drop from the Nipple, the most turgid Breast sometimes suddenly becomes empty and subsides, it is obvious, that the lacteal Tubes are a Continuation of the Arteries, without the Intervention of any Follicles. But the Milk naturally disposed to Coagulation, becoming stagnant in the distended lactiferous Vessels, is divided into a Coagulum and Serum. The latter being thin, may easily pass through the Apertures of the Nipple, or return into the Mass of Blood: Whereas, the former deprived of its Serum, remains immoveable in the lactiferous Vessels, where being more dried, it often degenerates into a Scirrhus not to be resolved. And as a Scirrhus formed in the Glands, properly so called, is often obstinate against the best Medicines, because the Impetus and Efficacy of the vital Humours could produce scarcely any Effect upon the coagulated Juice contained in the Cavity of the Gland, so the same will happen in the Breasts; for the larger lactiferous Tubes correspond to the Cavities of the Glands collecting the secreted Liquor. Their narrow Extremities opening into the Nipple, are of a similar Use with the Emunctories of the Glands, which carry off the Humour collected in their Cavities. Hence the Reason is obvious, why Scirrhuses are often formed in the Breasts, tho' they are not, properly speaking, glandular.

As for the Arm-pits and Groin; The Glands situated in these Parts are very fit for receiving what is secreted from the whole Mass of Humours. For which Reason, both in Diseases and sometimes in Health, by a salutary Effort of Nature, some Humours are deposited here, which would have been more hurtful elsewhere. Hence sudden Tumors are often produced in these Glands, and frequently prove very obstinate, whether on account of the virulent Nature of the Matter impacted, or on account of the intricate vascular Compages of these Glands;

by which it happens that the Impetus of the arterial Blood can act with little Efficacy on the obstructed Parts. When an inveterate Scirrhus seizes the Breasts, the subaxillary Glands generally become tumid and indurated. And every one knows, that by means of a venereal Contagion, the Glands of the Groin are often changed into Scirrhuses, not to be cured without the greatest Difficulty.

Nor only in the external Parts of the Body are Scirrhuses found, but also in the internal Parts, where they prove the Causes of the most obstinate chronical Disorders.

As for the Pancreas and Mesentery; 'Tis certain, from many practical Observations, that these Parts have been found scirrhus. Thus, in *Miscel. Curios. Dec. 2. An. 6.* A Country Woman of fifty-one Years of Age, the Mother of a numerous Family, and one who had generally preserved her Health pretty well, yet became sick for about five Years, being afflicted with a Suppression of the Menfes, and a frequent Vomiting, whilst in the mean time a Tumor of the Abdomen was formed, which gradually increasing, filled the whole Right Hypochondrium, might be felt with the Hands, and moved towards the Left-Part of the Body. But after a great deal of Torment she died; and upon laying open her Body, besides other Disorders, all the Glands of her Mesentery were found scirrhus; and the Tumor, which might be felt externally with the Hand, was found to be the Pancreas become tumid and scirrhus. The Mouth of the Pylorus was, also, found scirrhus, and the interior Part of the Stomach was every where full of indurated whitish Glands. *Paré, in Lib. 7. Cap. 21.* informs us, that in a Woman of sixty Years of Age, he saw the whole Pancreas and Mesentery scirrhus, and preternaturally large. And in the same Part he affirms, that in scrophulous Patients, after their Death, he had found the Glands of the Mesentery tumid, of various Bulks, whilst some of them were as large as an ordinary Fist. In some, also, there was a whitish, and in others a purulent Matter. *Lamotte, in his Traité Complet de Chirurgie,* informs us, that in the Carcass of a dropical Woman there were many scirrhus Glands found, ten or twelve of which were as large as an ordinary Fist, and as hard as Wood.

As for the Uterus; *Hippocrates, in his Treatise de Mulierum Morbis, Lib. 2. Cap. 38.* informs us, that the Uterus is subject to scirrhus Tumors. And in this Place alone, so far as I remember, he uses the Word σκίρρυνος. "For, says he, 'if the Uteri are affected with a Scirrhus (ἡ ἀμύρτα σκίρρυνος) the Menfes are obstructed, and the Mouth of the Uterus collapses, and renders them incapable of Conception, and is, as it were, quite different from what it was in a natural State: And if touched, it appears like a Stone.'" In *Paulus Aegineta, Lib. 3. Cap. 68.* a Scirrhus of the Uterus is described. And *Hippocrates, in his Treatise de Natura Mul. Cap. 28.* informs us, that a Cancer is to be dreaded from a Scirrhus of the Uterus. "For, says he, when the Uterus of a Woman becomes hard, it falls down to the Pudenda. If the Groins become hard, and there is a preternatural Heat in the Pudenda, a Cancer is beginning to be formed." 'Tis also certain, from the Observations of the Moderns, that a Scirrhus is frequently found in the Uterus. *Paré, in Lib. 24. C. 41.* in the Carcass of a Woman, who had long been afflicted with an hard and distended Abdomen, found the Uterus as large as the Head of a full-grown Person. And when in the Presence of several Physicians and Surgeons, he took it out and attempted to cut it, he found the whole Substance of it so hard and scirrhus, that it was hardly to be divided by a sharp Knife. The Sides of the Uterus, when cut, exceeded three Fingers-Breadth in Thickness. And in its Cavity was found a thick scirrhus Body, as large as two ordinary Fists, and only in some Parts adhering to the Sides of the Uterus. In this Substance were found Atheromas, Cartilages, and even Bones. In the Middle of the Neck of the Uterus, there was found a similar Scirrhus, larger than an Hen's Egg. This Uterus, with its Contents, exceeded nine Pounds in Weight. *Hildanus, also, in Observat. Chirurg. Cent. 1. Cap. 65, 66, & 67.* furnishes us with Instances which sufficiently evince this.

But tho' Scirrhuses are most frequently found in the Parts of the Body here enumerated, yet they have, also, been found incident to other Viscera. Thus we every where read in practical Authors, that the Liver has been found scirrhus either in whole or in part. *Arctæus de Caus. & Sign. Morb. diuturn. Lib. 1. Cap. 14.* informs us, that a Scirrhus is a Disorder which is not only familiar to, but also lasts a long time in the Spleen. 'Tis also certain from Experience, that scirrhus Tumors have been found in the Stomach and Intestines. In the Abridgment of the *Philosophical Transactions, Vol. 3.* we have an Account of a scirrhus urinary Bladder, whose Membranes were a Quarter of an Inch thick.

Hence a Scirrhus may be produced by an Inflammation; by stagnant, caseous, indurated or coagulated Milk; by a Contusion; by strong Attrition; by Carbuncles; by Bubbles; by Ulcers too speedily closed; by the atrabilious Matter of the Blood or Bile, especially when the Menfes or Hæmorrhoids are obstructed; by a lapidescent, gross, austere, and gypseous Matter; by a melancholy Life; by Hard-living; and by an hereditary Disposition.

As for an Inflammation; 'Tis observed under the Article INFLAMMATIO, that an Inflammation sometimes terminates in a Scirrhus; in which Case the Extremities of the obstructed Vessels, together with the stagnant Fluid with which they are infarcted, are not separated from the adjacent sound Parts; but the morbid Part still remains, and often acquires such a virulent Nature, that it can never after be resolved, but either continues during the whole Life, or must be removed either by the Knife or the Cautery. The ancient Physicians took notice of this Origin of a Scirrhus from an Inflammation. Thus *Arctæus, in his Treatise de Caus. & Sign. Morbor. diuturn. Lib. 1. Cap. 13.* informs us, "That if the Liver is not suppured by an Inflammation, it generally happens, that in Progress of Time the hard Tumor is changed into a Scirrhus." And *Paulus Aegineta, Lib. 3. Cap. 68.* when treating of a Scirrhus of the Uterus, speaks in the following manner: "Sometimes the Uterus becomes suddenly scirrhus, without any evident Cause; tho' this Misfortune generally arises from a preceding Phlegmon, which is neither resolved nor converted into an Abscess." Such scirrhus Remains of an ill-cured Inflammation are found not only in the glandular, but also in other Parts of the Body. This was observed by *Galen, when treating of the Cure of an Erysipelas, in his Meth. Med. Lib. 14. Cap. 3.* For after he had said that an Erysipelas required greater Refrigeration than a Phlegmon, he informs us, "That by the incautious Use of refrigerating Medicines, the Skin becomes livid, or even black, especially in old Persons; so that some of the Parts thus refrigerated, cannot be perfectly cured by Discutients, but leave a certain scirrhus Tumor behind." In inflammatory Disorders a Scirrhus is, perhaps, frequently produced in such Parts as are not glandular, whilst by too frequent Venesections the Strength is so weakened, that the Impetus of the vital Fluid is not able to resolve the obstructing Molecules impacted in the narrowest Parts of the Vessels, nor to separate them by a gentle Suppuration. Hence, perhaps, it is, that after a Pleurisy not only the Pleura, but also that Part of the Lungs adhering to it, are indurated into a Scirrhus; for after the preposterous Cure of violent Inflammations, surprizing Degeneracies have been observed in the membranous Parts. Thus sometimes, and even oftener than is generally believed, the Pericardium is inflamed. And in Subjects who have died of long-protracted Disorders of the Breast, this thin membranous Bag of the Heart has not only been found surprizingly inspissated, but also indurated. Thus in the *Acta Physico-Medica, Vol. 2. Obs. 20.* in the Carcase of a Sailor, who had laboured under a violent Asthma and a Cough, and at last died of a dropical Tumor of the Abdomen, Scrotum, and Legs, the Pericardium, among other Disorders, was found an Inch thick, firmly adhering to the Heart, and of a cartilaginous Hardness; so that it would hardly yield to the Knife. For tho' *Malpighi, in Epist. ad Societat. Londin. de Structura Glandul. Conglobat. and Santorini, in Observat. Anatom.* found the Fabric of the Pericardium, when changed by Diseases, glandular; yet in this Case its membranous Substance seems to have degenerated, since no dilated and indurated Follicules were found; but the Pericardium was become cartilaginous.

A Scirrhus may be produced by stagnant Milk. A Scirrhus frequently arises from this Cause in the Breasts of Nurses; who, dreading a Suppuration, expose their inflamed Breasts to the Heat of the Fire, or foment them with Spirit of Wine: By this Means the Tumor is often lessened, since the thinnest Part of the Milk, stagnant in the lactiferous Ducts, is either dissipated, or discharged from the Nipples; but the remainder is, by that means, rendered thicker, and often forms a Scirrhus not to be resolved by any Art.

A Scirrhus may, also, be produced by a Contusion: As 'tis certain, from Anatomy, that the Glands consist of numberless Arteries, by the various Disposition of which a thin Liquid is separated from the arterial Blood, which, when collected, is discharged from their Emunctories, 'tis obvious, that when these Parts are injured by a Contusion, these Vessels may, by that means, be destroyed, or the Emunctories of the Glands so compress'd or obstructed, that a free Discharge of the Liquid, secreted by the arterial Fabric of the Glands, is hindered. Hence by Stagnation, and an Exhalation or Resorption

sorption of the more liquid Parts into the minute Veins, there arises an Infiltration of the secreted Liquid, and a Tumor is form'd which is hard, scarcely capable of a Resolution, without Pain, and known by the Name of Scirrhus. But if an inveterate, hard, and rough Tumor of this Kind is accompanied with Pain, it is called a Cancer.

A Scirrhus may, also, be produced by violent Attrition. By this Means an Inflammation, and all its Consequences, may be produced. Thus in common Prostitutes, scirrhus Condylomas are frequently produced in the Vagina, by too frequent and violent Attrition. Those addicted to unnatural Lust, are, also, afflicted with scirrhus Tumors; whilst, as *Juvenal* happily expresses it:

— — — *Podice levi*

Caduntur tumida, medico ridente, Marisca.

A Scirrhus may also be produced by a Carbuncle. This happens when, by a sudden and violent Inflammation, the Skin together with the subjacent Parts of the Tunica Adiposa, is converted into a dry and hard Eschar; the Cure of which consists in having its whole Circumference, by means of a Suppuration, so separated from the live Parts, that it may fall off. But if this cannot be obtained, after allaying the Inflammation of the adjacent Parts, such a scirrhus Tumor will remain, especially if it is lodged in the glandular Parts.

A Scirrhus may, also, be produced by a Bubo. Tho' Tumors of the Glands, in various Parts of the Body, are sometimes called Bubos, yet this Name is in a peculiar manner appropriated to Swellings of the inguinal Glands: Such Tumors are most frequently produced by a venereal Contagion, remain long, and prove obstinate against the best Remedies.

A Scirrhus may, also, be produced, by closing an Ulcer too soon. 'Tis frequently observed, that when a Phlegmon is converted into an Abscess, the middle Part is entirely soft and matured, though the whole Circumference of the Tumor is as yet hard, as is observed under the Article SUPPURATIO. Hence such an Abscess is not to be soon opened; but it sometimes happens that in the Top of the Abscess, the Integuments being rendered tense, and macerated by Cataplasms, are spontaneously ruptured, and afford a Discharge for the contained Pus, whilst the rest of the Matter remains crude and hard; unless such an Ulcer remains open, and is treated with such Medicines as excite a Suppuration, there often remains a scirrhus Hardness for a considerable Time; which, however, is generally gradually dissipated in such Parts as are not glandular. But when, after an ill-cured Suppuration, such a Hardness remains in the Breast, it often leaves a Scirrhus which cannot be resolved. But never is a Scirrhus more frequently produced by this Cause, than in venereal Buboes; when, for Instance, being suppurated, they are opened before a perfect Maturation; or when, after they are opened, the Surgeon, weary of the long-protracted Cure, attempts their Consolidation by desiccative Medicines; for in this Case something of a scirrhus Nature is always left.

A Scirrhus may also be produced by the atrabiliarious Matter of the Blood, or of the Bile. When the Blood is deprived of its most fluid Part, whether by violent Motion of the Body, or protracted Exercise of the Mind, then the remaining Part is blacker than usual, becomes incapable of Circulation, in Consequence of its Pitch-like Tenacity arising from an Union of the thick Oil of the Blood with its terrestrial Parts, and with greater Difficulty passes through the narrowest Parts of the Vessels. Hence this Matter, which is called Black Bile, is very fit for producing Obstructions; but when the Bile properly so called becomes stagnant in the Gall-Bladder, it may acquire a surprising Tenacity, and often degenerates into calculous Concretions. Such a sordid and tenaceous Matter, produced by a Stagnation and Infiltration of the Bile, is, also, called black Bile; but it is far more acrid, and more easily becomes putrid, than the former Species produced from the Crassamentum of the Blood. This latter Species may disturb the whole Laboratory of the Bile, obstruct the Parts in which it is contained, and afterwards becoming putrid, produce the most terrible Disorders: But the former Species seems principally calculated for producing scirrhus Tumors; since the Blood, contaminated by such a Lentor, easily becomes stagnant in the intricate Structure of the Glands. Practical Observations evince, that scirrhus Tumors are most frequently found in such Persons as, in Consequence of a peculiar Idiosyncrasy, incline to an atrabiliarious Temperament, the Signs of which are enumerated under the Article TEMPERAMENTUM. The ancient Physicians almost always accused the black Bile, as the Cause of a Scirrhus and Cancer; and Galen, in *Method. Medend. ad Glaucon. Lib. 2. Cap. 12.* affirms, that the only Cause of a Cancer is when the black Bile collected in the Body is neither evacuated by the Hemorrhoids nor Varices, nor propelled to the Skin, but conveyed to other Parts of the

Body. In this Opinion he was confirmed by observing, that in the Parts thus affected, the Veins appeared full of a thick and black Blood: Why this should happen, is shown under the Article CARCINOMA. The great Similitude between a Scirrhus and black Bile sufficiently evinces, that the former often arises from the latter; for the tenacious and pitch-like Humour, called Black-Bile, generally fills and obstructs the Vessels of the abdominal Viscera, and produces Diseases principally of a chronical Nature. When this stagnant black Bile, by any Cause, began to be colleagu'd and corrupted, it was, by the antient Physicians, called the turgescens, or moved black Bile; and when it acquires such a State, it rages with incredible Fury, and excites, in the coldest Constitutions, the most acute Fevers, which soon prove Mortal. It, also, brings on the worst of Dysenteries, Corrosions of the Viscera, Deliquiums, and, frequently, sudden Death. A Scirrhus may be long lodged in some Parts of the Body, without proving uneasy to the Patient, unless it happen strongly to compress the adjacent Vessels: But if the Matter of an inveterate Scirrhus begins to be moved, either spontaneously, or by imprudent Treatment, it soon degenerates into a terrible Cancer.

Scirrhus Tumors are most generally formed in Women, when their Menses cease. The most considerable Changes happen in the Bodies of Women, when their Menses first begin to appear, and when they cease in Women after the Season of Conception. The Observations of almost all Physicians evince, that about those Times, scirrhus Tumors are produced in the Uterus and Ovaria, by an Infarction of the Vessels; but there is so great a Consent between the Breasts and Uterus, that as soon as the Excretion of the uterine Blood is obstructed, the Breasts begin to swell, as appears in pregnant Women, as also in Child-bed Women, when, after the Cessation, or considerable Diminution of the Lochia, the Breasts become turgid with Milk: 'Tis, therefore, not to be wondered at, if, upon the Cessation of the Menses, the Breasts should be affected, their Vessels distended, and scirrhus Tumors formed. 'Tis, also, frequently observable, that scirrhus Tumors, produced by other Causes, are about this Time increased in Bulk, and often changed into Cancers. *Hippocrates*, in his *Treatise de Morb. Mulier. Lib. 2. Cap. 20.* informs us that "the Menses retained in the Uterus, regurgitate to the Breasts;" and after enumerating many Symptoms, by which Women were deceived into a Belief of their Pregnancy, he subjoins, "in their Breasts arise hard Tubercles, some of which are large, and some small. These never come to a Suppuration, but become gradually harder, till at last they terminate in occult Cancers." *Dionis*, in his *Cours d'Operations de Chirurgie demonstr. 9.* concludes, from his own Observation, that among twenty Women afflicted with Cancers, fifteen are seized with this Misfortune between the forty-fifth and fiftieth Years of their Age; and he adds, that in a Journey through the Provinces of France, he saw many in the Hospitals, of almost every Town, afflicted with Cancers, but that the Patients were generally about the Age now mentioned; or if the Disorder happened to such as were younger, the menstrual Discharge was defective in them. *Hollerius*, in *Comment. 2. in Lib. 3. Coac. Hippocrat. No. 40.* informs us, that by the Retention, or scanty Discharge of the Menses, glandulous Tumors are, also, formed in other Parts of the Body; for, in one Year, he saw more than two hundred Girls, who, about the middle of the Spring, had Tumors formed on the Groin, in Consequence of a too scanty menstrual Discharge. And in the Case mentioned above, a Woman about the forty-sixth Year of her Age, before found, having her Menses suddenly suppressed, began to be sick; and when she died, upon opening her Body, the Mesentery, Pancreas, Stomach and Pylorus were found scirrhus; from all which it is sufficiently obvious, how much a Cessation of the Menses contributes to the Production of a Scirrhus, or to the Increase of it after it is already formed.

Scirrhus Tumors are, also, very readily formed, upon a Suppression of the hemorrhoidal Discharge. As the black Bile is frequently conveyed to the abdominal Viscera, and there produces many surprising Misfortunes, nothing seems more commodious than that the tenacious, and often pitch-like Blood should be evacuated by the hemorrhoidal Veins; and this is frequently observed in Persons of a melancholic Habit. Hence *Hippocrates*, in *Aphor. 12. of Sect. 6.* commends the Hemorrhoids as beneficial to melancholic Patients. When, therefore, the atrabiliarious Matter is retained, in Consequence of the Suppression of an usual hemorrhoidal Discharge, it may lay a Foundation for the most obstinate Obstructions in the glandular Parts, as we have already observed.

A Scirrhus may, also, be produced by a lapidescent, gross, austere or gypseous Matter. Unless it were certain, from numberless Experiments, it could hardly be believed that there is, even in the most fine and limpid Humours of the human Body, a certain Matter of which a pretty hard Stone may be formed.

form'd. Thus, limpid Urine separated from the Blood through the minute renal Ducts, often lays a Foundation for calculous Concretions, not only when it becomes stagnant in the Pelvis, Ureters and Bladder, but also in the Kidneys themselves, which have sometimes been found entirely calculous. I have seen, says *Vanswieten*, many renal Stones discharg'd, which had Stalks, by which they seem to have been inserted in the renal Ducts, whilst the rest of their Surface was globular. I also saw, says the same celebrated Author, a small Stone extracted from the sublingual Gland. In the Cavity of the Abdomen, which is only moist with a fine exhaling Dew, small Stones have, also, been found. Calculous Concretions of this Kind have, in like Manner, been found in the Substance of the Brain, and almost in all the Parts of the Body. If, therefore, simular Concretions are form'd about glandular Parts, highly obstinate scirrhus Tumors will be produced. The Stones formed in the human Body are of various Degrees of Hardness; for sometimes they are excessively hard, as is principally observable in the Stones of the Bladder; at other Times they are far more soft and friable, as is principally observable in those form'd in the Gall-Bladder: And, says Doctor *Vanswieten*, I have seen white friable Stones, almost resembling Plaster, thrown up from the Lungs in Coughing. And we are by *Paré* informed, that the Glands of the Mesentery were found scirrhus and turgid with a gypseous Matter.

A Scirrhus may also be produced by a sorrowful Life: In melancholic Disorders, this surprizing Circumstance is observ'd, that black Bile predominating in the Blood, and especially lodging about the Abdominal Viscera, produces such a strange Uneasiness, and so insupportable Sadness, that the miserable Patients are often prompted to lay violent Hands upon themselves. It is, also, observable, that violent Passions produce a simular Matter in the Blood, and fix it in the Vessels of the Abdominal Viscera. Since, therefore, Sadness may produce atrabiliarious Matter, it is obvious, that it may, by that Means, lay a Foundation for a Scirrhus.

A Scirrhus may, also, be produced by coarse Diet: Among other Causes, Melancholy may be produced by austere, hard, terrestrial and dry Aliments, long used, especially if the Patient enjoys too much Rest and Ease. Hence studious Men are so often afflicted with Obstructions of the Abdominal Viscera, because they frequently use Flesh and Fish indurated by Salt, or in the Smoke or Air, Pease and Beans; whilst, in the mean Time, they employ their Minds intensely, without giving any Manner of Exercise to the Body; such Persons generally find to their great Injury, that these coarse and heavy Aliments are to be forsaken by them, and that the softest Pot-Herbs, such as Lettice, Endive, and Succory, together with the tender Fleashes of young Animals, agree far better with the Health of the Learned. When the Children of poor Persons eat farinaceous Substances, crude and unfermented, their Abdomens are rais'd into a Tumor, because their tender Viscera are infarcted with an insuperable Lentor. The like Misfortunes are produced in the Children of Country People, by greedily devouring austere and unripe Fruits.

A Scirrhus may, also, be produced by an hereditary Taint: That a Phthisis, Epilepsy, and Gout are transferr'd from Parents to Children, is certain from daily, but fatal Experience. The same, perhaps, holds true with respect to several other Disorders: And such hereditary Diseases, if not incurable, are yet by all Physicians reckoned very hard to be cured. The celebrated *Boerhaave* us'd on this Occasion to tell his Audience, that he knew a certain Family, all the Children of which, at a certain Period, became icteric, and at last died dropical, since their Disorder would yield to no Medicines; that the Cause of such a Misfortune might be discovered, and afterwards prevented, their Carcasses were cheerfully submitted to the Examination of Physicians, who, upon opening them, found the Liver scirrhus.

The Effects of a Scirrhus form'd are, by its increas'd Bulk to affect the adjacent Parts, to press upon them and compress them, to injure the peculiar Functions of the scirrhus and adjacent Parts, and by these Means to produce Inflammations, Suppurations, Gangrenes, Palsies, Atrophies, a Sphacelus, Sterility, difficult Labours, the Iliac Passion, and many other Disorders of the like Nature, which may be easily deduced from the Nature and Office of the injur'd and compressing Part.

The scirrhus Part is increas'd in Bulk, by which Means it must necessarily happen, that the Vessels of the adjacent Parts must be rendered narrower, and sometimes totally compressed. For this Reason, under the Article OBSTRUCTION, scirrhus Tumors are enumerated among the Causes which by

an external Compression of the Vessels lessen their Diameters. The Effects, therefore, of a Scirrhus may be numberless, and quite different, according to the Variety of the Parts affected, and the Functions of the Parts compressed by the increasing Scirrhus. Thus a Scirrhus form'd in the Breast of a sound Woman by an external Cause, often continues till the Patient is far advanced in Years, without creating her any Pain. But when a Scirrhus seizes the Oesophagus, or the adjacent Parts, which by becoming tumid can lessen and compress its Cavity, Deglutition is entirely obstructed, and after the Patient is tantalized, often for several Months, inevitable Death ensues. 'Tis, therefore, here sufficient to specify the general Sources from which the Effects of a Scirrhus may be deduced. But the Knowledge of the particular Disorders produced by a Scirrhus depends upon the Functions of the Parts affected; the most considerable, however, of these Disorders are here enumerated; such as

Inflammations, Suppurations, Gangrenes, and a Sphacelus: Under the Article INFLAMMATIO, where the Causes of an Inflammation are consider'd, 'tis observ'd, that all the Causes of Obstructions may produce an Inflammation: But, as has been just now observed, a Scirrhus is one of these Causes of Obstruction, which, by an external Compression, lessens the Cavities of the Vessels: But an Inflammation form'd may be succeeded by all its Effects, and consequently by a Suppuration, Gangrene, and a Sphacelus. 'Tis, however, to be observ'd, that a Suppuration never happens in a legitimate and confirm'd Scirrhus; but only in the adjacent Parts compressed by the tumid Scirrhus. Besides, under the Article GANGRENA, when the Causes of an Inflammation are consider'd, 'tis obvious, from the Observations of *Hildanus*, that a Gangrene was form'd in both Legs, in consequence of a scirrhus Tumor compressing the *Vena Cava* in that Part where it is divided into the two Iliacs; and this Gangrene was succeeded by a Sphacelus, which ascended to the Knees, and prov'd mortal to the Patient.

A Scirrhus may also produce Palsies: In order to the voluntary Motion of the Muscles, 'tis requisite there should be a free Communication through the Nerves, between the Brain and the Muscles. If, therefore, a Scirrhus should all along compress a Nerve distributed from the Brain to any Muscle, such a Muscle will be paralytic. Now, if a large, nervous Trunk, distributed to any Member of the Body, should be compressed by such a Cause, a perfect Palsy of that Member will be produced. When the subaxillary Glands becoming scirrhus and tumid, strongly compress the adjacent nervous Trunks, 'tis sufficiently obvious that a Palsy may be produced by this Means. Thus, says Doctor *Vanswieten*, in a Woman of sixty Years of Age, I saw the whole right Breast scirrhus; after which the Glands under the right Arm-pit became tumid and hard, and this Circumstance was succeeded, first, by an intense Pain, and then by a Stupor and beginning Palsy in the whole Arm. The Glands, in the mean time, in the right Side of the Neck, were highly tumid and hard; whilst the Patient was subject to frequent Diliquiums, perhaps from a Compression of the *Par Vagus*, and the intercostal Pair of Nerves.

A Scirrhus may, also, produce an Atrophy: 'Tis observ'd under the Article *Vulnus*, that if a large Artery is so divided, that no more Blood can be convey'd to the Parts farther from the Heart than that Division, then all such Parts as received the vital Blood from this large Trunk become mortified, because they are entirely deprived of the Influx of the vital Fluid. 'Tis under the same Article, also, observ'd, that this may happen in two Manners; for the Fluids no longer propell'd by the Motion of the arterial Blood, either become stagnant and corrupted, by which Means a slow and putrid Gangrene is produc'd: Or, the Humours left in the Parts farther from the Heart than such a Division, by the proper Contraction of the Vessels, pass into the Veins, which by the Assistance of the adjacent turgid Muscles return the Humours they receive to the Heart: Thus the Vessels totally deprived of their Fluids will collapse, their collaps'd Sides will grow together, and the Bulk of the Part will be daily lessen'd, till at last becoming dry, it almost resembles Mummy; as is shewn by a surprizing Instance under the Article *Vulnus*. 'Tis sufficiently obvious, that the same Misfortunes must be produced, if a Scirrhus so compresses the Artery distributed to any Part of the Body, as totally to obstruct the Circulation of the Blood in it.

A Scirrhus may, also, produce Sterility: 'Tis not to be doubted but Sterility may be produced, in either Sex, if the Organs of Generation are so indurated into a scirrhus Tumor, as either to abolish or lessen their peculiar Functions. Thus, 'tis certain, from many Observations, that the Testes in Men may become scirrhus. But since in Women there are still more Conditions absolutely necessary,

not only for the Reception of the Rudiments of the Fœtus, but also for its Retention, Support, and Nourishment, to perfect Maturity in the Uterus, 'tis sufficiently obvious, that the Causes of Sterility are far more frequent in Women than in Men. 'Tis certain from Experience, that scirrhus Tumors, either in the genital Parts or those adjacent; and by their Bulk compressing all the contiguous Vessels, frequently prove the Causes of Sterility. Hippocrates, in his Treatise de Natura Muliebri, cap. 19. observes, that in fat Women the thick Omentum so compresses the Uterus, that they are incapable of Conception. In the same Part he informs us, that if the Mouth or Neck of the Womb is scirrhus, which may be discovered by introducing the Fingers, the Woman will be barren, unless that Disorder is cured. By laying open Carcasses, it has often appeared, that scirrhus Tumors of the Uterus have been the Causes of Sterility. Hildanus in Observat. Chirurg. Centur. 1. Obs. 65. informs us, that upon the Death of a Woman of sixty Years of Age, who had been twice married, but remained barren, he laid open her Body, in order to discover the Cause of her Sterility, upon which he saw a Scirrhus, which like a Ring encompass'd the Neck of the Matrix, and so clos'd up its Aperture, that the Point of a Probe could hardly be introduc'd into it. In the same Century, Obs. 66. he informs us, that in another Woman, who in her first Labour being seized with an Inflammation of the Uterus, afterwards remained barren, he, after her Death, found a Scirrhus as large as a Goose's Egg, so situated before the Mouth of the Uterus, as intirely to block up the Passage to it; and so strongly adhering, that it was impossible to separate it. I saw, says Vanfweiten, the whole Vagina scirrhus, and so tumid, that it would hardly admit a Probe. 'Tis, also, observable, that in such Women as have lived barren, a cancerous Disposition of the Uterus is produced, about the Time that the Menfes generally cease; and this Disorder sufficiently manifests its Malignity by the excessive Pains, the acrid Sauces discharg'd, and the profuse Hemorrhage subsequent to the varicose State of the Vessels, which are at last corroded; from all which it is obvious, that a Scirrhus is justly reckon'd among the Causes of Sterility.

A Scirrhus may also produce difficult Labours: That the Fœtus, when arriv'd at a State of Maturity, may be discharg'd from the Uterus, 'tis requisite that its Orifice and Vagina should be capable of a free Expansion: If, therefore, these Parts are indurated by a scirrhus Tumor, or if such Tumors in the adjacent Parts should compress these Parts, 'tis sufficiently obvious, that the Birth must, by this Means, be render'd difficult, and sometimes absolutely impossible. 'Tis true, that a Scirrhus is rarely so soon enlarged to so great a Bulk, as, if it did not exist before the Conception but is form'd during Pregnancy, to do a great deal of Injury when the Fœtus is to be excluded. But a Scirrhus form'd in the Uterus or Vagina, must, in all Probability, lay a Foundation for Sterility; for which Reason it is enumerated among the Causes of that Misfortune. 'Tis, however, certain, that some Women have become pregnant, tho' the Aperture by which the Semen was convey'd into the Uterus was very small. Hence absolute Sterility is not always produc'd, tho' there is a large Scirrhus in these Parts, tho' in such Cases the Labour will always be difficult. In practical Authors there are many Observations which confirm this Doctrine. Thus, says Vanfweiten, I knew a Woman of thirty-eight Years of Age, who died during Labour of her first Child, neither could the Fœtus be brought into the World. In the Hist. de l'Acad. des Sciences, for the Year 1705, the celebrated Mr. Littré informs us, that in the Carcass of a certain Woman he found the Neck of the Uterus clos'd up by a glandular Substance, which adher'd to the Uterus, and was here and there perforated with small Holes. In the Medical Essays, Tom. 3. we have an Account of a Woman of forty Years of Age, who in her first Labour could only have the Fœtus extracted dead, on account of the excessive Narrowness of the Pelvis: Three Months after Marriage becoming pregnant, she was about the Time of the Delivery, for two Days, rack'd with intense Pains, without any Dilatation of the Mouth of the Uterus. As the Surgeon had not a Speculum Uteri at hand, he separated the Sides of the Vagina with a coarse Instrument, upon which the Cicatrice of the Orifice of the Uterus, which was grown together, appeared; and when with a Knife the Surgeon was laying open the Mouth of the Uterus, he found a cartilaginous Hardness all round it, and was forced to make many small Incisions in it, before he could procure a sufficient Dilatation: A dead Fœtus was extracted by the Surgeon's Hand, upon which the Patient was immediately seiz'd with an acute Fever, a pleuritic Pain, and an obstructed Respiration, which in twenty-four Hours proved mortal. Hildanus in Observat.

Chirurg. Cent. 1. Obs. 67. informs us, that in the Carcass of a Woman who died, after suffering her Pains of Labour six Days in vain, he found the Uterus torn, and the Head of the Infant sticking in the Cavity of the Abdomen. The Cause of this Misfortune was a Scirrhus, almost as large as the Head of the Fœtus, and which by its Bulk hinder'd the Exclusion of the Infant.

A Scirrhus may, also, produce the Iliac Passion: Whatever Cause is capable of so contracting any Part of the intestinal Canal, that its Contents, which by the peristaltic Motion ought to be propell'd to the Anus, cannot pass, may produce this terrible Disorder. Hence, the peristaltic Motion being inverted, the Contents of the Intestines return to the Stomach, and after great Uneasiness, are vomited up in a most unseemly Manner. When an Inflammation accompanies this Disorder, it often proves mortal: But when it has no concomitant Inflammation, the Patient may, for a long Time, be afflicted with it. It has been frequently observ'd, that scirrhus Tumors compressing or totally obstructing the Intestines, have laid a Foundation for the Iliac Passion. Hildanus, in Observat. Chirurg. Cent. 1. Obs. 69, informs us, that in the Carcass of a Man who for some Years labour'd under a fixed and continual Pain, under the Region of his Liver, and at last died of a violent Iliac Passion, he found an exulcerated Scirrhus in the Bottom of the Intestinum Cæcum. The celebrated Boerhaave saw a remarkable Case which confirms this Doctrine. A lively Boy, the Son of a Family of Distinction, happening to over-heat himself by skating, went into the Sledge in which his Father was, where he remained for about an Hour, exposed to a pretty intense Cold: Soon after he perceived a Pain in his Abdomen, and was continually in a languishing Condition. A few Weeks after this he began to be costive, till at last the Discharge of his Fœces was almost entirely suppress'd: His Appetite remained pretty good, though every three Days, after great Uneasiness, he vomited up all the Aliments he had used during that Time. After using various Medicines to no Purpose, the Boy died, and the Body was inspected by the Physicians employed whilst he was alive, and who were of different Opinions with respect to the Disease. Boerhaave prognosticated that his Misfortune proceeded from a latent Scirrhus, and for that Reason only prescribed gently resolvent Medicines, and such Aliments as could generate but a small Quantity of Fœces. Other Physicians concluded, that the pituitous Sordes lodged in the Intestines, and obstructing them; was to be eliminated by Vomit; and persuaded the Boys Parents to have him treated in this Manner. But all the Symptoms were increas'd by these Means. Upon opening the Carcass, there was found a Scirrhus compressing the Intestinum Ileum, in that Part where its Extremity is inserted in the Intestinum Colon. Before the obstructed Part, the small Intestines appeared enormously dilated; but behind it, so contracted, that they hardly surpassed the Bulk of the Vermiform Process.

Besides the Disorders now enumerated, many more may arise from Scirrhuses form'd in other Parts of the Body. Thus we read in practical Authors, that fix'd chronic Pains are produced by scirrhus Tumors of the Stomach and Pancreas, tending to the Malignity of a Cancer. A Scirrhus of the Liver often produces an incurable Jaundice, and afterwards a mortal Dropsy. From what has been said, 'tis sufficiently obvious, that many obstinate chronic Disorders arise from scirrhus Tumors form'd in the internal Parts of the Body. We now come to consider the diagnostic and prognostic Signs of a Scirrhus.

A Scirrhus is known to be present from a Knowledge of its Causes, Effects, and Symptoms, together with an Acquaintance with the Part affected, and the Temperament of the Patient.

A Scirrhus formed in the external Parts of the Body is easily discover'd, but with more difficulty known when concealed in the internal Parts. But obscure Cases of this Nature are illustrated by a Consideration of the following Circumstances.

As for the Cause of a Scirrhus: If the Cause predisposing to the Generation of a Scirrhus is an atrabiliarious Spissitude of the Humours, arising from a long protracted Use of austere, terrestrial and coarse Aliments, without violent Exercise; or from a long-continued Influence of Passions, especially Grief; and if, at the same Time, the efficient Cause is a Contusion; if an Inflammation is neither resolv'd nor changed into a Suppuration; if the usual Discharge of the Menfes or Hemorrhoids is suppress'd; or if the Taint is hereditary, we may from such preceding Causes justly dread a Scirrhus.

As for the Effects of a Scirrhus: A Scirrhus always injures not only the Functions of the Part affected, but also frequently

frequently the Action of the adjacent Parts, which it compresses by its Bulk. Hence, if the Causes fit for producing a Scirrhus have preceded, if the Signs of the injured Functions evince that the Uses of certain Parts, which they enjoy'd in a sound State, are disturb'd, or totally abolish'd, and if the Disorder long continues in the same State without any considerable Increase, the diagnostic Signs of a present Scirrhus are by these Means strengthened. Thus, for Instance, if after an acute Disorder of the Breast, which is neither cured by a gentle Resolution, nor a benign Suppuration, a Difficulty of Breathing and a dry Cough remain; and if these Symptoms are increased after the least Exercise, or a liberal Use of Aliments, we may justly conclude that a Scirrhus is form'd in the Lungs; which by its Bulk straitening the Air Vessels of the Lungs, renders Respiration difficult; and by compressing the Blood-Vessels, hinders the Blood expell'd from the right Ventricle of the Heart from being freely convey'd through all the narrow Parts of the pulmonary Artery. Hence the Motion of the Blood being increas'd by Exercise, or a large Quantity of crude Chyle being mixed with the venous Blood in the right Ventricle of the Heart, the Lungs begin to be compress'd, and the Resistance made to the Action of the right Ventricle of the Heart is increas'd, and this increas'd Resistance cannot be surmounted by all the Efforts made by such a Patient for augmenting his Respiration. A latent Vomica of the Lungs compressing the adjacent Parts, will produce the same Symptoms; but the Uneasiness will be augmented in Proportion to the Increase of the Pus, till the Patient is either suffocated, or freed from his Disorder by a Rupture of the Abscess. A gentle hectic Fever, the almost perpetual Concomitant of a Scirrhus of the Lungs, will sufficiently discover such a latent Disorder. In a Scirrhus, also, of the Lungs, all Circumstances for a long Time remain in the same Condition; and the Symptoms often continue for several Years, without any Increase.

As for the Symptoms of a Scirrhus: When this Disorder affects the external Parts, it is known by a Tumor, Hardness, and Absence of Pain: But when it seizes the internal Parts, these Phenomena cannot be discovered by the Senses; in which Case the Effects of a Scirrhus are only capable of guiding the Physician's Judgment, and directing his Practice.

As for the Part affected: 'Tis already observ'd, that scirrhus Tumors are principally form'd about glandular Parts, especially if the Fluid secreted by the Fabric of the Glands is naturally easily inspissated, such as the Milk in the Breasts, for Instance. Hence scirrhus Tumors are by slight Causes produced in these Parts.

As for the Constitution of the Patient: An atrabiliary Habit, as is already observ'd, most powerfully contributes to the Production of a Scirrhus; and the Signs of such an Habit are enumerated under the Article TEMPERAMENTUM.

From the Circumstances enumerated above, the Termination of a Scirrhus may be prognosticated, considering at the same Time the Duration and Effects of the Disorder: And a Scirrhus, which is of its own Nature benign, by an increas'd Circulation of the Humours acquires a malignant Quality.

In prognosticating, we not only determine the easy or difficult Cure of a Scirrhus known from its diagnostic Signs, but also foresee the Misfortunes which will be produced by the Injury done to the Functions of the scirrhus Parts, or of the adjacent Parts compress'd by the Bulk of the Scirrhus. The Prognostic, therefore, of a Scirrhus, is to be deduced from the same Circumstances on which its diagnostic Signs are founded. Thus, for Instance, a Scirrhus arising from an atrabiliary Spissitude of the Humours, is with far greater Difficulty cured, than a Misfortune of the like Kind remaining after an Inflammation. For greater Misfortunes are to be dreaded, when a Scirrhus adjacent to large Vessels compresses them, than when a Scirrhus seizes the Breast, in which Case it hardly creates any Uneasiness to the Patient, unless it degenerates into a Cancer. But in forming the Prognostic of a Scirrhus, the Physician is principally to attend to the Duration and various Effects of the Disorder; for, as we shall afterwards shew, there are generally great Hopes, that a recent Scirrhus may be cur'd; whereas, when it is of several Years standing, it is incurable, except there is a Possibility of extirpating it. The Effects of a Scirrhus are various, according to the Diversity either of the Parts immediately affected, or of those compressed by its Bulk.

As a scirrhus Tumor is without Pain, it is not naturally productive of great Misfortunes, except when situated in those

Places where, by compressing the adjacent Parts, it disturbs some considerable Functions of the Body. Thus, says Doctor *Vanswieten*, I have known a scirrhus Tumor lodg'd for twenty Years and more in the Breast, without producing any Inconvenience. And 'tis certain, from the Observations of practical Authors, that Tumors of this Kind have been conceal'd in the internal Parts of the Body, without any great Detriment to Health. Thus, in the *Hist. de l'Academ. des Sciences* for the Year 1700, Mr. *Litre* informs us, that in a Man of sixty Years of Age, killed by a Fall from an Height, he found the whole Spleen putrified, though the Man had never complain'd of any Disorder, but always lived in an apparently sound and healthy State. But the Bulk of this Spleen must have been very small, since it only weigh'd an Ounce and an Half, and consequently could not by its large Size greatly press upon the adjacent Parts. *Hippocrates*, in his Treatise *de Affectionibus*, cap. 5. when treating of splenic Persons, speaks in the following Manner: "In process of Time, a splenic Disorder degenerates in some Patients into a Dropsy, and they waste away. In some others, the Spleen comes to a Suppuration, and the Patients, when cauteriz'd, are cur'd; whilst in others the Spleen becomes hard, and large, in which Case the Misfortune lasts till the Patient becomes old: But Disorders of this Kind are produced, when in consequence of Fevers, or the preposterous Cure of any other Disease, Bile, or Phlegm, or both, are deposited on the Spleen; and though Misfortunes of this Kind are long protracted, yet they are not mortal". If, however, the Nature of a Scirrhus is consider'd, it will be sufficiently obvious, that numerous Disorders may arise from it, provided, by any Cause whatever, the Motion of the Humours through the Vessels is augmented: For in the Scirrhus there remains a Liquid, coagulated or inspissated, either collected in the Follicles, or dispersed through the highly intricate Fabric of the vascular Parts. This Liquid may, therefore, be conceived as a dead and unactive Body lodg'd in these Parts: But the Vessels fill'd with this stagnant Liquid, or the Follicles, defended by its Means, in their Membranes, contain Vital Vessels, which being straiten'd by the Compression of the scirrhus Concretion, the Circulation of the Humours becomes more difficult, tho' it may as yet be carried on where the Motion of the vital Fluids is moderate. But if by a Fever, for Instance, the Velocity of the Circulation is increas'd, these vital Vessels, every where compress'd by the scirrhus Concretion, cannot be so dilated, that in the same Time a larger Quantity of Fluids will be convey'd through them: Hence an Obstruction will be form'd in them, and by a quicker Circulation of the Humours, an Inflammation. But since, in consequence of this strong Attrition in these contracted Vessels, a pretty strong Heat must be produced, as is observ'd under the Article INFLAMMATIO, a Putrefaction of that scirrhus Concretion will soon after ensue, and all the Misfortunes enumerated under the Article CANCER be produced. The Reason is therefore obvious, why a Scirrhus, which is of its own Nature benign, may, by an increas'd Velocity of the Circulation, be render'd malignant.

As this accelerated Motion of the Fluids often cannot be avoided, a Scirrhus lays a Foundation for constant Dread and Terror.

No Physician is possess'd of so uncommon Skill, as at all Times to prevent an accelerated Circulation of the Fluids in his own Body; for the Passions of the Mind, which can neither be avoided by any, nor duly check'd by the wisest, often greatly augment the Impetus and Velocity of the Circulation, as is observ'd under the Article SANGUIS. Slight Errors with respect to Diet, may, also, sometimes produce the same Effect; and an increas'd muscular Motion will prove hurtful in the same Manner. But Patients can never be prevail'd upon to avoid these Things with due Caution, since a Scirrhus, in consequence of its Freedom from Pain, is almost always neglected. But though the Patient was, with the greatest Caution, to follow these Dictates, yet he cannot possibly guard against the Irritation of a mild Scirrhus, either by the Shocks of epidemical Disorders, external Injuries, a Contusion, for Instance, or other Misfortunes of a like Nature. Besides, the Changes naturally incident to the human Body are capable of converting a Scirrhus into a Cancer: Such as the Cessation of the Menfes, for Instance, in Women past the Date of Conception, as is shewn under the Article CARCIOMA. 'Tis, therefore, obvious, that a Scirrhus in any Part of the Body lays a Foundation for the constant Dread of a more terrible Misfortune, since no Art nor Care are sufficient to prevent all the Causes capable of changing a benign Scirrhus into the most malignant Cancer.

Hence the Physician is to observe,

1^{mo}, That the Cure of a Scirrhus, which is recent, benign, situated in a proper Place, not perfectly hard, and afflicting a Person whose Juices are laudable, is to be attempted by emollient and resolvent Medicines; the most considerable of which are acid Fumes, and Mercury duly used.

In the Cure of a Scirrhus great Prudence is requisite, and nothing is to be attempted rashly, since Errors committed cannot afterwards be rectified, but bring on a Train of terrible Misfortunes. Physicians and Surgeons ought, therefore, always to remember the salutary Advice of *Hippocrates*, who, in *Apbor. 38. Sect. 6.* informs us, "That it is expedient not to attempt to cure Patients afflicted with occult Cancers, since by these means they soon die; whereas those whose Cures are not attempted, live for a great while." By occult Cancers, *Hippocrates* seems to have meant malignant and inveterate Scirrhuses, which are so easily irritated by the Application of Medicines, and degenerate into exulcerated Cancers. Before, therefore, any Remedies are applied to a Scirrhus, the Physician ought carefully to examine whether it is capable of being resolved. But this is known from its having the following Qualifications.

If it is recent; For in this Case, the concremented Humour has not, in Consequence of the Dissipation of its most liquid Parts, degenerated into an irresoluble Mass; and in a recent Scirrhus the whole Substance of the Gland is rarely affected. Hence there is a better Opportunity of conveying to the affected Part, through the as yet pervious Vessels, resolvent Medicines, whose Efficacy will be still the greater upon the scirrhusous Concretion; because it has not as yet acquired a calculous Hardness. If, therefore, a Scirrhus has for several Months affected any Part of the Body, only small Hopes of its Resolution remain. Hence *Artaeus*, in his *Treatise de Curat. Morb. diuturn. Lib. 1. Cap. 14.* when treating of a Scirrhus of the Spleen, justly advises "to prevent approaching, and resolve beginning Scirrhuses." But in the same Passage he informs us, that the Resolution of a Scirrhus is not very easy.

If the Scirrhus is benign; So long as the Scirrhus is without Pain, not too large nor hard, the Colour of the Integuments unchanged, and no Itching and preternatural Heat perceived in the affected and adjacent Parts, the Scirrhus is said to be benign: But if it is attended with the opposite Symptoms, it is said to be of the malignant Kind; the Signs of which are hereafter enumerated.

If the Scirrhus is situated in a commodious Place. If, for instance, Medicines can be commodiously applied to it, and an Access is given to the Surgeon's Hand, that if, contrary to Expectation, a Scirrhus before benign, being irritated by the Application of Medicines, may be extirpated by means of the Knife.

If the Scirrhus is not perfectly hard. For a stone-like Hardness, and a rough uneven Surface, indicate a confirmed Scirrhus, which will soon degenerate into a higher State of Malignity, by the Application of the most mild and resolvent Medicines. The Scirrhus, therefore, ought to yield to any Pressure; otherwise 'tis to be dreaded that the Vessels and Liquids coagulated in them, are almost concreted into an irresoluble Mass.

If a Scirrhus seizes any Part of a Body whose Juices are found. For since, as we have already observed, an atrabiliarious Cacochymy greatly favours the Production of a Scirrhus, it will be of no Service, by many Efforts, to resolve the Matter impacted in the Vessels; if, after its Resolution, a similar Obstruction is soon produced by the same Cause. Thus, for instance, if the Mass of Blood is affected with an acrid and putrid Scurvy, a Putrefaction, in this Case so hurtful, is to be dreaded, whilst the Resolution of the Scirrhus is attempted by emollient and resolvent Medicines.

So many Precautions are requisite, in order to cure a Scirrhus in a safe and proper manner: But fraudulent Quacks, deceiving Old Women, and too often imprudent Chymists, presumptuously confiding in their Arcanums, despise the Dangers of which they are ignorant; and by their pompous, but delusive Promises, precipitate Persons into the greatest Miseries.

But when, after a mature Consideration of all Circumstances, it is probable that a Scirrhus is capable of Resolution, Emollients which relax the Vessels, and Resolvents which, without exciting a great Commotion, fuse the concremented Humours, are the only Medicines to be used. *Artaeus*, in his *Treatise de Curat. Morb. diuturn. Lib. 1. Cap. 14.* affirms, that in order to remove a scirrhusous Hardness of the Spleen, we are to use Medicines as hot as Fire; but immediately after he orders the Parts to be sprinkled with Oil, Vinegar, and Honey; as also with the Powder of the Glans Unguentaria. For the same purpose he also recommends soft and emollient

Cataplasms. *Galen*, in his *Treatise de Method. Medend. Lib. 14. Cap. 4.* when treating of the Cure of a Scirrhus, lays it down as a practical Rule, "That if any one attempt an Evacuation with violently attractive and discutient Medicines, without softening the Tumor, and colliquating the concreted Juices by moistening and heating Substances, the Cure will for a few Days at the Beginning seem to proceed excellently: But the Remainder of a Disorder, thus treated, will be incurable, for by this means, also, the most subtle Parts being dissolved, what remains will be similar to a stony Concretion." The Truth of this Doctrine is sufficiently evinced in Nurses, who, in order to avoid a Suppuration, expose Tumors formed in their Breasts to the Live-Coins, and rub them; for by this means the Tumor is soon lessened, and a Suppuration prevented; but an incurable Scirrhus remains all the Patient's Life after. In such Cases nothing is more proper than twice a Day to expose the Part affected to the Steam of tepid Water; then to rub it softly, and apply some aromatic Plaister, especially with an Addition of the ferulaceous Gums, such as Gum-Ammoniac, Sagapenum, Galbanum, and others of a like Nature. Fomentations and Cataplasms, prepared of similar Substances, may also answer the same Intentions. Thus:

Take of the Flowers of Marsh-mallows, Chamomile, Melilot, and Elder, each one Handful; of the Lesser Centaury, half an Handful; of the Leaves of Worm-wood, White Hore-hound, Rue and Savin, each one Handful; of White Briony-Root, four Ounces; and of Garden-Angelica, one Ounce: Boil in Water in a close Vessel, and, straining the Liquor through a Cloth, with every four Pints of it mix four Ounces of the Spiritus Vini Theriacalis. Apply to the naked Skin with woollen Cloths, laying over them a Swine's Bladder anointed with a little Oil.

Of the above-mentioned Ingredients boil a proper Quantity in as much Water as is sufficient for making a Cataplasma; adding towards the End, of Gum Galbanum dissolved with the Yolk of an Egg, three Ounces; of Linseed-Meal, two Ounces; and of Linseed-Oil three Ounces.

A Plaister for a Scirrhus is prepared in the following manner:

Take of Gum-Ammoniac, Galbanum, Sagapenum and Opoponax, each two Ounces: Melt all together in an earthen Vessel over a gentle Fire, and depurate; then mix intimately with the whole four well-beaten Eggs; of yellow Wax, two Ounces; of the Meal of White Briony-Root, three Ounces; and of the Oil of Rue, by Infusion, a sufficient Quantity.

By this Method, says *Vansweiten*, continued for some Months, I have frequently cured recent scirrhusous Tumours of the Breast. I have, also, seen happy Effects produced by so thick a Solution of Venice-Soap in Milk, as to resemble a thin Poultrice, received into a Sponge, and applied to the scirrhusous Part, with a Swine's Bladder anointed with Oil, over it.

Acid Fumes, especially those arising from vegetable Juices, prepared by Fermentation, such as Vinegar for instance, are of great service in resolving scirrhusous Tumors. This Method is, by *Galen*, in *Method. Medend. Lib. 14. Cap. 5.* greatly recommended; for he would have the Application of Emollients to be interposed with the Use of such Medicines as attenuate and incide the Matter of the Scirrhus; and he extolls Vinegar as the best of the inciding Liquors. For the Cure of scirrhusous Indurations of the Tendons and Ligaments, he extinguishes the ignited Fire-Stone, or a Piece of a Milstone, in the strongest Vinegar, and orders the scirrhusous Tendons and Ligaments to be moved up and down over the ascending Steam; after which he again applies the emollient Remedies. He was, however, afraid lest the Steam of the Vinegar too long or often applied, should injure the Substance of the Tendons and Ligaments; but affirmed that its Use was safe in a Scirrhus of the Spleen, or any fleshy Parts. He also informs us, that he invented some compound Medicines prepared of Vinegar, and procured a perfect Cure of a scirrhusous Spleen, by the Application of Gum-Ammoniac dissolved in Vinegar to the Consistence of Clay, without any other Remedy. But in his *Method. Medend. ad Glauc. Lib. 2. Cap. 6.* he excellently observes, that by the Use of laxative Medicines, the Scirrhus was mollified, but not diminished; whereas its Bulk was considerably lessened by the Application of Medicines prepared of Vinegar; for which reason, he recommends the alternate Use of these Remedies. *Galen*, also, in the same Book, *Cap. 7.* recommends the internal Use of Vinegar for curing a Scirrhus of the Viscera; and informs us, that

in a Scirrhus of the Spleen external Applications alone are not sufficient; since, in order to the Cure, the Patient must drink strong Potions prepared of the Barks of Caper-Roots and Spleen-Wort, together with the Roots and small Branches of the Tamarisk boiled in Vinegar or Oxymel. The Observations of the Moderns sufficiently evince the salutary Use of Vinegar, in resolving scirrhus Tumors; whether its Steam acts upon the Part affected; whether it is used by way of Fomentation; or whether, being mixed with the ferulaceous Gums, it is applied to the Part affected. 'Tis customary almost in all Shops to dissolve Gum-Ammoniac, Galbanum, Opoponax and Sagapenum in Vinegar; and then to depurate them by straining them. After which they are again dried by means of a gentle Fire. But this Method of Preparation seems not only to have been designed for the Depuration of these Gums, but also that the most acrid Parts of the Vinegar, whose thin and aqueous Parts are dissipated, might be united with the Gums, and their Efficacy, in dividing and attenuating Concretions, by that means increased. Thus *Hildanus*, in *Observat. Chirurg. Cent. 1.* informs us, that a robust young Woman, when suckling a Child, had her Left-Breast inflamed; but when the Inflammation was removed, there remained an hard Tumor, which the Women and Quacks in vain endeavoured to remove by many Medicines. But when *Hildanus* was called, he ordered the Infant to be weaned, and the Breast to be daily anointed with a Liniment, which, among other Ingredients, contained a large Quantity of Gum-Ammoniac dissolved in Vinegar of Squills. He, also, twice a Day applied an emollient Cataplasm; and by this Method, exhibiting at proper Intervals a gentle Purgative, the hard Tumor was entirely resolved. The same Author affirms, that the like Measures proved successful with him in a similar Case.

There is, perhaps, no internal Medicine more efficacious than Vinegar saturated with an highly pure alkaline Salt; or if to a Pint of *Rhenish* Wine, we add half an Ounce of the Salt of *Carduus Benedictus*, of the Stalks of Beans, or some such Substance, of which Mixture the Patient is to take half an Ounce three or four Times a Day. The Ancients greatly extolled the Use of such Medicines. Thus *Pliny*, in *Histor. Natur. Lib. 23.* informs us, "That the Ashes of the Twigs of Vines and vinaceous Trees, when mixed with Vinegar, cure Condylomata, and other Disorders of the Anus; that they cure Tumors of the Spleen, when mixed with Oil of Roses, Rue and Vinegar; and that the Ashes of Twigs sprinkled with Vinegar, cure Disorders of the Spleen." The Steam of kindled Sulphur directed to the scirrhus Part, is, also, greatly commended; but as it is offensive to the Lungs, it cannot, for that Reason, be properly used. The known Virtue of Vinegar, in dissolving the Blood, also, affords greater Hopes of a Cure in such Cases; whereas the Acid of Sulphur, especially when strong, induces a Coagulum of the Blood.

The Efficacy of Quicksilver in removing Obstructions, is universally acknowledg'd; and both the external and internal Use of it has often greatly contributed to the Cure of a benign and beginning Scirrhus: For when it has acquired a stony Hardness, and begins to be malignant, no Relief can be expected from the strongest mercurial Preparations, nor from a Salivation excited by Quicksilver, but all the Symptoms are rather increased by these Means; and, in consequence of the increased Motion of the Humours, the Scirrhus is sooner changed into a Cancer. To a resolvable Scirrhus the Emplastrum de Ranis with Mercury is generally applied with Success, only we must take care, lest, by an imprudent Application of it, a dangerous Salivation should be excited, which frequently happens. Hence, as soon as the Patient begins to perceive any Pain or Tension about his Gums, the Plaster is to be taken off, and the Part to which it adhered carefully washed with a Lixivium of Soap. This Plaster generally produces happy Effects in the Resolution of scirrhus venereal Buboës. The Steam of kindled Cinnabar proves beneficial, since the Virtues of the Sulphur and Quicksilver are united, but it often excites a sudden Salivation.

2do, If the Scirrhus does not yield to these Medicines; if its Place, Situation, adjacent Parts, Mobility, the State of the Disorder, and the Strength and Condition of the Patient permit, it is with all Expedition to be totally extirpated with the Knife.

If, after the Use of these Measures for several Weeks or Months, the Tumor is not diminished, nothing remains but to extirpate it, lest being left, it should lay a Foundation for the perpetual Dread of a Cancer. 'Tis, also, expedient to take this Step as soon as possible, because such a Scirrhus, when long left, is generally increased in Bulk, and often adheres to the adjacent Parts, in consequence of which the Ex-

tirpation is afterwards far more difficult, and often impossible. Besides, it often happens, that the Disorder is propagated to the neighbouring Glands, in which Case several Scirrhuses must be extirpated before a perfect Cure can be obtained: For it rarely happens, that large and irresolvable Scirrhuses are lodged long in the Breasts, before the subaxillary Glands are affected with the like Disorder. Thus, says Doctor *Van-sweiten*, in a Woman who, by means of an external Contusion, had a Scirrhus formed in her Breast, which by the frequent Application of almost boiling Spirits of Wine, had assumed a stony Hardness, not only the subaxillary Glands, but also the whole Breast, Neck and Shoulder of the same Side become hard. But it can never be too warmly inculcated to Surgeons never to think of the Extirpation of scirrhus Tumors, unless they are absolutely certain that they can be totally removed: For if the smallest Part should remain after Extirpation, it will soon degenerate into a Cancer, as is certain from fatal Experience. Before, therefore, the Extirpation of a Scirrhus is resolved upon, the following Circumstances are to be duly considered.

As for the Place of the Scirrhus; This ought to be such as to afford an easy Access to the Hands and Instruments of the Surgeon: For none was ever so far deserted by his Reason, as to think of the Extirpation of internal scirrhus Tumors. Tho' *Tulpius*, in *Observat. Med. Lib. 3. Cap. 34.* informs us; that in a Widow of fifty Years of Age, he saw a Scirrhus, formed in the Vagina, as large as an ordinary Fist, covered with a thick coarse Membrane, within white and resembling the Substance of a Man's Testicles, happily extirpated by a skilful Surgeon, without any Injury done to the adjacent Parts, by which means the Patient was freed from a woeful Train of Misfortunes; since the Tumor, when cut out, afforded pretty satisfactory Proofs, that the Scirrhus was degenerating into a Cancer.

As for the Situation of a Scirrhus, and the Parts adjacent to it; These are principally considered with respect to the large Vessels adjacent, and from an Injury done to which, great Danger arises; if, for instance, there was a Necessity for extirpating the subaxillary or parotid Glands: Nor even in these difficult Cases is the skilful Surgeon absolutely to despair of Success; since 'tis certain from Experience, that expert Surgeons have extirpated Scirrhuses even in these Parts. Thus *Hildanus*, in *Observ. Chirurg. Cent. 2. Obj. 79.* informs us, that he extirpated from a Woman's Breast a Scirrhus already become cancerous; and that he happily extirpated three other Scirrhuses under the Axilla of the same Side, one of which was as large as an Egg; to the Vessels distributed to it he applied a Ligature, for fear of the Hemorrhage justly to be dreaded on such an Occasion. *Abraham Kaau*, in his *Dissertatio de Scirrbo*, informs us, that he saw the parotid and subaxillary Gland, when become scirrhus, happily extirpated by a skilful Surgeon at the Hague; that after the Extirpation of the parotid Gland, there was no Occasion for tying the Arteries, since the Hemorrhage was easily stopt by putting in a Piece of Sponge dipt in some astringent Liqueur, which spontaneously fell out on the eighth Day, whilst a Discharge of Pus appeared underneath. From these Circumstances we may learn what happy Effects may be produced by a skilful Hand, even in the most dangerous Cases.

As for the Mobility of the Scirrhus; Before the Extirpation of a Scirrhus is agreed upon, it ought to be evident, that it is moveable in all Directions, and not adhering to any Part; for unless it is totally removed, the smallest Portion left will most infallibly degenerate into a Cancer, as all practical Authors affirm. But every Gland is lodged in a cellular Coat, and is with it naturally moveable every Way; a Scirrhus ought, therefore, to be laid hold on with the Fingers, and moved upwards and downwards, and to the Sides in all Directions; and when it moves with equal Ease in all Directions, it is said to be moveable, and neither adheres to the sub-jacent nor circumjacent Parts. The cellular Coat, indeed, every where adheres to the Gland, but the one may be separated from the other, without any Loss, or even without any considerable Pain, as we shall afterwards shew. It sometimes happens, that a Scirrhus can be easily enough moved downwards and to the Sides, whilst the Skin adheres to its superior Part; but this is easily known, because in that Part the Skin cannot be elevated. But a Scirrhus of this Kind may be, also, extirpated by cutting out, at the same time, that Part of the Skin to which it adheres. But in such a Case the Wound ought to be very large, and the Cicatrix will be unseemly on account of the lost Skin.

As for the State and Condition of the Scirrhus; Whether, for instance, the Scirrhus is single, or whether other scirrhus Tumors, if present, can be resolved, or, if Necessary calls for it, extirpated with the Knife. Thus, for instance, it would signify nothing to remove a Scirrhus from the Breast, when it is evident, from certain Signs, that the Uterus is

also scirrhus, or that there is a Scirrhus in the other Breast, which, for Reasons to be after mentioned, cannot be extirpated.

As for the Strength and Condition of the Patient; 'Tis certain, that all the Efforts of the Physician ought to aim at the Recovery of the Patient. Hence, if the Strength is so far destroyed, as that the Death of the Patient might be dreaded from the Pain, the Hemorrhage, or the violent Suppurations which often ensue upon the Extirpation of large Tumors, the Cure is, in such a Case, attempted in vain. The same Caution is to be observed in Cases where an excessive Cacochymy has infected the whole Mass of Blood; for in this Case Wounds can hardly ever be brought to a good Cicatrix, unless the State of the Blood could be rendered better. 'Tis certain, that if there is a Suspicion, that a Scirrhus will soon degenerate into a Cancer, this dubious Remedy is to be preferred to so certain and so terrible a Misfortune; and in this Case the prudent Physician ought to advise the Extirpation of the Scirrhus, though the Operation could not be performed without Danger.

When, after a mature Consideration of all Circumstances, the Extirpation of a Scirrhus is agreed upon, great Caution is necessary with respect to the Method in which it is to be done; for actual Cauteries and corrosive Applications are not to be used, unless the Scirrhus is so small, that it may, by these means, be destroyed all at once; and even, in this Case, it is more safely extirpated by the Knife, since, if the smallest Portion is left, a Cancer is to be dreaded. If a scirrhus Tumor, which rarely happens, should be totally prominent beyond the Surface of the adjacent Parts, to which it is only fixed by a Kind of Foot-stalk, some have advised the tight Application of a Ligature about this Stalk, so that all Nourishment being by this means intercepted, the Scirrhus may die away and fall off. But this Method is not to be used, unless the Surgeon is certain, that nothing of the Scirrhus is thus divided by the Ligature; for the Part left, though the far greater Part were already fallen off, would degenerate into a Cancer. The celebrated *Baerhaave* had an Opportunity of observing a memorable and fatal Instance of this, whilst some Persons thus attempted the Cure of a large scirrhus Tumor, with a small Neck situated on the Back, though they were sufficiently advised, that their Measures might be productive of the worst of Consequences: For by means of two Brass Laminæ, prepared on purpose in such a manner as to become gradually tighter by Screws, they endeavoured to compress the Root of this Tumor, but the Event was fatal; for not only the Scirrhus, but also the adjacent Parts, were seized with an excessive Putrefaction, and diffused so fetid and disagreeable a Smell, that the Patient being deserted by every Body, and by his Surgeons, fell a miserable Victim to the preposterous Measures which had been taken with him.

It, therefore, seems most proper to remove a Scirrhus by the Knife, with all Expedition, when there is no hope of a Resolution; for a Scirrhus when left long, is ready to increase in Bulk, adhere to the adjacent Parts, or propagate itself to the neighbouring Glands. A Scirrhus may be extirpated in two manners; for after making an Incision in the Integuments, the entire Scirrhus may be taken out; or the Scirrhus together with the Integuments may be cut out at one and the same Time. The former Method is safer, though more slowly performed, and is to be used in removing small scirrhus Tumors, no where adhering to the Skin, but remaining every where free in the *Membrana Cellulosa*. But when the Scirrhus is large, and adhering to the Skin, the latter Method is to be used; when, for instance, the whole of the Breast being scirrhus, is to be extirpated. In order to take out a Scirrhus in the former manner, the Surgeon stretching the Integuments, is to make an Incision through the Skin and *Membrana adiposa*, to the Scirrhus, without wounding it. This Incision must be varied according to the Bulk of the Scirrhus: Thus, if the Tumor is but small, a strait Incision is sufficient; but if it is large, a crucial Incision is requisite. Then by small Hooks elevating the Corners of the divided Integuments, they are, by a Knife, to be separated from the Scirrhus, till the whole anterior Part of it is exposed to View; then thrusting the Forceps of *Helvetius* into the Body of the Scirrhus, it is to be gently drawn upwards, that it may be the more commodiously separated by the Knife, and taken out. When a scirrhus Gland is lodged in the *Membrana Adiposa*, this Separation may be made without any great Pain, except in that Part where the Vessels enter the Scirrhus. Having removed the Scirrhus, and stopt the Hemorrhage, we are to examine whether any Thing of a scirrhus Nature is left behind; then we are to proceed in the Cure, in the same manner as in the Cure of other Wounds, accompanied with Loss of Substance. See the Article *VULNUS*. The Extirpation of such a Scirrhus, together with all the Cautions necessary to be observed on such an Occasion, are

exactly described in the before-cited Dissertation wrote by *Abraham Kaau*, who saw the Operation happily performed by a skilful Surgeon. In that Dissertation, the Author justly advises, that the Scirrhus should not be imprudently drawn in the Separation: For when the Nerves distributed to the Scirrhus are stretched, and rendered tense, a violent Pain is not only excited, but, also, mortal Convulsions have followed, sometimes long after the Operation. We are, also, to take care not to irritate the Surface of the Wound by acrid Styptics; nor are we to use such Things as violently coagulate the Blood: For the concreted Clots of Blood lodged in the divided Veins, may, through Ramifications which continually become larger, be conveyed to the Heart and Lungs, and lay a Foundation for Polypuses. Lint applied by a proper Bandage, is generally sufficient; Puff-Ball is, also, of singular Use in stopping the Hemorrhage.

But when the Scirrhus is taken away, together with the incumbent Integuments, as in the Extirpation of a Breast, it is requisite there should be an Incision made under the Scirrhus, through the *Tunica adiposa*, without hurting the subjacent Parts: In order to this, the Scirrhus is to be elevated from the subjacent Parts, either with the Hands of the Surgeon only, or by passing proper Needles through it, or by thrusting the Forceps of *Helvetius* into the Substance of the Scirrhus; or passing a kind of Fork through the *Membrana cellulosa* between the Scirrhus and subjacent Parts, the Extirpation is to be performed by a Knife, which passing along close under the Fork, divides all the Parts, and goes through the *Membrana adiposa*. During the Operation, the Scirrhus is to be elevated by raising the Fork, by which means the Knife is hindered from injuring the subjacent Parts. But different Methods of Extirpation are chosen by Surgeons, according to the Bulk of the Scirrhus, and the Nature of the Part in which it is lodged. But the Extirpation of such a Scirrhus cannot be made without leaving a large Wound. Hence there is always Danger, lest the Patient should either be exhausted by too copious a Suppuration, or that the Pus collected in so large a Wound, being resorb'd by the bibulous Veins, should contaminate the Mass of Blood with a purulent Cacochymy. Hence the former Method of extirpating a Scirrhus is safer, since it is never succeeded by so violent a Suppuration, and the Wound is much sooner cured. The Surgeon ought, also, to have intrepid and skilful Assistants, in order to compress the divided Arteries, lest the Blood discharged should incommode the Operator.

If a Scirrhus is old, or known to be malignant from its Colour, Hardness, Roughness, Itching, and beginning Pain; if a bad Event is to be dreaded from the Part affected, or those adjacent; if the Scirrhus adheres to any Parts; if it happens in a cacochemical Person, or cannot possibly be extirpated. Then all those Things are to be avoided which increase the Motion of the Fluids, lest the Scirrhus should become a Cancer. Hence Medicines of an emollient, suppurant, corrosive, caustic and dissipating Nature are bad.

Having already considered the Measures to be taken for the Resolution and the Extirpation of a Scirrhus, we now come to enquire what ought to be done when there are no Hopes of a Resolution, and no Possibility of an Extirpation. The Impossibility of a Resolution is known from the long-standing of the Scirrhus; from a Change of the natural Colour of the Integuments to a red, purple, or livid Colour; from a stony Hardness, accompanied with a rough and uneven Surface of the Tumor. But if to all these an Itching is added, it is greatly to be dreaded, that the Scirrhus will soon degenerate into a Cancer; for then the Scirrhus begins to be put into a kind of Commotion, and the Nerves distributed through it are gently distended. Hence arise so keen a Titillation and Itching, that the Patients, tho' told that a Cancer will be formed, if they scratch it, cannot yet abstain from doing so. And if a Pain soon succeeds the Itching, the Disorder is still more terrible. The Extirpation of a Scirrhus is known to be impossible, if it has so grown to the adjacent Parts, that it cannot be totally extirpated; when it is situated in a Place to which the Hands of the Surgeon cannot have Access; or when the Largeness of the adjacent Blood-Vessels render the Operation too dangerous. But in this last Case, a great deal is to be expected from the Skill and Dexterity of the Surgeon. But if a malignant Cacochymy has so infected the Mass of Blood, that the Consolidation of the Wound made in the Extirpation of the Scirrhus, can hardly be expected; or if several scirrhus Tumors appear in other Parts of the Body, 'tis sufficiently obvious, that, in such Cases, the Operation must be vain and to no purpose. Since therefore, in such a Case, the Disorder can neither be corrected nor removed, the whole that Art can do, is to retain it in the same State, and prevent its degenerating

ing into a more terrible Misfortune. This is that Case concerning which *Hippocrates* affirmed, that it was most expedient not to attempt to cure those labouring under occult Cancers; because those who are thus treated die soon after: Whereas those whose Cures are not attempted, live longer; for a Scirrhus, accompanied with the Symptoms just now enumerated, may be justly called an occult Cancer. It is to be observed, that an irresoluble Scirrhus very soon degenerates into a Cancer, if the Motion of the Humors is increased either in the whole Body, or in the Part affected, as we have already observed: All such Remedies, therefore, as increase the Motion of the Humors, are hurtful, under whatever specious Names they may be recommended; for in this Case a Suppuration can never happen, by means of which the irresoluble scirrhus Concretion may be separated from the sound Parts; but a malignant and unsurmountable Putrefaction, which preys upon all the adjacent Parts, will ensue, as is observed under the Article *CARCINOMA*. So long as a Scirrhus, degenerating into a Cancer, is contained within its own Integuments, it is tolerable; but when, after a Rupture of the Integuments, an exulcerated Cancer is produced, it rages with unsurmountable Fury; all emollient and suppurating Medicines, therefore, by lessening the Cohesion of the Integuments, accelerate and hasten this Misfortune. But corrosive and caustic Medicines prove injurious, far sooner and in a far more terrible Manner. *Hildanus, in Observ. Chirurg. Cent. 1. Observ. 89.* has, by his Observations, demonstrated, how pernicious emollient Substances are, when applied to inveterate scirrhus Tumors. And, says *Dr. Vansweiten*, I myself have often seen foolish Women, when endeavouring to bring scirrhus Tumors in their Breasts to a Suppuration, have soon converted them into exulcerated Cancers, by the Application of such Medicines. *Ettmüller, in Oper. Med. Tom. 2. Part 2.* orders an incurable Scirrhus to be left entirely untouched, or to be converted into a stony Hardness, by the Application of Nitre dissolved in Vinegar. But this seems to be a dangerous Piece of Practice, since the increased Bulk of the Tumor denotes its greater Malignity; for it would be irritated by these acrid Substances, and especially if the Scirrhus is already troublesome by the Punctures with which it is accompanied; if it is painful when touched, or of a livid Colour; to a Scirrhus of which Kind, he orders the Application of this Remedy. It is, therefore, better to hinder the Scirrhus from degenerating into a worse State, by such Things as prevent an Inflammation, or allay it when formed; since the Obstinacy of this Disorder surpasses the Power of any Art hitherto known.

But the most proper Medicines under this Disorder, are Anodynes; such Substances as allay the Motion of the Humours; Preparations of Lead, and mild Preparations of Mercury.

The Food ought to consist of recent Milk, Butter-Milk and Whey; Broths prepared of the fresh Fleshes of Quadrupeds and Fowls; Preparations of frumentaceous Substances, such as Oats, Barley, Millet, Canary-Grass, Rye, Wheat, the Pot-Herbs enumerated under the Article *FIBRA*, mild mature Summer-Fruits, which are partly acid and partly sweet; especially boiled. The Drink ought to be Decoctions of the Roots of China, Sarsaparilla, and the three Species of Sanders. All violent Passions of the Mind ought, also, to be carefully avoided, or, when excited, prudently soothed and removed. All acrid heating Substances, or such as throw the Humours into a Commotion, are in this Case highly injurious. If lancinating Pains, and an uneasy Itching, are perceived in the scirrhus Part, these Symptoms are to be allayed by Anodynes, both internally used and externally applied. Thus:

Take of White Poppy-Seeds bruised, two Ounces; of the Roots of Fennel, four Ounces; of Wild Poppy-Flowers, six Drams; and of the Flowers of Mallows, one Handful. Boil in Water in a close Vessel for a Quarter of an Hour; and with each two Pints mix two Ounces and an half of the Syrup of White Poppys. Of this Preparation let the Patient now and then drink three or four Ounces.

Take of Sperma-Ceti, prepared Red Coral, and unwash'd diaphoretic Antimony, each one Dram; and of pure Laudanum, two Grains; Reduce to a fine Powder, to be divided into four equal Doses; of which the Patient is to take one every Morning and Evening.

External Medicines are also of Use, and an excellent Fomentation may be prepared in the following manner.

Take of the Flowers of Henbane, Melilot, Red Poppy and Elder, each one Pugal. Boil with Water in a close Vessel; and with each Pint and an half of the Liquor, mix Vinegar of Elder and Roses, each two Ounces; and of the rectified Spirit of Wine, four Drams.

Take of the Vinegar of Litharge, one Ounce; of the expressed Oil of Henbane Seeds, of the expressed Oil of White Poppy, and of the Oil of Roses by Infusion, each two Drams: Make into an Ointment, adding towards the End six Grains of pure Opium.

For Plaisters we may use the Red-Lead Plaister, and the Unguentum Diapompholygos: Or,

Take of the expressed and recent Juice of the Leaves of Henbane, Garden-Poppy, and Phellandrium, each four Ounces: Boil over a gentle Fire, inspissate; and towards the End, mix eight Ounces of White-Wax, and one Ounce of the Oil of Roses by Infusion: Mix into a Plaister. Or,

Take of the Sugar of Lead, Cerufs, an Amalgama of Mercury and Lead, each two Drams; of White-Wax, four Ounces; and of the Oil of Roses, by Infusion, three Drams: Make into a Plaister.

But if the Integuments of the Scirrhus begin to be inflamed, we are, by prudently applying Preparations of Lead, to endeavour to check that Inflammation. The most considerable Medicines of this Kind are Vinegar of Litharge, diluted in a large Quantity of Water; the Unguentum Nutritum, prepared of this Vinegar, and the Oil of Night-shade intimately mixed, and the Emplastrum Diapompholygos. These Medicines, also, allay the Itching. The scirrhus Part is to be carefully covered with a Piece of soft Leather, in order to prevent all Attrition of the Cloaths, by which the Integuments might be easily excoriated. Hence Women who have scirrhus Breasts, should never wear Whale-bone Stays, nor use hard Exercise; since, in that Case, the Scirrhus would be agitated by the subjacent pectoral Muscle. Mild mercurial Preparations are in this Case of great Use. An Amalgama of Quicksilver and Lead, mixed with the Emplastrum Diapompholygos, has sometimes proved highly beneficial in Cases where the Integuments of the Scirrhus have already been beginning to be inflamed. Others recommend a thin Plate of Lead, besmeared with Quicksilver, and adapted to the Figure of the Scirrhus. But when Mercurials are applied to a Scirrhus, we ought to be very cautious, lest, by an unskilful Use of them, a Salivation should be excited, which, in this Case, will always prove hurtful, since it cannot resolve the scirrhus Concretion; whilst at the same time it increases the Motion and Acrimony of the Humors, and consequently promotes the Degeneration of the Scirrhus into a Cancer.

If at the same time the Temperament of the Patient is peccant, that is above all other Things to be corrected.

Since the whole Intention of this palliative Cure is to prevent the greater Bulk of the Scirrhus, and hinder it from degenerating into a Cancer, it is sufficiently obvious that the morbid Temperament of the Patient, if he has such, ought to be corrected. We have already observed, that an atrabiliarious Habit, of all others, lays the greatest Foundation for scirrhus Tumors: If, therefore, such a Temperament is present, it will increase a present Scirrhus; for which reason the Diet and Aliments ought to be such as are proper for correcting this Temperament. For this purpose, the Patient is to use such Things, as, by mild and saponaceous Quality, fuse the atrabiliarious Juice. On the contrary, all Substances possessed of any considerable Acrimony are to be carefully abstained from. Honey, Venice-Soap, the mild but strongly resolvent Juices of Herbs, are of singular Service; as also proper Decoctions, such as those prepared of Succory, Goats Rue, Endive, Fumitory, and some others. If, in like manner, the Patient was afflicted with a violent Scurvy, that Disorder is, in like manner, to be removed, or at least mitigated by proper Medicines; because acrid Juices, mixed with the Scirrhus, increase its Malignity, and soon change it into a Cancer. *Van Swieten.*

When a Scirrhus appears to be inveterate, and the Patient is of an infirm Constitution, no Digestion must be attempted; for this Treatment, especially if the Disorder is seated in the Breasts of Women, may easily make the Scirrhus degenerate into a Cancer. But where the Scirrhus is recent, soft, and attended with little Pain, and the Constitution of the Patient is sound, it may not be improper to undertake

undertake its Discussion by the Use of Digestives both internally and externally. The most efficacious internal Medicines are the Decoctions of the Woods, the digestive Essences and Tinctures, with the milder Mercurials, interposing Laxatives for resolving the thick inspissated Humours. As the Use of external Medicines alone are generally more pernicious than beneficial, a skilful Physician ought always to be consulted, not only to prescribe proper internal Medicines, but likewise a necessary Regimen with regard to Diet.

The principal external Resolvents are Plaisters of the Gummi Ammoniacum, Galbanum, Opopanax, Sagapenum, Bdelium, and the like, either separately or mixed; or the Powder of the Roots of Briony and Birth-wort, may be added to them. Of the same Intention are the Emplastra de Cicuta, de Ranis Vigonis, and of Diachylon, with Mercury. Or the following:

Take of the Gums Galbanum and Opopanax, each an Ounce; Ammoniacum and Bdelium, each two Ounces; Olive-Oil, two Pounds; yellow Wax, half a Pound; Powders of the Root of long and round Birth-wort, Lapis Calaminaris, Myrrh, and Frankincense, each an Ounce; Venice Turpentine, four Ounces: Mix them for a Plaister.

Cataplasms may be reckoned the next efficacious Remedies to Plaisters. Thus:

Take of the Roots of white Briony, four Ounces; Roots of round Birth-wort, and Angelica, one Ounce; of the Herbs, Savine, Rue, Scordium, and of Camomile-Flowers, each a Handful; of the Flowers of Melilot, Elder, Mallows, and Lesser Centaury, each a Handful: Boil them in clean Water, and a close Vessel, to the Consistence of a Cataplasm; adding at the End, of Galbanum dissolved in the Yolk of an Egg, three Ounces; Linseed Meal, two Ounces; Linseed Oil, enough to make the whole into a Cataplasm.

This Cataplasm, or a Fomentation made of the same Herbs, boiled in Vinegar, may be applied warm, not forgetting the Use of internal Medicines.

Some greatly recommend Fumigations of Acids, as Digestives in this Case, using boiling Vinegar, either common or that made of Lavender, Elder, Rue, or Treacle, for several Days. Some sprinkle the Vinegar on an ignited Stone, and receive the Steam through a Funnel. Others expose the Part affected to the Vapour of burning Sulphur; but the strongest Remedy used of this Kind, is the Fume arising from ten to twenty Grains of Cinnabar thrown upon live Coals, or an ignited Stone. But particular Care must be taken, that these Fumigations be not too strong, nor too frequently used; for by being drawn into the Lungs, they may produce dangerous Effects; and as the Cinnabar contains Mercury, it may raise a Salivation.

Mercurial Remedies are excellent in this Case, either when applied immediately, or after other Medicines have proved unsuccessful. Besides the internal Use of Mercury, an excellent Ointment may be prepared, by mixing it with Hog's Lard, and a sufficient Quantity of Turpentine, in a Glass or Marble Mortar. With this anoint the Scirrhus twice or thrice a Day, and apply the *Emplastrum Vigonis* with Mercury, or the like. But in order to prevent a Salivation from being raised by this Method, 'twill be necessary to exhibit every fourth or fifth Day a gentle Purge, as the Powder of Jalap, or the laxative Pills, for carrying off the Mercury. Mean while the Fauces should be carefully inspected, which, when they swell or are painful, threaten a Salivation. But in order to prevent it, more frequent Purging is necessary; and the mercurial Remedies must be omitted till the Symptoms of a Salivation vanish. By observing these Cautions, you need not doubt the Patient's Recovery, unless the Case be already desperate.

If all these Remedies prove ineffectual to discuss the Scirrhus; and if it is safely situated and moveable, and the Strength of the Patient will permit the Operation, it will be proper to extirpate the Scirrhus, lest, as often happens, it should degenerate into a Cancer. The Wound may be healed with *Arcæus's*, or any other vulnerary Balsam, as in other Wounds.

But when the Scirrhus is immoveable, unequal and deeply seated; when the Constitution of the Patient is infirm; when the Disorder proceeds from an hereditary Infection, and several are generated in the same Person; when it is seated in some noble Part, and from its Vicinity to the larger Blood-Vessels, an Hemorrhage may prove fatal, then the Use of the Digestives, of the Knife, or of Corrosives is evidently improper. This Sort of Scirrhus almost always degenerates into

a Cancer, or is, at least, attended with very acute Pains. Here, therefore, the Pains are to be removed, and the Cancer, at least, prevented.

In this Case the Blood must not only be corrected by suitable external and internal Medicines, but a proper Regimen of Diet must be observed. Let the Patient, therefore, be nourished with various kinds of Broth, made of the Flesh of young and tender Animals, with some mild Pot-Herbs, such as Barley, Oats, Rice, Millet, Manna, the softer Pulses, Spinache, Asparagus, Viper's Grass, Goat's Beard, Succory, Parsneps, and fresh Hops. The most wholesome common Drink is either fair Water, or a Pisan made of the China Root, Sarsaparilla, Grass, Polypody, Veronica, Hart's Tongue, Agrimony, Saracen's Confound, Pellitory of the Wall, Maiden Hair, and the like. If the Scirrhus be attended with Pain, add to the Patient's Drink a little of the Seed of white Poppy, which may be sweetened to the Patient's Taste. In order to correct the Acrimony of the Blood, exhibit the Powder of Crabs-Eyes, prepared Shells, Salt of Wormwood, native Cinnabar, crude Antimony, and diaphoretic Antimony, mixing with every Dose, to alleviate the Pain, half a Grain of Laudanum Opiatum, once, twice, or thrice a Day, according to the Circumstances of the Patient. What, also, excellently answer this Intention, are, the recent Powder or Juice of Millepedes, a Dram of Sperma Ceti, given with the other Powders; mercurial Purges, either in Pills or Powders; and, lastly, frequent Bleeding and Purging in Spring and Autumn.

Outwardly apply, constantly, a thin leaden Plate well impregnated with Quicksilver; which will not only mitigate the Heat and Pain, but may avert the Danger of a Cancer. If this leaden Plate is not effectual for this Purpose, apply Plaisters and Ointments, composed of Ingredients proper for assuaging Pain; such as the following.

Take of Unguentum Diapompholyges, two Ounces; Opium, ten Grains; mix them together, and therewith frequently anoint the Part affected; and, also, apply it with a Linnen Cloth. Or,

Take of amalgamated Mercury and Lead, one Ounce; Ointment of Roses, a sufficient Quantity; make them into an Ointment, which apply to the Part with a Linnen Cloth, like a Plaister. Or,

Take of the Vinegar of Litharge, one Ounce; the expressed Oils of Henbane, and white Poppies, each two Ounces; the infused Oil of Roses, two Ounces; mix and make them into an Ointment, to which, at the End, add from six to ten Grains of Opium, which spread upon a Linnen Cloth, and apply to the Scirrhus several Times a Day.

If the Patient dislikes these Ointments, refrigerant Plaisters may be applied; such as the leaden Plaister of *Mynsicht*, the Plaister of red Lead, and of Diapompholygos; or the following Composition, which is excellent for alleviating Pain.

Take of the recent, expressed and purified Juice of Henbane Leaves, Garden Poppy, and Water Hemlock, each four Ounces; inspissate them by boiling over a slow Fire; and at the End add, of white Wax, eight Ounces; of the infused Oil of Roses, one Ounce; make them into a Plaister. Or,

Take of Sugar of Lead, Cerus, amalgamated Mercury and Lead, expressed Oil of Henbane, and infused Oil of Roses, each two Ounces; White Wax, four Ounces; mix and make them into a Plaister.

If the Pains are very violent, add to these a little Opium.

Some eminent Physicians, in the Cure of a Scirrhus, bring it to Suppuration, or use corrosive Medicines, or the actual Cautey. But as Suppuration and Corrosives endanger a Cancer, and as People have a natural Abhorrence to the actual Cautey, besides many other Inconveniencies which attend these Methods, they ought to be laid aside as slow, hazardous and cruel. The easiest and readiest Method, therefore, of curing a large and painful Scirrhus, whether it be in the Lips, Salival Glands, or Breasts, or Testicles, is to remove it entirely by Incision, unless much Danger may be feared from the Hemorrhage. But if any of the corrupted Part should be left behind, it will be liable to generate a Cancer of a most malignant Nature; and although the Scirrhus should be entirely extirpated, a new one will frequently arise, without any Fault of the Surgeon. Some Physicians, after the Incision, apply the actual Cautey, in order to stop the Hæ-

Hemorrhage, to entirely extirpate the Scirrhus, and prevent its Return. But this Application appears to me unnecessary, as it contributes little to prevent a new Scirrhus, and as there are many milder and more proper Remedies for stopping the Effusion of Blood.

SCIURUS. The Squirrel. The Fat of this Animal is said to be emollient, and to mitigate Pains of the Ears, if put therein.

SCLAREA.

- The Characters are;

The small Leaves under the Whorls are of a different Shape from the rest; the under Leaves are wrinkled, and of a rarer Texture. The Calyx is tubulous, quinquefid, and as it were bilabiate. The Galea is fulcated, long, crooked; the Beard tripartite, the middle Segment bifid and hollow. The Flowers surround the Joints of the Stalks in circular Order, and are generally six in number, and disposed, as it were, in form of a Spike. The Seeds are roundish.

Beerhaave mentions twenty-nine Sorts of *Sclarea*, which are;

1. *Sclarea*, Tourn. Inst. 179. Boerb. Ind. A. 163. *Horminum*, *Sclarea*, Offic. *Horminum sativum vulgare*, sive *Sclarea*, Park. Theat. 55. *Horminum Sclarea dictum*, C. B. P. 234. Raii Hist. 1. 543. *Gallitricum*, Ger. 668. *Gallitricum sativum*, J. B. 3. 309. *Gallitricum sive Horminum*, Ger. Emac. 768. CLARY.

The lower Leaves of Clary are large, rough, rugged, and wrinkled, broad at Bottom, and ending in a blunt Point: The Stalks are about two Foot high, very hairy and clammy, of a strong Scent as well as the Leaves, growing thick together, and clothed with smaller Leaves: The Flowers stand in large Spikes, of a pale blue Colour, pretty big and large, bending hollow Galea's: They are set on *Verticillatum*, or Whorle fashioned, having two round, hollow, thin, whitish Leaves, with a green Border under each Whorle. The Calyx of the Flower, which is very clammy, is divided into two Parts, the upper ending in three, and the lower in two Spinulæ, containing four round blackish Seed. The Root is woody, and not much branched, and perishes after it has born Seed. It grows in Gardens, and flowers in June and July. The Leaves are used.

Clary is accounted to be of a warming and drying Nature. Infused in Wine, it comforts a cold, windy Stomach: It is particularly commended to strengthen the Kidneys, to help a Fluor Albus, and invigorate a cold relaxed Womb. Miller's Bot. Off.

2. *Sclarea*; flore albo.

3. *Sclarea*; Syriaca; flore albo. T. 179. *Horminum Syriacum*, C. B. P. 238. Prodr. 114.

4. *Sclarea*; Orientalis; folio rotundo; flore magno; partim albo, partim purpurascens. T. Cor. 10.

5. *Sclarea*; Lusitanica; glutinosa; amplissimo folio. T. 179.

6. *Sclarea*; vulgaris; lanuginosa; amplissimo folio. See ÆTHIOPIS.

7. *Sclarea*; laciniatis; foliis. T. 179. *Æthiopis*, laciniatis foliis. Barrel. Ic. 188.

8. *Sclarea*; ficula; folio argenteo, subrotundo. *Æthiopis*, tota, argentea; perennis lanuginosa. Cupani.

9. *Sclarea*; Æthiopica; folio subrotundo; perennis. Ind. 63. *Marum Ægyptiorum*. Alpin. Exot. 252.

There grows in the dry and rugged Parts of Egypt, a Kind of sweet-scented Plant, which runs up in one whitish jointed Stalk, to the Height of a Cubit, or more: On each Side of the Joints stands a long thick Leaf, very like that of the *Horminum Sylvestre*, both in Size and Shape, without Smell, and almost without Taste, but drying, with somewhat of Astringency. These Leaves are covered with a white Down, and proceed from the Joints in opposite Order in the lower Part of the Stalk. In the upper Part, or above the Middle of the Stalk, there proceed from the Joints, together with the Leaves, short, slender, square, Branches; from these Joints on each Side are produced white Flowers, very much resembling those of the *Sclarea*, or *Herba Sancti Johannis*; and having, as well as their small Leaves, a very strong, though not unpleasant Smell: These are succeeded by small Seed-Vessels, containing round, minute Seeds, like Cabbage-Seeds; and of a penetrating Smell. All the young Shoots of the Stalk, with the Leaves, Flower, and tender Branches, are very fragrant; and being dry'd in the Shade, serve to put among Clothes to defend them from Moths, and communicate to them its Fragrancy; for the tender Branches being dry'd, change their strong Smell into one more pleasant.

The Flowers and Seeds are heating, digestive and resolvent. A Decoction of the Leaves, and especially the tender Shoots, in Wine, is good for cold and flatulent Pains, and being apply'd to the griev'd Part, are surprizingly effectual. The

Juice of the Leaves, with Vinegar and Honey, are good to remove Pains from the Face. Prosper Alpinus de Plantis exoticis.

The Juice of the first, second, third, and fourth, and of the twenty-second, called *Africana*, being drank will cause Ebriety; it also resists Acidity, and is for that Reason mixed in Beer, to which, besides, it communicates a vinous Quality, for which it is esteem'd by the Dutch Peasants, who love Beer that will make them soon drunk. It is, also, of Use in Surgery, for it is discutient, and removes Tumors, restores Heat, and resists Putrefaction. But it is to be used with Caution, if fermented, in which Circumstance it is sudorific. The Leaves of this Plant, especially of the first and second Species, and in some measure of the third and fourth, being smelled to for a considerable Time, will procure Ebriety; and the Leaves boiled in Beer, qualify it for rendering Persons soon drunk; but, used with Moderation, they comfort the Spirits and Nerves. The Plant is aperient, antihysterical, and proper in difficult Labours, and Obstructions of

of the Menfes, and is very good also for the Fluor Albus, and a great Provocative to Veneri. The Leaves bruised emit so strong and vinous a Smell, that it is commonly us'd instead of burnt Wine in Liquor intended for Fomentations; for it communicates a heating Quality, and produces Spirits. The Plant is well known to the Cooks. The Leaves bruised, resolve cold Tumors, and expel Sweats. *Hist. Plant. ascript. Boerhaave.*

SCLERIA, *σκληρία*, from *σκληρός*, hard, Hardness, in a general Sense, comprehends all Kinds of Hardnesses, in the same Extent as *σκληρώσις*, *Sclerosis*; but is used by *Galen*, or whoever was the Author of the *Medicus*, to signify a Hardness of the interior Parts of the Eyelids. *Castellus.*

SCLERIASIS, *σκληρίσις*. The same with the preceding Word.

SCLEROCOITIA, *σκληροκοΐτις*, from *σκληρός*, hard, and *κοίτη*, a Bed. Lying on a hard Bed, hard Lodging. Thus *Hippocrates*, *Lib. de Salubr. Diata*, advises those who are of a fat and gross Habit of Body, and are desirous to become lean, among other Parts of Regimen, *σκληροκοΐτιαν*, "to lodge hard;" and those who practise it, are called, *Lib. 3. de Diata, σκληροκοΐταις*, *Sclerocoitiae*.

SCLEROMA, *σκληρώμα*, from *σκληρός*, of *σκληρός*, hard, in the *Definitiones Medicæ*, is a somewhat hard Tumor arising in some Part of the Uterus. In a more general Sense, it is the same as *σκληρίσμα*, *Sclerisma*, a hard Tumor. *Fœsius Castellus.*

A *Scleroma* of the Uterus is a Species of *Scirrhus*, seated principally in the Neck of the Uterus, and resembling a Tumor, but less renitent, and attended with a moderate Pain. *P. Ægineta, lib. 3. cap. 68.* The Cure is the same as that of a *Scirrhus* of the same Part. See **UTERUS** and **SCIRRHUS**.

SCLEROPHTHALMIA, *σκληροφθαλμία*, from *σκληρός*, hard, and *φθαλμός*, an Eye. A *Sclerophthalmia*, or hard Lippitude, is a Disease of the Eye, attended not only with a Hardness and Slowness of Motion, but with a Pain and Redness. The Eyelids, in this Affection, are hard and dry, never effusing any Moisture, with small, writhed, dryish, mucous Concretions in their Corners, and a Difficulty of opening or Inversion, after Sleep, on account of their Dryness. This Disease seems to be a Kind of Inflammation, whose general Characters are a Pain and Redness, but it differs from an Inflammation in a Property peculiar to itself, which is Dryness. It differs also from a *Xerophthalmia*, or dry Lippitude, in that this latter, though necessarily hard on account of its Dryness, is, however, much less hard than a *Sclerophthalmia*, and not so painful.

SCLEROSARCOMA, *σκληροσάρκωμα*, from *σκληρός*, hard, and *σάρκωμα*, a *Sarcoma*, a hard, carnosous Abscess, affecting the Gums, and resembling sometimes a Cock's Comb, sometimes the Flesh of a testaceous Animal. *Castellus.*

SCLEROSIS, *σκληρίσις*, is the same as **SCLERIA**, which see.

SCLEROTICA Tunica, one of the Coats of the Eye, which see described under **OCULUS**.

SCLIOSIS, **SCLIROMA**, **SCLIRUS**, or **SCLERUS**, all import the same as **SCIRRHUS**.

SCLOPETUM. A Gun. For the Preparation of the *Aqua Sclopetaria*, see **AQUA**. For Gun-shot Wounds, see **VULNUS**.

SCOBIS. The rasped Powder of Hartshorn, or Ivory. It also imports the same as *Cineres Clavellati*; or the Scorise of Metals. *Castellus.*

SCODEGHINO. The Name of a particular Sort of Incision-knife, described by *Sculietus*, and us'd by *Roussset* in performing the Cæsarean Operation.

SCODINEMA, *σκιονημα*. This Word is explained by *Erotian*, a Heaviness of the Head.

SCOLECIA ÆRUGO. See **ÆRUGO**.

SCOLECIUM. A Species of venomous Spider. See **PHALANGIUM**.

SCOLECIDES, *σκολεικίδης*. The same as **VERMIFORMIS**, an Epithet for a Worm-like Process of the **CEREBELLUM**.

SCOLEX, *σκόλεξ*. A Worm.

SCOLIOSIS, *σκολίωσις*, from *σκολός*, oblique, Obliquation, Perversion, a turning aside, is particularly apply'd by *Hippocrates* to a Distortion, or Perversion of the Spine sideways.

SCOLIOTES, *σκολιότης*, from *σκολός*, oblique, Obliquity, in *Hippocr. de R. V. 7. A.* is spoken of the Hypochondria, and explain'd by *Galen* in his Comment on the Place, by *σκολιότης*, Inequality.

SCOLOPAX. See **GALLINAGO**.

SCOLOPENDRA, Offic. Charlt. Exer. 57. Mouff. Insect. 199. Mer. Pin. 205. *Scolopendra terrestris*, Aldrov. de Insect. 635. Jons. de Insect. 127. **THE MANY FEET.**

The *Scolopendra* is a flat, slender Worm, three Digits in Length, of a yellowish, or reddish Colour, furnish'd on both Sides with a Multitude of Feet, two pretty long Antennæ, and a bifid Tail. Being boiled in Wine, it is esteem'd by some a Depilatory, or Medicine to take off Hair.

The Bite of the *Scolopendra* is said to be poisonous, *Oribani de Morb. Cruat. l. 3. c. 69.* advises to wash the injur'd Part with Brine; or to lay upon it Ashes with Vinegar.

The *Scolopendra* is a venomous Insect with eight Feet, and a forked Tail. The Bite of this Animal causes a Lividness and Tumor in the Parts about the Wound; sometimes there appears a Feculency, and, though but seldom, a Redness. The Part affected immediately begins to ulcerate, and the Ulceration is both painful, and difficult to be cured; to which we may add, that there is a pruriginous Sensation over all the Body.

For the Cure, pounded Salt is to be apply'd to the Place, or Rue bruised, or Ashes work'd with Vinegar. The Wound is also to be washed with strong Brine, or, as *Archigenes* directs, with plenty of hot Oil, before the Things first order'd are to be applied. Inwardly are to be exhibited, *Aristolochia* in Wine, or *Serpyllum*, or *Calamint*, or *Wild Rue*, or *Trefoil*, or half a Hemina of the Juice of the Root of *Asphodel* mixed with Wine. *P. Æginet. lib. 5. cap. 9.*

This Author makes two Sorts of *Scolopendra*, the terrestrial and marine; and says, that the Bite of the latter is succeeded sometimes by an aqueous and pellucid Tumor; but that of the other, by a Redness of the tumify'd Part: But *Oribosius*, *Aetius*, and *Æturius*, make no such Distinction of a *Scolopendra*.

Aetius advises the same Remedies as are prescrib'd for the Bite of the *Mus Araneus*, with the Application of Salts mixed with Tar, or Cedria with Honey, or Garlick with Fig-leaves, and Cumin and Ervum in Wine. For Portions, the same Things are proper which are recommended against the *Mus Araneus*, and besides these, Wormwood and Mint in Wine.

SCOLOPENDRA MARINA, Offic. Charlt. Exer. 62. Raii Insect. 44. Mouff. Insect. 322. *Scolopendra marina prima*, Rondel. de Aquat. 2. 108. Aldrov. de Insect. 635. Jons. de Insect. 143. *Scolopendra marina rubicundior*, Mouff. Insect. 322. Mer. Pin. 205. **THE SEA MANY FEET.**

It is found in the Bottom of the Sea, according to *Gesner*; or in Oyster-Beds, as *Mouffet* says.

Boiled in Oil, and the Parts anointed therewith, it taketh off the Hair; but the Touch thereof excites Itching. *Dioscorides, lib. 2. cap. 16.*

SCOLOPENDRIA. See **ASPLENIUM**.

SCOLOPOMACHÆRION, from *σκολοπαξ*, a Woodcock, and *μαχαίριον*, a Knife. An Incision-knife shaped like a Woodcock's Bill.

SCOLYMOCEPHALUS. A Name in *Boerhaave* for several Sorts of *Conocarpodendron*, *Hypophyllocarpodendron*, and *Lepidocarpodendron*.

SCOLYMUS. The Artichoke. See **CINARA**.

The Characters are;

The Calyx is squamous; the Ova are separated from one another by a small, thin Leaf which grows to them: The Seed, when ripe, still adheres to the Leaf: It has the Appearance of a Thistle.

Boerhaave mentions two Sorts of *Scolymus*, which are:

1. *Scolymus*; *Chrysanthemus*. C. B. 388. *Tourn. Inst.* 480. *Boerb. And. A. 91.* *Scolymus*, Offic. *Scolymus Theophrasti* frue *Eryngium luteum Monspeliensium*, Park. 972. *Carduus Chrysanthemus Narbonensis*, Ger. Emac. 1155. Raii Hist. 1. 258. *Spina lutea*, J. B. 3. 84. *Cichorium luteum Scolymoides Spinis horridum, Narbonense*, Hist. Oxon. 3. 55. **GOLDEN THISTLE.**

It grows in Italy; and the Root, which is the Part used in Medicine, is supposed to agree in Virtues with that of *Eryngo*. See **ALÆ**.

2. *Scolymus*; *Chrysanthemus*; annuus. A. R. Par. 3. Bot. Monsp. *Cichorium luteum, Scolymoides, spinis horridum, Hispanicum annuum*. M. H. 3. 55. *Boerb. Ind. Alt. Plant. Vol. 1.*

The Root of the *Scolymus* boiled in Broth, in the Spring Time, is reckon'd a wholesome Aliment: The same decorticated, and taken with Vinegar and Oil, is a Carthartic. *Hist. Plant. ascript. Boerhaave.*

SODYMUS SYLVESTRIS. See **CINARA**.

SCOMBER. Offic. Aldrov. de Pisc. 270. Schonef. Ichth. 66. Raii Ichth. 181. Ejsid. Synop. Pisc. 58. *Scomber frue Scombrus*, Gesn. de Aquat. 841. Jons. de Pisc. 63. *Scombrus Bellon de Aquat. 200.* Rondel. de Pisc. 1. 234. Salv. de Aquat. 241. **THE MACKREL OR MACAREL.**

It lives in the Sea, and is commended for the Jaundice, and Obstructions of the Liver.

This Fish is well known, and always found in the Sea, but never in fresh Water. It is fished for when about the Size we usually see it; for it afterwards increases in Bulk, and is not looked upon as the same. This Fish is much used in *England*, but only for a certain Season of the Year, after which it disappears; but in some Countries they have it at all Seasons. Those are best which are fresh, thick, tender, juicy, and agreeable to the Taste. When it is salted, it becomes not so well tasted.

It is nourishing Food, and reckoned to be of a dissolving Nature; but is heating and not reckoned wholesome, producing viscous and gross Juices, and is not easy of Digestion. It contains much Oil, volatile Salt, and Phlegm. *Belonius* blames those who boil Macarel, and says it should be roasted, and seasoned with such Things as promote Digestion. Undoubtedly the Roasting divests it more of its viscous and gross Juices. It agrees, in the Spring and Summer, with young People of a healthy Constitution, who have a good Stomach. *Lemery on Foods.*

SCOMBRUS. The same as SCOMBER.

SCOPARIA. See CHENOPODIUM.

SCOPS. *ουξ*. The Name of a Bird, a Sort of Owl, of no Use in Medicine.

SCOPTULA. The same SCAPULA.

SCOPULA. A Brush.

The Flesh-Brush is an Exercise most useful for promoting a full and free Perspiration and Circulation. Almost every Body knows what well Currying will do to Horses, in making them sleek and gay, lively and active, even so much as to be worth half the Feeding. This it can no otherwise effectuate, than by assisting Nature to throw off, by Perspiration, the Recrements of the Juices, which stop the full and free Circulation; and by constant Friction, Irritation, and Stimulation, to allicite Blood and Spirits to the Parts most distant from the Seat of Heat and Motion, and so to plump up the superficial Muscles. The same Effect it would produce in other Animals, even human Creatures themselves, if they were managed in the same manner, with the same Care and Regularity. I should think it, therefore, well worth the Pains of Persons of weak Nerves and sedentary Lives, especially those threatened with paralytic Disorder, to supply the want of Exercise of other kinds, with spending half an Hour Morning and Night, in currying and rubbing their whole Body, more especially their Limbs, with a Flesh-Brush. And 'tis a wonder to me, that Luxury has not brought Cold-Bathing and Currying in Use, upon the Animals (especially those of them upon whom they can be so readily made use of, such as Oxen, Pigs, Veal, Lamb, and all Poultry, which naturally delight in Cold-Bathing) which are brought to the Table. For certain it is, that Cleanliness and due Exercise (of which Currying is one Part) would much contribute to make all Animals whatsoever, without Exception, healthier in themselves, fuller of Juice and Spirits, and consequently better Food for human Creatures. *Cheyne of Health and long Life.*

SCORAX. The Gum of the Olive-Tree. *Rulandus.*

SCORBUTICA. Remedies for the Scurvy.

SCORBUTUS. The Scurvy.

The Scurvy, a Disorder very frequent in maritime and northerly Countries, is the Cause of many other Diseases; and though it has not been entirely overlooked and neglected either by the Ancients or Moderns, yet it has not hitherto been accurately described, for want of long Voyages and Travels into the cold Countries, where it principally rages.

As this Disorder often imposes on the Physician, by its surprising Variety of Symptoms, it cannot be better known than by forming a Judgment of its Nature, after premising a complete History of it.

It is found among the *Britons, Dutch, Swedes, Danes, Norwegians*, and Inhabitants of the inferior or northern *Germany*; so that it principally affects the northern Nations, and the People living in cold Climates; among these it is in a particular manner injurious to those adjacent to the Sea, to Places overflowed by Sea-Water, to Lakes and Marshes, to fat spongy Soils, to Valleys surrounded by high Hills, and to the Brinks of Rivers or Lakes. It is principally incident to those who lead an idle and sedentary Life; to those who in the Winter-time live cold in Places paved and built with Stone; to Sailors, who use salt Aliments, smoked Fleshes, Biscuits, putrid and verminous Water either by Sea, or on Land; to those who are Lovers of Water-Fowls, salt Fishes, Beef or Pork salted and indurated by the Air or by Smoke; to those who use farinaceous unfermented Substances, Pease, Beans, and salt, acrid, or old Cheese; to those who are subject to Melancholy, Madnefs, hypocondriac or hyfteric Passions, slow Disorders, and more especially to those who have used large Quantities of Peruvian Bark.

When it attacks such Persons, it seizes, is increased, and maturated with the following Phenomena.

First, There is a preternatural Laziness, Torpor, and Love of sitting and lying in Bed, a spontaneous Lassitude and Weight of the whole Body, a Pain of all the Muscles, as it were arising from excessive Fatigue, especially in the Legs and Loins; a Difficulty of Walking, especially up a rising or down a declining Ground; and in the Morning after Sleep, a Sensation of all the Limbs and Muscles, as if they were fatigued and confused.

2do. The Respiration is difficult, laborious, and almost defective upon the smallest Motion; there is an appearing and disappearing Tumor of the Legs, which become so heavy as to be immoveable. On the Legs there appear red, brown, yellow and violet-coloured Spots. The Colour of the Face is of a palish brown. There is a beginning Fætor of the Mouth, the Gums becoming tumid, painful, hot and itching, and upon the least Pressure discharge Blood. The Teeth, in consequence of the Retraction of the Gums, are denudated and loose. Various wandering Pains through all the external and internal Parts of the Body, producing surprising pleuretic, stomachic, iliac, colical, nephritic, cystic, hepatic and splenetic Disorders. There are, also, various but slight Hemorrhages.

3tio. The Putrefaction of the Gums smells like a Carcase; they are, also, inflamed, discharge Blood, and are at last seized with a Gangrene. The Teeth become loose, yellow, black, and at last carious; the Annuli, adjacent to the Venæ Raninæ, become varicose. There are Hemorrhages, which often prove mortal, from the external Skin, without any Appearance of a Wound, from the Lips, the Gums, the Mouth, the Nostrils, the Lungs, the Stomach, the Liver, the Spleen, the Pancreas, the Intestines, the Uterus, and the Kidneys. There are formed every where, especially in the Legs, Ulcers, so obstinate as to yield to no Applications, and which, for a long Time, continue fetid, and inclin'd to a Gangrene. The Patient is afflicted with an Itch, crustaceous Eruptions, a dry and gentle Elephantiasis. The fibrous Part of the Blood taken from the Veins, is black, grumous, thick, though not compact; whilst its serous Part is saline, acrid, and its Surface abounding with a yellowish green Mucus. The Patient is, also, afflicted with corroding lancinating Pains, which soon terminate, and are increased in the Night-time, through all the Limbs, Joints, Bones, and Viscera. Livid Spots, also, appear on the Skin.

4to. There are form'd various burning, malignant, intermittent, wandering, periodical, and continual Fevers, which bring on an Atrophy. The Patient is subject to Vomitings, Diarrhæas, Dysenteries, severe Stranguries, Deliquiums, Anxieties, which frequently prove mortal; the Dropsy, a Consumption, Convulsions, a Tremor, a Palsy, Contractions of the Parts, black Spots, a Vomiting and Purging of Blood; a Putrefaction and Consumption of the Liver, Spleen, Pancreas, and Mesentery; and in this State of the Disorder the Contagion is very quick.

Hence 'tis obvious, that the Nature and Effects of a Scurvy are easily understood by those who duly consider what has been said:

Hence 'tis, also, obvious, that the proximate Cause of a Scurvy is such a State of the Blood, in consequence of which it is in one Part peccant, with respect to Thickness, and in the other with respect to its acrid, saline, alkaline or acid Thinness; which Circumstances are above all Things to be accurately investigated and distinguished.

From these Circumstances, known from the Nature of the Disease, all its Phenomena, however surprising, may be deduced.

This is evinced more fully by the Rules which the prosperous or unlucky Cure of this Disorder has established, the principal of which are these following.

In a Scurvy, that which is thick is to be rendered thin; that which is stagnant, moveable; and that which is coagulated, fluid.

That, in like manner, which is too thin, is to be inspissated; and that which is acrid, corrected, and mitigated, not only in a general, but, also, in particular.

And in the Concretion of the one, we are always to have a due Regard to the Nature of the other. Hence great Skill and Judgment are necessary to the successful Cure of a Scurvy.

Acrid evacuating Medicines always exasperate this Disorder, and sometimes render it incurable.

1mo. Hence the Cure is to be begun with mild, attenuating, deobstruent, and purgative Medicines, exhibited in small but reiterated Doses. Thus,

Take of the Vitriol of Tartar, which is not acid, of the Crystals of Tartar, and of Sal Polychrestum, each half a Dram; reduce to a Powder, to be taken in the Morning

ing in Whey, drinking twelve Ounces of Whey after it. Or,

Take of Sal Polychrestum, two Drams; of the greater Pilulæ Cochizæ, one Scruple; of the solutive Syrup of Roses, with Senna, six Drams; and of distilled Succory-Water, two Ounces; mix up for a Draught. Or,

Take of the Elixir Proprietatis, prepared with Salt of Tartar, two Drams; of the solutive Syrup of Roses, with Senna, seven Drams; and of distilled Fumitory Water, two Ounces; mix up for a Draught. Or,

Take of the greater Pilulæ Cochizæ, one Dram; make into twenty-one Pills, of which let the Patient take two at Night, before going to Bed, and five in the Morning, before Breakfast.

2do. We are to proceed in the Use of attenuating and digesting Medicines, such as *Helmont's* Tincture of the Salt of Tartar, one Dram of which may be taken in two Ounces of Wine; *Harvey's* Tincture of the Salt of Tartar, four Drams of which may be taken in three Ounces of Wine; *Ludovicus's* Tincture of Mars, one Dram of which may be taken in one Ounce of Wine; vitriolated Tartar, Cryffals, and Cream of Tartar, and Vitriol of Mars, half a Dram of any of which may be taken in three Ounces of Wine; Sal Polychrestum, and *Tachemius's* Salts, prepared from Vegetables, one Dram of any of which may be taken in three Ounces of Wine; the Elixir Proprietatis, prepared with Spirit of Vinegar, two Drams of which may be taken; the Elixir Proprietatis, prepared with Salt of Tartar, two Drams of which are sufficient for a Dose; the Elixir Proprietatis, prepared with aromatic Waters, three Drams of which may be taken for a Dose; the volatile, oleous, aromatic Salts, one Dram of which may be taken; Venice Soap, four Drams of which may be taken; *Starkey's* Soap, half a Scruple of which may be taken; simple Oxymel, four Ounces for a Dose; simple Oxymel of Quills, three Ounces for a Dose; compound Oxymel of Quills, two Ounces for a Dose. To this Class, also, the Conserves of Sorrel and Wood-Sorrel; as, also, Oranges, China Oranges, Citrons, Lemons, and Pomgranets.

3tio. After this we are, for a long time, to persist in the Use of mild Specifics, exhibited in any Form; such as Male and Female Southern-Wood, broad and small-leaved Wormwood, all the Species of Sorrel and Wood-Sorrel, Maudlin, Agrimony, the Male and Female Pimpernel, Mugwort, Costmary, Burdock, Beccabunga, Oak of Jerusalem, red Cabbage and Colly-Flower; wild Parsley, Box, Chervil, Ground Pine, Germander, Succory, wild Cabbage, Cumenoides, Endive, Hemp-Agrimony, Fennel, Fumitory, both Species of Galangals, Ground-Ivy, Docks, Lovage, Marjoram, Baum, Mint, Water and Garden Cresses, Moneywort, Rhubarb, Sage, Scabious, Scordium, Flixweed, Paul's Betony, Nettles, Oranges, Citrons, Lemons and Pomgranats; Barberries, ripe Cherries of all Kinds, Strawberries, Gooseberries, Mulberries, sweet and somewhat acid Apples, Apricots, and all ripe Plums. The Fruit of the red and grey Bramble, Raspberries, Elder-Berries, Tamarinds, and Spanish Whortles.

4to. In the mean time, the six Non-naturals are to be duly regulated, so as to be contrary to the Causes of the Disorder before specified.

In the second Stage of the Disorder, described in No. 2. the Substances last-mentioned are proper. Then we are, for some time, to use somewhat more acrid Antiscorbutics, in the Form of expressed Juices, Conserves, Spirits, volatile Salts, medicated Wines, and Ales. The Substances proper for this Purpose, are the Acriviola, Garlicks, Jack-by-the-Hedge, Cuckow-Pint, wild Raddish, Wormwood, Onions, the greater Celandine, Scurvy-Grafs, Elicampane, Hedge-Mustard, Rocket, Gentian, Hedge-Hyffop, Woad, Dittander, Leeks, the Parmica Draco, Garden and wild Raddish, Rue, Savin, Worm-Seeds, Soapwort, the lesser Houfleeck, Mustard, and Water Trefoil. An expressed Juice may be prepared thus:

Take of the Shavings of wild Raddish, four Ounces; and of the recent Leaves of Scurvy-Grafs, Money-wort, and Nettles, each four Handfuls: Express the Juice, and mix with Sugar, and let the Patient take two Drams four or six times a Day.

A Spirit may be prepared thus:

Take of the Seeds of Mustard, Garden Raddish, Rocket, Hedge-Mustard, and Garden Cresses, each one Ounce; of the Leaves of Scurvy-Grafs, Dittander, and wild

Raddish, each two Handfuls. To these, when cut and bruised, add of Sea-Salt two Ounces; of Yest, one Ounce; and of Spirit of Wine, a Quantity sufficient to rise two Finger-Breadths above the Ingredients; distil and cohobate three Times.

A volatile Salt may be thus prepared:

With the preceding Ingredients for the Spirit, instead of Sea-Salt and Yest, mix of Sal Ammoniac bruised, three Ounces; and of Pot-Ash, seven Ounces. Distil as before.

A medicated Ale may be prepared thus:

Take of the recent Leaves of Scurvy-Grafs, Rocket, Hedge-Mustard, and Water-Trefoil, each one Handful; of the recent bruised Seeds of Garden-Cresses, and Garden-Raddish, each two Ounces; of the Flowers of Lesser-Centaurry, one Ounce; and of the Roots of Wild Raddish, five Ounces. Put all into half a Firkin of recent fermenting Ale, which is to be used for ordinary Drink.

A medicated Wine may be prepared thus:

Take of the Bulb of Arum, newly dug out of the Ground, half an Ounce; of wild Raddish, one Ounce; of the Leaves of Scurvy-Grafs and Trefoil, each one Handful; of Mustard-Seeds, two Ounces; and of Rhenish Wine, six Pints: Make into a medicated Wine.

Externally Baths for the Body and Feet are to be used, prepared with antiscorbutic Ingredients. Hot dry Frictions, together with specific Liquids, are, also, to be used. Besides, Venesection will often contribute to diminish the acrid Fluids, lessen the Corrosion of the too much distended Vessels, procure a Revulsion, and pave a Way for the Operation of other Medicines to be used.

But according as the acrid Tenuity of the Fluids, the Heat and the Dread of an Hæmorrhage are greater; or according as the Thickness, and languid State of the Fluids, and Coldness and Paleness of the Vessels are greater, we are to use Specifics moderately astringent, somewhat cooling; or hot and acrid. The moderately astringent Antiscorbutics are Capers, Flowers of Broom, the common Ash-tree, Dock, and all the Species of it, Hops, Polypody of the Oak, Rhubarb, and Tamarisks. The somewhat cooling Antiscorbutics are Oranges, Citrons, Lemons, China-Oranges and Pomgranates; somewhat acid and sweet Summer-Fruits, Sorrel, Wood-Sorrel, Succory, Endive, Lettice, Dandelion, Milk and Water in the Summer, Whey and Butter-milk; Tartar, and all acid tartarized Substances. The hot and acrid antiscorbutic Medicines are already enumerated.

For removing the Disorders of the Mouth in this Species of Scurvy, we must use antiphlogistic, antiscorbutic Medicines, appropriated to the various Species of Scurvies. In hot Scurvies of the Gums, the following Gargarisms may be used.

Take of Lemon-Juice and Honey of Roses, each two Ounces; of the dulcify'd Spirit of Salt, half a Dram; and of distilled Rue-Water, two Ounces: Mix all for a Gargarism. Or,

Take of the Spirit of Sea-Salt, two Drams; and of distilled Sage-Water, eight Ounces: Mix for a Gargarism. Or,

Take of recent Lemon-Juice, one Ounce; of Sal Ammoniac, one Dram; and of distilled Rue-Water, six Ounces: Mix for a Gargarism.

In cold Scurvies of the Gums, the following Gargarism may be used.

Take of the Spiritus Theriacalis, and of the Spirit of Scurvy-Grafs, each one Ounce; and of the Honey of Rosemary, two Ounces: Mix for a Gargarism. Or,

Take of camphorated Spirit of Wine, half an Ounce; of the Tincture of Myrrh, one Ounce; of the Rob of Juniper Berries, half an Ounce; of the distilled Water of Wormwood, four Ounces; and of Sal Gemmæ, one Dram: Mix for a Gargarism.

For the Cure of the third Species of Scurvy, described No. 3. all the already prescribed Measures are to be used; only the Patient is to use large Quantities of lenitive, diuretic, antiseptic,

septic, and antiscorbutic Medicines; whilst a gentle Discharge by Sweat, Urine and Stool, is to be long continued. Thus:

Take of Fumitory, Sorrel, Brook-Lime, and Water Trefoil, each one Handful; of Whey and Butter-milk, each two Pints: Make into a Decoction. Or,

Take of Wood-Sorrel, one Handful and an half; of Betony and Chervil, each half an Handful; and of Tamarinds, one Ounce and an half: Cut all down, and in three Pints of the Whey of Summer-milk, infuse for an Hour in an almost boiling Heat, tho' without Boiling: Then with the Liquor, when expressed through a Linen-Cloth, mix of the Syrups of Citron-Juice, Rasp-berrys and Violets, each one Ounce: Of both these Preparations let the Patient drink one Ounce every Half-Hour during the Day.

The fourth Species of Scurvy is rarely to be cured; but the Method of Cure is to be varied according to the Variety of the Symptoms. Sometimes Mercurials prove beneficial, as also the Medicines last recommended.

If what has been said is duly considered and compared with the Phenomena of the Disorder, and the Dissections of those who have died of it, it will be obvious, that, in order to a successful Cure of this Disease, the Physician must carefully investigate the Nature of the peccant Humor, and the peculiar predominating Acrimony. And as this Acrimony may be either saline and mucous, acid and austere, alkaline and fetid, or rancid and oleous; so a Knowledge of these particular Circumstances will render the Cure of the Disease more easy than it would otherwise be. Hence, also, the Reason is obvious, why Whey, Butter-milk, and medicinal Waters, have so often removed the most terrible Symptoms of this Disorder, and what these Symptoms are? Why the acid Juices of ripe Summer-Fruits, such as Oranges, Citrons, Lemons, Pomegranates, Sorrel, Wood-Sorrel, Vinegar, Rhenish and Moselle Wine, are so often Specifics for this Disorder; and in what Cases they prove such? Why astringent and austere Substances, such as Rhubarb, Dock, Tamarisks, Capers, austere Wine either of the black or red Kind, and Preparations of Steel, so often prove beneficial, and in what Cases they are so? Why the most acrid aromatic Substances, such as Scurvy-Grass, Dittander, Ginger, the lesser acrid House-Leek, alkaline Salts of the volatile, fixed, oleous, aromatic, and saponaceous Kinds, so often prove beneficial without the Help of any other Medicines? Why what is serviceable to one scorbutic Patient, is prejudicial to another? And lastly, why, instead of perplexing ourselves about the various Names of this Disorder, we ought rather to investigate the peculiar Genius of each Species of Scurvy, as if it was a distinct Disease? *Boerhaave Aphor. § Mat. Med.*

The Name *Scurvy* is at present so extensive and common, that almost any chronical Disorder, if accompanied with any Degree of Impurity, comes under that Denomination. Thus nothing is more usual, than to class a Cachexy, a Gout, a Dyspnea, a Palsy, an Erysipelas, a Colic, an Atrophy, a Rheumatism, the Purples, and several others, among the scorbutic Disorders. 'Tis, also, customary for ignorant Physicians, when, from certain Signs, they can neither know the Disease nor its Cause, to affirm that it is a Scurvy, assigning for its Cause a scorbutic Acrimony. In Practice there, also, frequently occurs a singular Disease, accompanied with surprising spasmodic and convulsive Symptoms; in which Case the Ignorant either refer the Disorder to Fascination, or falsely call it by the Name of the Scurvy. This Opinion is opposed by some celebrated modern Physicians, who either absolutely deny that there is any such Disorder as the Scurvy, or pretend that it is only an Exacerbation of the hypochondriac and hysterical Disorders. But in this they are mistaken, as will afterwards appear.

A Scurvy, properly so called, is a violent Injury of the Functions of the whole Body, arising from a preternatural Dyscrasy and Corruption of the Blood and vital Juices, produced by the Fault of the Diet and Air, familiar not only to the Inhabitants of maritime and northerly Parts, but also to Soldiers residing in Camps; and not to be cured without great Difficulty.

This Disorder, which is accompanied with various and terrible Symptoms, principally discovers its Nature in the external Parts; for if it is approaching, a spontaneous Lassitude seizes the whole Body, which is succeeded by a Heaviness of the Legs and Feet, accompanied with an Inability of Motion: Then the Colour of the Face recedes from its natural Redness, an Ichor mixed with Blood is discharged from the Gums, whose Flesh is relaxed and consumed to the very Roots of the Teeth, which by that means are rendered loose. In the Legs there appear Spots of various Figures, Bulk and Co-

lours, and which frequently terminate in malignant Ulcers. As the Disorder increases, the Limbs are generally seized with lancinating Pains, either of the wandering or fixed Kind, accompanied with a certain Inability of Motion or convulsive Strictures.

That a Scurvy was not altogether unknown to the Ancients, is pretty certain from *Hippocrates*, who, in his *Treatise de Internis Affectibus*, describes the Scurvy under the Name of the *Disease of the Spleen*, in the following manner: "The Person, says he, who is seized with this Disorder has his Abdomen inflated, then his Spleen becomes tumid, hard, and afflicted with acute Pains. The Colour of the Face becomes black, or pale, resembling the Rind of a Pomegranate. The Gums have a fetid Smell, and are separated from the Teeth. Ulcers resembling nocturnal Pustules, appear on the Legs; the Limbs are extenuated, and the Patient is costive." *Pliny*, also, in *Histor. Natural. Lib. 25. Cap. 3.* beautifully confirms this, in the following manner: "When *Cæsar's Army* was on the other Side of the *Rhine in Germany*, by their drinking insalutary Waters, supposed to be contaminated by some Spells, there appeared among them two new Disorders; one of which being a putrid and fetid Disorder of the Mouth, they called *σφοδραία*; by means of which, in two Years Time, all the Teeth dropt out. Whilst the other so injured the Nerves of the Legs, as to loosen the Joints of the Knees, and vibrate the Legs; from which it got the Name of *οκνισμός*."

But in order to render the Nature and Genius of a Scurvy more conspicuous, we shall trace the History of this Disorder with all its terrible Symptoms, through the several Parts it generally affects, beginning with the Abdomen. Patients of this kind do not very often complain of a Weight and Pain of the Stomach, tho' they are sometimes affected with a Nausea, Cardialgia and Vomiting. The Appetite is, in some, pretty much impaired, and in others preternaturally increased. But it is quite otherwise with respect to Thirst; for there is scarcely any Desire for Drink. Acid, bitter, nidorous, and fetid Eructations are frequently discharged with Violence. Rumbings and a Noise are frequently perceived in the Stomach and Intestines. Some have their Bodies very soluble, whilst others are so costive, that the indurated Faeces can hardly be discharged. In some the *Anus* is, as it were, drawn inwards; so that nothing can be commodiously introduced into it without the greatest Uneasiness. In the Abdomen are violent Colic-Pains, far different from those of the common Kind; for they are lancinating, acute, and so intolerable, that the Patient is ready to lay violent Hands on himself. Nor in this, as in other Colics, is the Abdomen distended with Flatulences. Since the Navel is drawn inwards, so far that an ordinary Fist may be put into the Cavity. This Disorder is long protracted, nor does it easily yield to Medicines and Fomentations, but has this peculiar to it, that it frequently terminates in a Palsy.

We now come to consider what Symptoms occur in the Breast under a Scurvy. Patients of this Kind are afflicted with a Difficulty of Breathing, which frequently arises, or is exasperated, by excessive Motion. This is often accompanied with an Uneasiness which the Patients perceive under the Diaphragm, in the Middle between the Hypochondria, where the *Cartilago Ensisformis* is situated, and which does not suffer them to breathe freely, except in an erect Posture. There is an easy Transition from this Disorder to a Dropsy, which first discovers itself by a Swelling of the Legs, and then of the Abdomen, especially if drastic Purgatives have been used. Besides the Difficulty of Breathing in the Thorax, a Pain is perceived sometimes in the Left, and sometimes in the Right-Side; sometimes towards the Back, and sometimes towards the Sternum, and at other times in the Sternum. But this Pain ought not to be confounded with a true Pleurisy, in which the Pain is continual, pungent, and accompanied with a Fever, a continual Cough, and an Expectoration of coloured Matter. But this is not observed in a scorbutic Pleurisy, where the Pain is most acute, but not continual; since it recurs by Intervals; nor is it accompanied with Thirst and a Fever; nor is the Breathing difficult, except under the Pain. Besides, in a scorbutic Pleurisy, the small and unequal Pulse is quite different to that which happens in a true Pleurisy. Sometimes there is no Cough, or one which is not very troublesome; and when such a Symptom is present, it proceeds not so much from any Disorder of the Thorax, as from a Matter falling down on the Glands of the Fauces. This Disorder may, therefore, be justly called a spurious scorbutic Pleurisy, and may be easily distinguished from a true Pleurisy; because the former continues longer than the latter. A Palpitation of the Heart is, also, frequently incident to scorbutic Patients, who are, likewise, subject to Coarctations of the Breast, and Deliquiums, into which they fall when they endeavour to get out of Bed, without any external Cause. But these Deliquiums differ

differ from others in this, that during the former, the Pulse is large and strong; whereas, in other Deliquiums, it is small and intercepted. Besides, in the Thorax, because in it the Oesophagus is situated, there happens another Symptom; for scorbutic Patients frequently complain, that their whole Gullet is obstructed, and that something like a Stake is contained in it, which would so hinder the Deglutition of the Aliments and Drink, that if any Attempt was made that way, they would run a Risk of being suffocated.

Having thus considered the Thorax, we now proceed to the Neck, Fauces and Head, where various Symptoms occur; such as a preternatural Discharge of the Saliva, a Symptom very frequent to scorbutic Patients. The Gums, also, are in this Disorder greatly affected, since in the Beginning they become tumid, and, when gently handled, discharge a serous Blood. A luxuriant Flesh is, also, often copiously formed on them, which is at last accompanied with a highly fetid Smell. When the Gums are thus indisposed; the Teeth begin to be loose in their Sockets; so that they may sometimes be taken out. There is, also, frequently a Tooth-ach, without any manifest Cause; but this Tooth-ach differs from others in this, that it suddenly disappears, and easily recurs. The Patient is often afflicted with violent and generally wandering Head-achs, which principally have their Periods towards the Evening, but terminate in the Night-time upon the Eruption of a Sweat. Vertigos, also, and Dimness of Sight, frequently happen, and, at certain Intervals, a Drowsiness; and, on the contrary, other Patients are for many Weeks tormented with Watchings, without being weakened, as it happens to feverish Patients. Sometimes, also, an excessive Dejectedness, or an absolute Delirium, happens. But this Species of Delirium differs from others in this, that it seizes the Patient in an anomalous manner, and seemingly without adequate productive Causes.

If we consider the external Parts, we find the Scurvy productive of Convulsions, Pains, and Spasms in them. Thus Convulsions frequently happen in the Hams of the Legs, and the Ancles are sometimes contracted. Here and there, also, violent Contractions happen, which frequently remain in the Joints. This Disorder is excellently described by *Georgius Horstius*. Palsies, also, frequently happen, especially in the Legs, after violent Spasms of the Intestines: In which case, a preceding Stupor is the Fore-runner of the approaching Misfortune. But these Palsies differ from an ordinary Palsy, which is gradually formed, continues long, and destroys all Motion; whereas a scorbutic Palsy seizes quickly, disappears suddenly, and in some measure leaves the Motion of the Part, especially if the Patient keeps his Bed. Besides, an excessive Weariness seizes all the Limbs, without any manifest Cause. Some scorbutic Patients, also, complain of a vermicular Pain, and sometimes an obtuse tensive Pain seizes the Marrow of the Bones. Others are racked with the most intense, pungent and lancing Pains, just as if the Parts were torn asunder. These Pains are generally wandering, and transfer themselves from one Part to another, which they, also, soon leave. Hence they are called the Wandering-Gout. But sometimes they seem to keep a fixed Seat in the Breast; in which Case a Pleurisy is to be dreaded.

Pains arise principally in the Legs, as also about the Ancles and Soles of the Feet; sometimes in the Extremities of the Fingers, the Hip, the Knee, the Back, the Loins, and the Nape of the Neck; and these Pains differ from a true Arthritis, because they wander up and down, not only about the Joints, but also in the Flesh, about the Membranes. In this Disorder the Patient is also afflicted with profuse, troublesome and wasting Sweats, especially in the Night-time. Hemorrhages, also, sometimes happen from the Nose, and are not to be stopped without great Difficulty. Besides, on the Skin appear Spots, which are sometimes larger, and sometimes smaller, resembling the Bites of Gnats, and which are generally at first red, then purple, and somewhat livid, and last of all black. The larger Spots sometimes occupy the whole Legs, and diffusing themselves far, appear sometimes on the Thighs, Neck and Breast, and vanish, and again appear at Intervals. Sometimes, also, Tumors and Tubercles appear in different Parts of the Body. Oedematous Tumors are formed in the Feet, and Exulcerations happen in the following manner: First, the Part is very painful; then the Cuticula is separated from the subjacent Skin, just as if boiling Water had been poured upon it, the Serum is discharged, and then the Part is intensely painful; but a true Pus is hardly ever observed in such Parts. Some Patients are, also, afflicted with dry and deep Ulcers, which discharge neither Pus nor Sanies, but easily degenerate into a Gangrene. Gangrenes are, also, frequently incident to scorbutic Patients, especially in their Toes; but such Gangrenes differ from others in this, that they seize without a manifest Cause and Inflammation, spread slowly, and are long before they destroy the Patient. These are the principal Signs and Symptoms of a Scurvy, which are not all

equally observed in all Patients, since some are afflicted with more, and others with fewer of them; in some they are more violent, and in others more mild; in some continue a longer, and in others a shorter time.

Having given a compleat History of the Scurvy, together with the several Symptoms with which it is generally complicated, we now come to consider the proximate and remote Causes, from which this, and its several Effects, proceed; because both the Prevention and Cure of this Disorder, in a great measure, depend upon an accurate Knowledge of its true Causes. We have already, in the Definition of a Scurvy, placed its continent and proximate Cause in an excessive Impurity and Corruption of the vital Juices, which is highly unfriendly to Life and Health. But since it is not as yet agreed upon, wherein this Taint principally consists, or how it arises and exerts its unlucky Influence, we shall inquire with more Accuracy into these Circumstances.

'Tis, therefore, certain from Physiology, that a good State of Health, or the Soundness of the natural, vital, and animal Functions, depends upon a laudable Temperament, Mixture and Crasis of the vital Humors, the Blood, the lymphatic and nutritive Juices, and the nervous Fluid, and their due Influx and Circulation, through all the Parts of the Body. But since a due Temperature and Purity of the Juices principally consists in this, that the more subtile, moveable, aqueous, æthereal, elastic, and gently sulphureous Parts, be in a due Proportion mixed and united with the gelatinous and fine mucous Parts; and that the gross, glutinous, terrestrial, and various kinds of saline Parts, as, also, the tartareous, alkaline, sulphureous, or bilious, and superfluous, aqueous, and pinguinous Parts be duly eliminated through proper Strainers and Emunctories; such as the Skin, through which Perspiration is made, the Liver, the Kidneys, the Intestines, and the glandular Coats of the Fauces, Nose and Bronchia, it is sufficiently obvious, that an Impurity of the Juices, or a Caco-chymy, must be produced, when the terrestrial, tenaceous, sulphureous, and saline Parts, retained in the Body, surpass those of the mild and temperate kind. But 'tis to be observed, that the impure Dyscrasy of the Blood, in this Disorder, is not always of the same kind, but differs according to the Nature of the excrementitious Particles, and induces different Symptoms; for in some Patients the peccant Matter is highly viscid, fixed, terrestrial, saline and acid; whereas, in others, it is bilious, saline, alkaline, and sulphureous. Hence Authors have ascribed a Scurvy either to a cold or an hot Cause. To these I add a third Species of Scurvy, which arises from a vapid Disposition of the Juices, tending to a putrid Corruption; and this is found to be a Scurvy of the worst and most malignant kind.

The putrid Corruption and vapid State of the Juices is sufficiently evinced from this, that the Scurvy is often propagated by Contagion, and all contagious Disorders have for their Foundation and Cause putrid Exhalations, which penetrating deep into the Body, like a Fomes or Leaven, contaminate, and convert into their own Natures, the predisposed Humours, especially those of the pinguinous Kind. Hence *Sennertus*, in his Treatise *de Scorbuto*, Cap. 1. § 4. observes, that a Scurvy has been produced only by the Stench of Patients who have died of this Disorder; and *Caspar Hoffman*, in his Treatise *de Febris*, Cap. 57. has excellently described the noxious Nature of scorbutic Exhalations in the following manner. "Immediately, says he, after the Patient's Death, there is no Danger; but after the Carcass begins to grow putrid, all Persons ought to keep at a Distance from it, unless they chuse to be infected with the same Disorder." Besides, the excessive Corruption of the Blood and nutritious Juice is sufficiently evinced, from the spontaneous Lassitude; the Languor and Weakness of the Limbs; the Loss of Strength, so far as to produce a Deliquium; the weak and languid Pulse; the excessive Stench of the Sweat and Urine; and the quick and easy Sphacelation of the external Parts, without any previous external Cause.

But in order to generate the Symptoms which afflict scorbutic Patients, the depraved and corrupted State of the Humours alone is not sufficient; but 'tis, also, requisite the Union of the fluid and solid Parts of the Blood should be destroyed, which may be pretty distinctly collected from various Phenomena accompanying the Scurvy. But this Separation of the Fluid, from the more solid and heavy Parts of the Blood, is by no Circumstances better known than by the Discharges of aqueous Blood, which generally happen from the Nose, Gums, and Anus; as, also, from this, that in the external Parts, such as the Face, Lips, and Legs, the Mouths of the Vessels sometimes spontaneously open and discharge Blood. Scorbutic Patients are, also, frequently subject to copious Discharges of the Saliva, Urine and Sweat, which, also, indicate an excessive Separation of the Serum from the thick Blood. Whereas, on the contrary, the in-

constant Pains wandering from one Part to another; sufficiently evince the Thinness and subtle Acrimony of the impure Serum; for a thin and acrid Humour extravasated, is easily and quickly convey'd from one Part to another, which principally happens in a wandering scorbutic Gout. To this Cause we may, also, justly refer the Uneasiness of the Præcordia, the spasmodic Constriction of the Orifices of the Stomach and Diaphragm, and the lancinating Pains of the Intestines and Breast, commonly called a spurious Pleurisy; together with the Itching and Exulceration of the external Parts. The Lentor and Thickness of the scorbutic Humor may be known from the Tumors, the fixed Pains, the Weariness of the Limbs, the Horror and Stupor. Hence, also, we are to account for the Palpitations of the Heart, the Syncope, the Carus, the Lethargy, the small and weak Pulses, the Sadness, the Melancholy, the polypous Concretions in the large Vessels of the Heart, the paralytic Disorders, the sudden Swelling and Increase of the Body, the Largeness of the Liver and Spleen, and the Tubercles in various Parts of the Body.

Besides, that the Union between the solid and fluid Parts of the Blood, which is highly necessary to its Circulation through the minute Vessels and Viscera, is destroy'd; may be known from Blood taken from the Veins of scorbutic Patients, which is generally grumous, black, heavy and thick; with a large Quantity of fetid and ill-tasted Water. I have frequently seen the Blood discharg'd from the Feet of scorbutic Persons in Water, soon compacted into fibrous Concretions; whilst in others, I have seen the Blood received in a Vessel, soon after covered with a very tenacious, glutinous Pellicle. But in others, instead of a duly consistent Blood, I have, with Admiration, seen, a thin, florid, and acrid Serum discharged, which left no thick, black Substance in the Bottom of the Vessel.

Having thus investigated the Causes of a Scurvy, we now come to examine, which of the Viscera are principally affected by it, and what is most properly to be esteemed its Seat. But as Authors differ with respect to this, we shall enquire which of their Opinions approaches nearest to Truth. The Antients, and among the rest *Hippocrates*, affirm'd, that the Spleen, which they thought the Seat of the melancholic and atrabiliarious Humours, was most affected. But from the accurate anatomical Disquisitions of the Moderns, 'tis certain, that the Seat of this Disorder is rather to be placed in the Liver. Thus *Sennertus*, in *Med. Præf. Lib. 3. Sect. 2. Cap. 2.* informs us, that upon opening the Body of a Person who died of the Scurvy, he found almost the whole Omentum putrid and corrupted, but no apparent Disorder in the Spleen. *Forestus*, in *Lib. 20. Observ. Schol. 2.* informs us, that upon opening the Body of a certain Man of Distinction, who died of this Disorder, he rather found the Liver affected than the Spleen. *Reusnerus*, in *Exercitat. 4. de Scorbuto*, informs us, that he saw the Liver of a scorbutic Man, corrupted, callous, and unfit for the Depuration of the Blood, whilst the Spleen had the Bulk and Colour of a sound Liver. *Horstius*, also, in his *Treatise de Scorbuto, Sect. 2. p. 8.* tells us, that he saw the Liver of a scorbutic Man totally scirrhus, both internally and externally, without any Vessels or Blood contained in it; whilst the Spleen was three Times larger than in a natural State it generally is, appeared very found, and by its pretty red Colour, and fleshy Substance, resembled the Parenchyma of the Lungs. And Dr. *Willis* often, dissecting the Bodies of many scorbutic Patients, observ'd, that the Parts most frequently affected, were the Liver or the Gall-Bladder; for in some he found the Liver absolutely without Blood, and like a Cow's Udder after the Milk is drawn from it. In some he found the Gall-Bladder entirely empty, in others obstructed with Stones, and in others full of highly bitter Sordes; whilst the Spleen was found and free from any apparent Disorder.

But I shall not hesitate to affirm, that in this Disorder all the Viscera and Emunctories subservient to the Depurations of the Fluids are affected and disorder'd, since, in consequence of the slow Circulation of the Blood, their minute Vessels and Ducts are easily infarcted, obstructed by a viscid Sordes, and at last absolutely indurated: But in particular, that universal Emunctory of the whole Body, the Skin, through which the thin excrementitious Juices are exhaled, seems to be most considerably affected: Nor are the sanguineous Viscera in the Abdomen, to which the Vena Portæ is distributed, such as the Liver, Spleen, Mesentery, and Omentum, entirely unaffected by this Disorder; because the Liver is destin'd for the Secretion of the impure, saline, sulphureous Parts, and such as have a Tendency to an alkaline Nature. The Spleen, also, principally contributes to the intimate Mixture of the fluid and solid Parts of the Blood, for which Reason the Injuries done to these Parts in a Scurvy,

are to be particularly regarded. But I would have it observ'd, that in this Disorder we are not absolutely to confide in anatomico-practical Observations; because, we rarely find an Opportunity of dissecting scorbutic Persons who have died before they fell into a Dropsy, an Atrophy, an Hæctic, the Morbus Niger, or an internal Sphacelus.

That a Scurvy is so long protracted and so obstinate, as with Difficulty to yield to the most proper and efficacious Medicines, is, in my Opinion, owing to this, that the Laboratory of Digestion and Chylification, by which I mean the Stomach and Intestines, is disorder'd, and considerably injur'd: For as the intimate Dissolution of the Aliments, and the Preparation and Extraction of a laudable, sweet and chylous Juice, depend intirely on the Temperature, gently spirituous Quality, and sufficient Influx of the Salival, gastric and pancreatic Menstruums; so when by the Impurity of the Blood, these menstrual Liquors plainly lose their temperate Nature, they only produce a crude, viscid, and acid Chyle; which being convey'd to the Blood, by its peccant Pores, not only sustains, but also augments the Intemperature and Impurity of the Juices.

Having traced the continent and proximate Causes and true Seat of a Scurvy, and its several Symptoms, and consider'd in what Manner it diffuses itself to all the Parts of the Body, we now come to investigate whence these internal Causes of the Disorder derive their Origins; and this, in my Opinion, is best done by carefully adverting to what the Physicians commonly call the external non-natural Causes, which are daily necessary to the Preservation of Health. Thus, 'tis certain from Experience, that the Scurvy is endemial and familiar to some Countries, especially to northern and maritime Climates, such as those of the *Danes*, *Norwegians*, *Zealanders*, the *Freezlanders*, the *Ditmarshians*, the *Dutch* and the *Swiss*; the Cause of which is to be sought for in the Atmosphere, which being impregnated with impure, putrid, saline, and too aqueous Exhalations, is by that Means in a great Measure depriv'd of its elastic and expansive Force, on which the Tone and Strength of the Solids, and their moving and systaltic Force depend. Hence, in southerly Climates, marshy, dank, and low situated Places, where Inundations, Stagnations of Water, and cloudy Weather frequently happen, are very fit for generating the Scurvy, certainly, for no other Reason, than that the Air impregnated with many moist Exhalations and Vapours, by greatly relaxing the moving Fibres, retards and diminishes the Circulation of the Humours, and consequently the natural Secretions and Excretions.

But since, according to *Hippocrates*, in *Lib. de Flatibus*, Diseases proceed not only from the Air, but, also, from the Aliments: So we find from Experience, that hard, high-salted Beef and Pork, the compact Fleshes of old Animals, when much salted and indurated in Smoke, as also Fish, especially of the Sea Kind, when salted and hardened, greatly contribute to render the Scurvy familiar to some northern and maritime Countries. Pulses of a gross Texture, especially those produced in dank and marshy Places, and coarse, hard Bread, prepar'd of Rye reaped in rainy Weather, or which has contracted a Mouldiness, have, also, a Tendency to produce the Scurvy; which Disorder is, also, generated by crude, hard, saline and stagnant Waters, daily us'd; and by Ales prepar'd of such Waters, when not duly impregnated with Hops, or when they become acid or feculent. And all these Causes are far more injurious, if at the same Time the Life of the Patient is inactive, and free from Labour and Exercise; for by this Means the vital Circulation of the Fluids, and the Secretions and Excretions depending upon it, are greatly retarded, and a Thickness of the Blood and Humours induc'd.

'Tis, also, observable, that Persons of a spongy and loose Habit, those of a sanguineo-phlegmatic Temperament, those who are corpulent, and whose Vessels are very small and numerous, are more subject to a Scurvy than those of dry, slender and firm Habits, who have larger Vessels: Because, in the former the Circulation being slower, and the Secretions more languid, the pinguious watery Juices, upon the Approach of any Miasma, quickly degenerate into a putridinous Corruption. It is, also, observed, that Women are more subject to the Scurvy than Men; Persons who reside in Towns more than the Country People; and studious Persons more than the common People, who by Exercise and Labour expel by Perspiration the peccant Humours accumulated in their Bodies.

But nothing has a greater Tendency to corrupt the Mass of Blood, pervert the Laws of the Animal Economy, and suppress the several Evacuations by Stool, Sweat, and Urine, than a Suppression of the Menfes in Women, and of the Hemorrhoids in Men: So nothing can have a more immediate Influence in producing the Scurvy. Barren Women

are, also, subject to this Disorder; and those whose Menstrues have ceas'd on account of their Age; and in general all who totally omit usual Evacuations of Blood, whether by Scarification or Venesection; for by this Means the Humours being copiously accumulated in the Body, cannot pass freely through all the Vessels, but becoming stagnant here and there, contract an Impurity which is the Origin of the Scurvy. According to *Solomon Albertus, Eugalenus, and Willis*, excessive Hemorrhages from the Nose, the Uterus, the hemorrhoidal Veins, and in child-bed Women by the Lochia, have no less a Tendency to generate the Scurvy, than a Suppression of the usual Evacuations of Blood: For too great a Loss, as well as a Redundance of Blood, lays a Foundation for a Stagnation and Corruption of the Humours.

Old Persons are most subject to this Disorder; for the Diseases most familiar to them have a great Affinity with the Scurvy, because they derive their Origin from an impure, saline, and viscid State of the Blood and Humours. Nor is this difficult to be comprehended; for in the Decline of Life, the minute Vessels by which the Excretion of the Sordes is principally made, the Parts are nourish'd, and the Lymph is intimately mix'd with the Blood, begin to be dried, contracted, and render'd narrow; hence they cannot duly perform their Functions, by which Means the whole Mass of Blood is, in process of Time, rendered impure.

Among the remote Causes of a Scurvy, we may, also, justly reckon whatever weakens the Strength, and diminishes the vital Motions, together with the Secretions and Excretions. Nothing has a greater Tendency to produce these Effects, than violent Perturbations of Mind, induc'd by anxious Care, Sadness and Grief. Thus *Eugalenus in Tr. de Scorbuto, Obs. 15.* positively affirms, that all those who live on coarse Aliments, and labour under long Grief, are greatly dispos'd to the Scurvy. This Doctrine is confirm'd by *Willis*, who observes, that some have been rendered scorbutic by a sudden Fright; for the Passions of the Mind are of singular Efficacy in infringing the Strength of the Solids, and the Circulation of the Blood, which depends upon it: Hence the Humours circulating slowly, become thick, unfit for passing through the minute Vessels, and at last impure. Hence there is an easy Transition to the Scurvy.

As Ease and want of Exercise dispose to the Scurvy, so excessive Motion and Labour too long continued, have generally a Tendency to induce this Disorder; for by this Means, the most pure and subtle Parts of the Blood, nutritious Juice, and nervous Fluid, are dissipated and exhausted: So that the remaining Humours are afterwards easily susceptible of a foreign and corrupted Quality, especially upon the Access of a Contagion. But above all, we condemn unseasonable and intense Exercise, by which the Chyle, as yet not sufficiently digested, is too quickly convey'd to the Blood; and hence arise all the Disorders we have already observ'd to proceed from a bad Digestion and a crude Chyle. Thus *Galen, in Lib. 2. de Sanitate tuenda, Cap. 2.* informs us, "That when Exercise is perform'd, a large Quantity of crude and inconcocted Aliments and Juices ought not to be in the Stomach or Vessels, lest these should be convey'd to all the Parts of the Body before they are duly prepared by a mature Concoction."

Nothing, also, more easily and readily disposes to the Scurvy, than when any previous Disorder has left a kind of Taint in the Blood, the alimentary Juice, or any of the principal Viscera. Hence nothing is more frequently observed in Practice, than that a Scurvy succeeds continual and intermittent Fevers, when preposterously suppressed; or when the Patients, as yet weak, eat liberally. The Reason of this is obvious; for the vital Juices being, by the febrile Heat, deprived of their due spirituous Quality, and their most subtle and sulphureous Parts, circulate with Difficulty. Hence the Miasma, left by the preceding Disease, easily contracts a foreign Quality. But not to mention the many Observations which evince the Power of all Disorders to produce the Scurvy, we shall only specify the Affinity between the hypochondriac Disorder and the Scurvy; for the latter very often either accompanies or succeeds the former, so that some Physicians have falsely asserted, that there was no Difference between those Diseases.

The Patient's Method of Life, also, sometimes proves the antecedent Cause of a Scurvy. Thus Mariners, who undertake long Voyages, are surrounded with a moist Air, and eat large Quantities of gross and high-salted Aliments, are in a principal Manner subject to it. The Scurvy is, also, very frequent in a Camp; because the Soldiers, observing no Regimen, drink stagnant Waters, and often corrupted Liquors, eat crude, and sometimes half putrid Aliments, mouldy Bread, and rancid Bacon; expose their Bodies to an impure, moist and cold Air, especially in the Night; and waste their

Strength by Watchings and Hunger. *Olaus Magnus, in Lib. 16. de Regionibus Septentrionalibus, Cap. 51.* tells us; "That by high-salted and smok'd Fish and Flesh, by cold and crude Aliments, and by ill-bak'd Bread, the Scurvy is produced, in which the Fauces and Gums become putrid, the Stomach is tormented, and the Teeth are seiz'd with a Stupor and become loose." *Hoechsteterus*, also, in *Obs. Med. Decad. 7. Cas. 10.* has a long Observation concerning the Scurvy, as a Camp Disease, formerly raging in the Middle of Germany, the most considerable Circumstances of which Observation are these following: After the King of Sweden, in the Year 1634, subdued *Ausburg*, the Soldiers billeted in the Houses of the Citizens brought into the Town a burning malignant Fever, accompanied with a Delirium and Petechiæ, under which the Emperor's Soldiers, also, laboured, so that great Numbers were cut off by it. But this Disorder remitting in the Beginning of the Winter, many of the Citizens complain'd of a Weariness, Sense of Weight, and Inability to walk, nor could they stand upright on account of the Rigidity, Pain, and Hardness of their Legs, which in some were swell'd, and in others extenuated. Those who were of dry Constitutions, had the Tendons, Nerves, and Muscles of their Legs drawn upwards, so that they could not extend them; and sometimes this Disorder of their Legs was accompanied with an acute Pain, and sometimes not; some were able to tumble up and down in their Beds, but not to extend their Legs; and many of these Patients died about the End of the cold Winter, in the Year 1634. The Legs of some were so weak, that they could not stand upon them, though they were capable of moving themselves in Bed. Spots of the Skin were common to all these Patients, and appeared first red, like Lentils, then blewish, and then livid, sometimes covering the whole Legs. The Gums of the younger Patients were seiz'd with a lax and flaccid Tumor, which when roughly handled, or rub'd, a black and fetid Blood was discharg'd; the Breath was, also, disagreeable, and the Mastication defective: A Leucophlegmatia, an Ascites, a Tympanites, an Atrophy, a Diarrhœa, or a Jaundice succeeding, prov'd mortal to the Patient. Under this Disorder the Sick could not well bear a dry Air, on account of the Ebullition of their Blood. Hence, also, excessive Motion was prejudicial to them.

Having given the History, enumerated the Signs, and specified the Causes of a Scurvy, it will be easy to distinguish it from other Disorders, with which, in regard to its Symptoms, and the impure Dyscrasy of the Blood, it seems to have a great Affinity. I know that many, both of the antient and modern Physicians, affirm, that a Scurvy is the same Disease with that described by *Hippocrates* in *Lib. de Intern. Affect.* under the Name of *Ileum Cruentum*; for in this Disorder, as well as in the Scurvy, the Breath is highly fetid, the Gums recede from the Teeth, Hemorrhages of the Nose happen, and sometimes Ulcers of the Legs appear, some of which are cur'd, whilst others become worse. But since the Spots of the Skin, by which the Scurvy is at present discovered, are not so much as mentioned by *Hippocrates*; and since those labouring under the *Ileum Cruentum*, are said to be sufficiently capable of walking, or labouring, whereas those afflicted with the Scurvy have a Languor, Weight, Coldness of the Legs, and an Inability to walk, I can hardly induce myself to embrace the Opinion of these Physicians. Some, also, refer the Scurvy to the Black Jaundice, in which, also, the Breath is fetid, and the Gums, being corroded, discharge a black Blood, and have Ulcers form'd in them, which are with Difficulty brought to a Cicatrix. The Patients are, also, afflicted with Laziness and Languor, and the Disorder is not cur'd without great Difficulty. But though these two Disorders, on account of the violent Corruption of the Humours, have a great Affinity; yet they differ in this, that in the Black Jaundice the Colour of the Face and whole Body is black, the Fœces are porracious, a bitter Taste is perceiv'd in the Mouth, neither is there any Fever, or Force of Contagion. Besides, in a Black Jaundice, the Liver is principally affected; whereas, in a Scurvy, all the Viscera are disorder'd, and the nervous System afflicted with lancinating Pains and Spasms; which, however, does not happen in the Black Jaundice.

A Scurvy is, also, easily distinguished from hypochondriac and melancholic Disorders, with which, however, it is frequently accompanied; for that in hypochondriac and melancholic Disorders, on account of the destroy'd Tone of the Viscera, and the slow Circulation of the inspissated Blood, there is a certain Impurity and Corruption of the Humours, as also Spasms and Pains, from a Stagnation of the Juices, yet the Mass of Blood is not so putrid and corrupted, nor impregnated with so many and so acrid Salts, as in the Scurvy.

Scurvy. Hence, not only the contagious Force, but, also, the Spots, the putrid Ulcers, the relaxed and bloody Gums, the Weariness of the Body and Limbs, and the Loss of Strength, sometimes productive of Deliquiums, all which are the Symptoms of a Scurvy, are wanting. Besides, the Scurvy, on account of that Corruption which preys both on the solid and fluid Parts, on account of the Spots, Pains and Ulcers, and even on account of its contagious Nature, has a great Affinity with the Lues Venerea. 'Tis, however, of great Importance, to make a due Distinction between these two Disorders, otherwise many Errors will be committed in Practice: We are, therefore, to remember, that the Lues Venerea only arises from Contagion; whereas the Scurvy is produced by a Fault of the Air, Aliments, Water, or an Abuse of the Non-naturals; for which reason, it is peculiar to certain Regions and Climates. Besides, the Scurvy principally affects the Gums, and renders the Teeth carious; whereas the Lues Venerea rather exulcerates and corrodes the Tonsils, Uvula, Nostrils, and Bones of the Palate. The Urine, also, of scorbutic Patients is thick, highly coloured, and richly impregnated with lixivial Salts; whereas, in a Lues Venerea, the Urine is paler coloured, and turbid, with a slimy Sediment. And, lastly, in a Scurvy, the Spasms and Pains are wandering; whereas, in a Lues Venerea, they are more fixed, situated in the Bones, and exasperated in the Night in Bed.

But a Scurvy has a greater Affinity with no Disorder, than with the red chronical Purples, which is generally free from a Fever, and so common, that, by way of Distinction, it is called the scorbutic Purples; because this, as well as a Scurvy, is produced by a great Impurity of the Humours; but it differs in this from a Scurvy, that, in the former, numerous Pustules, as large as Millet-Seeds, here and there appear with Corrugation, Asperity, and Dryness of the Skin, and being accompanied with a profuse Sweat, diffuse a Stench, especially about the Beginning of the Disease, when the Patient is afflicted with Horripulations, Itchings, Heats, and a certain Oppression of the Breast; but none of these Symptoms happen in a Scurvy. Besides, no other exanthematous Disorder is so instable, especially in Persons of delicate Constitutions, as the Purples, since it suddenly appears and disappears, often leaving no bad Consequences behind it, but a certain Oppression of the Breast, and an Hoarseness; which Symptoms are, however, easily removed by a proper Regimen.

Among the Disorders which bear a great Affinity to the Scurvy, we may also justly reckon that Species of Cachexy, which, by the modern Physicians, is generally called scorbutic. But that we may know how far these Disorders differ, 'tis to be observed, that a Cachexy is neither contagious nor epidemic, nor highly offensive to the Gums, nor accompanied with Spots; all which Symptoms, however, generally accompany a true Scurvy. Besides, the material Cause of a Scurvy differs from that of a Cachexy, which proceeds rather from a Redundance of a thin, than of a glutinous and acrid Serum. Hence the external Parts of cachectic Patients Bodies are observed highly relaxed, flaccid and tumid.

Having thus specified the Difference between a Scurvy and other Diseases, which have an Affinity with it, we now come to consider how we may form a prudent Judgment with respect to its Cure and Event. First, then, 'tis to be observed, that the Scurvy is one of those Disorders which neither suddenly seize, nor suddenly forsake the Patient; but proceeding slowly, require a long Time and an exact Regimen, both for their Mitigation and total Cure. Hence it happens, that a Scurvy, upon the slightest Error in Regimen, easily recurs, especially where there is an hereditary Disposition to it, in which Case it is rarely totally removed. The same also happens, when the Disorder is inveterate, the Patient old, or the Body weakened and exhausted by previous Diseases; for, in these Cases, it gradually paves the way to a Dropsy, an Atrophy, a Palsy, Convulsions, a Carus, a Lethargy, an Apoplexy, Sphacelations of the Extremities, and other mortal Disorders. But 'tis otherwise when the Disease is beginning, the Patient young, the Habit firm, and its Origin owing to Contagion; for then 'tis easily cured, especially if its Fomes is carried off by the menstrual or hæmorrhoidal Discharge. It is, also, more easily cured by removing the Patient from insalubrious, maritime and northerly Climates, to more healthy and southerly Countries. When hypocondriac and cachectic Patients, or those labouring under a violent Gonorrhæa, are seized with scorbutic Symptoms, the Cure is highly difficult, tho' not absolutely to be despaired of. It is observable, that tho' the Inhabitants of northerly Climates are very robust, yet they are more difficultly cured of a Scurvy than those of southerly Countries. The Reason of which seems to be assigned by Hippocrates, in Aph. 30. where we are told, "That those who perspire little, are robust, and not

"subject to Disorders; but if they become sick, they are not without great Difficulty restored to Health;" for in the Inhabitants of Northern Countries, whose Skin is thick, dense and constricted by the intense Cold, the subtle and spirituous Part of the Blood is copiously retained and not exhaled. Hence these People are robust and vigorous: But when they are afflicted with Disorders, which ought to be cured by Perspiration, they are with Difficulty restored to Health, on account of the Thickness and Constriction of their Skins.

A sudden Eruption, and a sudden Disappearance of scorbutic Tumors, frequently indicate a Palsy; Gripings of the Abdomen, and continual Contorsions about the Navel, in old Persons bring on a Sphacelation of the Intestines, and sudden Death, or a Tympanitis; the blacker the Spots are, the more malignant is their Nature; and if they degenerate into Ulcers, they are not to be cured without great Difficulty, and often terminate in a sphacelous Corruption. It is, also, a bad Sign, when the Gums and adjacent Parts are exulcerated, and an Abscess is form'd in the Jaw.

Diseases arising from a scorbutic Dyscrasy of the Humours, such as Palsies, chronical Purples, and Cachexies, easily recur, sometimes every Year, and at other times, at longer Intervals, according to the Patient's Method of Living, Regimen, and other Circumstances; and if any Taint is conveyed to the Viscera and nervous Parts, it is not easily removed; for the scorbutic Humour partaking of the Nature of Leaven, and being deeply rooted in the Blood and nutritious Juice, is, with great Difficulty, expelled.

It is, farther, to be observed, that generally hypocondriac and scorbutic Patients, are rarely restored to their former and natural State of Health, because they rarely submit to dietetic Rules and the Directions of their Physicians, but are fond of a sudden Cure by means of Medicines. Hence it is, that running from one Physician to another, and changing one Medicine for another, they render their Disorders worse; especially if Nature being habituated to Medicines, eludes the Force of the most powerful and efficacious. Besides, few Physicians know the Art of treating these rebellious Disorders with proper Remedies, exhibited in a proper Order, Method and Dose; for in these Cases they exhibit powerful and drastic Medicines; whereas it ought to be laid down as a general Rule, that the Scurvy, the most violent of all chronical Disorders, is not to be treated with drastic, but with the most mild and simple Medicines.

Having already consider'd the Origin, Nature and Termination of a Scurvy, we now come to enquire into the Measures most proper to be taken for the Prevention and Cure of this Disorder. But, as in any Disorder, these two Intentions cannot be obtained without removing both its remote and proximate Causes; so there is no more proper Method, both for preventing and curing the Scurvy, than a Removal of its Causes: And as these Causes are to be sought for in the preposterous Use of the Non-naturals, and especially in the Air; since no one, unless infected by another, ever laboured under the Scurvy, provided he has not committed terrible Errors in Diet and Regimen, it is sufficiently obvious, that if we intend to remove the Cause of a Scurvy, we must, above all Things, have a particular Regard to the Patient's Regimen; for which Reason we shall prescribe some dietetic Rules to be observed.

Those, then, who are disposed to the Scurvy, or already affected with it, ought to change the Air in which the Disease was formed, and remove from unhealthy Places where the Air is impure, vapid, deprived of its due Elasticity, cloudy, or impregnated with noxious Exhalations, to Places that are more salutary, and blessed with a purer Air. This seems to be confirmed by Hippocrates, in Lib. 4. Epidem. where a Change of Climates is pronounced highly beneficial in all chronical Disorders. This is, also, evinced from Experience; since we know that those who are born and educated in Places fit for generating the Scurvy, enjoy a far better State of Health, when they remove to Places blessed with a more pure, subtle and temperate Air. Nor in this Respect are any Set of People more curious and observant than the Italians, who, for the Preservation of Health, have one Place of Residence for the Summer, another for the Autumn, and another for the Winter. But the Germans, even those of Note and Distinction, little solicitous about the Purity of the Air, remove from healthy to unhealthy Places, where remaining for a long time; they contract a morbid Habit of Body. Every scorbutic Patient ought, therefore, if possible, to change his Habitation and Air, and to travel from northerly to more southerly Climates, especially to Italy and France. But if the Patient's Circumstances does not permit him to travel from unwholesome to more salutary Places, the Air is to be artificially corrected by burning Juniper-Wood in the Chimney, or by Amber thrown upon Live-Coals.

As for Aliments, those of difficult Digestion are to be avoided; such as the Flesh of old Animals, or Flesh smok'd, high-salted, or become rancid; dry'd Sea-Fishes, and Aliments of an austere and astringent Quality. Scorbutic Patients ought, also, to abstain from pinguous Fleshes, and such as incline to Putrefaction; as also from sweet Substances, which, according to the Diversity of the Juices lodged in the Primæ Viæ, either become acedent, or contract a Lentor, and by that Means induce an Infarction of the Viscera. But it is otherwise with Currants, which, by Means of their mild Sweetness, join'd with a subtle Acid, are laxative, emollient, and correct the Acrimony of the Humours. But nothing is to be more carefully inculcated than a proper Abstinence, or great Moderation in eating and drinking; especially in Patients who are voracious, corpulent, or of sanguineo-phlegmatic Constitutions; because excessive eating generally produces a Redundance of impure and peccant Juices.

Among Liquors, none more powerfully contribute to the Generation of the Scurvy, than Waters that are heavy, stagnant, turbid, and dispos'd to Putrefaction; for which Reason the Patient ought to drink only such Waters as are light, pure, impregnated neither with Salt, nor a calcarious, terrestrial Principle, and in which Meat is easily boiled; and the Ales prepared of such Waters; for it is hardly credible what Mischief is done in northerly Countries by drinking Ales prepared of unwholesome Waters, and not sufficiently hopp'd; which, as they easily become acid and feculent, not only with Difficulty pass through the minute Vessels of the Viscera and Excretories, but also generate large Quantities of Flatulences. Austere Wines, which contain a great deal of Acid, are, also, to be carefully avoided; whereas fragrant sweet Wines, possess'd of a subtle Spirit, moderately taken, prove very beneficial. But the best Wines for scorbutic Patients, are genuine Hungarian Wine, as, also, good Rhenish Wine, which is still better if impregnated with the Essences or Extracts of Wormwood, Scurvy-Grass, or Elicampagne.

As 'tis certain from Experience, that an indolent Life and excessive Sleep greatly contribute to the Generation of the Scurvy, so there is not a more infallible and efficacious Method, either of preventing or removing it, than due and proper Exercise: For, since the continual Systole of the Heart, and reciprocal Action of the Diaphragm and Thorax, by Means of which the Circulation of the Blood thro' the abdominal Viscera is excellently promoted, alone support and govern the vital Motion of the Solids and Fluids; and since this Motion is greatly assisted by Exercise, during which the muscular Motion is increas'd, and the Fluids contained in the Vessels propell'd, we may, without any Impropriety, call Exercise that Universal Remedy which preserves the natural Mixture of the Fluids; and Structure of the Solids, promotes the Circulation of the Blood and Humours, separates the pure from the impure Juices, and consequently prevents and removes Diseases of all Kinds, the Scurvy itself not excepted. Thus Hippocrates, in *Lib. 2. de Dieta*, informs us, "That Idleness moistens and weakens the Body, whereas Exercise dries and corroborates it." The Reason of this Doctrine is obvious, and greatly confirms my Opinion with respect to the Use of Exercise in the Scurvy; for by a sedentary Life, the Circulation of the Blood is render'd slower: Hence, the superfluous Moisture not being sufficiently eliminated through the Excretories, relaxes the fibrous and nervous Parts; whereas, by due Labour, the redundant Moisture is dissipated, by which Means the Tension of the Solids is increas'd, and the Body strengthened. Every thing, also, which diminishes the Circulation of the Blood, such as excessive Watchings, profound Meditations, obstinate Study, immoderate Venery, frequent Drunkenness, and especially exorbitant Passions, such as long protracted Grief and Fear, is to be avoided with the utmost Diligence.

These are the principal Directions to be observ'd, with respect to Diet and Regimen, to which I shall subjoin those Remedies which from Experience I have hitherto found best adapted to remove both the proximate and remote Causes of a Scurvy. Now we have already shewn, that the violent Symptoms accompanying a Scurvy are produced by the excessive Dyscrasy of the Blood, and the Accumulation of the excrementitious Sordes in the Blood, and other vital Juices; and that this Dyscrasy and Accumulation depend upon the slow Circulation of the Blood, and an Infarction or Obstruction of the capillary Vessels in the Viscera and Emunctories. Hence the Medicines adopted to the Removal of this Disorder, ought to dilute and correct the impure, acrid, saline and sulphureous Humours, dissolve those that are tenacious and viscid, open the obstructed Passages of the Viscera and Emunctories, and corroborate the weaken'd nervous

and muscular Systems; for by these Means a free and brisk Circulation of the Fluids through the minutest Canals, and what depends upon it, an intimate Mixture of the Fluids with the Solids, and a mild Temperature of the vital Juices, is excellently obtained.

The Physicians who have wrote expressly concerning the Scurvy, have asserted, that the Dyscrasy of the Humours is of two Kinds; but all of them agree, that, according to the Diversity of the morbid, saline Principle, different, alterative, and correcting Medicines are requir'd, which partly by changing the Acid, and partly by correcting the volatile sulphureous Salt, and allaying the caustic Acrimony, remove the Disorder. Though I grant the Difference of the Salts now mentioned, yet the different and far-fetch'd Correction of them seems to me ridiculous, since, I shall demonstrate, that the only and safest Method of correcting and subduing all morbid Salts, is by proper Fluids.

This Intention, then, is answered by pure and light simple Water, the genuine Menstruum and Dissolvent of all Salts, into which, when taken with a proper Regimen and in a due Quantity, the saline Particles of every Kind lodged in the Blood and Humors, easily immerse themselves, and are by that Means excellently diluted, mitigated and corrected. But besides the correcting Quality of Water, it, also, produces another happy Effect in the Scurvy, whilst it dissolves the tenacious, viscid and coagulated Humours, and frees the infarcted and obstructed capillary Vessels and Emunctories from the impacted, viscid Matter. But this laudable Quality and Virtue is still found more powerful, when Water that is pure, light and subtle, is possess'd with an additional mineral Principle, and impregnated with a sufficient Portion of a neutral, or volatile, or fix'd alkaline Salt; such as the various cold and hot Springs, especially the coroline and selteran Springs, together with those of *Ægra*, *Wildungen*, and *Empfen*; for these being far more active than common Water, pass sooner through the capillary Vessels, enter the Emunctories more expeditiously, and are, for that Reason, highly efficacious in removing Obstructions, and eliminating excrementitious Sordes. Hence 'tis not to be doubted, but the universal Remedy of a Scurvy consists in mineral Waters; especially since for more than thirty Years I have, with great Success, prescrib'd both hot and cold mineral Waters for the Cure, not only of the most obstinate chronical Disorders, especially those of the hypocondriac and hysteric Kind; accompanied with a certain scorbutic Impurity, but also of a confirm'd Scurvy. But the Use of these Waters is succeeded by a far more certain and happy Effect, if an accurate Regimen is, at the same Time, observ'd, and their Efficacy assisted by the repeated Exhibition of proper antiscorbutic and balsamic Medicines.

When these mineral Waters cannot be had, the Cure may be happily obtained by pure and light Fountain-Water; for in obstinate chronical Diseases, pure subtle Waters, impregnated with a chalybeate Principle, are of great Efficacy, as is obvious from the many Cures, not only of a Scurvy, but, also, of other obstinate Disorders, yearly performed by the Waters of *Lauchstadt*, about two Miles from *Hall* in *Germany*; for these Waters contain a subtle Crocus Martis, by which the relaxed Tone of the moving Fibres is excellently corroborated, by which Means the Circulation of the Blood through the whole Body, and the salutary Excretions are greatly promoted, especially if these Waters are us'd both externally and internally. Hence we learn, that the antient Physicians, especially *Celsus*, in *Lib. 2. Cap. 9.* and *Scribonius Largus*, in *Cap. 32.* for what they call the *Lien Magnus*, and the Disorders arising from it, so justly recommended the drinking of Water, in which ignited Iron has been extinguish'd.

But besides mineral Waters, nothing is more effectual in correcting a scorbutic Acrimony than the Milk of Animals, and especially that of Asses, which Hippocrates, Galen, Aretæus, and Celsus so highly extol in subduing various chronical Disorders, and especially those arising from Acrimony. Some of the most skilful of the Moderns, also, confirm this Doctrine; and as a Specific for the Scurvy, prescribe Milk, especially that of Asses, or the Whey of Cows, or Goats Milk; concerning which the curious Reader may consult *Drawitzius*, *Baltbas*, *Brunnerus*, *Eugalenus*, *Wierus*, *Solom. Alberti*, and *Matt. Martini*, who have wrote judiciously concerning the Scurvy; and unanimously confess, that they have cur'd more scorbutic Patients only by a Milk Diet, or Whey impregnated with the Juices of antiscorbutic Herbs, and long us'd, than by all other Remedies whatever; and that those who were wasting away with a Scurvy have received more Strength from this Remedy, than from the best Corroboratives. Nor is the Reason of this Effect difficult to be conceived; for as the violent Symptoms of scorbutic Patients, such as lancing

ing and spasmodic Pains of the Limbs, Corrosions and Exulcerations of the external Parts, derive their Origin from the excessive Dyscrasy of the Humours, a Diminution of the Excretions by Stool, Perspiration and Urine, and an Obstruction of the Vessels; so 'tis certain, that in order to open the obstructed Passages, dissolve the tenacious Humours, and correct such as are acrid and saline, no Medicines are more proper than those of a diluent and dimulcent Kind, and such as render the Humours fit for Transpiration, among which the most powerful are Asses Milk, which is sweeter than that of other Animals, or the Whey of Cows or Goats Milk, especially when infus'd or gently boiled with antiscorbutic Herbs, such as Scurvy-Grass and Water-Cresses, which, besides a volatile Salt, contain a bitter Principle.

But when a Scurvy is accompanied with an Infarction of the Viscera, and a Cachexy, or, which frequently happens, with the Hypochondriac Disorder, and the Purples, the Cure succeeds best if the Milk is mixed, not only with the milder Acidulæ, such as the *Selteran* Waters, and those of *Wildungen*, and *Tœnstein*, but also with the stronger cold Springs, such as those of *Pyrmont* and *Egra*, and thus drank under a proper Regimen. See *Frid. Hoffman. Dissert. de Connubio aquarum Mineralium cum Lactē*.

Besides these Remedies, we must also mention some of the pharmaceutic Kind, and especially those called the antiscorbutic Specifics; among which we may justly reckon Scurvy-Grass, and all the Species of Garden and Water-Cresses; Brooklime, Horse-Radish, the Roots of wild Radish, and Mustard; which, by their subtle and salino-sulphureous Principles, penetrate into the most reclusé Parts of the Body, and induce a surprising Change both on the disorder'd Fluids and Solids; for they dissolve viscid and tenacious Humours, exalt and subtilize such as are fixed and acid, and, by restoring the Tone, Vigour and Motion of the relaxed Solids, prevent a rapid Corruption of the Body. Various Preparations of these Simples are us'd; for some distill Waters, whilst others obtain Spirits from them by Fermentation or Abstraction; others from these Substances, when recent and cut down, express the Juice, which they take by Spoonfuls, either alone or with some proper Vehicle, such as Milk: Others mix them with their Aliments, boil them in Broths, add them to Ale during Fermentation, or prepare Conserve of them with Sugar, as the different Circumstances of the Patient require, which are to be judg'd of by the Physician.

There are, also, various other antiscorbutic Remedies, such as, among Bitters, the Roots of Gentian and Succory, and the Herbs Scordium, Carduus Benedictus, Wormwood, the lesser Centaury, and Water Trefoil: Among Balsamics and Corroboratives, Juniper Berries, the Tops of the Fir and Pine Trees, Winter's Bark, Cascarilla, Peruvian Bark, Copper Bark, the Herbs Spleen-wort, Paul's Betany, White Horehound, Dodder of Thyme, and the Roots of Elicampagne, Zedoary, and Arum: Among Gums, Gum Ammoniac, Sagapenum and Galbanum; and among Wood, Sassafras, Guaiacum, and Aloes; which, if us'd either in Substance or in Decoctions, or Infusions, or reduced to Extracts, or Elixirs, and exhibited at proper Times, in a due Order and in just Doses, are highly efficacious in mitigating the Symptoms and removing the Disorder; for by their active, gently sulphureous and balsamic Principle, they rouse and invigorate the languid Circulation of the Blood, and correct the acid and viscid Intemperature of the Humours.

There are, also, other Remedies no less efficacious in the Cure of a Scurvy; and these, partly by their gently sulphureous and vaporous Principle, and partly by their emollient and correcting Quality, are excellently adapted to allay and soothe the Pains and Spasms: Of these, the most considerable are the recent Fats of Animals, especially human and Dogs Fat, the Cream of Milk, Oil of sweet Almonds obtained without Fire, Sperma Ceti, Castor, *Asa-foetida*, the Extracts of Yarrow and common Chamomile, the Theriacal Cœlestis, Diafcoridium, Saffron, Earth-Worms, the Shavings of the Tooth of the Sea-Horse, and the Elk's Hoofs, of which various Medicines may be prepar'd in a liquid Form, and successfully exhibited according to the different Circumstances of the Patient, and Stages of the Disease.

Having already considered the Cure of a Scurvy, so far as it is obtain'd by those Medicines which attenuate and incise the gross Humours, correct those that are acrid and saline, open the obstructed Vessels, and corroborate the relax'd Parts, we now come to treat of Evacuants, because we derive the Origin of a Scurvy from a Diminution or total Suppression of the natural Excretions by Stool, Urine, and Perspiration; as, also, by the menstrual and hemorrhoidal Discharges. As for Venesection then, whether in the Arm

or the Foot, whether by the Lancet, Scarification, or the Application of Leeches, we affirm, that it is not to be used in the Scurvy without the greatest Caution, and a mature Consideration of all Circumstances. Thus, if the Patient is plethoric and young, if the Disorder is recent, and arises from the Cessation or total Suppression of the Menstrues in Women, or the Hemorrhoids in Men, Venesection may be properly and safely us'd, in whatever Part the Physician thinks most proper. But if, as it often happens in the Progress of the Disease, a Redundance of impure and corrupted Serum is generated, then Venesection, especially when copious, by impairing the Strength, would infallibly do more Harm than Good. But when a Diminution of the Quantity of Blood is indicated, and especially when the Pains, Tumors, and various Defections of the Parts, render such a Depletion necessary, it is most safely obtained by frequent, though not copious, Detractions of Blood, and, perhaps, still more properly by Scarification; which Method, as it is safest, so I always greatly approved of it in the Cure of violent Disorders.

As for other Methods of Evacuations, and the Use of Purgatives, I am of Opinion, with other skilful Physicians, that, excluding all drastic Substances, we ought only to use those of the mildest Kind, such as the Roots of Polypody, Sena Leaves, Agaric, Rhubarb and Manna, which when duly mixed with the abovementioned antiscorbutic Ingredients, and us'd by Way of Infusion or Decoction, are highly beneficial, by gently eliminating the peccant Humours lodg'd in the Primæ Viæ. This Intention is answered by the Pilulæ Polychrestæ Balsamicæ, prepared after *Becher's* Manner, of well depurated Aloes, Extract of Rhubarb, bitter Herbs, and temperate balsamic Ingredients, exhibited at proper Seasons, interposing or not, as the Physician thinks proper, the absorbent Powders and digestive Salts. The same Caution is to be observ'd with respect to Diuretics; the more drastic of which, because they too copiously evacuate the Serum, are to be rejected, and those us'd which gently evacuate the viscid and tartareous Humours, such as Decoctions of the five aperient Roots, especially of Parsly, Salery, Fennel and Asparagus, which were, also, us'd by *Hippocrates* and *Aretæus*. The same, also, holds true with respect to Diaphoretics, the best of which are those which open the Pores, render them pliant, and convey the Blood and Humors to the Surface of the Body. But we are to reject those which, by throwing the Humours into too violent Commotions and Exagitations, diminish the Serum and Strength, by excessive Sweat. The safest Diaphoretics are, therefore, these which gently promote Perspiration, such as the bezoardic Liquor of *Buffius*, the Spiritus Nitri dulcis, the Spirit of Tartar, the Mixtura Simplex, the succinated Spirit of Hartshorn mixed with three Parts of the Anodyne Mineral Liquor and Spirit of Scurvy-Grass, Flowers of Sulphur, Æthiops Mineral, Infusions of Tea, Paul's Betany, Carduus Benedictus, Scordium, and Elder Flowers, diaphoretic Antimony, Cerufs of Antimony, calcin'd and uncalcin'd Hartshorn, Amber, Bezoardic Mineral, Medicinal Regulus of Antimony, Native Cinnabar, and Cinnabar of Antimony, compound Powders of Crabs Claws, *Ludovicus's* and my Bezoardic Salt; to which, according to the Circumstances of the Patient, may be added, a Quarter of a Grain of Camphire.

Having thus considered the general Method of Cure, we now come to subjoin some Cautions with respect to particular Cases and Circumstances. In a hot Scurvy, therefore, which seizes young Persons of choleric Habits and accustomed to drink Wine, and arises from a Redundance of sulphureous and bilious Particles in the Mass of Blood, specific Antiscorbutics, turgid with a sulphureous volatile Salt, such as Scurvy-Grass and its Spirit, ought to be very cautiously exhibited; for, by sharpening the Spicula of the Salts in the impure Blood, and agitating them with a brisker Motion, they exasperate the Symptoms, produce Pains of the Head and Limbs, Anxieties and Inflations of the Spleen, by which Means they do more Harm than Good. But they may be more safely exhibited when corrected with Acids, such as Wood-Sorrel, and the Juices of Citrons, Oranges, Barberries and Pomegranates. Thus, the Conserve of Scurvy-Grass, mixed with an equal Quantity of the Conserve of Sorrel, taken twice or thrice a Day, drinking after it some Antiscorbutic Water, produces very happy Effects, especially if in hot and bilious Patients, it is accompanied with a moistening Diet, consisting of Milk Meats, Emulsions of Sweet Almonds, Decoctions of Barley and Oats, Broths prepared of Fowls, with Lettice, Endive, Sorrel and Cresses, interposing at proper Intervals, gentle Laxatives and Diuretics. But it is to be observed in general, that the Use of antiscorbutic Herbs, and their Juices, whether by themselves or with a Vehicle, ought to be very long persisted in. . . .

When

When a Scurvy proceeds from muriatic Salts, which happens in those who eat liberally of smok'd and high-salted Aliments, and have corroding Ulcers, a stinking Breath, putrid Gums, a thick and saltish Urine, as is generally observed in old Sailors, then happy Effects are produced by Whey, long and copiously drank; by Citrons, China Oranges, and ripe Fruits; whereas spirituous and volatile antiscorbutics are generally detrimental.

Scorbutic Patients are frequently afflicted with lancinating Pains of the Abdomen, and oppressive Pains of the Breast, which ought by no means to be treated with Carminatives or hot Medicines. But it is expedient at proper Intervals, and in due Doses to exhibit my anodyne Liquor, or an antispasmodic Elixir, prepared of the anodyne Liquor, and the Essences of Castor and Saffron. Besides, excellent Effects are produced by Broths of Fowls, prepared with a proper Quantity of Oil of Sweet-Almonds and Sperma Ceti; Whey, boiled with the Roots of Marsh-mallows, red Poppy-Flowers, and Earth-Worms; Water-Gruel; and emollient Clysters prepared of Milk, with the Addition of a little Castor and Saffron. No less Caution is requisite, if, as it frequently happens, there are spontaneous Evacuations, Diarrhæas, for instance: For these, if gently treated, generally afford great Relief; but when too soon stoppt, leave behind them Cardialgias, Inflations of the Hypochondria, and Infarctions of the Viscera.

In order to alleviate the intense Pain, and procure Rest, small Doses of Opiates, corrected with Purgatives, or Alexipharmics, are only to be exhibited twice or thrice, in order to preserve the Strength; which, when the Pains cease, is better restored, and renders the Patients fitter for surmounting the Disease. Topics are more frequently hurtful than beneficial in scorbutic Pains, Exulcerations, and Spots; as is principally observable in the wandering Gout, in which Topics, indiscriminately applied, by repelling the peccant Matter to the internal, and especially to the nervous Parts, often excite violent Symptoms, such as Vertigos, Dulness of hearing, Difficulty of breathing, Cardialgias, violent Gripes of the Intestines, and sometimes terrible Convulsions of the Limbs. 'Tis, therefore, better, in this Case, totally to abstain from Topics, and keep the Parts affected in an equal Perspiration, by wrapping them up in warm Linnen Cloths. But if crusty black Ulcers require external Remedies, we are to imitate *Eugalenus*, who prudently advised, that rejecting all acrid Substances, we should only use those of a mild Nature, such as Preparations of the Yolk of an Egg, Myrrh, Olibanum, Saffron, Oil of Roses, and Peruvian Balsam. When there is an excessive Impurity of the Humours, tending to Corruption, we are to be very cautious in ordering Scarifications, for fear of a Gangrene, which may be excellently prevented by Quick-Lime Water, exalted by camphorated Spirit of Wine, and Sal Ammoniac.

Where the Corruption of the Humours is very great, the Tumors and Inflammations easily degenerate into obstinate Ulcers, which create a great deal of Trouble both to the Physician and the Patient. When the Patient is of a dry and delicate Constitution, the Pains and Spasms easily produce Fevers, which greatly waste the Body, and impair the Strength. When the Body is spongy, phlegmatic, and corpulent, the Humours degenerate into a putrid Corruption, which spreads like a Sphacelus, and, in process of Time, produces a great and even a fatal Loss of Strength. For this Reason the prudent Physician ought to attack the Disorder, not only by Topics, but, also, principally by such internal Remedies as cleanse the Blood, and resist Putrefaction. But both Physician and Surgeon ought to take care not to open inflammatory Tumors, before they are come to a sufficient Suppuration: For when this Error is committed, a putrid Corruption is soon formed in corpulent and moist Habits.

In order not only to cleanse and consolidate the putrid and bloody Gums, but, also, to fix the loose Teeth, I have found nothing afford a more instantaneous and efficacious Relief than one Part of my Balsam of Life, mixed with three Parts of the Syrup of Oranges, and applied to the Gums by way of Ointment. If this Medicine cannot be had, we may commodiously substitute in its Room, the Essences of Amber or Myrrh, camphorated Spirit of Wine, and the dulcified Spirit of Salt, mixed with a proper Quantity of Honey. In such Cases, a gentle Scarification is, also, beneficial, in order to procure a Discharge of the ichorous Matter. In bloody Tumors of the Gums, great Benefit is, also, obtained by the external Application of the Unguentum *Aegyptiacum*, mixed with Honey of Roses and Spirit of Scurvy-Grass, or by applying Gum Lac and Spirit of Scurvy-Grass. Internally a Decoction of Horse-Raddish with Milk, or Ale boiled with the Tops of the Pine, produce very happy Effects.

When the Symptoms are mitigated, and the Disease begins to remit, *Matthæus Martini*, in *Traſſat. de Morbis Me-*

ſenterii, thinks Baths of sweet Rain-Water highly beneficial; and from the Advice of *Fernelius*, in *Obſervat.* 44. orders their Use to be persisted in for more than ten Years. Nor is this Advice to be rejected, since *Volcammer*, in *M. N. C. Diſc.* 2. an. 6. informs us, that an hypocondriac and scorbutic Patient was, in three Days time, perfectly cured, and recovered his Strength, by using every Morning and Evening a Bath of sweet Waters, prepared with emollient Herbs. In the Waters of the Bath, which were highly fetid, there floated a thick, black, acrid Sordes, which daily became larger. In order to soften and disolve hard and painful Tumors of the Feet and Legs, I have found nothing more beneficial than Baths prepared of the antiscorbutic Herbs, Brooklime, Water-Cresses, and Scurvy-Grass, left after the Expression of the Juice; as, also, Baths prepared of the Tops of Fir and Pine-Trees, frequently used.

I have only one Thing to advise, with respect to the Use of Baths, whether natural or artificial; and that is, that they ought never to be used after a putrid Corruption is discovered in the external Parts; and that they ought not to be too warm, and dispose the Body to profuse Sweats; for hence follow an excessive Weariness of the Limbs, an insatiable Thirst, Palpitations of the Heart and Cardialgias; which, if any one endeavours to remove, by drinking cold Liquors, or other refrigerating Substances, the Tone of the Stomach and Intestines will, in all probability, be greatly destroyed by that means.

Many scorbutic Patients, according to *Martini*, in the Part already quoted, perceive little Advantage during the Cure, but are cured when they dismiss their Physicians, and forbear the Use of Medicines: For Nature being weakened by the Medicines, upon desisting from them, recovers Strength sufficient to subdue the Disorder. This Circumstance was not only adverted to by the ancient Physicians, but, also, recommended for removing various Disorders. Thus, *Aetius*, in *Lib. 2. Serm. 2. Cap. 3.* and *Rhaſes*, order Medicines to be sometimes abstained from for three Weeks; and *Aræteus* asserts, that many Diseases are spontaneously cured by discarding the Physician. This Observation I have often found to hold in the Cure of many chronical Disorders, especially those of the hypocondriac and scorbutic Kinds; for that Maxim of *Celsus* is founded upon Truth, "That sometimes the best Medicine is to use no Medicine at all." *Frederic Hoffman*.

SCORDIUM.

The Characters are;

The Flower is like that of the *Chamædrys*, one or two preceding from the Ala of each Leaf. The Calyx is tubulated. The Smell resembles that of Garlic.

1. Scordium; *Offic. Ger.* 534. *Emac.* 661. *Raii Hist.* 1. 576. *Synop.* 3. 246. *Boerb. Ind. A.* 183. *C. B. P.* 247. *J. B.* 3. 242. *Scordium legitimum*, *Park. Theat.* 111. *Chamædrys palustris*, *Allium redolens*, *Hist. Oxon.* 3. 423. *Chamædrys palustris consensens*, seu *Scordium Officinatum*, *Tourn. Inst.* 205. 172. WATER-GERMANDER.

Scordium has a small, stringy, creeping Root, from which spring a great many square hairy Stalks, about a Foot high, beset with two oblong, round-pointed, somewhat wrinkled and hairy Leaves at a Joint, without Foot-Stalks, having roundish Indentures about the Edges. The Flowers come forth among the Leaves in thin Whorles, of a reddish Colour, having no Galea, but only a Labella. They are set in hairy five-pointed Calyces, at the Bottom of which grow four small Seeds. The whole Plant has a strong aromatic Scent; but with somewhat of the Garlick. It grows in marshy, fenny Places, as in the Isle of *Ely*, in great Plenty, and flowers in July. The Leaves are used.

Scordium is sudorific and alexipharmic, of Use both as a Preservative, and a Remedy against all malignant and pestilential Diseases, and putrid Fevers; it resists Putrefaction, and destroys Worms, and is good against the Bites of all venomous Animals; it is an Ingredient in *Venice Treacle* and *Mithridate*; and *Diaſcordium* takes its Name from it. *Miller's Bot. Off.*

The *Scordium* is bitter, aromatic, and gives a faint red Colour to the blue Paper: It contains an oily, volatile Salt, the Sal Ammoniac of which is not entirely disengaged, but wrapped up in a great deal of Sulphur. The *Scordium* is a good Dissolver; it is aperitive, diuretic, sudorific; the Infusion of it should be drank in malignant Fevers, the Small Pox, Measles, and Diseases of the Skin. It is used after the Manner of Tea, or a Pupil of it may be boiled in lean Broth, to restore the Appetite, kill Worms, and purify the Blood by insensible Transpiration. Half an Ounce of the Extract of this Plant in a Bolus, or an Ounce of the Conserve of its Leaves and Flowers; usually prove sudorific. This Conserve is of Use for purulent Spitting. This Plant is also deterfive and vulnerary: It is used in Lotions, with Wormwood and the lesser Centory. Fomentations are made of these Herbs, and they are applied

as a Cataplasin on Parts which are threatned with a Gangrene. To cure a Gangrene, the spacelated Flesh must first be eaten off with the Water of corrosive Sublimate, and Arsenic, or the Butter of Antimony; for without this Assistance, the vulnerary Plant would be of no Use. The *Scordium* is used in the *Theriaca*, the Mithridate, the Orvietan of *Hoffman's* Composition, *Matthiolus's* Antidote, and most alexipharmic Compositions. It has given Name to the *Diascordium* of *Fracaforius*, and to that of *Sylvius*. *Martyn's Tournefort*.

2. *Scordium*; alterum; five *Salvia agrestis*. C. B. P. 247. *Boerb. Ind. A.* 183. *Scorodonia*, *Salvia sylvestris*, Offic. *Scorodonia*, five *Salvia agrestis*, Ger. 536. Emac. 662. Raii Hist. 1. 576. Synop. 3. 247. *Scorodonia five Scordium alterum quibusdam*, & *Salvia agrestis*, Park. III. *Scorodotis five Scordium foliis Salviae*, J. B. 3. 293. *Chamaedrys fruticosa sylvestris melissae folio*, Tourn. Inst. 205. WOOD SAGE.

The wild Sage has several square, woody and hairy Branches, on which are set, by Pairs, rough, wrinkled, Sage-like Leaves, but which are greener and broader than Garden Sage; of a pleasant Smell, but with a Touch of the Garlick. The Flowers grow on the Tops of the Branches in long Spikes, with a small Leaf set on by each Flower; they are yellow, of the verticillate Kind, having no Galea, but in its Place a few purple Stamina; their Calyces are hairy, containing four brown Seeds. The Root is slender and creeping. It grows in Hedges and bushy Places, and flowers in July. The Leaves are used.

Wood Sage is accounted very good for the Gout, Rheumatism, Scurvy and Dropsy; it provokes Urine and the Menfes, and is an excellent vulnerary Plant, and prevents Mortifications and Gangrenes. *Miller's Bot. Off.*

Its Leaves are very bitter and aromatic; they have a little Taste of Garlic, and give hardly any Tincture of red to the blue Paper; which gives us Reason to believe they contain a Salt like that of the *Germander*, but loaded with more essential Oil, and in which the Sal Ammoniac discovers itself but little. This Plant is very aperitive, diaphoretic, vulnerary and resolvent: *Dodonaeus* prescribes the Decoction of it in the venereal Disease. *Tragus* commends its Juice and Infusion in Wine, as a Medicine very aperitive and sudorific, good to strengthen the Stomach and kill Worms, to provoke Urine, and to carry off the Jaundice and the Tertian Ague; they use it very successfully at *Paris* for the Dropsy, by giving to drink every four Hours a Glass of the Infusion of this Plant in white Wine. *Martyn's Tournefort*.

3. *Scordium*; frutescens; folio angusto *Salviae*; flore luteolo. *Boerb. Ind. Alt. Plant. Vol. 1.*

The first Species is found to be an excellent and safe Remedy against the Pestilence. *Rudbeckius* found by Experiment, that this Plant intruded into the Mouth, Intestines, and Nose of a dead Body, preserved it from Putrefaction. *Scordium*, among the Antients, was an Ingredient in all Medicines against the Poisons of mad Animals. It expels all foreign Matter, especially what inclines to Putrefaction, by Sweat; it has an intolerable and nauseous Bitterness, but not such as creates a Nausea, by which it seems qualified for killing all Manner of Insects and Worms. But I shall not take Occasion from hence to determine, whether or not the Eggs of Insects, as *Kircher* and others think, are drawn in by Inspiration with the Air, in pestilential Times, and thus cause the Infection, which this Herb, by killing those Worms as soon as generated, seems adapted to remove. It cures a Gangrene, resolves Tumors, and is proper in intermittent Fevers; externally applied, it cleanses Wounds and Ulcers, and mitigates the Pain of the Gout; the expressed Juice, with Sugar, is exhibited in pulmonic Disorders. *Fracastratus* has written largely of the Virtues of this Plant, and *Sylvius* in his *Praxis*, with a great deal of Labour, extracts from it a very penetrating Tincture, which is not to be had so good at the Druggists or Apothecaries, who will not take the necessary Pains for obtaining it. If therefore we would with any Measure of Certainty rely on its Effects, we ought ourselves to take Care of the Preparation. The Extract is called *Diascordium Sylvii*, and supply the Place of the *Mithridatium*, as a Sovereign Remedy. The Conserve is sudorific, and good for the Asthma and Shortness of Breath, and for Virgins labouring under a Chlorosis, and Obstruction of the Menfes; the Leaves infused in Wine, are serviceable in Dropsies. The second Species is adapted to surgical Uses; for the bruised Leaves, with Vinegar, Litharge, and Salt, cure a Gangrene and Cancer. *Hist. Plant. ascript. Boerhaave*.

Scordium, with other proper Things, is prescribed by *Heister* in Fomentations and Cataplasms, for a Gangrene and Sphacelus, and in a sudorific Potion for a Chilblain.

SCORDOLASER. *Asa Fetida*. See SILPHIUM.

SCORPOENA or SCORPIS.

This is a Sea-Fish, by some thought to be the Female of the Sea-Scorpion, because 'tis pretty much of the same Shape; but it is really another Species of Scorpion, far less, and of a cineritious or brownish Colour. Its Principle of Life is so strong, that it moves for some Time after its Heart and Entrails are taken out. Its Bite is not venomous, and it feeds upon Sea-Wreck, and is good Food. Its fixed Salt is possessed of the same Virtues with that of the Sea-Scorpion. *Lemery des Drogues*.

SCORIA. The Dross or Recrement of a Metal.

SCORITH. Sulphur. *Rulandus*.

SCORODON. Garlick. *Rulandus*.

SCORODONIA. A Name for the *Scordium alterum*, five *Salvia agrestis*.

SCORODOPRASSUM. See ALLIUM.

SCORODOTHLASPI, *Ulyssis Aldrovandi*, J. B. This is a Species of Thlaspi, or small Plant, which from its Root sends Leaves, resembling those of the Daisy. Some of these Leaves are jagged, others furrounded with small Teeth, and others without Teeth or Jaggs, but nervous and green. From amidst these Leaves arise some small Stalks, which also bear Leaves, and at their Tops Flowers, composed of four small white Leaves and a Pistil, which afterwards becomes a flat Fruit, like an oval Purse, which contains Seeds almost round and flat. The Root is simple, white, and furnished with some Fibres. The whole Plant smells like Garlick, and is of an agreeable Taste, having a small Degree of Sharpness in the Mouth. It is cultivated in Gardens, and is of an highly aperient Quality, and proper to resist Putrefaction. *Lemery des Drogues*.

SCORODOTIS. A Name for the *Scordium*; alterum, five *Salvia agrestis*.

SCORPIACA. The Name of an Antidote in *Galen de Antidot. L. 2. C. 12.* which is recommended against the Sting of the Scorpion.

SCORPIO. Offic. Schrod. 5. 346. Ind. Med. 107. Ims. de Insect. 95. Charl. Excr. 54. *Scorpius*, Raii Hist. Insect. 9. Aldrov. de Inxit. 577. Mouff. Insect. 204. THE SCORPION.

It is an Animal with eight Feet, resembling a Crab, only less, and of a blackish, or sooty Sort of Colour. Burnt alive, and the Ashes exhibited, they provoke Urine, when obstructed by the Stone in the Kidneys or Bladder; bruised and applied to the Place, they cure the Poison of their own Stings.

The Scorpion is an excellent Remedy of itself for its own Poison. Some bruise it and apply it to the Wound; others take it bruised in Wine; and others infill the Oil of Scorpion into the Wound, *Heister Chirurg.* The Oil of Scorpions is by some recommended as effectual in a Suppression of Urine, the Bladder being anointed with it hot, or before a Fire, *Idem*.

The Sting of the Scorpion is succeeded by a most violent Pain of the injured Part, with a Coldness, Tension and Numbness; a cold Sweat about the Wound, and over all the Body. They who are stung in the lower Parts, are affected with a Swelling of the Groins; if the Wound be in the upper Parts, and but slight, there is a Tumor under the Arm-pits; but if the Hurt be considerable, a burning Heat affects the Place, as in Ambustions; and there is an Eruption of Warts, resembling Ants, about the Lips and the whole Body; so that the Patient fancies himself struck with Hail-stones. The Face is distorted; a glutinous Sordes gathers about the Eyes; the Tears are viscous; there is a Hardness of the Joints, and a falling down of the Anus, with a Desire to go to Stool; a Froth about the Mouth, much Vomiting, Hickups, and Convulsions like those in an Opisthotos.

The Cure is performed by taking inwardly Serpyllum, the Root of Althæa, and Elaphoboscus, which last is an excellent Remedy, whether eaten green, or drank in Powder. The Seeds of wild Parsnep, and Hasle-Nuts, are, also, good Medicines; and the latter worn about the Body, are a Preservative against the Sting of the Scorpion. Or take a House-Snail and apply it, together with the Shell, upon the Place, and the Pain will immediately cease. Earth-Worms are said to have the same Effect. Or take a River-Crab, and bruise it with Wine and Lafer, and exhibit it in a Potion. Another excellent Antidote against the Poison of the Scorpion, and with which I cured myself when affected, is thus prepared: Take of Castor, Succus Cyrenaicus, Pepper, each four Drams; Costus, Spikenard, Saffron, Juice of Centaury, each two Drams; Honey clarified, a sufficient Quantity; the Dose in the Quantity of a Hasle-Nut, for the Sting of a Scorpion in diluted Wine; but for the Bite of an Asp, in Vinegar. It is of an attractive Quality, so as to attract the poisonous Juice, tho' digested, and settled in the Joints. Garlic, also, bruised either by itself, or with Salt; or Wild Rue, or the Herb Scorpiurus, are proper to be applied. I used to bruise a Dram of wild Rue in Vinegar, and with an Ounce of Wax, and a Quarter

Quarter of an Ounce of the Refin of the Pine-Tree, and a little Oil, make into a Cataplasim, and apply it to the Place, and it proves an admirable Remedy. Sheeps Dung, also, boiled in Wine, and applied immediately, removes the Pain. *Aetius, Tetrab. 4. Sermon. 1. Cap. 10.*

Oil of Scorpions is prepared, by putting thirty-five Scorpions into two Pounds of Oil of Sweet Almonds, and after exposing them to the Sun for forty Days, straining off the Oil.

SCORPIODECTOS, *σκορπιόδεκτος*, A Person wounded by a Scorpion. *Dioscorides.*

SCORPIOIDES.

The Characters are;

It has a Part full of Joints, and convoluted like a Snail or a Caterpillar, having in each Joint a Seed of an oval Figure.

Boerhaave mentions four Sorts of *Scorpioides*, which are,

1. *Scorpioides*; folio Bupleuri. *C. B. 287. Clymenos, Dioscoridis. Col. 1. 155, 156.*

2. *Scorpioides*; Bupleuri folio; filiquis lenibus. *Park. Theat. Bot. 1117.*

3. *Scorpioides*; filiqua crassa Boelii. *Ger. Emac. App. 1627.*

4. *Scorpioides*; Bupleuri. folio, corniculis asperis; magis in se contortis & convolutis. *M. H. 2. 127. Boerb. Ind. Alt. Plant. Vol. II.*

This Plant, by its Signature, promises some Virtue against the Bite of Serpents; but it is not safe to rely upon it in such Cases.

SCORPIOIDES LEGUMINOSA. A Name for the *Ornithopodium*; *Scorpioides*; filiqua compressa.

SCORPIOIDES MAJOR. A Name for the *Heliotropium*; minus; angustifolium; palustre; seu glabrum.

SCORPIOIDES MATTHIOLI. A Name for the *Ornithopodium*; *Portulaca folio.*

SCORPIOPECTOS. The same as **SCORPIODECTOS.**

SCORPIURUS ANNUUS. A Name for the *Heliotropium*; minus; angustifolium; arvense; seu hirsutum.

SCORPIURUS PALUSTRIS. A Name for the *Heliotropium*; minus; angustifolium; palustre; seu glabrum.

SCORPIUS. A Name for the *Genista-Spartium*; majus; longioribus aculeis.

SCORPIUS MARINUS. *Offic. Bellon. de Aquat. 248. Schonef. Ichth. 67. Salv. de Aquat. 199. Scorpis, Aldrov. de Pisc. 195. Jons. de Pisc. 41. Gesn. de Aquat. 845. Rondel. de Pisc. 1. 201. Scorpis major Rondeletii, Raii Ichth. 331. Ejusd. Synop. Pisc. 142. Scorpis, Charit. Pisc. 23. THE SCORPION FISH.*

It is taken in the *Mediterranean Sea*; the Gall of it is good for Cataracts, an Albugo, or other Infirmities of the Eyes which darken the Sight. *Dioscorides.*

SCORTUM. The **SCROTUM.**

SCORZONERA.

The Characters are;

The Root is carnosus, and full of a lacteous Juice: The Leaves are alternate; the Calyx is oblong, squamous, and shorter than the Petals of the Flower. The Seed is oblong, and generally contain'd in a Husk.

Boerhaave mentions six Species of *Scorzonera*, which are;

1. *Scorzonera*; latifolia; sinuata. *C. B. P. 275. Tourn. Inst. 476. Boerb. Ind. A. 89. Scorzonera nostra & Hispanica viperaria, Offic. Scorzonera Hispanica major, Park. Parad. 301. Raii Hist. 1. 248. Viperaria Hispanica, Ger. 598. Viperaria sive Scorzonera Hispanica, Ger. Emac. 736. Tragopogon Hispanicus sive Escorzonera, aut Scorzonera. I. B. 2. 1060. VIPERS-GRASS.*

The Root of this Plant is about a Finger thick, but little branched, of a reddish brown on the Outside, and white within, full of a white milky Juice: The lower Leaves are broad, long, sharp-pointed, and waved about the Edges, of a pretty firm Texture. The Stalk arises to be two or three Foot high, smooth and round, beset with Leaves, without Footstalks, broad at the Bottom, and growing narrower and grassy at the Ends. The Flowers grow on the Tops of the Stalks in scaly Calyces, compos'd of several Rows of narrow Petals, somewhat like Dandelion, which afterward turn into Down, having long, slender, whitish Seed. It grows in some Parts of *Spain*, but is planted here in Gardens, and flowers in *July*. The Root is used.

It is accounted cordial, sudorific, and alexipharmic, useful in all Kinds of Fevers and malignant Distempers, and is accounted good against the Stings or Bites of venomous Creatures. *Miller's Bot. Off.*

The Root of *Scorzonera* is of a sweetish and not unpleasant Taste, and as good to eat as a Parsnep, whether raw, boiled or pickled; it is even serv'd up at the Tables of Persons of Quality, and prefer'd before a Parsnep, or Skirret.

It is not only good for the Bite of the Serpent *Escorzo*, but for the Bites of all other Serpents. The Virtues hereof are extended, also, to pestilential Fevers, all Manner of Disorders of the Heart, Melancholy, Palpitations, Syncope, Epilepsy, Vertigo, Obstructions of the Viscera, and Affections of the Uterus. *Monardus* has written a Book on this Plant, in which he relates surprizing and even incredible Things of its Virtues against the Serpent *Escorzo*. The *Scorzonera* of the Island *Amagria* is bitterer than the *Spanish*, or what is cultivated in our Gardens, and is very serviceable in the Beginning of a Dropsy, or in a stubborn Jaundice. If you want an hepatic Medicine for gross and adust Bile, this bitterest Sort of *Scorzonera* is most effectual. The mountainous *Scorzonera* is celebrated as an Alexipharmic in *Ephem. Germ. Au. 11. Obs. 81. Raii H. P. 248.*

2. *Scorzonera*; latifolia; altera. *C. B. P. 275.*

3. *Scorzonera*; laciniatis foliis. *T. 477. Tragopogon, laciniatum, luteum, C. B. P. 274.*

4. *Scorzonera*; ficula; altissima; folio plantaginis hirsuto.

5. *Scorzonera*; foliis gramineis. *Sher.*

6. *Scorzonera*; foliis laciniatis; supina. *Bocc. Boerb. Ind. Alt. Plant. Vol. I.*

Scorzonera takes its Name from *Escorzo*, a *Catalonian* Word signifying a Viper, because it is said to be very effectual against the Bites of that Animal. The *Scorzonera* imported from *Spain* is far superior in Virtue to ours, which wants the aromatic Quality of the *Spanish*. Perhaps it had its Name from its Effects on the Viper, which if 'but touch'd with the Juice of this Plant, immediately droops and sickens; and it is said, that a Person may take a Viper in his bare Hand without receiving any Harm, if he first rubs his Hand with this Herb; for the Viper will not be able to bite, but faints and sickens. And I know an Apothecary, who commanded his Servant to take in his Hand a living Viper, such as they put into *Venice Treacle*: The Servant was immediately bit by the Viper, and sunk to the Ground, when his Master immediately apply'd this Herb bruised to the Wound, and to the Viper, which still hung to it. The Effect was, that the Viper immediately fell off, and the Servant was cured. The Juice is very serviceable in Inflammatory Diseases; three Ounces thereof being taken in the Morning fasting, are recommended against all volatile Poisons; and the Herb apply'd, cures envenom'd Wounds. The Root, which is perennial, is proper to be taken out of the Earth before it produces Leaves, and to be hung up or dry'd, or preserved in Sand. It is a proper Herb in all Diseases proceeding from too great a Mobility of the Humours, and which require Agglutinants and Demulcents; also, in all Disorders arising from a putrid Blood, such as the Small-Pox, Measles, Pestilence, burning Fevers, Peripneumony and Pleurisy. The Root is an excellent Cleanser and corrective, for which Reasons it is of extraordinary Use in hypochondriac Disorders, being boiled in Barley-Water. The Root bruised in a Marble Mortar, and the Juice expressed through a Linnen Cloth, makes an excellent Medicine; but all its resolvent and nutritive Virtue is lost in Decoction. It is of good Service in Melancholy, and Pains of the Gout, and some use it with Success in an immoderate Flux of the Menfes. There is no Herb more commended than the first, second and third Species in the Phthisis, Extenuations, and the Jaundice. *Hist. Plant. ascript. Boerhaave.*

Besides the foregoing Sorts of *Scorzonera*, *Dale* mentions the following.

SCORZONERA SUBCERULEA, *Offic. Scorzonera angustifolia subcerulea*, *C. B. P. 275. Raii Hist. 1. 249. Tourn. Inst. 476. Scorzonera elatior angustifolia Pannonica, Park. Theat. 410. Viperina 63, Ger. 598. Viperina angustifolia elatior, Ger. Emac. 737. Tragopogonis Species sive Scorzonera major angustifolia subcerulea flore, I. B. 2. 1062. HUNGARIAN VIPERS GRASS.*

It grows in hilly Places, and the Root, which is the Part used in Medicine, perfectly agrees in Virtues with that of the common *Scorzonera*, and may supply its Room.

SCOTODINOS, *σκοτοδίνος*, or **SCOTODINE**, *σκοτοδίνη*, or *σκοτοδίνη*. A Vertigo attended with a Dimness of Sight; from *σκοτος*, Darkness, and *δίνη*, a Vortex.

SCOTOMIA, or **SCOTOMA**. From *σκοτος*, Darkness. The same as **SCOTODINOS**.

SCOTOS, Darkness, or Dimness of Sight.

SCREATIO. The Action of Hawking, in order to bring up Matter lodg'd in the *Fauces*; or the Matter thus brought up.

SCRIBLITA. A Wafer. *Castellus.*

SCRIBONIUS LARGUS. The Name of a Roman Medicinal Author, who lived under the Emperors *Tiberius* and *Claudius*, and wrote many Things in Medicine, of which his Treatise *Of the Composition of Medicines*, is still extant, [* N n]

extant, and often quoted by *Galen*: It was dedicated to *C. Julius Callistus*, the favourite Freedman of *Claudius*; and it is only by this Dedication that we are able to judge of the Time in which *Scribonius* lived, for he speaks in one Place of *Messalina* and *Claudius* after a Manner which leaves no room to doubt that he lived under their Reign: "*Messalina*, says he, the Consort of our God *Cesar*."

Some learned Men have thought that *Scribonius* wrote this Book in *Greek*, and what we now have in *Latin* is nothing but a *Latin* Translation, made a long Time afterwards. What gave Occasion for them to think thus, was, that the *Latin* of *Scribonius* did not seem to them to come up to the Purity of that Language, which was still preserved in the Reign of *Claudius*. But *Rhodius* has prov'd, that these learned Men are mistaken, and that our *Scribonius* has all the Air of an Original, though the Language be not quite so pure as that of *Celsus*, who preceded him not long before; which only proves, according to *Rhodius*, that Men who live in the same Age speak not always with equal Purity of Style; and indeed, the whole Book shews that he wrote it in *Latin*; and in the Preface he makes his Acknowledgments to *Callistus* for presenting his *Latin* Medicinal Treatise to the Emperor. As to his Person, his Name shews that he was a *Roman*, and of the *Scribonian* Family, except it be suppos'd that he borrowed that Name from the same Family, in Imitation of other Strangers; but if this were the Case, he would have join'd his own proper Name to it. *Le Clerc*, *Histoire de la Medicine*. *Fabricii Biblioth. Græc.*

SCRIPTULUS. A Scruple; the same as **SCRUPULUS**.

SCROBICULUS CORDIS. The Pit of the Stomach.

SCROFFA. The same as **SCROPHULA**.

SCROLLUS. A River Fish, found in the *Danube*, somewhat smaller than the *Perch*. It is red on the Back, greenish on the Sides, with a Mixture of red Spots, and white on the Belly. It is esteem'd excellent Food, but is not used in Medicine. *Lemery des Drogues*.

SCROPHULA. The King's-Evil; from *Scrophæ*, a Swine; because this Animal is said to be much subject to such a Disorder.

Quincy remarks, that the Gout and the King's-Evil agree, in being frequent amongst Persons strong both in Body and Mind, who are hearty Feeders, and on other Accounts well and healthful; in this respect, however, considerably differing, that the Evil generally appears at three, four, or five Years of Age; and dries away by that State of Manhood that the Gout gives its first Warnings of approach; though neither of these are without some Latitude of Exception. And as the Gout is owing to sharp saline Humours, that are contracted by a particular Way of living, and favoured in their Accumulation by a peculiar Make of the Parts where they settle, upon the Declension of the natural Strength, so this Disease seems owing to a hot, sharp Humour, propagated *à Semine* from the Parent, in the first Formation discovering itself at an Age, when certain Glands are fitted for its Reception, and disappearing when the digestive Powers have arrived to their greatest Strength.

That Persons subject to the Evil do early shew an uncommon Vivacity of Mind, and Forwardness of Understanding, is a Fact that all have experienced who have been accustomed to such Opportunities of Observation; as, also, that if the Distemper goes on without much Interruption from its natural Course, and dries away about the Age of Manhood, as it commonly does, such Persons are generally strong, and free from Distempers afterwards.

That such a Humour can be derived from the Parent, is granted, perhaps, in more Instances than where it is really so, and is likely to be yielded by many, more on the score of a vulgar Opinion, than for any true Notions of the Manner how such a Thing is possible: It may be, therefore, necessary to form some rational Conceptions hereof, in order to judge what Disorders spring from such an Origin, and which not; because, without some Rules to determine by, Cases may be confounded and mistaken, from some Resemblance in their Appearance, which flow from very different Causes.

To this Purpose, then, I cannot see what we have to do with the Philosophy of the Microscope, so far as it asserts the Semen to be animated before Generation, because it seems not in any Manner to affect the Matter under Inquiry; but so far as we get any Knowledge of the sensible and manifest Properties of that small Portion of Matter, from whence we boast the Production of the finest Machines in the Creation, it appears to consist of a very subtle, active Salt, floating in a soft, balsamic Vehicle; whereas, therefore, we can conceive what Consequences to the Economy already formed, may flow from an Excess or Defect in the more active Prin-

ciple of such a Composition; so may we, by a Parity of Reason, conjecture, what must be the Result of every Deviation from the natural Standard in the same Principle before its Animation in the Matrix. Where, then, this Principle abounds with Heat and Pungency in the masculine Semen, it will not only irritate more frequently and more strongly to venereal Embraces, but carry with it the same Qualities into the impregnated Ovum; and, without some uncommon Interruption, or Contemperature from opposite Qualities, will encrease in the growing Fœtus, in Proportion to its Enlargement, and make a Part of that Constitution to which it gave Being, with the same Affections and Properties as it stood possessed of in the generating Semen.

Hence, it will be no difficult Thing to imagine what a Condition the Off-spring of such a Parent must be in; and how, sooner or later, in one or another Part, this primitive Matter may shew itself in a very troublesome, if not a very mischievous Manner; as the Circumstances of Life, and Strength of the Constitution encourage or obstruct its Exertion, and the peculiar Configuration of the Glands favour or resist its Accumulation and Lodgment: And though in the Case immediately under Enquiry, it principally shews itself from a little Time after Birth to a State of Manhood, is probable from this Reason, that sooner, it is not in Quantity enough to be discernable, or is hindered from Exertion by the Laxity of the Parts, and Viscidity of Humours, which is always more or less the Case of very young Children; but that when the Parts have got some Degree of Firmness, and have digested away the tough Humours, this hot, sharp Matter becomes sensible to the fine Strainers and Membranes as it passes in the Course of Circulation, and at last fixes upon them so as to occasion Pain, Inflammation, Swelling, and running Sores: But when, again, the Constitution takes another Turn, and arrives to its utmost Vigour, the digestive Powers become able either to destroy its Pungency by Attrition and Comminution, to detach it off by some natural Outlet, most commonly the Glands of the Skin, or to lessen it, so much at least, in Quantity, that it flows with the ordinary Current without sensible Effect, and never afterwards appears, but in giving to the generating Principle the same bad Taint from whence it derived its Existence: And that even frequent Coition and Propagation shall vent and draw off a great deal of this Matter, to the Benefit of the Parent, and Detriment of Posterity, is not only probable, but almost demonstrable; because, during that Time of Life, and in Proportion to such Indulgence, the Parent is always the most free from it, and that during the Travail of a Woman with Child, before subject to such Humours, or any of the like Kind, she shall be entirely free from it then, though, if the Issue survives the common Fate of Convulsions, a little more Age seldom fails to discover when such a Mother had her temporary Relief.

That the Distemper then under Consideration may be thus propagated, is not only out of Question from common Experience, but the Manner of it may in some measure be conceived from these Hints, and the Nature of the generating Matter. The same Way of Thinking, also, will suggest in what Circumstances a Person may fall into this Distemper without having it to charge upon Parents, or the Milk of a tainted Nurse, which, also, may possibly happen, tho', it is believed, very rarely; and that is from a Way of feeding, or any other Condition of living, that gives to the Mass of Humors an uncommon Heat and Sharpness, which in Time shall fix upon the same Parts, inflame and ulcerate them in the same Manner as that derived from a distemper'd Semen. And this will not appear at all strange to those who consider how many cutaneous Foulnesses, that are generally propagated by Infection, do sometimes derive their Origin from a Constitution thus disposed to generate the same Humour within itself, without any Infection; as what is ordinarily called the Itch, which is commonly got by Infection, does yet in some scorbutic Habits arise to the Height of that Distemper, so as to be in a Condition of infecting others, though it was generated *de novo* of itself.

The various Shapes and Appearances of this Distemper, as it is differently circumstanced in Proportion to the Quantities, Aperities, and other Aggravations of the Peccant Humours, with the Parts it settles upon, must be left to the Descriptions of Authors who have professedly wrote about it, it being sufficient to our Design here, to take Notice, that it is from a hot, sharp Humour, fitted to be deposited upon certain Glands, and affect them in the Manner as it is notoriously known to do.

But so far as from the principal Circumstances of this Distemper are suggested to us any Means of Cure, it is most obvious, that as the greatest Difficulty in getting rid of the morbid Humour which causes the Gout, is in its lying so far distant

distant in the Habit from the common Reach of Medicine, so this seems not quite so remote, but to flow mostly in the common Stream of the Blood, and to be immediately deposited by that upon the Parts affected, and most suited for its Reception. Besides, therefore, promoting Digestion, Commixtion and Transpiration, as, also, softening and smoothing the Asperities of burning corrosive Humours, a constant well-chosen Course of Diuretics must necessarily be of great Service. And too many Instances we have, by Experience, of Cases that have been sufficiently laboured with Mercurials, and the ordinary officinal Alterants, without Success; that have afterwards been conquered by means seemingly much slighter, such as the Millepedes, and the common antiscorbutic Drinks, made principally with cooling and diuretic Herbs and Roots; no general Form of which can be contrived to suit every Patient and Circumstance, and must, therefore, be left to the Contrivance of a Physician, according to the particular Exigences of different Constitutions. As to that singular Way of Cure, whence this Distemper comes by the Name of the King's Evil, there is something in it so remote from all good Sense, since it can take place only on a deluded Imagination, that I think it justly banished with the Superstition and Bigotry that introduced it. *Quincy's Medicina Statica.*

The *Scrophula* or *Struma* is a hard glandulous Tumor, usually of the same Colour with the Skin, seated principally on the Sides of the Neck, about the Musculi Mastoidei, behind the Ears, and under the Chin; either more or less moveable, single of the conglobate Kind, or in Clusters of the conglomerate Kind; many Patients having been observed to have them contiguous from the Ear down to the Clavicle.

Though the principal Seat of this Disease is in the Sides of the Neck, scarcely any Part of the Body is exempted from it; and it affects either Glands, Muscles, Membranes, Tendons, Bones, or the Viscera.

The Glands are the most remarkable Seat of this Distemper, and whenever the outward Glands appear swelled, those of the Mesentery may be concluded to be so too, the Mesentery being usually the Part first attacked by this Malady.

In the Eyes it shews itself in a troublesome Ophthalmia, producing both the Anchylops and Epylops; and in the Lids, the Epiphora and Lippitudo; sometimes the whole Ball of the Eye is thrust out by these glandulous Tumors. This Distemper appears in the Nose, by the Ozena; in the Lips, by the Labrifulcium; or thick pouting Tumor, especially of the upper Lip, with a Fissure in the middle; in the Throat, by the tumefied Tonsils; under the Tongue, by the Ranula; on the Wind-Pipe; by the Bronchocle; under the Chin, and on the Sides of the Neck, by the Struma, properly so called. It breaks out in the Groin and Arm-pits, and the Breasts too are subject to it. The Testicles and Prostates may be liable; but in these Cases another Distemper is generally suspected. The Strumous Matter is sometimes collected, like a gummy Substance, about the Muscles and Tendons, especially in the Fingers, Hands, Feet, and Toes; and the Elbows, Knees, and Ankles are often attacked in this manner. The fixed, immoveable, white Swellings on the Joints, are the undoubted Offspring of this Distemper.

The Bones are often affected with this Distemper, not the Skull itself excepted; though the Bone swells, it appears externally hard and sound, but the Heart and Marrow may be entirely rotten; and this is called the Spina Ventosa. When a strumous Tumor touches a Bone, it becomes carious. The Viscera too are often subject to these Tumors, which is not surprising, if we consider that most of the Viscera are supposed to be made up of Glands.

The strumous Tumors of a round Figure are reckoned the mildest, which, as well as others, arise without Inflammation or Pain, and with moderate Hardness, but by Increase of Heat inflame and suppurate. Some of the mildest and biggest suppurate, without changing the Colour of the Skin, but in a few Days they renew their Hardness. When they suppurate with Inflammation, the Matter is mixed with Blood, and they are named Phlegmonoides; others are indurated and become scirrhus, yet sometimes fret, and grow painful and soft in their upper Part, which by some has been mistaken for a Suppuration; but at their Opening they only gleet, and often degenerate into a Cancer. Sometimes these Tumors are primigenial, as when the Disease is Original; and secondary when they succeed some other Distemper, as particularly a Fever, which often terminates in a Congestion of Matter. It, also, sometimes happens after Catarrhs, and other Distempers; and some proceed from sudden Fluxion, and others from long Congestion. The *Steatoma*, *Atheroma*, and *Meliceris*, as they are frequently Companions of, so they are often not easily distinguishable from, these Tumors.

When the Tumor affects a conglobate Gland, it is usually round, moderately hard, and moveable without Pain. Those

of an oval Figure, which are hard, and accompanied with Pain without Inflammation, are malignant; and if they grow unequal, threaten a Cancer. When the Tumor seizes a conglomerate Gland, the Shape of the Gland is usually preserved, especially when it is wholly affected; but sometimes they are oval, round or flat. In a Muscle the Shape of the Tumor is uncertain, and always distinct from the Muscle.

The Particulars to be considered in the Prognostic are, whether the Tumors be many or few; in Clusters, or more distinct; great, or small; deep, or superficial; moveable, or immoveable; benign, or malignant; soft, or hard; the Situation; whether near great Vessels, Joints, Nerves, Tendons, or Bones; also, the Habit of the Body, and Age of the Patient.

If the Habit of Body be tolerable, the Patient young, the Strumæ recent, and but moderately hard, the Resolution and Suppuration may be easily effected; but if they have been of long Continuance, are hard and lie deep among the Vessels, the Work becomes difficult; yet the Cure of both is often promoted by accidental Ferments, which often either resolve or suppurate them. If the Strumæ be moveable and free from remarkable Vessels, the Extirpation is not difficult; but if the Habit of Body be bad, and the Strumæ immoveable, they are not to be meddled with; if they be moveable, and yet lie deep among the great Vessels, the Extirpation is dangerous: Besides, in the best Habits of Body, new Strumæ are ready to rise while the old ones are extirpating.

If the Strumæ have been long ulcerated, and are become sinuous and virulent; and if they lie near one another, they often find a Communication to one another, though they appear distinct: In this Case the Lips grow callous, and the Ulcers corrosive, frequently sordid, and the Cure is not to be hoped as long as any one Cystis remains, or the Vessels that feed them; but if the Ulcerations be simple, the Cure is accordingly easy. Those who are seized with Strumæ in the Neck, after forty Years of Age, seldom recover, as they generally labour under great Obstructions, whence spring scorbutical Affections, Jaundice, Fainting, Vomiting, Loss of Appetite, sometimes a Dropsy; and sometimes a Cough, in which Case they die tabid.

If strumous Tumors arise from Caries in the Bones of the Fingers or Hands, their Cure will require great Care; if in the Foot or Toes, it will be more difficult; if in the Os Calcis, Joint of the Ankle, or Astragalus, or in the Knee-Bones, and Ichia, or the like, where you can't lay open, or judge of the Caries, the Case is deplorable, the Work is long, and the very Discharge of Matter exhausts the Spirits of the Patients; so that they generally die of a Marasmus. But if, by Strength of Body and Help of Medicines, the Ulcer digests, sometimes the rotten Bones moulder and exfoliate, and by a *Callus* within, the Member is supplied.

If strumous Tumors outwardly foul the Bones; if the Habit of Body be tolerably good, and the Ulcers well handled, they may recover: But if the Habit of Body be bad, new Ulcers arise; so that the Work is long and difficult.

THE METHOD OF CURE.

In the Cure, three Things are required.

1. A Regimen of Diet, and the other Non-naturals.

2. Pharmacy, or internal Prescriptions.

3. The Application of Externals, either to discuss, suppurate, or extirpate the Glands.

With respect to a Regimen of Diet, Regard ought to be had to the Constitution of the Patient, whether it be hot or cold, dry or moist, old or young, robust or delicate. If the Body be cold or moist, we generally suppose a Surfeit preceded, and Crudity to abound; in which Case, Abstinence from Meat and Drink, or at least great Moderation, is requisite. Their Diet ought to be moderately heating and drying, as Mutton, Kid, Rabbit, Pullet, Chicken, Partridge, Pheasant, Poultry, and the like, and these roasted; avoiding all Aliments which yield a gross phlegmatic Nourishment, such as Water-Fowl, Fish, especially those of Standing-Waters, Herbage, Cheese, all smoak'd, seasoned or dried Meats. Their Bread ought to be of Wheat, well-baked, and their Drink medicated Ale or Beer; Wine also is allowed, and Water utterly forbidden.

In hot and dry Constitutions tending to a Hætic, we allow a Diet of a more humid Nature, their Meat being boiled with Lettice, Spinnage, Purslane, Wood-Sorrel, and the like; to some of these we dare scarce permit the eating of any Flesh, but rather a Milk-Diet, or Asses Milk; though Milk will not be always found agreeable; in which Case we prescribe medicated Broths. Pork is, by some, forbidden strumous People.

Air is a great Help to the Cure, which ought to be mild and gentle, in cold Weather heating and attenuating, and in the hot cooling. Exercise of Body ought to be enjoined, it being

being necessary to waste Superfluities. Sleeping in the Day is forbidden, unless where the Case is painful, to which it is an Anodyne. The Passions of the Mind ought to be moderated.

The internal Prescriptions must be qualified according to the Habit of the Body. If it be cold and phlegmatic, abounding with gross viscid Humors, the Prescriptions ought to be heating and attenuating. In plethoric Constitutions, the stronger Cathartics ought to be exhibited, or the milder often repeated. The Purgatives are, the Species Hieræ with Agaric, Diaturbeth, Pulvis Cornachini, Pilulæ Cochizæ, à duobus, Rudii, de Hermodactylis, Alophanginæ, Imperiales, à Succino, Trochisci, Alhandal, Diagrydium, Refina Jalapii, and Mercurius Dulcis, and all those Medicines prescribed in the Lues Venerea.

Alteratives are also usefully taken on those Days in which the Patient does not purge. Among these, a Decoction of the Woods claims a Pre-eminence; to which are added one or other of the Specifics, so called, such as the Roots of Fig-wort, Drop-wort, Devil's-bit, Soap-wort, Bur-dock; the Bark of the Walnut-tree; the Herbs, Rag-wort, Crane's-bill, Herb-Robert, the greater Celandine, Hound's-tongue, white Hore-hound, Fox-glove, and the like.

In these Decoctions, it is very common to put also a Lump of crude Antimony, of four Ounces or half a Pound Weight, grossly powdered and tied up in a Rag; a Specimen of which you have in Dr. Fuller's *Decoction Liberans*, and his *Decoction Edulcorans*; of a Diet, in his *Cerevisia ad Scrophulas*, and his *Decoction ad Scrophulas*.

For such as are not able to be at the Expence of these, or unwilling to be at the Trouble of preparing them, which must be continued for a long time, I have frequently ordered a Solution of Quick-Lime, one Pound, to a Gallon of Spring-Water; which being decanted, two or three Ounces of the Shavings of Sassafras Wood, with half an Ounce, or an Ounce of Liquorice Root sliced, may be steeped therein; these not only taking off the brackish Taste, and changing it for one more pleasant, but giving, likewise, a very agreeable Smell and Colour to the Solution.

As to the cold Infusion of several Drugs, prescribed by some Physicians, the Cost seems to be ill bestowed; the Water being before saturated with the Salts of the Lime, and the Woods too compact to yield any Virtue this Way, which require a Decoction of many Hours, with as many taken up in a preceding hot Infusion preparatory thereto: For which Cause, when I would have the Water more thoroughly medicated therewith, I either order them to be boiled in Lime-Water, somewhat weaker, prepared for the purpose; or having made the Decoction in Spring-Water, to each Quart thereof, half a Pint of the common Lime-Water may be added. And thus the Salts of the Lime have been found, perhaps, more beneficial than more pompous Forms of Remedies.

Besides these Liquors to be taken as a Diet, there are other Medicines, such as the diaphoretic Antimony, Bezoar Mineral, Æthiops Mineral, and Gum Guaiacum.

The Lapis Spongiæ, or Sponge-Stone, with Sponge itself calcined, Dr. Turner says, he has often experienced successfully, and relates the following Case.

A Countryman, about thirty Years of Age, presented himself to me for Advice, with both Sides of his Neck (where the Strumæ were placed *racematim*, as I may say) like a Bunch of Grapes, but more fitly compared to that of Turneps, with which extending forwards, the Larynx was so compressed as to endanger Suffocation. He had the like Glands upon the pectoral Muscles, about the Axillæ, with other ganglionide Tumors on his Arms and Wrists. Of a Case so pertinacious and inveterate I had little Hope; I prescribed him a Diet of the Woods, with some Antistrumatics; Purgation with Extract of *Rudius*, and *Mercurius Dulcis* between whites; also an alterative Electuary of Gum Guaiacum, Æthiops Mineral, Powder of Millepedes, made with the Conserve of Hips; together with a Roll of the Plaister of Frogs, with double the Quantity of Mercury, to be applied externally upon the Glands plaister-wise, and renewed as there was Occasion; returning him back into the Country, where he had before undergone a copious Salivation for thirty Days; notwithstanding which the Distemper increased.

But growing weary of Method, he quickly after threw all aside; till meeting with one who had laboured under the like Malady, and had got his Cure by a Remedy, which required no Regimen, this Acquaintance procured from his Correspondent in Town some of the same for our Patient, being a large Gally-Pot full of a dark or blackish Powder, out of which he took a Spoonful, Night and Morning, in a Draught of Beer; and finding his Kernels waste, he was encouraged to go on, especially considering how easy it was purchased; his Friend making no Secret of the Matter, but frankly telling him what it was. Upon which, that he might not be far-

ther troublesome, he desired a Relation he had here, according to the Direction given him, to buy a large Quantity of the most gritty and fabulous Sponges he could pick out, which drying in an Oven he reduced to Powder; and having continued taking the same for about three Months, the Glands were all dispersed, and his Distemper vanquished; so that being in Town about some Business at the Year's End, I saw him with a smooth Neck, scarce a Vestige of the Disorder remaining, having, as he expressed himself, *Piss'd away the King's Evil*.

Somewhat related to this, adds Turner, is the *Pulvis ad Strumas* of Dr. Bates, prepared of Lapis Spongia, three Parts; Sal Gem, two Parts; and vitriolated Tartar, one Part; which I have seen beneficial, also, in some Cases. But whoever thinks that by this he has got an infallible Medicine, will find himself mistaken. *Grulingius* prescribes it thus:

Take of Sponge, Sponge-stone, and Pumice-stone, each equal Parts; let them be calcined, and take a Dram for a Dose, twice a Day, with a Diet-Drink.

In another Part of his Writings I find it thus:

Take of Sal Pumicis, half a Scruple; Sal Gem, two Scruples; Salt of Tartar, one Scruple; mix and make them into a Powder. Let it be given in Wine, or Aqua Scrophulariæ, beginning when the Moon decreases, and continuing to the Change.

For the same Purpose in another, I find this:

Take of the Powder of the Root of the Gladiolus, half a Dram; let it be taken in a Spoonful of the Syrup of Violets, every Morning, for a Month.

If the Patient be of a hot and dry Constitution, the Case is more difficult, because the Medicines eminent in the Cure of this Disease, are generally such as are like to injure the Body in one of these Qualities, being most of them such as either heat, or at least dry it; many of them do both, as *Sarsa*, and the Woods; as, also, the Cineres Spongiæ, Sal Gem, and all the Species. In this Case the Waters will have their Place, though *Wiseman* does not so particularly approve them as others do. Asses Milk is of great Efficacy in this Case; and where Asses Milk does not agree, distilled Milk may be prescribed: Also, Decoctions of *Sarsa*, China, Mastich Wood, white Sanders, and Shavings of Harts-Horn and Ivory, with the more temperate Pectorals and opening Roots. Purging, in this Case, if the Body requires it, ought to be with Lenitives; and to Children, the Infusion of Rhubarb is sufficient. Emulsions, Pearl Julaps, and Opiates, are, also, beneficial. *Wiseman*, also, directs the testaceous Powders; but Turner says, that by Reason of their Grit, or exceeding Hardness, unless very finely levigated, I should suspect their Passage through the Lacteals; or passing, their being coacervated in the mesenteric Glands; as I remember once to have found them in a strumous, tabid Patient upon Dissection, who had taken great Quantities of them.

I have, therefore, a better Opinion of the Millepedes, which are usefully prescribed, not only in these Infarctions, but for attenuating, absterging, or cleansing all mucilaginous and tartarous Concretions upon the Viscera, which they precipitate by Urine.

The Method of prescribing them, is after they are washed and dried, to bake them in an Oven, and reduce them into Powder, which is given from a Scruple to half a Dram, in any convenient Vehicle, such as white Wine; but their Infusion alive in white Wine, and taking the Expression is much preferable. Thus two, or two and a half Ounces of the live Millepedes, may be steeped in a Pint of good white Wine, and two or three Spoonfuls of the Expression given for a Dose twice a Day. Or twenty may be swallowed at a Time, an easy Task to many, whereby their volatile Parts are preserved; which may be impaired, if not destroyed, by the Heat of the Oven.

The third Intention is performed by the Application of Externals, 1. To the Tumors which we endeavour to resolve, or suppurate, or to extirpate. 2. To the Ulcers which are the Effect either of Suppuration or Extirpation. In Tumors we shall begin with Emollients and Discutients, though it is no easy Work to resolve these Glands, if we consider the Stubborness of the Matter, and its being contained within a Cystis; yet in some soft delicate Bodies the milder Sort of Glands, which are not too much indurated, frequently resolve. The *Emplastrum de Ramis cum Mercurio* is frequently applied for this End, as also that of the Gums, *Annoniacum*, *Galbanum*, *Bdellium*; to which crude Mercury may be added, as it is in the New Dispensatory. Some neat

Forms of which are to be met with in *Dr. Fuller's Emplastrum Antimoniale*, and the *Linimentum de Bryonia*, prescribed for the same Purpose; as also in *Bates's Emplastrum ad Strumas*, and *Diagalbanum*, with his *Unguentum Digitalis*.

Zacutus de Prax. Admirabile, Vol. II. Lib. I. Obs. 101. says he never used the following Ointment without Success.

Take of the Root of Great Bryony, plump and round, half a Pound; cut it into small Pieces, and fry it with three Pounds of recent Olive Oil, till they become dry and wasted; strain it, and add of Turpentine of Fir, half a Pound; Yellow Wax, five Ounces; remove it from the Fire, and make it into a viscid Ointment.

The Herb Goose-grass or Clivers, beat up with Lard, and the Strumæ therewith anointed, discusses the same, while the distilled Water of the whole Plant lends farther Assistance. The Root of Smallage is recommended by Mr. Ray for the like Use. *Crollius* as highly extols the Lesser Celandine or Pilewort, whose Roots, he says, are a Kind of Specific in this Disorder. An Ointment prepar'd of these Roots is directed thus.

Take of the Root of the Lesser Celandine, cleaned and bruised, and Hogs Lard, each a Quantity at Discretion; let them be pounded and boiled together, till the Roots become dry; repeat this Operation twice, till the Lard is well impregnated with the Roots; and thus you have an excellent Ointment.

Etmuller and Mr. Ray recommend the *Pulvis Cyani*, or Tincture of its Flowers; others, the *Radix Cynoglossi*, or Root of Hound's Tongue, drinking the Decoction of it, and applying it outwardly in Cataplasms. But the *Folium Digitalis*, or Leaf of Fox-Glove, pounded and applied to the Strumæ, or the Ointment of its Juice, is highly esteemed by the Botanists. *Dr. Bates's* Preparation of this Ointment stands thus.

Take of May Butter, three Pounds; fresh Leaves of Fox-glove, bruised, as much as you can mix with the Butter; expose them to the Sun thirty Days; then boil them till the Leaves become curled, and let a strong Expression be made.

This seems to be the same used by Mr. *Wiseman*, which he calls the *Valentia Digitalis*, having undergone a repeated Infusion of fresh Leaves, by which the same is farther impregnated with the Virtues of the Plant. *Helmont* praises the spongy or hairy Excrecence, growing out of the Canker-Rose, the Powder being taken to half a Dram mixed with Sugar.

The *Radix Ruscii*, or Root of Butcher's Broom, in fine Powder, given to a Dram every Morning in White-wine, especially if an equal Proportion of those of *Flupendula* or *Scrophularia* be added, and administered in the like Dose, is praised by *Ermuller*, as is the Rue-leaved Whitlow-Grass by Mr. *Boyle*. *Arnoldus Villanovensis* says, that the fresh Root of *Scrophularia*, eaten for ten Mornings fasting, certainly cures the King's-Evil.

When the Glands discuss not, but begin to enflame, a Suppuration will be the Consequence; to promote which, let the stronger emollient Suppuratives be applied, as the Roots of white Lillies, Bryony, Marshmallows, Sow-bread, wild Cucumbers, to which may be added, fat Figs, and Pigeons Dung; and if the Progress be very slow, for stirring up the sluggish Humour, and rousing its Heat, the Root of Pellitory of Spain, and the Seeds of Staves-acre and Mustard. To promote the Suppuration, it is, also, common to pinch them hard; and some People in the Country thrust a Thorn into them, which excites Inflammation, and disposes them to suppurate. Care must be taken to endeavour a perfect Concoction; for if they are opened while any Part of the Gland is hard, it will encrease, and occasion a Necessity of eradicating it, or of leaving the Cure imperfect.

With regard to the Manner of opening them when suppurated, that by Incision makes the least Scar; but if the Struma be large, the Caustic may give a larger Opening with less Pain: The Matter being discharg'd, you may deterge with *Paracelsus's* mundificative, precipitate, and the Vitriol Stone; and afterwards incarn and cicatrise.

But in old and hard Strumæ, we seldom obtain a complete Suppuration: Sometimes, during the Application of the most subtle Discussants, we raise a Heat in the Skin, which affecting the Cystis, and Part of the Gland next under it, causes an imperfect Suppuration; by the continued Use of

the Discussants it at length frets its Way in small Apertures; which, if the Applications are continued, grow bigger, and become so many painful Ulcers, spreading one into another; the Body of the Gland remaining hard; without Hopes of Suppuration. But if you dress them one, two, or three Days with a Pledge of *Unguentum Basilicon*, you may qualify the Heat, and moderate the Ulceration; and so by interchangeably applying the Discussant or Lenient, you may happily waste the whole Gland; if the Patient be treated with proper Internals. Sometimes the Strumæ protrude in a Fungus, and may be thrust quite out by passing a Spatula under them, and the Ulcer may be healed in a few Days: Where they are incapable of being so thrown out, the protuberant Part may be cut off, and the remaining Basis consumed with Echarotics.

If the Struma be movable, and free from remarkable Vessels, the speediest Way of Cure is by cutting the Skin; and taking them out whole with their Cystis: Those which have Stalks, and are pendent, or grow small near the Basis, may be tied and cut off: In those which are so thick in the Basis, that you cannot make Deligation on them, you may pass a proportionable big Needle under the Roots of them, and cut them off under the Needle.

The common Way of taking out all the Species of Strumæ, Atheromata and Meliceris, by Incision, is in cutting the Skin the Length of the Tumor; and the Incision should be made warily, lest the Cystis should be divided; and the Matter flow forth. After they are separated round to the Basis, it may be sometimes necessary to make a Ligature upon the Vessels, before they are cut off. Those which are very large, with a proportional Basis, as Steatomata, generally called Wens, are sometimes taken out by making a crucial Incision, and sometimes by an oval one, taking off so much of the Skin as may be judged superfluous; then separate it with great Caution, because the Skin commonly adheres so close to the Cystis, that they cannot be divided without the Help of the Knife: Having separated it, turn it out, and make a Ligature underneath upon the Vessels, and cut it off; then bring the Lips of the Wound together, with two or three Stitches, and dress it up in a proper Manner. Some Empiricks cut them off without more ado; scarce making a Ligature on them: But this Way being always attended with a Flux of Blood, others chuse rather to pass a Seton-Needle with a strong Ligature close under the Basis, or as near as it may be, and that way make a Ligature strictly about it. Sometimes we make the like Ligature without Incision, and are content to eat off the Tumor by straitening it; thus it falls off without Effusion of Blood; but there is great Danger of mortifying the sound Parts underneath, or of causing such a Disturbance as prolongs the Cure. Therefore, it may be more proper in great Steatomas and complicated Tumors, which are inclosed in Cystises, rather to cut the Cystis, and with the Hands pull out the preternatural Body, leaving the Cystis behind. The Cystis will, by Digestion, separate and cast off; and the Wound will, also, heal by Agglutination, if the superfluous Skin be cut off, and the remaining Lips brought together.

After the same Manner may all those Tubercles in the Eyebrows and Face be treated, where the Cystis separates difficultly from the circumjacent Parts, or where a great Scar may be unseemly.

Where the Strumæ are large or lie deep near considerable Vessels, there, if Extirpation be safe, the best Way will be by Caustics and Escharotics. To prepare the Patient for this Operation, the Body ought to be purged frequently; and, if the Constitution be plethoric, Bleeding may be necessary; also, during the Extirpation they ought to be under an antistrumatal Course of Physic, with Alteratives; otherwise new Glands will arise while you are eradicating the old; upon which Consideration, you are to furnish yourself with such Escharotics as may penetrate deep into the Gland, and do their Work with least Pain.

In eradicating the Strumæ, we are sometimes necessitated, upon the accidental Erosion of an Artery, to apply the strongest Escharotics; but generally we qualify them according to the Habit of Body, Age and Strength of the Patient, and Condition of the Glands; as they are hard or soft, have more or less Sense, or are seated in or near an Emunctory. Those Compositions which have Sublimate in them, are exceedingly painful, scarce to be endured in the strongest Bodies; and though they be taken off in five or six Hours Time, yet the Salts having once penetrated the Glands, the Pain will continue vehement many Hours after, and affect the neighbouring Parts with great Inflammation and Tumor, frequently raising new Glands. When these Compositions are applied to the softer Sex, or tender Bodies, it affects the Head with violent Pain, benumbing that Side

and the circumjacent Parts, and depriving them of their Series. Fainting, and Palpitation of the Heart, are frequent Effects of such Escharotics.

The Method I usually begin this Work with, is by the Application of such a Caustic as will least spread, making it proportionably long, reaching from the lowest Part of the Gland upward; for in consuming, the Strumæ will sink downwards. The Sides must be defended with Plaisters, to prevent it from spreading; for the Lips being once divided, they will give way, and accordingly as your Escharotics penetrate into the Body of the Gland, the Sides of it will fall in, and be eradicated out of the narrowest Opening you can make; and the narrower it is, the less Blemish will arise from the Cicatrix, and the sooner it will be cured. The Eschar being made, you may divide it the whole Length, and with a caustic Stone rub into it till it hath penetrated into the Body of the Gland, which it will the sooner do, if interchangeably you press into the same Place with a Stick dipped in Oil of Vitriol. Having thus done, dress it up with Unguentum Basilicon, with Lint-seed Oil hot, embrocating the Parts with Oil of Roses, and with Vinegar, and apply a Plaister of Bole over all. This Way of dressing is not without Pain, but it seldom lasts above half an Hour. The third Day after you may dress again, and if you find the Eschar in the Middle dried hard, dress it with Lenients; but if it feel soft, rub it again interchangeably with the caustic Stone and Oil of Vitriol, thrusting them every Way into the Body of the Glands, taking Care that the Lips of the Ulcers be not enlarged thereby. By this Way of proceeding, a great Part of the Strumæ will be eradicated, before the first Eschar in the Circumference cast off from the Skin. Having thus near eradicated the Struma, you may consume the Remainder with precipitate Mercury, and keep it open with Dossils of Lint, permitting the Ulcer to contract narrower the while, that it may heal with a Cicatrix. This I conclude the easiest and speediest Way to eradicate the largest Strumæ; but in these complicated Strumæ, and others which will not admit of such Proceeding, I apply an Escharotic, or the strongest cathartic Powders, as I see Cause. The Steatomia being Suet, yields not to Escharotics.

Hitherto we have treated only of the King's-Evil as it is contained in a Cystis, being the Struma of the Antients; but as in the History of the Disease, we enlarged its Bounds further, we shall proceed to the other Species here mentioned, which cannot be reduced to the Method here proposed. As to the Struma, and other preternatural Tumors included in a Cystis, affecting the Muscles, Tendons, Ligaments, and other Parts of the Body, they differ not in the Way of Cure from what has been already delivered, except that they require more Caution in the Extirpation of them, as they affect the Joints, or sensible Parts.

The Gumminess upon the Muscles and Tendons, require emollient and discutient Dressings.

The Swellings affecting the Joints in this Disease are of two Sorts, both made by Congestion, and increase gradually; yet differ, in that the one arises externally upon the Tendons, and between them and the Skin, or between them and the Bone; the other internally, within the Bone itself.

That which arises externally affects the Ligaments and Tendons first, and sometimes relaxes them to such a Degree, that the Heads of the Joints frequently separate from one another, and the Member emaciates and grows useless. But for the most Part, the Humours over-moistening the Ligaments and Tendons, produces a Weakness and Uneasiness in the Joint, raising a Tumor externally, and, in its progress, the Membranes and Bones are corroded by the Humour.

Particular Care must be taken, not to be deceived in taking the Case either for a Dislocation or some common Abscess, for fear of undoing the Patient with rough Usage, under Pretence of setting a Bone that was never out; or, by treating it with Maturatives, of making Work for a fistulous Ulcer with foul Bones, which will never after be in your Power to heal up again. As a farther Guide in the Way of Diagnosis, if the Tumor be of the strumous Kind, arising more especially from an internal Cause, there are usually some of the other Symptoms attending, as sore Eyes, swelled Lips, Glands about the Neck, or under the Chin, or the Parents have been subject to the same Distemper, and entail'd it thus upon their Issue. But if its Rise were first of all from some Strain or Bruise, the greater Caution is requir'd in forming a right Judgment.

In order to the Cure, apply, in the Beginning of the Fluxion, astringent and drying Plaisters, as of red Lead, and Bole, with moderate Bandage, and place the Member in such a Position as may prevent the Descent of Humours. If Blood abound, a Vein may be opened; but this

Humour requires purging with Calomel, &c. and Alteration by specific Decoctions, diaphoretic Antimony, Bezoar mineral and the like. In the Decline of the Fluxion, strengthen the Joints with Fomentations, and Plaisters of a discutient and astringent Quality, Tops of St. John's Wort, Centaury, Wormwood, Marjoram, and Betony, Flowers of Sage, Rosemary, Red-roses, Balauftines, Cypress Nuts, Myrtle and Juniper Berries, &c. in Wine, with the Addition of Brandy and the Emplastrum de Sandice. But if, through want of such Treatment, they grow excessively swelled, and the Humour incapable of being pressed back or discussed, you may suspect the Bones to be corroded; for that Swelling is mostly raised by a Hyperfarcosis within; and ought not be opened without a Prediction of a Caries; for, however it may, by a seeming Fluctuation, be thought to have Matter, yet, upon opening, it will only discharge a Gleet, and the Hyperfarcosis will thrust out in a Fungus. If in some particular Part a Suppuration visibly appears, and upon Aperture an albuginous Matter is discharged, you may conclude the Bone under it is rotten, especially if it be in the Hand or Foot; and the longer you delay the Opening, the more rotten the Bones will be.

Therefore, in such Cases, having foretold the Patient or his Friends of the Danger, give vent to the Matter proportionably large (according to the Rectitude of the Vessels) to the Bone, and proceed to the Cure as in Ulcers with Caries, being careful to keep the Member in a right Position, that the Joint above it do not contract; as it frequently happens in the Elbow, Knees and Hip. It sometimes happens, that these Diseased Creatures fall into the Hands of Pretenders to Surgery, who, by improper Applications, raise great Tumors; and not knowing how to dress them, suffer the Aperture to be filled up, and overgrown with luxurious Flesh till the Bone rot underneath. Others, when consulted in such Cases, although they know the Bones to be carious underneath that Hyperfarcosis, advise the leaving them to Nature, persuading their Patients, that it is the Work of Time, and that the Assistance of Surgery will but increase the Malady. But as one rotten Bone cannot cast off another, they may well rot in Pieces; and till the Hyperfarcosis be removed, and the Bones laid bare, nothing can be expected but Apostumations one after another, and the Patient will at length die hectic. It is proper, therefore, to consume the Hyperfarcosis by such Applications as the Strength of the Patient can bear, making way for the Bone or Bones; pull out such as are loose, and dispose the others to exfoliate; then by Compress and Bandage press out the Matter, and endeavour to restore the Part to its natural Smallness; and for this Purpose, the Ulcer must be well deterged, and the native Heat cherished by discutient and drying Fomentations. The Compresses under the Bandage ought, also, to be pressed out of a Solution of Salt of Nitre, &c. in Vinegar. By this Method you may happily cure them, if Internals be prescribed, with Regulation of Diet.

The other Sort of Abscesses, which take their Beginning from an Ulcer in the Bone, have been already mentioned under the Name of *Spina Ventosa*. This Disorder arises from a morbid State in the medullary Juice, which corroding the Fibres, makes a Solution of Continuity there, corrupts the interior Part of the Bone, and at last (if not prevented) corrodes the Shell, and passes its subtiler Humour through some Perosity it had made.

This Disease of the interior Part, by Degrees, usually so affects the external Shell of the Bone, as to raise it to a preternatural Tumor, which at the same Time over-stretching the Periostum, causes an Uneasiness; and this Pain, if it grow so acute as to produce Inflammation, an Abscess consequently follows.

If the Bone be spongy, and is soft, it is wonderful to see how quickly the Fibres of it will be mollified, and prepared for a sudden Distention, as if the Part were rather muscular than osseous. So in Childrens Fingers I have seen a Bone swelled in a Night; and the like Tumor raised in the spongy Bones of Adults, in a few Days, and without much Difficulty yield again to exsiccant Remedies.

It sometimes happens, that the interior Part of the Bone is totally corrupted, without any external Tumefaction or Pains, till the acid Humour makes its Way through the Cortex, and corroding the Periosteum, causes a Solution of Continuity there; which, by Access of Pain, swells and inflames the external Parts, and produces Maturation in a few Days. Those the protuberating Bones, also, frequently raise Abscesses after the same Manner, and sometimes when the exterior Parts suffer under another Ulcer, different from this.

In some Species of this Disease, there is a sudden Tumor raised in a Night; in others it swells gradually, and never corrupts externally. In others, the Humour pierces through the

the Cortex, and raises suddenly an Abscess. And these Differences may be said to arise, somewhat, from the Place or Bone they affect; for, accordingly as the interior Part of it is softer or harder, or the external Cortex is solid or porous, so it suffers Solution sooner or later. Those of the Cranium, for the most Part, pass their Way through the interior Lamina, and affect the *Dura Mater*, &c. producing great Pains, Convulsions, Spasms, Epilepsies, and they die before the Disease is discovered. In the great Bones of the Knees, Ancles, Elbows, &c. they pass their Matter slowly, and are more generally diseased with Apostemations, externally arising from the Protuberance of them. In the *Ossis Tali*, or Heel-bone, which is spongy within, and full of external Pores, they make their Way through, more suddenly, and so they do in the Jaws, Fingers and Toes.

The most visible Signs of the *Spina Ventosa*, are a Protuberance of the Bones, without discolouring the Skin, and often without Tumor or Pain.

The Apostemations proceeding from the *Spina Ventosa*, most certainly shew them, rising always between the Membranes and Tendons; and somewhat a Fluctuation may be felt there before the external Skin be considerably inflamed; also, if upon opening it search be made with a Probe, it will penetrate deep into the Bone, yet is the Cortex of it white; whereas the other Abscesses always begin externally; and if the Bone be bare, yet is it only superficially carious, or stained by the Matter.

The Cure of the *Spina Ventosa*, in the lesser Bones, is possible; but those in the bigger Bones are for the most part deplorable. Infants and Children are generally the Subjects of this Disease.

In the Cure of these, the same Method is required which has been above proposed in those Abscesses, and Ulcers with Caries; as, also, the same Regulation in Diet, and other Non-naturals.

The Topics ought in the Beginning to be such as are astringent and drying, as the Plaster e Bolo, *Cæsaris*, of simple Red-lead, &c. with Soap de Sandice, and of Eriogs, with double Mercury, with good Bandage.

If afterwards they press their Matter externally, they must be laid open by Incision, according to the Length of the Protuberance. Those of the Cranium are not much protuberant, from the Reasons given; yet you ought to make Inspection, and proceed accordingly, by Rugin, or Trepan, as the Symptoms indicate. Those of the Jaws are visible, and require Vent by the Extraction of the Teeth, after which the Caries must be consumed by Medicines of a drying Quality, of which the Actual Cautery is the most speedy and effectual. Those of the Fingers and Toes are to be laid open by Incision, in case of Apostemation, the Length of the Protuberance, and the Bone cut into, and the Caries dried up. The Ulcers in the greater Bones ought, also, to be opened, that the Matter may be discharged, and the Bone laid bare in order to Exfoliation, if it be possible. But if the interior Part be much corrupted, your best Way will be to keep that Part of the Ulcer dilated, which lies over the Aperture in the Bone, by some Dressing dipped in Spirit of Wine, or the like, healing the rest of the Ulcer, and prescribing such Internals as may dispose the Body to a better Habit; for these only are the carious Bones which we may leave to Time, it being in vain to attempt the Exfoliation of great Bones, where the Rottness, as in a Pear, beginning at the Core, hath consumed the Substance of them. See Os.

OF THE STRUMOUS OPTHALMIA.

This Species of sore Eye takes its Beginning from vicious Humours inflaming the Tunica Adnata, which increasing, sometimes affects the other Tunics with great Pain, Tension, and Pulsation, whence Pustules arise and suppurate, terminating for the most Part in Ulcers, which leave hard Cicatrices, and, by reason of the sharp Desquiction falling upon the Edges of the Eye-lids, make a Blearedness; and therefore these Inflammations are in *Latin* called *Lippitudo*.

The Causes are the same with those of the *King's-Evil*; yet it may be more particularly imputed to Abundance of Humidity repleting the Head, and descending to the weak Eyes.

An Ophthalmia is supposed to be strumous, when it has been of long Continuance, arising without manifest Cause, and yielding not to the common Remedies of Bleeding, Blistering, Purging, with the Anodyne Collyria, vulgarly prescribed. It is known to be so, when it is periodical, and accompanied with strumous Swellings in the Neck, a thick chopt upper Lip, an Ozæna, a crusty, scabby Nostril, and the like.

If the Ophthalmia be from Plenitude, the Face is high-coloured, the Eye-lids somewhat swelled and inflamed, the capillary Veins large and full; yet the Humours are not so liable to fret as in other Cases, nor is the Pain extremely vehement. If the Disease be from Choler, the Visage is not red, but the Pain is sharper, and with Excoriation of the Eye-lids. If it proceed from pituitous Humours, all the before-mentioned Symptoms of Inflammation, Pain, &c. are more remiss, and the lacrymal Humours are not corroding, unless there be a Mixture of saline Humour joined with it. Whether an Ophthalmia can arise from Melancholy, may be doubted; but if it do, there is a small Fluctuation or Pain. That proceeding from the *King's-Evil* is of an acid Quality, with sharp Fluctuation and Pain; the Eyes are, also, more subject to be gummed together with a viscous Humour, than they are in those from the aforesaid Causes. Whether the Humours affecting the Eyes, flow from the external or internal Vessels, may be discerned from their Complaint: For, if they flow from the Pericranium, &c. the Pain, Pulsation, with Heat in their Forehead and Temples, will demonstrate it; but if the contrary, the Pain will be more intense, and deeper within amongst the Membranes; there will be, also, an Itching in the Palate and Nostrils, with frequent sneezing.

The Time of the Inflammation ought also, to be considered, in order to the Cure, and is thus discerned: In the Beginning, the Eyes look red, and the Humours distilling upon them are thin: In the Increase, the Heat and Pain are augmented; in this State, the Inflammation and Pain are great, and the Humours thicken, and gum the Lids together, especially in the Night: In the Declination, the Fluxion, Pain, &c. visibly diminish.

The strumous Ophthalmia is of most difficult Cure, and in Children very vexatious, by reason of the Humidity they abound with; also, because of their Frowardness, and Incapacity of taking proper Remedies, or admitting external Applications; and, in consideration of the Laxity of their Eyes, they are subject to relapse upon every little Disorder. Those arising by Consent from the internal Parts, the *Dura Mater*, &c. are subject to more grievous Symptoms than those which proceed from the Pericranium, and other external Parts.

If in an Ophthalmia the Pain, &c. persevere any long Time, there is Danger that the Tunics of the Eye may be corroded; and if the Cornea happen to have been long ulcerated, a Blindness follows, or at least a Dimness of Sight, by reason of a Condensation of a gross Matter about the Pupil.

In order to the Cure, the Diet ought to be of Meat of easy Digestion, with great Moderation, avoiding all sharp, salt, hot, or spicy Meats, and such as may beget Crudities. In the Beginning of the Disease, Wine is forbidden: Hydromel is allowed; but in hot, bilious Desquictions, a Decoction of Barley, with a small Quantity of Cinnamon-Water, is only permitted. The Air ought to be pure and temperate; that which is windy, dusty or smoaky, being offensive to the Eyes: So is Sun-shine; therefore, a Piece of Silk, or Linnen, should be put before the Eyes, commonly a Piece of green Sarfenet. Exercise of every Kind is forbidden, and Quiet enjoined. Sleep in these Diseases is necessary, when it can be obtained, the Eyes enjoying Quiet the while, which mightily conduces to their Recovery.

The same Antistrumatics are to be directed as were mentioned before, for the Disease in general; unless, that in Place of the hotter Cathartics, the more lenient and gentle Purgation is by some preferred, giving Calomel over Night, and purging it off therewith next Day, or the Day after; repeating the same once, if not twice a Week; remembering that on the purging Days, especially if the stronger have been administered, some gentle Anodyne be given at Night, as half an Ounce, or six Drams of *Syrupus e Meconio*, in one or two Ounces of the Water of Cowslip Flowers, or the Water of white Poppies. On the intermediate Days, the Expression of Millepides may be given, as above directed.

Revulsion and Derivation is necessary, by cupping on the Neck and Shoulders, bleeding with the Lancet in the Arm and Jugulars, or with Leeches at the Temples, or behind the Ears. Shaving the Head, Blistering, Issues and Setons, are of frequent Use; but Issues in the Neck often cause Strumæ to arise thereabouts, and therefore some prescribe them behind the Ears. In the declining of the Ophthalmia, and after general Evacuation and Diversion of the Humours, bathing the Body in luke-warm Water will be found of great Advantage in contemporizing hot, sharp Humours, if the Season of the Year, and the Age of the Patient will permit.

In the Application of external Remedies to the Eyes, we ought not to be too hasty; for the mildest Medicines dropped into them, prove generally offensive in the Beginning of Inflammation. Authors do not agree on the set Time when we should begin our Applications to the Eyes; but all of them concur in proceeding first with general Evacuation and Diversion of the Humour, and afterwards, suppose about the third Day, to use Collyria. The Ingredients mixed with Collyria, ought to be well washed, that they may be without Acrimony, and so finely powdered that they be not the least gritty. The Decoctions also ought to be cleanly made; and in dressing the Eyes, special Care ought to be taken in cleansing them and their Lids of viscous Matter, to which Purpose an Eye-cup is most necessary.

In the Use of external Remedies, it must be considered, whether the Disease be in its Beginning, State, or Declination. For let the Empyrics boast of this or that universal Collyrium, they cannot cure these Ophthalmias with any one particular Medicine; for, in the Beginning of the Inflammation, they require Repellents; in the Increase, somewhat of Resolvents ought to be mixed with them; in the State, they ought to be treated with Resolvents of a digestive Quality; and in the Declination with Resolvents and Deterfives of an exsiccant Quality.

Thus, in the Beginning, all Epithems or Collyria are to be moderately repercutient, as the Waters of Roses, Plantane, Frogs-Spawn, with the Water beat up with the White of Eggs. To these are added the Lapis Tutiae and Calaminaris, or the Sief Album Rhafis.

In the Increase, Resolvents should be mixed with the former; among these are reckoned the Waters of Eye-bright, Celandine, Fennel, with the Mucilages of Linfeed, and the Seeds of Fenugrec and Marsh-Mallows. To which, in the State, are added the Gum Sarcocolla, moistened with Breast-milk, as more powerfully digesting than some others. Again, in the Declension, Resolvents with Restrictives.

When great Pain attends the Fluxion, some mild and anodyne Collyria are most convenient; such are the Mucilages of the Seeds of Mallows, Flea-wort, and Quinces, extracted in Poppy-Water, also Womens Milk dropped from the Breast into the Eyes, and Pidgeons Blood infilled into the Eyes. Likewise, the Mucilages of the Seeds of Poppy and Henbane, extracted in Rose-Water, to any of which may be added, in extreme Pain, a few Grains of Opium. When there is great Heat, Itching, and Redness, add half a Scruple of Sugar of Lead, to two or three Ounces of the Collyria, with one, two, or three Grains of white Vitriol.

During the Use of these Remedies, Intercipients may be applied to the Temples, as Gum Maffich, or Tacamahacca, with a few Grains of Opium and Camphire, melted and spread upon a circular Piece of thin Leather.

Epithems, or frontal Defensives may, also, be laid to the Forehead, of true Bole, Dragons-Blood, Frankincense, with Whites of Eggs, Vinegar of Roses, and Farina Volatilis, [or the fine Flower that flies off in dressing Corn]; or the Whites of Eggs beat up with Rock-Allum. Which last Sort are to be frequently renewed, as they grow stiff and dry.

Instead of these, more especially over the Eye-lids, may be applied Cataplasms of the Pulp of four Apples, roasted under the Ashes, mixed with any of the above Mucilages; or a Decoction of the Leaves of red Roses, and Flowers of Elder, with the Addition of Crums of White Bread, the Yolk of an Egg, and a little Saffron.

A Fomentation of the same Decoction may be farther serviceable to resolve the Tumor, and give a Breathing to the impacted Humor, if judiciously prescribed. Where the Cilia, or Eye-lashes, are subject to be glued together, as commonly happens after Sleep, let them be lightly smeared with a Feather, dipped in the Unguentum Tutiae, upon going to Rest.

While these Topics are applied, some other Internals are to be prescribed, which from their supposed Faculty of strengthening the Sight, are named Oxydorcica; some Forms of which you may meet with in the Cerevisia Oxydorcica, Pulvis Cibarius, Pulvis Ophthalmicus, and the Electuarium Oxydoricum of Dr. Bate. What specific Virtue is in the Euphrasia, the Basis of these Compositions is uncertain; but the Millepedes ought to be mixed with them, or added to the other Ingredients. And indeed, if the Ophthalmia be strumous, the other Alteratives before recited seem preferable.

If there should happen any Danger to the Sight, by a Speck or Suffusion on the Pupil, some gentle Deterfiv may be dropped in, as a Collyrium prepared of white Sugar-candy, with some Grains of Sal-Ammoniac, or white Vitriol, dissolved in the Water of Fennel, Oats, Eye-bright, or Celandine. The Juice, also, of those Plants are often mixed with Honey, and made into a Liniment, or with the fine Powders of Myrrh and Aloes, also the Water distilled from Honey is recommended for these Uses.

The subtle Powder of Crocus Metallorum, infused for some Days in one of the abovenamed Waters, half a Dram or a Dram to two Ounces of the Water, which must be poured off clear at the Time of Use, has excellent Effects in this Case. But there are many Compositions for this End; some proper Forms you will meet with in the Collyrium Ammoniacum, Collyrium de Succis, and the Collyrium Vitriolicum of Dr. Fuller, and a very celebrated one in the Aqua Ophthalmica Sappharina of Dr. Bate. For the EPIPHORA see CATARRHUS.

OF THE STRUMOUS ÆGILOPS.

Æglops is a Tubercle in the inner Canthus of the Eye, either scrophulous, atheromatous, or of the Nature of a Meliceris, or sometimes with Inflammation. The Greeks call it Ancylops when not ulcerated; and Ægilops when it is. In which latter Case it is liable to grow sinuous, and being so, is called Fistula Lachrymalis, sometimes passing through the Bone of the Nose itself.

The Causes of the Ægilops are the same that produce the like Tumors in other Places. But in some Cases it is made by Fluxion, and appears first as a small Phlegmon. This Disease frequently occurs in the *Lues Venerea*; but these here treated of are strumous.

If it proceeds from the Struma, it is then made by Congestion, and the Tubercle is round, without discolouring the Skin. If it be made by Fluxion, Pain and Redness appear, with Inflammation over all the Eye. Sometimes it begins only with a Weeping of that Corner, and is not discovered till it affects the Eye with Redness; and then by Pressure with the Finger upon that Canthus, a mixed Matter may be discharged, Part of which is not unlike the White of an Egg. Sometimes this Matter eats quite through the Bone, and discharges itself downwards through the Nose, with a fetid Smell.

Fistulae Lachrymales are difficult of Cure, from what Cause soever they arise, the Part being loose and spongy, and the Eye very sensible, and the Laxity of the Part makes Humours subject to soak into it, and to penetrate even to the Bone itself. The Sensibility of the Eye renders it subject to Pain and Fluxion, and, also, unfit to be dressed with sharp Medicines, such as these Diseases require. That Fistula which is recent, with sufficient Opening, is the easiest of Cure. Those of a long Continuance are for the most part accompanied with Ulcerations of that Gland, and Caries in the Bone, which makes them subject to a Weeping after they are cured. If the Ulcer be accompanied with Erosion, it will be subject to terminate in a Cancer.

The Indication of Cure is taken from the Condition of the Ægilops; whether it be in its Beginning with Inflammation, or by Congestion, passing its Matter forth under the Cilium in the Eye; into which Case it is fistulated.

In the Beginning of the Ægilops Bleeding by Lancet is necessary, and so is purging; also, such Alteratives as have been prescribed in the general Cure of Strumæ, with Regulation of Diet accordingly.

You may attempt to resolve the Humour by some gentle Anodyne, and discutient Cataplasma; but if it inflame and suppurate, you must hasten the Maturation, as well as the Discharge, because of the Part it lies upon, and the Danger thence arising from delaying the Evacuation. Having dilated the Sinuosity, and digested the little Abscess, you may try a Sarcotic of Myrrh, Aloes, and Sarcocolla, made up with Honey of Roses, or a Tincture of the said Gums in Wine, mixed with equal Parts of the Honey. But when, notwithstanding your Endeavours to incarne and agglutinate, the Matter still continues to discharge, not only by the outward Orifice, but, also, under the Cilium into the Corner of the Eye, you may try some more powerful Desiccative; such is the Solution of the *Lapis medicamentosus Crollii*, in Plantane Water, or a strong Lime-Water, assisted by a suitable Compression on the Cavity; for which a late-invented Instrument, by the Screw, has been admirably well contrived and adapted.

These Remedies failing, let it be considered, whether you have a good Foundation to heal upon; and having made Trial with your Probe, if you discover any Roughness on the subjacent Bone, or if the same be made bare by the Acrimony of the Humour, it will be to little Purpose to proceed farther in the above Method, till by a fine-pointed actual Cautey you have dried it, and fitted it for Desquamation, or perforated quite through, thereby deriving the Matter by the Nostril, and disposing the Caries to throw off that Way; when your outward Ulcer, which before had baffled your Endeavours, will heal up with the milder Epulotics, or perhaps with a little dry Lint, without any farther Disturbance.

In the Use of Medicines to this Part, you must not only have Regard to the Eye itself, but to the Gland and its Caruncle; for if they happen to be too detersive, corrosive, or sharp, there may be Danger of a Rhyas, or Consumption of the Part; as by the Digestive and Sarotic too long continued, an Encanthis, or too great Prominence may ensue; for which, as Incarnatives will be wanted for the former, so Cathartics will be required for the latter.

OF THE SCROPHULOUS TONSILS.

The Tonsils, or Almonds of the Ears, are, also, frequently swelled in the King's-Evil. These Swellings are raised by Congestion, gradually, without Pain, and, therefore, are seldom taken Notice of, till by their Growth they bring Inconveniencies with them; as a Catarrh, Cough, or Difficulty of Deglutition, insomuch, that the Drink often runs out at the Nose.

These differ from the common Swellings of the *Amygdalæ*, as Tumors by Congestion do from those made by Fluxion; which latter are of sudden Growth, and terminate as soon; whereas the other may have been many Years growing; increasing and decreasing with the Moon, as generally all Tumors by Congestion in the Glands do. The Causes of Tumefaction of these Glands are the same with those of the Strumæ.

They are soft, fleshy Tumors, of a round or oval Figure, retaining the natural Colour of the Skin, and have little Sensation; so that you may pierce the Body of them with a Knife or Probe, without causing Pain or drawing Blood; yet are they subject to Inflammation, and the like Accidents that other Swellings of the Glands are.

If the Tumefaction be small, the Disturbance is little; many having had them from their Infancy without great Inconvenience. If the Swellings be big, there may be Danger of Suffocation. But in that Case they may be extirpated without running great Hazard.

In order to the Cure, Physicians generally prescribe Venesection, and Evacuation by Clysters and lenient Purges: They, also, endeavour Derivation by blistering, cupping, Fontanels, and the like, which is necessary, in which astringent Lotions may be, also, proper. But in those made by Congestion, the speediest Way of Cure is by Extirpation; and that either by Abscission, at once cutting them off, or by actual or potential Cautery. Modern Writers have said little of these Extirpations. *Fabricius, ad Aquapendente*, makes the Abscission of them both difficult and dangerous.

The Extirpation of them may be attempted by the Actual Cautery, passing it through a Cannula, and twice or thrice perforating the Body of the Tonsil; but some Remains of the Excrecence will be left. The Way of Potential Cautery, is by working with a caustic Stone, and other Escharotics, fixed in such an Instrument as may serve to eat into them, without offending the neighbouring sound Parts. To this Purpose, make way into the Body of the Gland, consuming it within; and at last the Shell, or exterior Part, falls in Pieces, and is so eradicated. The Way by Excision is, by making a Ligature about the Basis of them, and snipping them close off with a Pair of crooked probe Scissars. In this Work you ought to consider well, how they are eradicated; for sometimes they are rooted like a Crista, deeper in the Throat; in which, if in cutting them you only cut that Part you tied, and cut the Ligature at the same Time, it will slip down into the Throat, and hazard their choaking. Therefore, while you hold the Ligature with one Hand, you must pass the Scissars down as close by the Basis of it as you can, so as by one Strip you may cut it clear off. But lest you should fail, it will be necessary to have another Ligature fitted in an Instrument for your Purpose, and the Patient's Head to be held steady, that in case you fail in the first Attempt, and it fall into the Throat, you may readily return it, and tie it at the same Time; which is no difficult thing to do. The Excision made, the Bleeding will be soon stopped by Gargling with Oxycrate; and you may cicatrize it in, few Days, by touching it with the Vitriol and Alum Stones.

OF THE STRUMOUS RANULA.

The Ranula is a soft Swelling, possessing the salival Glands under the Tongue, sometimes on one Side, at others on both Sides of the Frenum. It is made by Congestion, and in its Progress fills up the Space between the Jaws, and makes a Tumor externally under the Chin. It is a soft Tumor, without Pain or Alteration of Colour in the Skin, yielding to the Impression of the Fingers, but rising on taking them

off. It contains a Matter not unlike the White of an Egg, or such as we meet with in an Atheroma. By raising the Tongue, it obstructs the Freedom of its Motion, and occasions a thick Speech, which some have fancifully compared to the Croaking of Frogs; others, from a supposed Resemblance that this Tumor has to that Creature, will have it thence denominated *Ranula*. It is not dangerous as to Life, but difficult of Cure.

As for Topics; they seldom have much Effect, especially when it has been of long standing. However, some of the volatile, or of the fixed Salts, with certain Aromatics and stiptic Powders, may be held under the Tongue, to attenuate and discuss the viscous Humours; such as Sal-Ammoniac, Sal-Gem, the Powder of the Root of Ginger, Cloves, Pomegranate Peel, dried Hyssop, Powder of Galls, and the like. These, with others of the like Nature, having been ineffectually tried, the Tumor must be opened, and the Contents discharged, either by a pointed actual Cautery, which is commonly used, or by Incision.

That Stones are formed about this Part, the Tonsils, and others adjoining, some of them gypseous, or brittle, like the Gout-Stones, others more solid, like these found in the Bladder, we have many Examples; and that Struma's are liable to such Concretions, is less surprizing, if we consider the Proneness of their Juices to Coagulation.

OF THE STRUMOUS OZÆNA.

The Ozæna is an Ulcer of the Nostrils, so named from its fetid or strong Scent; which, if strumous, has usually the same Attendants for its diagnostic Signs, with the Ophthalmia. It admits of a doubtful Prognostic, being a stubborn Malady, hard to cleanse, so as to get a firm Foundation for healing upon; and, when of long standing, a Work difficultly accomplished.

In the Cure, the usual Evacuations by bleeding and purging may be necessary to carry off the Humour other Ways, while the same antistrumatic Alteratives are prescribed, as for the other Species. Having loosened the crusty Matter usually stopping up the Passage, by putting up a little Oil, a Bit of fresh Butter, or throwing up some emollient Injection, such as the Decoction of Mallows in Barley Water, you are, after thus digesting, to mundify, or deterge, by another Decoction of the Leaves of Agrimony, Plantain, Lesser Centaury, and St. John's Wort, adding to the strained Liquor a little of the Honey of Roses, from an Ounce to half a Pound; or if the Ulcer be putrid, half an Ounce of the Tincture of Myrrh and Aloes, more or less, according to the Degree of Putrefaction, and the Sense of the Part; may be added; as, also, of the Unguentum *Ægyptiacum*, an Ounce or more, especially the *Mel* thereof fluctuating on the Top, which may be farther increased, and is a most suitable Medicine, not only for the fordid Ulcers of this Part, but of the Throat also.

The Ulcer being deterged, we may attempt to heal it with the Ointment of Tutty, thrust up with a Tent, or some other Epulotic, which availing not, a stronger Desiccative must be used, as a Solution of the Lapis Medicamentosus, or the Lime-Water, with a little Honey of Roses; likewise a strong Tincture of Rose-Leaves, Pomegranate Peel, and Flowers of Balaustines, drawn in the Forge-Water, or a rough stiptic Wine. This Tincture may be thrown up with a Syringe, made with a Snout for that Purpose.

But when these, and other Errhines of the like drying Nature, succeed not, we have recourse to the cinnabarine Fumigation. Some have recommended the Fume of a Wax-Candle burnt under the Nostril, for the same Intention.

But observe, that in setting about the Cure of this Disease, as well as the Ophthalmia, with others of the same Kind, you must be careful to distinguish the venereal from the strumous; for as in the first, we can do nothing without Mercurials; so in the last, together with them, we are to direct some antistrumatic Remedies between whiles.

For the Labrifulcium, or chopped Lip, see *LABRISULCIUM*. *Wifeman and Turner*.

Those Tumors are called strumous or scrophulous, which appear externally, on the anterior and lateral Parts of the Neck. Of these Tumors there are different Species; some are small, some of a moderate Size, and some surprisingly large; some are soft, others hard; some are moveable, others immoveable; some are favourable, others malignant. Scrophulous Tumors arise in indurated Glands of the Neck; sometimes in the small moveable Glands; sometimes in the superior and inferior salival Glands, and sometimes in the Thyroid Glands, which last are by some particularly called *Scrophulæ*.

le, or the King's-Evil; and by the *French, Ecouelles*. Some are of the same Nature with encysted Tumors, containing a Substance sometimes harder, and sometimes softer, like Cheese, Suet, or Lard. But when a Tumor arises in the anterior Part of the Neck between the Skin and the Aspera Arteria, and is distended with Air, Humors, or a thick Matter, having been occasioned by a Strain, in lifting a Weight or the like, it is named a Bronchocele. It is proper to observe, that some Nations are almost free from this Distemper, whilst others are severely afflicted with it. Among the latter may be reckoned the *Spaniards*, and among the *Germans*, the Inhabitants of *Styria, Swabia, Bavaria, and Switzerland*; but above all, those of *Tyrol*, among whom the strumous Swellings increase to such a prodigious Size, as to hang down to the Belly or Navel, and sometimes to the Knees. This Species is always flaccid. The Cause of this Disorder raging in particular Places, is ascribed to the Nature of the Air, and of the Water. But the Manner in which these operate, has not yet been sufficiently explained by Medicinal Writers, although many specious Opinions have been offered. In some Women these Tumors appear in different Parts of the Neck after a difficult Labour. Besides the Differences already mentioned, some are mild and almost without any Pain or Inconvenience; some are attended with Inflammation and Pain; some become indurated, like a Scirrhus, and obstruct Respiration and Deglutition, or being entirely malignant, gradually degenerate into a Cancer. But to whatever Species they belong, when they become inveterate, they seldom or never are cured; but when they are recent, they may be discussed, especially when the Tumor proceeds from an Induration of the Glands.

In order to the Cure of a recent Struma, it is not only necessary to prescribe an exact Regimen of Diet and Way of Living; but also to remove the internal Cause by digestive, sudorific and purgative Medicines, agreeable to the Age and Constitution of the Patient. Such internal Medicines should, also, be assisted with the following Ointment externally applied.

Take of crude Mercury, one Ounce; Venice Turpentine, two Drams; Hogs-Lard, a sufficient Quantity to reduce them into an Ointment, in a Glass Mortar.

Let the Tumor be anointed with this Ointment several times a day, and apply the *Emplastrum de Ranis cum Mercurio*, mixed with a little Roman Vitriol, or the Plaister of Galbanum, of Sperma Ceti, of Henbane, or of Soap. It will, also, be necessary to exhibit a proper Cathartic once or twice a Week, lest the Mercury, mixed with the Ointment, should occasion a Salivation. *Scultetus* and *Fabricius ab Aquapendente*, prefer the following Ointment in this Case.

Take of the Oil of Bays, one Ounce; Rock-Allum, half an Ounce; common Salt, two Drams; make them into an Ointment.

Others, not improperly, apply *Oleum Philosophorum*, or *Petroleum Album*, either alone or mixed with the Oil of Soap. Some advise to apply to a recent strumous Tumor or Bronchocele, a leaden Collar or Plate of Lead anointed with a mercurial Ointment, and secured by a proper Bandage; by which, if the Tumor is not entirely discussed, its Increase is at least prevented. Some superstitious Remedies are advised in this Case, which are supposed to act by Sympathy, such as drawing the Hand or Bone of a dead Person gently over the Tumor, with others of the same kind not worth mentioning.

If the strumous or scrophulous Tumor has been of long Continuance, but moveable, the Knife becomes preferable to Medicine, because it may then be entirely rooted out by Incision. But if it be entirely fixed and deeply seated in the Neck, a Cure can scarcely be expected unless they be soft; for in this Case the large Blood-Vessels and Nerves are exposed to the utmost Danger of being divided, or at least wounded, if Incision be attempted; the Consequence of which would be some violent Disorders, or even Death itself. *Garengot* and *Petit* affirm, that no indurated or scirrhus Glands, not even those which are immoveable, are connected with, or rooted in the sound Parts; and therefore Extirpation may be safely used in fixed strumous Tumors. But as they have given us no Instances of their Success from this Opinion, it must, at least, be looked upon as doubtful and uncertain. When the Tumor hangs by a slender Part, like a Stalk or Root, (which is not a frequent Case) it may be extirpated with a Ligature. But if it be connected with a broad Root, a longitudinal or crucial Incision, if the Swelling be very large, must be made through the Integuments, to the Bag of the Tumor, from which the Lips of the Wound must be sepa-

rated with the Knife. It may then be extracted, like other encysted Tumors, with the Hand, or a Hook, or a threaded Needle, or with a proper Forceps. (See *Tab. 44. Fig. 1.*) Mean while Assistants should be ready with Linen-Cloaths, or a Sponge, for wiping the Blood from the Wound, which might otherwise obstruct the Surgeon in the Operation. If a large Blood-Vessel should happen to be divided with the Root of the Tumor, it must be closed by applying rectified Spirit of Wine, or some other styptic Liquor; and if these fail, by a Ligature or the actual Cautey. As the divided Skin is now more than sufficient to cover the Wound, the superfluous Part must be cut off, and enough left to induce a Cicatrix; then the Lips may be brought into Contact, and the Wound may be healed by a sticking Plaister, as in other Wounds. Soft Tumors of the strumous and scrophulous Kind, I have opened with the Knife or Cautey, extracted the contained Matter, deterged the Wound, and healed it, as before. As these Tumors are often attended with little or no Pain, it is not surprising that they should be often neglected, especially by the poorer Sort of People, who disregard the Deformity produced by them, and are apprehensive of the Torment they must undergo in the Cure. Such a Neglect is still less surprising, if these very Tumors should be esteemed a considerable Ornament, as they are by the *Tyrolese*. If the Patient be afraid of the Knife, Tumors of this Kind, which are mild, soft, not connected with large Veins, nor deeply seated, may be removed by Caustics. *Heister's Surgery*.

SCROPHULARIA.

The Characters are;

The Calyx is monophyllous, consisting of five long, slender, obtuse, or acute Segments. The Flower is monopetalous, anomalous, open on both Sides, generally globular, bilabiated, pitcher-shaped; the upper Lip trussed up with two small Leaves, in Form of Ears, and the Beard bent downwards, with wide Fauces; from the Inside of the Bottom of the Flower arise four Stamina. The Fruit is round, acuminate, cleaving into two Parts, and divided by an intermediate Partition.

Boerhaave mentions fifteen Sorts of *Scrophularia*, which are;

1. *Scrophularia*; annua; folio Urticæ. *M. H.* 2. 481.
2. *Scrophularia*; annua; folio Lamii; flore luteo, *M. H.* 2. 482.
3. *Scrophularia*; nodosa; sætida. *C. B. P.* 235. *Boerb. Ind. A.* 234. *Tourn. Inst.* 166. *Scrophularia*, Offic. *Scrophularia major*, *Ger.* 579. *Emac.* 716. *Raii Hist.* 1. 764. *Synop.* 3. 283. *Scrophularia major vulgaris*, *Park. Theat.* 610. *Scrophularia vulgaris* & *major*, *J. B.* 3. 421. FIG-WORT.

Figwort has tall square Stalks a Yard or more high, with two Leaves set opposite at a Joint, which are at some Distance; they are each Pair set on a contrary Position, on short foot Stalks from a broad Base, ending gradually in a sharp Point; they are serrated about the Edges, and frequently of a brown Colour, with a Smell like Elder. The Flowers grow on the Tops of the Branches in small Clusters, of a purplish dark Colour, being monopetalous, and, as it were, labiated with a gaping Mouth. The lower Part is round and hollow; the upper flat, and cut into two Parts. The Seed-Vessels are roundish pointed, cut into two Parts, full of small brown Seed. The Root is long and spreading, full of white Knobs. It grows in the Hedges and Thickets, and flowers in June.

This Plant, from the Signature of the Root, is accounted good for scrophulous Tumors, or the King's Evil in any Part of the Body; as also for the Pain and Swelling of the Hæmorrhoids, or Piles either used inwardly or outwardly; as also for cancerous stubborn Ulcers. *Miller's Bot. Off.*

Its Leaves are very bitter and stinking, even more than those of Elder, and give but a very faint Tincture of red to the blue Paper; the Root gives it a deeper, which makes us conjecture that the Sal Ammoniac, which is naturally in the Salt of the Earth, predominates in this Plant, where it is united with a great deal of fetid Oil.

By the chymical Analysis, we obtain from this Plant a great deal of volatile concrete Salt and Oil. Thus it is no Wonder, that it should be so resolvent, emollient, and sweetning. These Qualities are essential to Medicines which are to dissolve the most obstinate Tumors, accompanied with Inflammations, and those, also, which are called cold. The fetid Oil softens the Fibres, diminishes their Tension, and lenifies; whilst the Sal Ammoniac attenuates, divides and evaporates the Matter that is lodged in the Pores of the Flesh. The greatest Part of Plants that smell like Elder, or the *Stramonium*, have almost the same Virtues, with reference to Inflammations and Tumors, and none are more proper for Wounds in the tendinous Parts. The Juice of this Plant is used to cleanse the most putrid Ulcers; and even those that this

are carcinomatous. The Ointment made with the Roots of this Plant, is used to resolve scrophulous Tumors, and assuage the Inflammation of the Piles. The Parts, also, must be a little strewed with the Powder of the same Roots.

Figwort Ointment, according to *Tragus's* Method, is made thus: Draw the Juice of the whole Plant in *May*, and keep it a whole Year in a Bottle well stopped; then mix it with an equal Quantity of Oil and new Wax. The same Author affirms, that he has seen it cure all Sorts of Scabs and itching Humours, even such as are but a little different from the Leprosy. He recommends the distilled Water of it very much for Pimples and Redness of the Face. The Author of the *Hist. Lugd.* advises to make the Ointment of Figwort after this manner: Take up the Roots in Autumn, bruise them with fresh Butter, and put them a Fortnight in a Vault, in a Stone-Pot well stopped; then dissolve them over the Fire, and keep this Ointment, after having strained it through a Cloth. If you follow *Tragus's* Method, you must put some Oil upon the Figwort Juice, to keep it from growing mouldy, or else mix it with a sixth Part of Spirits of Wine. If you keep this Ointment according to the *Hist. Lugd.* instead of bruising the Roots with fresh Butter, and putting them in a Vault, they must be put in Digestion in *Balneo Mariae* for three Days in a Glass Cucurbit, with its Chapter. These Ointments are excellent for the Gout, Piles and Tetters; but at the same time that they are used, a Dram of the Powder Root of Figwort, mixed with some convenient Conserve, should be taken in the Morning; or else the Patient should drink a Glass of Wine, in which the Root has been infused a whole Night. *Martyn's Tournefort.*

The *Scrophularia* has its Name from its nodous Root, whose white Knobs resembling the Tumors of the *Scrophula*, which this Plant is said to cure, gave Occasion for the Appellation. The Root cures strumous Swellings, and the Hemorrhoids, and is of Use in cancerous and inveterate creeping Ulcers, and a malignant Itch. If any Person, also, be afflicted with the tormenting Pain of the blind Hemorrhoids, let him take but a very small Quantity of the Root or Leaves of *Scrophularia* in his Meat or Drink, and he will immediately receive Ease; or let him take the Plant in Substance either dry or green, or its Decoction. This is an Observation of *Hen. ab. Heers*, who says he has had repeated Experience of the Truth of it. The Powder of the dried Root applied cures the Hemorrhoids; a Dram of the same taken inwardly, expels Worms from the Belly; the distilled Water of the Root, takes off the Redness of the Face.

The following Plaister for the Scrophula, or King's Evil, is the Prescription of *Dr. Sibbald*, in his *Prodromus Histor. Natural. Scotiae*.

Take Fat of Swine, one Pound, and dissolve it over a gentle Fire; then take Leaves of *Scrophularia*, Hounds Tongue, Flowers of the white *Lamium*, of each an equal Quantity; cut them very small, and boil them in the Fat over a gentle Fire, repeating the Boiling three or four Times, till you have an Ointment of a deep green Colour. Then weighing the Ointment, take half its Weight in Wax, as much Rosin, two Ounces of Turpentine, and an Ounce of Verdigrase. Dissolve them all together, then strain it through a Linnen Cloth, and make thereof a Mass, of which spread a sufficient Quantity upon Leather, and apply to the Place. *Raii H. P.*

4. *Scrophularia*; radice fibrosa. *Boerb. Ind. A.* 234. *Betonica aquatica*, Offic. Ger. 579. Emac. 715. *Betonica aquatica major*, Park. Theat. 613. *Scrophularia aquatica major*, C. B. P. 235. *Raii Hist.* 1. 764. Synop. 3. 283. *Tourn. Inst.* 166. *Scrophularia maxima radice fibrosa*, J. B. 3. 421. *Yquetoya Brasiliensis*, N. MSS. D. Tanc. Robinson. M. D. WALTER BETONY.

This has larger and taller Stalks than the former, less-branched, having larger Leaves, round-pointed, and in Shape like *Betony*, growing on longer Foot-stalks. The Flowers are in Shape like the former, but little larger, and of a redder Colour. The Seed-Vessels and Seed much alike; but the Root has none of the Knots, or Tubercles, and it grows by watry Places and Ditch-Sides, and flowers in *June*. The Root is used.

It is much of the Nature of the former, and where that is not to be had, it may supply its Place. It is, likewise, deterfive and vulnerary, and is commended by some as good against the Itch. *Miller's Bot. Off.*

This Plant stinks, is bitter, deterfive, and gives hardly any Tincture of red to the blue Paper; so that it is probable it may contain some Sal Ammoniac, mixed with fetid Oil and Earth. Thus it is no Wonder that it should be deterfive and vulnerary. It has the same Virtues with the *Scrophularia major*. *Martyn's Tournefort.*

5. *Scrophularia*; nemorensis; folio *Urticae rugoso*; flore atropunicante.

6. *Scrophularia*; *Melissae folio*. T. 166.

7. *Scrophularia*; *Hispanica*; *Sambuci folio glabro*. T. 166.

8. *Scrophularia*; maxima; *Lusitanica*; *Sambuci folio lanuginoso*. T. 167.

9. *Scrophularia*; *Ruta caninadicta*; vulgaris. C. B. P. 236. *Ruta canina*. Clus. H. 209.

10. *Scrophularia*; *Lusitanica*; frutescens; *Verbenacae foliis*. T. 167.

11. *Scrophularia*; *Orientalis*; foliis *Cannabis*. T. Cor. 9.

12. *Scrophularia*; *Nebrodenis*; folio *Urticae*; altissima; flore *Phæniceo*. H. Cath. H. *Maurocen.* 158.

13. *Scrophularia*; peregrina; frutescens; foliis *Teucrii crassifolius*. *Breyn. Prodr.* T. 166.

14. *Scrophularia*; subrotundo, crasso, & nigricante folio; flore luteo-pallido; capsula turgida. *Bacc. Mus.* 2. 65. T. 60.

15. *Scrophularia*; *Hispanica*; foliis tenuissimis. *Salvad. Boerb. Ind. Alt. Plant.* Vol. 1.

This Plant takes its Name *Scrophularia* from *Scrophula*, because by its Inequality it resembles the *Scrophula*, and not because it cures scrophulous Tumors about the Neck, as the common Opinion is. The third Species is the *Scrophularia major* of the Shops; but the *Scrophularia minor* is the same as the *Che-lidonium minus*.

The *Scrophularia* is of an acrid and aperient Quality, accompanied with a copious Mucus; whence it is an effectual Lenitive in all Pains proceeding from a peccant Acrimony, mitigating the same, as well as dissipating any gross Matter. A Cataplasm thereof is of universal Esteem for discussing, resolving and maturing, though the Humour be of considerable Hardness. The Leaves, dried in the Shade, retain their corroborating Virtue. The Powder sprinkled on watry Ulcers, closes and conglutinates them, and is proper in a Dilatation of the Hemorrhoids. The third is commended for curing all Strumæ, and resolving hemorrhoidal Tumors. The fourth takes off the nauseous Taste of *Senna*; and because no Cathartic is in better Esteem than *Senna*, a certain Surgeon made a profitable Secret of it, but was discovered by a Botanist, who, by putting the Leaves in Water, found it to be this Plant, and by the same means discovered whence *Senna* had such an Effect. In order, therefore, to take off the nauseous Taste of *Senna*, as well as perfectly to remove its Acrimony, by which it is offensive to the Brain and Nerves, to two Drams of *Senna* add half a Dram of this Plant. The Leaves fresh bruised and applied, cure the Hemorrhoids and Corns in the Feet. *Hist. Plant. Ascript. Boerhaave.*

SCROTOCELE. A Hernia of the Scrotum.

SCROTUM.

The Scrotum is the cutaneous Covering of the Testes outwardly. It is a Bag common to both, formed by a Continuation of the Skin of the neighbouring Parts, and commonly very uneven, having a great Number of Rugæ on its outward Surface. Interiorly it is fleshy, and forms a Muscular Capsula for each Testicle, termed Dartos.

The exterior or cutaneous Portion of the Scrotum is nearly of the same Structure with the Skin in general, of which it is a Continuation, only it is something finer; and it is likewise plentifully stored with sebaceous Glands and Bulbs, or Roots of Hairs.

Though it is a common Covering for both Testicles, it is nevertheless distinguished into two lateral Parts by a superficial and uneven prominent Line, which appears like a kind of Suture, and from thence has been termed Raphe.

This Line is a Continuation of that which divides, in the same manner, the cutaneous Covering of the Penis; and it is continued through the Perinaeum, which it divides, likewise, all the way to the Anus. It is only superficial, and does not appear on the Inside of the Skin.

The inner Surface of this cutaneous Bag is lined by a very thin cellular Membrane, through which the Bulbs and Glands appear very distinctly, when we view its Inside. The Rugæ of the Scrotum are in the natural State commonly a Mark of Health, and then its Size is not very large. It increases in Size, principally according to its Length, and then the Rugæ disappear, more or less, according to the Degrees of the preternatural State or Indisposition. *Winslow's Anatomy.* See DARTOS.

For the Dropsy, and *Paracentesis*, of the Scrotum, see HERNIA. And for proper Bandages for the Scrotum, see FASCIAE.

SCRUPULUS. A Scruple; a Weight equal to twenty Grains. It is the third Part of a Dram, and the twenty fourth of an Ounce.

SCUMA. The same as *Squama*. A Scale. *Rulandus.*

SCUTA TABESI. A Tortoise. *Rulandus.*

SCUTALIS CARTILAGO. The Scutiform Cartilage, at the inferior Part of the Sternum. From *Scutum*, a Shield.

SCUTELLARIA. See CASSIDA.

SCUTIFORME OS. The *Patella*.

SCUTIFORMIS CARTILAGO. The same as *Scutalis Cartilago*.

SCUTUM. A Shield. The *Patella*, is, also, sometimes thus called.

In Pharmacy, a *Scutum*, or Shield, is a pretty solid stomachic Topic, made in the Form of a Shield, and may be either prepared by Way of Bag or Plaster. The former is to consist of hot stomachic Powders, of a corroborating Quality, and the latter, of a due Mixture of Mastich, some stomachic Powder, and the odorous Gums, with a proper Quantity of Turpentine. The Topics of this Kind are used after purging, in order to corroborate the Stomach, correct a cold Intemperature, restore Digestion, and prevent vomiting, *Morelli, Form. Remed.*

SCYBALA. σκυβάλα. Excrement indurated in Lumps.

SCYBELITES. σκυβελίτης. A Sort of Must, which distils spontaneously from Grapes, without pressing.

SCYLACION. σκυλάκιον. The Flesh of Puppies. *Hippocrates.*

SCYROS. σκυρος. A Scirrhus. *Hippocrates.*

SCYTALA. A Sort of Serpent, resembling the *AMPHISBOENA*, which see.

SCYTALIDES. σκυτάλιδες. The Phalanges of the Fingers.

SCYTALION. A Name for the *Cotyledon*, or *Umbilicus Veneris*. *Oribasius, Medicin. Collect. L. 11.*

SCYTHICA RADIX. Liquorice. *Blancard.*

SEB. Gold; or *Alum*. *Rulandus.*

SEBEL. The Arabic Name for the Disorder of the Eye called a *Pannus*.

SEBESTEN. See *MYXA*.

SEBUM. Suet. Suets are esteemed emollient, discutient, and somewhat astringent. That of the Stag, Fallow Deer, Goat, Kid, Sheep, and Cow, are used in Medicine.

SECACUL. A Name for the *Tordylium*; *Oriente*; *Secacul Arabum dictum Rauwolfio*.

SECALE. The Characters are;

It has all the Characters of Wheat, only it has a flatter Spike, which is always bearded with a thinner and more naked Grain.

Boerhaave mentions ten Sorts of *Secale*, which are;

1. *Secale*; *hybernium*; *vel majus*. *C. B. P. 23. Theat.*
425. *Tourn. Inst. 513. Boerb. Ind. A. 2. 156. Secale, Offic. Ger. 61. Emac. 68. J. B. 2. 416. Raii Hist. 2. 1241. Synop. 3. 388. Secale vulgatius, Park. Theat. 1128. RIE.*

Rie grows taller than any other *English* Corn, with a bearded Ear, slenderer than Wheat, and having a smaller darker Grain. It is a Winter Corn, and ears a Month earlier than Wheat, it being a common Saying, That *April* never goes out without an Ear of *Rie*, nor *May* without an Ear of Wheat.

Rie is more used for Bread than for Medicine, tho' it is less nourishing than Wheat, and subject to cause Gripings in those not used to it.

The Farina is sometimes prescribed outwardly in Cataplasms against Tumors and Inflammations. *Miller's Bot. Off.*

Secale is so called a *secundo*, "from cutting;" for there being two Sorts of Fruits of the Earth, the *frumentaceous* and *leguminous*, the latter are gathered, (*leguntur*) or pulled by the Hand, but the *frumentaceous*, such as *Rie*, and other like Grain, are cut (*secantur*) or reaped.

There are two Species of *Rie* observed by *C. Baubine* and *Miller*; one the common, or Winter *Rie*; the other the lesser, or Spring *Rie*. The first is sown in Autumn, as Wheat; the other may be sown in the Spring, in the Season for Barley; but those seem to differ only in the Time of Sowing, and the Accidents thence produced.

Rie holds the next Place to Wheat among *frumentaceous* Grain; the Bread made of it is black and heavy, and has something of an obstruent Quality, is difficult of Concoction, and heavy upon the Stomach, especially if it be not cleansed from the Bran, and generally provokes to Stool, not without Gripings, to such as are not used to it. The Country People are persuaded that the Use of Bread made with *Rie* strengthens the Body. And *Brucerus* assures us, that in the County of *Lyons*, and the neighbouring Parts, the Women who feed on *Rie*-Bread, are strong, jolly, and handsome, tho' at the same Time he supposes, that this affords but a very mean Aliment to the Body. Some prefer Bread made of *Rie* to what is made of Wheat or Spelt, on account of its Moistness, and because it is not so soon dried with the Air.

The People of our Country, says *Baubine*, use to mix with this *Rie* an equal Quantity of Meal of Wheat or Spelt, that the Bread may the longer retain its Softness, and be the lighter and more grateful to the Taste; and the Bread so prepared is,

by Advice of the Physicians, much used by Persons of Quality, especially in Summer.

Here in *England*, and, as *Ruellius* says, in *France*, we sow not only *Rie* by itself, but mixed with Wheat, almost in equal Quantities; and this Mixture we call by a Latin Name, *Miscellane*, and in some Places *MUNG-CORN*.

The Meal of *Rie*, not cleansed from the Bran, bound about the Head in a Linnen-Cloth, is a very certain and approved Remedy in an inveterate Pain of the Head, and is observed, also, to be of Service in a Delirium, especially if mixed with some Tops of Wormwood. *S. Paulli*. It is usual among the common Sort, to put some dry Meal of *Rie* in a Linnen-Cloth, and apply it to the Place affected with an Erysipelas, and by that means to discuss it.

By immoderate Rains, the lower Corn of the Ears of *Rie*, when ripe, grow out into a black purple Grain; or as *C. Baubine* expresses it, some Seeds are protruded a considerable way out of their Husks, and grow to a considerable Bulk; and some of them are bent in the Figure of a Horn; all which contract a black Colour on the Outside, but contain within a white farinaceous Substance, of a pretty close Contexture; of the Taste of Malt, called in some Parts of *Germany* *MUTTERKORN*, that is, the *Mother of Rie*, and esteemed a sovereign Remedy in an immoderate Flux of the *Lochia*. This degenerate *Secale* is, by *C. Baubine*, called *Secale Luxurians*; and by *Lonicerus*, *Clavi Siliginis*. It is proper to enquire whether the Excrescences be occasioned by the Puncture of an Insect. *Raii Hist. p. 1741.*

2. *Secale*; *vernum*; *vel minus*. *C. B. P. 23. M. H. 3. 179.*

1. *Gramen*; *spicatum*; *secalinum*; *latifolium*; *maritimum*; *spica brevior*. *T. 518. Spartium maritimum; frue oceanum, latifolium. J. B. 2. 512.*

2. *Gramen*; *spicatum*; *secalinum*; *maritimum*; *maximum*; *spica longior*. *T. 518. Spartium, spicatum, pungens, oceanum. J. B. 2. 511.*

3. *Gramen*; *spicatum*; *secalinum*; *maritimum*; *maximum*; *spica laxior*. *T. 518. Spartium, Hollandicum, maximum, maritimum; spica secalina. Raii Hist. 1260. Meth. 172.*

4. *Gramen*; *Spartium*; *Juncifolium*. *C. B. P. Theat. 69. Spartium; parvum Lobelii. J. B. 2. 513.*

5. *Gramen*; *Spartium*; *Hollandicum*; *folio capillaceo*; *minus*. *C. B. P. 5. Prodr. 11. No. 30.*

6. *Gramen*; *Spartium*; *Hollandicum*; *variegatum*. *C. B. P. 5. Theat. 72.*

7. *Gramen*; *spicatum*; *aristis longissimis*; *setas equinas referentibus*.

8. *Gramen*; *Spartium*; *pennatum*. *C. B. P. 5. Spartium, Austriacum, pennatum. Clus. H. 221. Boerb. Ind. Alt. Plant. Vol. 2.*

The Seeds of *Rie* yield a Meal, with a proper Bran belonging to it, of which Bread is made, which is of excellent Service in such Cataplasms as are emollient and resolvent. The Crust of it toasted, cleanses the Teeth. The Bread is less nourishing, and not so soon digested as that of Wheat, but is very loosening, and good for those who are costive. The Bran is detestive and emollient, and of Service in a Diarrhæa and an inveterate Cough. *Hist. Plant. ascript. Boerb.*

SECAMONE. The Name of a Species of *Egyptian Apocynum*, called by *C. Baubine*, *Apocynum angusto salicis folio*. It grows in *Egypt*, and is remarkable for a yellow hot Juice which flows from it, and which, when dried, is said to purge off powerfully thin Humours. *Raii Hist. Plant.*

SECANIABIN. Oxytel. The Word is Arabic.

SECESSUS, imports either an Abscess, or a Separation of Parts in a mixed Body; or a Stool.

SECHA. Wormseed. *Castellus* from *Ardoinus*.

SECLA. The same as SECALE. *Rye*.

SECRETIO. Secretion. See GLANDULA.

SECTA. A Sect. For an Account of the various Sects of Physicians, see THE PREFACE.

SECTACROA. The Flower of Nutmeg. *Donaus.*

SECUNDINÆ. The Secundines, or After-birth. See CHORION, AMNIOS, ALLANTOIS, and GENERATIO.

The Human Secundine is said to be of some Use in Medicine. Thus it is by some ordered to be applied, warm as it comes from the Uterus, to the Face, in order to remove Freckles. A Water is also distilled from it in Balneo Marie, for destroying Spots or Blemishes of the Face. When dried and reduced to a Powder, it is used internally against Epilepsies, for accelerating the Delivery of the Fœtus, and allaying the Pain of Wounds. The Dose of this Powder is from half a Scruple to two Scruples. *Lemery des Drogues.*

SECUNDIFORMIS. The same as CHOROCIDES.

SECUR. Gold. *Rulandus.*

SECURIDACA.

The Characters are;

The Flowers are disposed in Form of Rays, and the Pod is strait, flat, annulated, full of Joints, and containing in each Joint a rhomboidal Seed, emarginated inwardly.

Boerhaave mentions but one Sort of *Securidaca*, which is, *Securidaca lutea major*. C. B. P. 348. *Raii Hist.* 1. 921. *Tourn. Inst.* 399. *Boerb. Ind. A.* 2. 52. *Securidaca*, Offic. *Securidaca flore luteo, filiquâ latâ, oblongâ*; I. B. 2. 345. *Securidaca, Hedyfarum, Pelecinum*, Chab. 155. *Hedyfarum majus sive Securidaca major vera*, Park Theat. 1087. *Hedyfarum majus*, Ger. 1056. Emac. 1233. HATCHET VETCH.

It grows among the Corn in hot Countries, but is cultivated with us in Gardens, and flowers in June.

Securidaca, or *Hedyfarum*, is described by *Discorides* as a shrubby Plant, with Leaves like the *Cicer*, and Pods resembling a Horn, and containing a yellowish Seed; of the Figure of a two-edged Hatchet, whence it took its Name *Pelecinum*, [*πέλεκυς*, *Peleys* signifying a Hatchet, or Ax] and of a bitter Taste. It grows among Wheat and Barley.

Clusius says, that the Seed of no Plant better resembles the Hatchet of the Antients than this; and I, says *Dale*, am of this Opinion.

Securidaca taken inwardly, is good for the Stomach, and is an Ingredient in Antidotes. Used in a Pessary with Honey before Coition, it is supposed to prevent Conception. *Discorides*, Lib. 3. 146.

The *Historium Plantarum* ascribed to *Boerhaave*, says its Virtues are unknown.

Securidaca Egyptia. A Name for the *Senna*; *Orientalis*; *fruticosa*; *Sophera dicta*.

Securidaca dumetorum. A Name for the *Coronilla*; *herbacea*; *flore vario*.

Securidaca peregrina. A Name for the *Pelecinus*; *vulgaris*.

SEDAFF. *Rulandus* explains this *Concha marina*.

SEDALIA VASA. The hæmorrhoidal Vessels. *Willis*.

SEDANTIA. Sedative Medicines.

Sedative Medicines are such as are possessed of a Power not only of composing, checking, and allaying the exorbitant and irregular Motions of the Solids and Fluids, but, also, of alleviating and resolving the painful, spasmodic Structures of the Parts. As the Effects of these Medicines are very extensive, we may justly include in their Number, Paregorics, which not only gently relax and soothe the rigid Fibres, but, also, obtund the Acrimony of the Juices; Anodynes, which alleviate the Violence of racking Pains; Antispasmodics, which mitigate and remove the spasmodic Structures of the Parts; Antiepileptics, which check convulsive Motions; Hypnotics, which procure Sleep; and Narcotics, which induce a considerable Stupor of the Senses, and Torpor of all the Motions of the Body.

This sedative Quality is eminently possessed by the Roots of Piony, Valerian, and Mug-wort; the Herbs Clary, Basilicon, Night-shade, and Herb Paris; the Flowers of Sage, Bastard Dittany, the *Egyptian* Thorn, Meadow-sweet, Elder, the Lime-Tree, Piony, red Poppy, common Chamomile, Yarrow, Roses, Mallows, Lily of the Valley, Primroses, and white Lillies; all the Parts of the Poppy, such as its Seeds, Bark, Flowers, Juice, Opium and the Seeds of white Henbane, Dill, and Piony; the Barks of Elder, and the Lime-Tree: Among aromatic Substances, Saffron, Nutmegs and Mace; among Fruits, the Kernels of Cherries, Peaches, Bitter Almonds, and the Nux Vomica. To this Class, also, belong Asa-fœtida, Camphire, depurated and artificial Nitre, Preparations of Cinna-bar, and Substances obtained from Animals, such as Castor, Musk, Civet, human Fat, that of Dogs, Badgers and Foxes, Milk, Cream, the Yolks of Eggs, Earth-worms, and the Shavings of Bones, such as those of Hartshorn, of the Tooth of the Sea-Horse, of the Elk's Hoof, of the Animal Unicorn, of Ivory, of the Stone found in the Head of the Sea-Cow, and of the Human Skin: Among chymical and prepar'd Substances, my anodyne mineral Liquor, the Spiritus Nitri Dulcis, volatile Tincture of Sulphur, Laudanum Opiatum, the Laudanum of Sydenham, Laudanum impregnated with the Juice of Quinces, Hysteric Laudanum, Theriaca, Diacordium, the Theriaca Coelestis, the Pilulæ de Cynoglossa, the Pilulæ de Styrace, the Pilulæ Wildegansii, and the Pilulæ Starkei; the Syrups of red Poppies, Chamomile and Yarrow, the Oils of Henbane and Earth-Worms, the anti-epileptic Powder of *Dresden*, (the Basis of which consists of the Ashes of the Lime-Tree and Mug-Wort;) the cephalic Specific of *Michaeli*, the Pulvis Marchionis, the anti-epileptic Water of

Langius, Waters distill'd from the above-mentioned Flowers, and the Ointment of Poplar.

These Sedatives, in various Manners, exert their Efficacy both on the Solids and Fluids of the human Body. Thus Paregorics, by their mild, mucous, sulphureous and subtle Parts, by an immediate Contact, not only relax the indurated and spasmodically constricted Fibres, but, also, sheath up and obtund the vellicating Spicula, and consequently in Pains, painful Tumors, and acrid Defluxions, great Service is done by Cataplasms, Plaisters or Ointments, prepared with Saffron, the Flowers of common Chamomile, Melilot, white Lillies, Elder, Mallows and Poppies, the Leaves of Henbane, Milk, Cream, the Yolks of Eggs, and the Poplar Ointment for Burns, which is most commodiously prepared of Mallows, the Barks of the Lime and Elder Trees, Linseed Oil, and Wax.

As many Disorders and Symptoms arise, as from their proximate Cause, from spasmodic Strictures and Crispatures of the Vessels and nervous Parts, so Antispasmodics are of very extensive Use in Medicine, though they do not produce their Effects in one and the same Manner; for, by an immediate Contact, they either mollify and relax the tense, indurated, and constricted Fibres, as Milk, especially that of Asses, Oil of Sweet Almonds, Emulsions of Almonds, and of the four cold Seeds, the Fats of Animals, and the Cream of Milk; or by their mild, volatile Sulphur, they allay the tumultuous Commotions of the nervous Fluid: Of this Kind the most considerable are, Waters distill'd with Rain-Water, or May-Dew, from the Flowers of Sage, Bastard Dittany, the *Egyptian* Thorn, the Lime and Elder Trees, Meadow-Sweet, Peaches, white Lillies, common Chamomile, Cowslips and Yarrow; the Kernels of Peaches, Cherries, and Apricots; which Waters, on Account of their antispasmodic Virtue, are with great Benefit exhibited in convulsive and epileptic Fits; or some Antispasmodics produce their Effects by a certain subtle, volatile Sulphur, obtained from the animal Kingdom, and consequently more friendly to Nature, such as Earth-Worms, Castor, the Powders of the human Secundines, of the Intestines of Wolves, Vipers, the Shavings of the human Skin and Cranium, of the Elk's Hoof, of the Tooth of the Sea-horse, and of the Stone found in the Head of the Sea-Cow; as, also, Musk and Civet, which in epileptic and convulsive Motions, as, also, in chronical Epilepsies, are used with great Success.

Of an anodyne Quality, proper for alleviating Pain, and inducing Sleep, are Preparations of Poppies, Opium, Saffron, and Hounds Tongue, which, by their volatile sulphureous Exhalations pervading the small Tubes of the Membranes, check the tumultuous Commotions of the nervous Fluid, and thus not only allay the preternatural Motion in the Part affected, but, also, in the whole Body, since by this Means the Motions of the Heart and Arteries are render'd more moderate; for, as during an excessive Motion and Agitation of the Membranes of the Brain and nervous Parts, the Patient is afflicted with watching; so when these are in a quiet and moderate State and Condition, a kindly Sleep approaches.

But Narcotics, which induce a Torpor and Stupor of the Senses, together with profound Sleep; by a sulphureous, ungrateful, and unfriendly Vapour, by which the Motion of the nervous Fluids is almost extinguish'd, operate in so dangerous a Manner as to prove mortal to weak Habits, and in others to produce Madness. The pernicious Medicines of this Kind are, all Preparations of white and black Henbane, of the Thorn-Apple, and a particular Species of it, the Dutoy, as, also, of Night-shade, and its Apples.

Some Sedatives, also, allay Spasms, mitigate Pains, and procure Sleep, by removing the Causes which hinder these salutary Effects: Of this Kind the most efficacious are Nitre-purified, or artificial; as, also, Preparations of Cinna-bar and Camphire; for nitrous Preparations not only check the Heat and brisk intestine Motions of the sulphureous Parts of the Blood, but also moisten the solid Parts, and render their exorbitant Motions more moderate, so that they possess an excellent refrigerating, moistening, anodyne, and antispasmodic Virtue. Preparations of Cinna-bar, skilfully us'd, are of singular Service in mitigating those epileptic and convulsive Motions, which arise from viscid Lymph, stagnating in the Brain, and in the Membranes thereof; and the spinal Marrow; because, when their Use is long persisted in, they powerfully colliquate such a viscid Lymph. Camphire, especially when mixed with Nitre, excellently diffuses Inflammations, which are always accompanied with Watchings, Pains, and sometimes a Delirium; and thus it exerts an antispasmodic and sedative Virtue. Asa-fœtida and Sagapenum, two fetid Gums, exert their Efficacy in two Manners in allaying those Spasms of the Intestines, which, in hysteric Disorders, greatly afflict Women, partly because they soothe the

the-Spafms and Pains; and partly because by their saponaceous, gummous and acrid Salt, they resolve the tenacious Juices, and remove Obstructions of the Glands and minute Ducts.

Sedatives are therefore of singular Efficacy, since, in Consequence of their active Principle, and subtle volatile Exhalations, when exhibited in very small Doses, they not only suddenly, but intimately pervade the interior Pores and Ducts of the solid Parts, but also remarkably change and allay the exorbitant Motions of that highly subtle and moveable Lymph, which communicates Sensation and Motion to the Parts. But as in all Medicines, the more mild, gentle, safe, and friendly to Nature, are to be preferred to those of a more drastic and active Kind, so the same Caution is carefully to be observed, and diligently inculcated in the Use of antispasmodic, anodyne and sedative Medicines. Nor are we ever to use those of the more drastic Kinds, such as Opiates, when the Intention can be answered by those of a milder Nature, such as hypnotic Waters, prepared from fragrant Flowers, Emulsions of Poppy-Seeds, or Preparations of Nitre, Cinnabar and Castor.

And tho' Opiates, corrected by the Addition of Purgatives and Balsamics, as in the *Pilulæ Starkii*, and the *Pilulæ Wildegansii*, or by the Addition of Alexipharmics, as in the *Theriaca Coelestis*, and the *Diascordium*, or by the Addition of Analeptics, as in the *Laudanum of Sydenham*, are of singular Use and Efficacy, if prudently exhibited; yet if other safer Medicines, capable of producing the same Effects, can be found, 'tis better totally to abstain from the former, especially in weak Habits, old Persons, Children, and Patients whose Strength is impaired by whatever Cause. But we are still more carefully to abstain from those Medicines which have a Mixture of narcotic Substances in their Composition, such as the *Pilulæ de Cynoglossa*, which besides Opium, contain the Seeds of Henbane; and tho' these Pills are at present frequently used by some who are Enemies to all other Opiates, yet I have sometimes observed terrible Effects produced by the Use of them.

Tho' I formerly made frequent Use of corrected Opiates, yet since I happily found the Method of preparing from the sulphureous Portion of Vitriol, which was by the ancient Chymists accounted anodyne, that penetrating Liquor, which is of a fragrant Smell and aromatic Taste, I have safely rejected the Use of all other Opiates: For this Spirit, which I call my anodyne mineral Liquor, is totally sulphureous, burns suddenly and violently till it is consumed, suddenly takes Fire by the Flame of a Candle, tho' at three Inches Distance from it; and in a warm Room is quickly dissipated in the Air. It is, however, cold as Ice to the Touch, and when well distilled and rectified, like Oil it swims upon Water. The Use of this Medicine is very extensive, and its Virtues very various; for it excellently alleviates Pains, and procures Sleep; hence it is with great Success used in violent Pains of the Cholic, Stone, Cardialgia and Gout, as also in Head-achs and Tooth-achs. It also promotes Sweat; and tho' it is of an intensely hot Nature, yet it produces no Commotions in the Blood. Besides, it leaves no Torpor nor Weakness in the Head; for which Reason it is with great Success exhibited to all weak Constitutions, when the Strength is greatly impaired, as in an hectic Fever, for Instance; and which is still more surprising, it even increases the Strength. And as its principal and primary Action is on the Stomach, so it is of singular Use in all Disorders incident to that Part, such as Nauseas, hypocondriac, asthmatic and cardialgiac Inflations, by procuring a Discharge for the Flatulences. *Frederic Hoffman*. See LIQUOR MINERALIS.

SEDENTARIUM OS, in *Deventer*, is the Protuberance of the *Os Coxendicis*, upon which we sit.

SEDES. The ANUS. It, also, imports a Species of Fracture. See FRACTURA and HEDRA.

SEDHE. Cinnabar. *Rulandus*.

SEDIGITUS. A Person who has six Fingers.

SEDIMENTUM. Sediment.

SEDINA, or SEDEN. Dragons Blood. *Rulandus*.

SEDMA. The Lapis *Hæmatitis*. *Rulandus*.

SEDUM.

The Characters are;

The Leaves are alternate, not ordinate. The Calyx is monophyllous, multfid, and deeply cut into as many Segments as the Flower has Petals, which are five, at least. The Flower is pentapetalous, or polypetalous, rosaceous, and generally furnished with as many Stamina as Petals. The Ovary is seated in the Bottom of the Calyx, and consists of a Multitude of little Husks, equal in Number to the Petals of the Flower, each furnished with one Tube, nearly resembling Sheaths, with a corniculated Apex, collected into a round Head, somewhat distant from one another, and containing great Numbers of small Seeds.

Boerhaave mentions twenty eight Sorts of *Sedum*; which are;

1. *Sedum*; majus; arborescens. *J. B.* 3. 686. *M. H.* 3. 470. *Sempervivum*, five *Sedum*, arborescens, majus. *Dod.* p. 127.

2. *Sedum*; majus; arborescens; *J. B.* *Foliis elegantissime variegatis, tricoloribus*.

3. *Sedum*; Canarium; foliis omnium maximis. *H. A.* 2. 189.

4. *Sedum*; Africanum; frutescens; folio longo, serrato, confertim nato. *Ind.* 121.

5. *Sedum*; Africanum; frutescens; caule pellucido; folio subrotundo. *Ind.* 121.

6. *Sedum*; Afrum; montanum; foliis subrotundis, dentibus albis serratis, confertim natis.

7. *Sedum*; vulgare; maximum. *M. H.* 3. 474.

8. *Sedum*; majus; vulgare, *C. B. P.* 289. *Raii Hist.* 1.

687. *J. B.* 3. 687. *Tourn. Inst.* 262. *Boerb. Ind. A.* 286.

Sempervivum majus, *Sedum majus*, *Offic. Sempervivum majus*,

Ger. 411. *Emac.* 510. *Raii Synop.* 3. 269. HOUSE

LEEK.

House Leek has a great many thick succulent Leaves, set together in a round Form, convex on the Outside, and flattish within, sharp pointed, and with somewhat hairy Edges. The Stalk grows to be about a Foot high, reddish, and having a succulent Bark, covering a tough, white String or Pith; the Leaves which grow on it are thinner and longer than those below; on the Top of the Stalks grow reflected Spikes of starry Flowers, made up of several narrow, sharp pointed reddish Petals, set about a greenish hollow Crown, which is afterward enlarged into several small, hollow, horned Pods, or Seed Vessels, which inclose very small Seed. The Root is long, woody, and full of Fibres; it grows frequently on the Tops of Houses all over England; tho' Mr. Ray seems to doubt, whether it be a Native or no.

House Leek is cooling and restringent, and tho' not often given inwardly, is commended by some as good to quench Thirst in Fevers, mixed with Posset-drink, as also for Heat and Sharpness of Urine. *Prevotius*, in his *Medicina Pauperum*, commends an equal Quantity, that is, three Ounces of the Juice of this, and *Periscaria maculata*, boiled to the Consumption of a third Part, and given in Drink as a certain Medicine to stop a Looseness and Bloody Flux. Outwardly it is useful against Burns and Scalds, St. Anthony's Fire, and the Shingles. *Miller's Bot. Off.*

This Plant being analysed, yields a good deal of Acid and Earth, and a very little concrete volatile Salt. It probably contains a Salt resembling Alum, mixed with a little Sal-Ammoniac; for the Juice of this Plant evaporated to one Half, emits an urinous Smell. The House Leek is deterfive and astringent; it is used sometimes to resolve; but it is repellent. For the Quinsy, gargarize the Patient with the distilled Water, and apply some Cray Fish to the Throat, bruised with its Leaves. The Juice also of Cray Fish and House Leek, is used with Success as a Gargarism. These Juices are used also in Injections in the *Procidencia Uteri*, and sinuous Ulcers. The Leaves are applied to Corns, and the Knots of the Gout. For foundered Horses, nothing is better than to make them drink a Pint of the Juice of this Plant. *Martyn's Tournesort*.

It is customary, with us, among the common Sort, says *Schroder*, to give the expressed Juice of House Leek and Sugar in Fevers and hot Diseases. The Botanists in our Country prescribe the Juice infused in Posset, and Dr. *Tancred Robinson* says, he has known it exhibited with good Success in Fevers, and especially in those of the erysipelatous and hectic Kinds; for this Plant abounds with a medicinal alkaline Salt.

Tragus writes, That Linnen Cloths moistened with the Juice or distilled Water, and applied to Inflammations in any Part of the Body, and especially in Phricesies, are of extraordinary Service, as they are, also, in Inflammations and Redness of the Eyes, as well as of the Liver and Kidneys; they give Relief, also, under the Gout, and cure Ambustions. The Juice mixed with the Juice of *Solanum*, and boiled in Swines Fat with Poplar Buds, then strained and made into an Ointment, is of admirable Efficacy, and, in the Opinion of *Tragus*, to be preferred before all Preparations of Unguentum Populeum whatever. *Galen* and *Dioscorides* direct the Application of the Juice with Vinegar, instead of an Epithem, to an Erysipelas, which no Physician, says *Caspar Hoffman*, in our Times, would venture to prescribe. The Juice rubbed on Warts and Corns, so as that they may be well moistened therewith, and the Cuticle or thin Membrane of the Leaves afterwards laid upon the same, effectually cures and extirpates them. For Corns, or horny Excrescences of the Feet take of Leaves of the greater House Leek, a sufficient Quantity, bruise them, and apply them for six Days together. *Chesneau*.

For Ulcers of the Matrix and Urethra, take Juice of the greater House-Leek, four Ounces; Litharge, one Ounce; with two Yolks of Eggs; beat them all together in a leaden Mortar, and so use them. It is the Prescription of a Surgeon of Paris.

The Leaves of the great House-leek stripped of their outer Membrane, and put into pure Water, or Rose-Water, and every now and then applied to the Tongue, when dry or chapt, in Fevers, and renewed frequently, are remarkably lenient and serviceable in such a Case. *Raii Hist. Plant.*

9. Sedum; vulgari magno simile. *J. B. 3. 688.*

10. Sedum; montanum; tomentosum. *C. B. P. 284. M. H. 3. 474. Sempervivum, montanum, rubrum, gnaphalides, Col. 1. 291.*

11. Sedum; Alpinum; roseum; minus; viride; & sub-hirsutum.

12. Sedum; echinatum; vel stellatum, flore albo. *J. B. 3. 680. M. H. 3. 473. Cotyledon stellata. C. B. P. 285.*

13. Sedum; minus; teretifolium; album. *C. B. P. 283. Raii Hist. 2. 1040. Synop. 3. 271. Tourn. Inst. 262. Boerh. Ind. A. 286. Sedum minus, Offic. Sedum minus Officinarium, Ger. 413. Emac. 512. Sedum minus folio longiusculo, tereti, flore albo, J. B. 3. 690. Vermicularis flore albo, Park. Theat. 733. SMALL HOUSE-LEEK.*

The Stalks of this Sedum, before they flower, are of a bluish green Colour, beset, especially towards the Tops, with fat, thick, succulent, blunt-pointed, round Leaves. When they arise to flower, they have a few of the like Leaves growing alternately on them. They have on their Tops small Umbels, of white five-leaved Flowers, which are succeeded by as many little horned Seed-Vessels, full of very small Seed. The Root is fibrous. It grows upon old Stone-Walls and Buildings, and flowers in Summer.

The Leaves and Stalks are used, being much of the Nature of the great Sedum, and, like that, cooling and good for all Kinds of Inflammations. This is the *Sedum minus* that ought to be put in the *Unguentum Populeon*; but if not to be procured, the *Prickmadam* may supply its Place. *Miller's Bot. Off.*

14. Sedum; minus; lato & crasso caule, Portlandicum Belgarum; *M. H. 3. 471.*

15. Sedum; minus; luteum; folio acuto. *C. B. P. 283. M. H. 3. 471. Sedum; minus; flore luteo, J. B. 3. 692. PRICKMADAM.*

This Sedum, in manner of growing, is much like the small Houseleek. The principal Difference is, that the Leaves are slenderer, sharp-pointed, flattish in the Inside, and seeming only stuck on the Stalks; the lower Parts of them turning up a little. The Flowers grow in Umbels, being yellow, of six sharp-pointed Leaves, with as many Stamina and Apices in the Middle. The Seed grows in horned Pods as the other, and the Roots much alike. It grows upon old Walls, and on the Tops of Houses; and is much more frequent than the last, flowering at the same time, and may very well supply its Place, being as cooling, and in all Respects as serviceable. *Miller's Bot. Off.*

This Plant has an herby, styptic, saltish Taste, and gives a pretty deep Tincture of Red to the Blue Paper, which seems to shew that its Salt resembles Alum; but is mixed with a little Sal Ammoniac, a pretty deal of Sulphur, and a great deal of Phlegm. Thus it is astringent. *Martyn's Tournefort.*

16. Sedum; minus; à Rupe Sancti Vincentii. *Raii Synop. 152.*

17. Sedum; minus; teretifolium; alterum. *C. B. P. 283. J. B. 3. 691.*

18. Sedum; parvum; acre; apicibus albis.

19. Sedum; parvum; acre; flore luteo. *J. B. 3. 695. Raii Hist. 2. 1041. Synop. 3. 270. Tourn. Inst. 263. Boer. Ind. A. 286. Illecebra, Offic. Illecebra minor, seu Sedum tertium Dioscoridis, Park. Theat. 733. Vermicularis, seu Illecebra minor acris, Ger. Emac. 517. Sempervivum minus vermiculatum acre, C. B. P. 283. WALL-PEPPER.*

Wall-Pepper, or small Stone-Crop, has its Stalks four or five Inches long, wholly covered with thick, fat, triangular, blunt Leaves, and on their Tops a few star-like, five-leaved, yellow Flowers, with several Stamina in the Middle. The Root is small and fibrous; it grows upon Walls, and the Tops of low Houses, and flowers in May and June. It has a very hot biting Taste, and therefore is called Wall-Pepper.

This is too frequently used in the Shops for the *Sedum minus*, and is sold for it by the Herb-Folks; but it having Qualities directly opposite to the other Sedums, and more apt to raise than to cure Inflammations, it ought not to be put into the *Unguentum Populeon*, nor into any other Medicine for it. This Stone-Crop has been found by Experience to be good

for the Scurvy, both taken inwardly in Decoctions, and the Limbs bathed with it in Fomentations; and it is likewise commended against the King's-Evil. *Miller's Bot. Off.*

The acid Part of the natural Salt of the Earth seems to have let a corrosive Salt resembling the Spirit of Nitre, involved and softened by some Sulphur, escape into the Texture of this Plant. *Martyn's Tournefort.*

There is a third Kind of Sempervivum, which some call wild Purslane, or *Telephium*, and the *Romans Illecebra*. It has small, pretty thick and dense Leaves, like Purslane. It grows on Rocks, and is of a heating, acrimonious, and exulcerating Quality; a Cataplasm thereof, with Swine's Fat, dissolves strumous Swellings. *Dioscorides, Lib. 4. Cap. 91.*

The Juice extracted by means of some-Liquor, and given inwardly, excites Vomiting, and potently discharges gross, pituitous and bilious Humors; whence it is of surprising Efficacy in Quartans.

20. Sedum; minimum; luteum; non acre. *J. B. 3. 695. M. H. 3. 471. Sempervivum, minus, vermiculatum, inspidum. C. B. P. 284.*

21. Sedum; minus; circinato folio. *C. B. P. 283. Aizoon da Syphyllon. Lugd. 1153.*

22. Sedum; Cepæa dictum. *Tourn. Inst. 263. Boerh. Ind. A. 287. Cepæa, Offic. Ger. Emac. 621. C. B. P. 288. J. B. 3. 679. Raii Hist. 1. 690. Cepæa Matthioli, Park. Theat. 727. BASE ORPINE.*

It is cultivated in Gardens, flowers in Summer, and the Herb is in Use.

Cepæa is like Purslane, but has blacker Leaves, and a slender Root. The Leaves exhibited in Wine cure the Strangury, and the Scabies of the Bladder, but more effectually, if taken in a Decoction of the Roots of the *Asparagus*, called *Myacanthus*. *Dioscorides, Lib. 3. Cap. 168.*

23. Sedum; vulgari magno simile; minimum; foliolis acutissimis, confertissime natis.

24. Sedum; Afrum; saxatile; foliolis Sedi vulgaris, in Rosam verè compositis.

25. Sedum; Alpinum; album; foliolis compactis. *C. B. P. 284.*

26. Sedum; pyramidale; elegantissimum.

27. Sedum; Alpinum; Coridis folio. *T. 263.*

28. Sedum; Hispanum; folio glaucò acuto; flore albido. *Boerb. Ind. Alt. Plant. Vol. 1.*

This Plant acquires the Name of *Sedum*, à *sedendo*, "from sitting," because of its sessile Posture on Walls where it grows; or à *sedando*, "from allaying," because it allays or mitigates the Pains of Inflammations; *Sempervivum*, because it is always green Winter and Summer; *Vermicularis*, because its Leaves resemble Worms; and *Jovis Barba*, "Jupiter's Beard;" but for this last Appellation I can give no Reason.

This Plant abounds with a Juice of extraordinary Efficacy in all manner of cold Diseases. All the Species, except the first, agree in their Properties, being of an aqueous, nitrous, emollient and laxative Quality, mixed with something of Acidity, Austerity, and a slight Measure of Astringency. On this Account the Leaves stripped of their outer Membrane, and macerated in Water, are commended in burning Fevers, Inflammations, Gangrenes, and Suppurations of the Stomach and Intestines, for Aphthæ, and the Quinsey. The *Africans* give ten Ounces of the new-expressed Juice in a Dysentery, and with the same cure not only this Disease, but all pestilential and spotted Fevers. It is, also, a very good Plant for correcting the Malignity of the worst Kind of Ulcers. The bruised Leaves cure the Erysipelas, Corns in the Feet, and the Nodes of the Gout. Of the same is prepared an excellent Ointment for the Hæmorrhoids. The nineteenth Species is as hot and acrimonious as the others are mild and gentle. There was in this Country a certain Empiric, who, with two Ounces of this Plant, infused in Milk or Beer, cured Quartans, Dropsies, and other chronic Diseases, by causing the Patients to vomit in a violent manner; under which, if the Disease proceeded from cold obstructing the first Passages, they recovered; but if there was an immoderate Heat in the Case, the Remedy proved mortal. It causes an Alteration in all the Humors, and is of very good Service in a slow Dropsy. It is highly commended in Pains of the Gout and Sciatica; tho' I should not venture to give it inwardly, because of its Acrimony. The former Species are of Service in Combustions and Cancers. *Hist. Plant. ascript. Boerhaave.*

SEDUM is also a Name for several Sorts of SAXIFRAGA and COTYLEDON; which see.

SEDUM AQUATILE. A Name in *Boerhaave*, for the ALOIDES.

SEDUM MINUS FRUTICOSUM. A Name for the *Chenopodium*; *seaisolia minimo*; *frutescens*; *perenne*.

SEDUM PETRÆUM. A Name for the *Alyssum*; *Alpinum*; *hirsutum*; *luteum*.

SEGAX. Dragon's Blood. *Rulandus*.

SEGITH. Vitriol. *Rulandus*.

SEL SERAPIONIS, & AVICENNÆ. The Name of a Fruit, of a bitter and acrimonious Taste. It is said to be produced near *Jerusalem*.

SELAA. A Node, or encysted Abscess. *Castellus* from *Forelius*.

SELACHOS, *ελαχος*. A cartilaginous Fish, or Fish whose Skin is cartilaginous. Of this Kind is the Skate, Ray, and many others.

SELAGINOIDES. A Species of Moss. See the Explanation of Terms under the Article BOTANY.

SELAGO. A Species of Moss. See the Explanation of Terms under BOTANY.

SELATUS. Quicksilver. *Rulandus*.

SELDONTUM ALCALI. *Paracelsus* describes this as something very readily dissoluble, and emitting a Tincture; but his Meaning is not understood.

SELENIACON. A Name for the Species of *Cyphi*, sacred to the Moon, and consisting of twenty-eight Ingredients. It is described by *Paulus Aegineta*, L. 7. C. 22. It was, also, a Name of a Sort of Amulet against the Epilepsy, worn by Children. It is derived from *selene*, the Moon.

SELENITES. Offic. Charl. Foss. 23. Kentm. 32. Worm. 56. Aldrov. Musf. Metal. 678. Boet. 396. Gesn. de Lap. 45. *Lapis specularis argenteus*, Cup. Hort. Cath. Supp. 252. *Crystallus Calcarea*, Mont. Exot. 14. THE SELENITE.

This is a rhomboidal, pellucid Fossil, divisible into thin *Laminae*. It is found in many Places, particularly near *Epsom Wells* in *Surrey*. It is said to agree in Virtues with the *Telluræa*, to be a Sweetner of the Blood, and to restrain Hæmorrhages. Externally it is used as a Cosmetic. In the Catalogue of Simples in the College-Dispensatory, it is confounded with the *Lapis Specularis*.

SELERI. See CELERI, and APIUM.

SELIBRA. Half a Pound.

SELINITES. An Epithet for Wine, impregnated with the Seeds of *Apium*. *Dioscorides*, L. 5. C. 74.

SELINUM MONTANUM. See APIUM.

SELINUM SEGITALE. A Name for the *Sium*; *arvense*; *five Segetum*.

SELINUSIA TERRA. A Species of Medicinal Earth, mentioned by *Dioscorides*, L. 5. C. 174. This, he says, agrees with the *Chian* Earth in Virtues. That is best, which is shining, white and friable, and which readily dissolves when mixed with any Fluid.

SELLA TURCICA. A Sort of Cavity in the Basis of the Skull, formed by four Processes of the *Os Sphenoides*. See CAPUT.

SEMASIA, *συναρσις*. The Access of a Distemper.

SAMBELLA. Half a Pound.

SEMEIOTICE. That Part of Medicine which treats of the Signs of Health and Diseases.

SEMEN. A Seed. The four greater hot Seeds are those of Anise, Caraway, Cumin, and Fenil. *Fr. Hoffman* says Dill, instead of Caraway.

The four smaller hot Seeds are those of Bishops Weed, Ammomum, Apium, and Dancus.

The four greater cold Seeds are those of the Citrul, Cucumber, Gourd, and Melon.

The four lesser cold Seeds are those of Succory, Endive, Lettice, and Purslane.

That the five greater hot Seeds are of singular Use in preparing domestic Medicines, is sufficiently certain from Experience. We shall not here consider them apart, but only observe, that whether reduced to the Form of a Powder, boiled with Ale, or infused in warm Water, by reason of the Sulphur and Oil they contain, which are mild, friendly to Nature, and volatile, they are highly efficacious in correcting the Acrimony, and resolving the Viscidity of the Humours; as, also, in soothing all the Parts of the Body, however agitated or rack'd. Hence they are highly expedient in all spasmodic and convulsive Disorders; for they excellently alleviate Spasms, discurt Flatulences, and, at the same time, correct the Humours. For which Reason we recommend them in Colics, Coughs, Diarrhæas, and Gripes, especially those to which sucking Infants are subject, on account of the caustic Acrimony of the Milk, which discovers itself by the greenish Colour of the Excrements. *Hippocrates* frequently used Anise Seeds, and they are certainly a valuable Medicine, on account of their friendly Quality to the Stomach and Intestines; for this Reason *Helmont* justly called them the great Reliever of the Intestines. A Decoction of these five Seeds with Chamomile Flowers, Oil of Sweet-Almonds, and a little Venice Soap, injected by way of Clyster, is of excellent Service in the most violent Disorders of Children, and excellently dispels their Flatulences, and relieves their Gripes. These five Seeds, also, whether used in a dry or liquid Form, provoke

the Menfes and Sweat; cure the Hiccup, prevent Abortion, strengthen the Stomach in Vomiting and Hiccups; discurt Flatulences; expel Urine and the Stone; remove Hoarseness, and facilitate Labour, especially if the Steam of them is admitted to the Uterus. The Steam of a Decoction of Fennel surprisingly cleanses the Eyes, and strengthens the Sight. It is, also, beneficial in Deafness, as we are informed by *Gabelcheverus Centur. 1. Curat. 6. in Annotat.* A Decoction of Fennel is, also, good for increasing the Milk, as we are told by *Amatus Lusitanus*, in *Centur. 6. Curat. 86.* Nothing is more efficacious than the Seeds of Cumin for strengthening the relaxed Tone of the Intestines; and discurt Flatulences. And *Reinerus Solmender*, in *Lib. 35.* informs us from *Serapion*, that it is excellent for strengthening the Uterus, removing its Flatulences, and checking the Menfes and Fluor Albus. *Hoffman de Præst. Remed. Domest.*

SEMICONGIUS. Half a Gallon.

SEMICUPIUM. A Half Bath; or a Bath in which the Parts above the Navel only are immersed.

SEMEDALIS. *σμηδαλιν*. Fine Wheat Flour.

SEMIFIBULEUS MUSCULUS. A Name for a Muscle of the TARSUS; called, also, PERONÆUS MEDIUS. See PERONÆUS.

SEMIMEMBRANOSUS MUSCULUS.

This is a long thin Muscle, partly tendinous, from whence it has its Name, and situated on the Backside of the Thigh, a little towards the Inside.

It is fixed by a broad Tendon, or long Aponeurosis in the irregular, obtuse, prominent Line, which goes from the Acetabulum to the Tuberosity of the Ischium, a little above the Insertion of the Semi Nervosus, and between those of the Gemellus Inferior and Quadratus, mixing some Fibres with the Triceps Tertius.

From thence it runs down fleshy, in an oblique Direction, behind the inner Condyle of the *Os Femoris*, below which it terminates in a thick Tendon, which is inserted in the posterior and interior Side of the inner Condyle of the Tibia, by three short Branches, the first or uppermost of which goes a little toward the Inside; the second more backward; and the third lower down. Before it is inserted, it sends off sometimes an Aponeurosis like that of the Biceps.

The *Semimembranosus* has the same Uses with the *Seminervosus*. It bends the Leg on the Thigh, and the Thigh on the Leg; it extends the Thigh on the Pelvis; and the Pelvis on the Thigh, and sustains the Pelvis when it is inclined forward. It differs in this one Thing from the *Sartorius*, *Gracilis Internus* and *Seminervosus*, that its Insertion is not on one Side, but behind the Joint; and for that Reason it is better disposed both to begin and continue the Flexion of the Leg, than they are. *Winslow's Anatomy*.

SEMIMETALLA. Semimetals, or Marcasites.

SEMINALIS. A Name for the Polygonum, or *Centindium*.

SEMINERVOSUS MUSCULUS.

This is a long Muscle, half fleshy and half tendinous; or like a Nerve, from whence it has its Name. It is situated a little obliquely on the posterior and inner Part of the Thigh.

It is fixed above to the posterior Part of the Tuberosity of the Ischium, immediately before, and a little more inward, than the Biceps. It is afterwards fixed by fleshy Fibres to the Tendon of the Biceps, for about the Breadth of three Fingers, much in the same manner as the *Coraco-Brachialis* is fixed to the Biceps of the Arm.

From thence it runs down fleshy towards the lower Part of the Inside of the Thigh, having a Sort of tendinous Interfection in the inner Part of its fleshy Portion. Having reached below the middle of the Thigh; it terminates in a small, long round Tendon, which runs down to the Inside of the Knee, behind that of the Gracilis, where it expands in Breadth.

It is inserted in the Inside of the upper Part of the Tibia, about two or three Fingers Breadth below the Tuberosity or Spine, immediately under the Tendon of the *Gracilis Internus*, with which it communicates. It has the same oblique Turn with the *Gracilis* and *Sartorius*, and sends off a like kind of Aponeurosis.

The *Seminervosus* bends the Leg, and may, also, bend the Thigh on the Leg. By its Insertion in the Tuberosity of the Ischium, it, also, extends the Thigh on the Pelvis, and carries it backward; and may, also, extend the Pelvis on the Thigh, when it has been inclined forward with the rest of the Trunk; and consequently prevent its being carried too far along with the Trunk, when we stoop forward, either standing or sitting. *Winslow's Anatomy*.

SEMIHOMBUS. See HEMITONON.

SEMIS. The Half of any Integer.

SEMIEXTUM. The same as HEMIECTON.

SEMISICILICUS. A Dram.

SEMISIDERATUS. Hemiplegic; that is, seized with an Hemiplegy.

SEMISPECULUM. An Instrument for dilating a Wound in the Bladder, in the Operation of Lithotomy, described by *Hildanus*, in his *Treatise de Lithotomia*. C. 15.

SEMISPINALIS COLLI, *five Transverso-spinalis Colli.*

This Name is given to all that fleshy Mass which lies between the transverse and spinal Apophyses, from the second Vertebra of the Neck to the Middle of the Back; the *Splenius* and *Complexus major*, which cover it, having been raised.

It is composed of several oblique converging Muscles, which may be divided into external and internal, and of these the external are the longest.

The external are fixed below, to the transverse Apophyses of the six, seven, eight or nine upper Vertebrae of the Back, by tendinous Extremities, which, as they ascend, become fleshy, and mix with each other. Their superior Insertions in the Neck are six in Number; whereof the first, which is tendinous, is in the seventh spinal Apophysis; the rest, which are fleshy, are in the five next spinal Apophyses.

The lowest of these external Muscles mix more or less by some communicating fleshy Fibres, with the *Spinalis*, *Longissimus*, and *semi-spinalis Dorsi*.

The internal are shorter and more oblique than the external, and partly covered by them. They are fixed, by their lower Extremities, to the transverse Apophyses of the three or four upper Vertebrae of the Back, and to the oblique Apophyses of the four or five lower Vertebrae of the Neck; and by their other Extremities they are inserted in the six spinal Apophyses of the Neck.

Some of these internal Muscles are very short, lying wholly between the spinal Apophyses, and the oblique or transverse Apophyses next them.

The *Semi-spinales* or *Transverso-spinales* of both Sides acting together, extend the Neck upon the Trunk, to keep it from inclining forward in standing or sitting, and bend it backward. The *Semi-spinales* of one Side acting alone, produce the same Motions in an oblique Direction, and in that Case they are assisted by the inferior or vertebral Portion of the neighbouring *Splenius* under which they cross.

The *Semi-spinales* of both Sides may, also, serve for the Rotation of the Neck, but then the inferior *Splenius* of the opposite Side must assist them. This Motion is made in the ordinary Situation of the Neck, principally on the fourth and fifth Vertebra. They may, also, perform the lateral Inflections of the Neck, by assisting the *Longus Colli* and anterior vertebral Muscles of the same Side. *Winslow's Anatomy.*

SEMI-SPINALIS DORSI, *five Transverso-spinalis Dorsi.*

This is a fleshy Mass, which from all the spinal and transverse Apophyses of the Back and Loins, is extended in distinct Fasciculi over the Vertebrae themselves.

It is made up like that of the Neck, of several oblique converging vertebral Muscles, the uppermost of which is fixed below, to the third transverse Apophysis of the Back, and above to the first spinal Apophysis. The lowest is fix'd below to the third transverse Apophysis of the Loins, and above to the last spinal Apophysis of the Back.

They may be divided into external, which are first discovered, and Internal, which lie immediately on the Vertebrae. The external from the first Vertebra to the seventh inclusively, appear to be longer than the internal, which are covered by them. They may, also, be distinguished into those which go from one Transverse to several spinal Apophyses, and those which go from several Transverse to one spinal Apophysis.

The *Semi-spinales* or *Transverso-spinales* being oblique, converging, vertebral Muscles, are Assistants to the *Sacro-Lumbaris* and *Longissimus Dorsi*, which they cross on each Side. By this Decussation joined to the Multiplicity, and graduated Distribution of their Insertions, they increase the Strength of the other Muscles considerably, whether they act equally and uniformly with them, or alternately. The Lumbar *Semi-spinales*, called by the Ancients, *Musculus Sacer*, (See *SACER*.) because of their Insertions in the *Os Sacrum*, are more exposed to Motions and Strains than those of the Back, and are, also, larger and thicker. They are much better fitted than the *Sacro-Lumbares* for supporting the Pelvis on both Sides in walking, and on one Side, when we raise the Foot on that Side, and support ourselves on the other. *Winslow's Anatomy.*

SEMISSIS. The same as *SEMIS*.

SEMITERTIANA. A Kind of complex Fever, which we call a *Semitertian*, and the Greeks *ἡμιτερταία*, *Hemitritæus*, and it deserves our careful Observation. It begins with a Horror, and goes off with a Sweat, yet not so as to leave the Patient entirely free from a Fever. But since it is complicated of an intermittent Tertian, and a continual Quoti-

dian, on one Day it is more exasperated, and moieties the Patient with a Horror, and frequently with something of a Rigor, attended with bilious Vomings or Stools, a burning Heat, and Exhalations of humid Vapours. On the other Day the Patient is rather sensible of a Cold than a Horror, and is not much afflicted with Heat or Thirst; the Pulse is more moderate, and the Fever more gentle on all Accounts; besides, on one Day may be observed two kinds of Fevers, on the other but one. A semitertian Fever is indeed but rare, but where it is once settled, very dangerous. An exquisite *Semitertian* is, when the Supplies of peccant Matter for the intermittent Tertian and continual Quotidian are nearly equal; otherwise there cannot be a pure *Semitertian*, and consequently the Disease, as it is thought, will the more easily give way to Remedies. *Lomii, Med. Obs.*

Among the epidemic Fevers of the intermittent and malignant Kind, we (in Practice) frequently meet with that Species which consists of an intermittent Tertian, and a Quotidian of the continual kind, for which Reason it is by the Greeks called *ἡμιτερταία*; and by the Latins, *Semitertiana*.

This Species of Fever generally seizes the Patient, in the Forenoon, with a violent Cold and Horror; and a contracted Pulse. This State is afterwards succeeded by an Heat, which lasts for some Hours, is accompanied with a frequent Pulse, and remits without being totally removed upon the Eruption of the Sweat. Towards the Evening the Heat is rather increased, after a gentle Refrigeration; and next Day the Disorder is milder, and accompanied with Thirst, till about the Evening, after a slight Horripilation, it again becomes more violent. But on the third Day, the Horror again seizes the Patient, and is succeeded by a more intense Heat, whilst the State of the Disorder is the same it was on the first Day. So that there is always present a kind of growing Fever, the Exacerbation of which happens towards the Evening; and on the third Day, in the Morning, this Exacerbation is most conspicuous, and accompanied with a Rigor. Besides, the Strength is impaired, the Appetite rendered languid, the Sleep defective, and the Urine thin and crude; whereas, after the Paroxysm of a Tertian, it is thick and high-coloured. In Coughing a small Quantity of crude Matter is spit up. This Species of Fever is, also, frequently accompanied with a Pain of the Back and Abdomen, which latter is, also, tumid. Some, upon the Approach of the Tertian Paroxysm, are afflicted with a Nausea and Cardialgia; others vomit; others fall into Deliquiums; and others become absolutely delirious.

This Fever is almost unknown in some Parts of Europe, the Inhabitants of which generally take it for a malignant intermittent Fever; but the former greatly differs from the latter, since it is neither contagious, accompanied with exanthematous Efflorescences, nor attended with so considerable a Loss of Strength. Besides, it has every third Day a conspicuous Exacerbation accompanied with Horror.

Others, in like manner, unjustly confound a *Semitertian* with a continual Tertian; for the latter, otherwise than in the former, has its Exacerbation only on the third Day, but not in the Evening; nor is it wholly continual; but tho' it at first seizes with a continual Heat, yet, on the third Day, it generally loses its Violence, and passes into an intermittent Tertian.

Nor is a *Semitertian* to be confounded with a double Tertian; for tho' the latter seizes every Day, yet the Paroxysms correspond to each other, and the Fever itself perfectly intermits; whereas, in a *Semitertian*, there is absolutely no Intermission, but a Remission. The Paroxysm, also, happens about the Evening, and is always double on the third Day.

A *Semitertian* is, therefore, composed of two Fevers, and must, therefore, have a double Fomes, and a double Cause; that is, the Source of the continual Fever in the Mesentery, in consequence of the intercepted Circulation of the Blood thro' its Structure, and its consequent inflammatory Stagnation in the contiguous nervous Coats. But the violent Paroxysm happening on the alternate Days, has, as well as a Tertian, its Seat and Cause in the Intestines, and especially in the Duodenum; for to the winding Cavity of this Intestine, the lymphatic, bilious, and corrupted Humors, in consequence of the Disorder of the Mesentery, are conveyed from the Glands, the Liver and Pancreas; as also crude Juices from the Stomach, which constitute a morbid Fomes; which, mixing with the Blood, and being conveyed to the nervous Membranes of the Spine, induces a preternatural febrile Motion.

Among the Things which have a Tendency to generate a *Semitertian*, we may reckon all those Substances and Circumstances which render the Juices thick and impure, and especially fill the Primæ Viæ and Vessels of the Mesentery with Sordes. Hence *Semitertians* are most generally incident to those, who, neglecting a salutary Regimen, eat liberally of
[* R r] sweet

sweet, acid, fermentable Aliments, and farinaceous Substances fried with Butter, Sugar, and Eggs; and to those who lead an idle and too sedentary Life; who drink too little; who are too great Lovers of sweet Wines; or who indulge the Passions of the Mind, especially Sorrow. Semitertians are, also, readily incident to Persons after a Recovery from acute Disorders; to those who are costive; to those who frequently use drastic Purgatives; and to such as have the menstrual or hæmorrhoidal Discharge suppressed. These Fevers are, also, less frequent at other Seasons than in the Autumn, the fruitful Source of terrible Fevers, on account of the Variety and Inequality of the Weather, which is highly unfriendly to salutary Perspiration. Semitertian Fevers, also, frequently happen to those, who, when overheated, greedily drink cold Liquors, or who, when sweating, sit down in moist Places.

Semitertians are observed to be more frequent in some Countries than in others. Thus *Galen*, *Spigelius*, and *Baglivi*, inform us, that they rage more in *Italy* than in other Climates. And certainly, in that Part of the World, the Heat, during the Day, generates many acrid recrementitious Sordes, whilst the cold Air of the Night hinders the Exclusion of these; and the cold Drink, of which they are so very fond as to prepare it by putting Ice into it, occasions, that the Juices in the Mesentery, where the Resistance is small, and the Circulation languid, as it were, stand still, and conceive an inflammatory Stagnation. And thus a continual Fever is generated, which is changed into a Tertian, by the corrupted Juices falling from the Mesentery to the Intestines. The like happens in *Hungary*, where a similar State of the Air, and a liberal Use of sweet and spirituous Wines, frequently excite Semitertians.

Since, therefore, a Semitertian, besides the common Cause of Intermittents in the Primæ Viæ, has, for a Foundation, an Inflammation, and a continual Disposition never to admit of a great Remission of the Symptoms, nor of a due Time for recovering the Strength, it is of a very dubious Nature, and far more dangerous than a simple Intermittent.

For this Reason, its Progress is quick, since, for the most part, it terminates on the ninth or thirteenth Day, either in Health, some other Disease, or Death.

When it is long protracted, the Inflammation either comes to a Suppuration, and the Disorder is changed generally into an hectic or slow Fever; or when there is a violent Obstruction of the Mesentery, it terminates in a Dropsy; or, which happens more rarely, when the Primæ Viæ are filled with Sordes, it ends sometimes in a simple, and sometimes in a double Intermittent.

But when the Sweat not only breaks out in the Decline of the Paroxysm, but also on the seventh Day, which is critical; or, if, after this Day, the Intestines are put into a Commotion, and a bilious, pituitous, or even a bloody Flux, is produced, it is a good Sign, and prognosticates the Solution of the Disease; or if there happen violent Pains of the Abdomen, which are increased at certain stated Hours, the Disorder is resolved by them, or afterwards terminated by a subsequent sanious and purulent Diarrhæa, or an Evacuation of a large Quantity of black Blood by Stool.

On the contrary, when none of these Circumstances happen, but rather a Heat about the Præcordia, a Tension and Pain in the whole Region of the Stomach, a Vomiting, a Hiccup, a Restlessness, a Tossing, and a Trembling of the Hands, are perceived, they are bad Prognostics, and indicate that the Inflammation has spread itself farther even to the Stomach.

Those who die of a Semitertian are taken off under the Access of a violent Paroxysm, which keeps the Type of a Tertian, the Inflammation, in the mean-time, being far diffused and converted into Putrefaction. Thus *Spigelius*, in his *Lib. de Semitertiana*, Cap. 14. informs us, that he always found this to be the Cause of the Death of such Patients, in the following manner: "When, says he, I reflect upon what I have observed, in dissecting those who have died of Semitertians, I can ascribe their Death to nothing else but putrid Stagnations in the Vessels; for in the Carcasses of such Persons, I found Inflammations formed of bilious and pituitous Blood, about the concave Part of the Liver, in the Stomach, in the great and small Intestines, in the Mesentery, Omentum and Spleen, and often in one or more of these Parts, and sometimes in them all; and a supervening Gangrene or Sphacelus, tho' perhaps small, was found to be the Cause of their speedy Death."

THE CURE.

The two principal Intentions to be pursued in the Cure of a Semitertian, are,

1^o. With all Expedition either to discuss or hinder the farther spreading of the inflammatory Stagnation lodged in

the Coats of the Mesentery and Intestines, and exposing the Patient to imminent Danger.

2^o. To correct and gently evacuate the febrile Matter during the Intermission, having a due Regard, at the same Time, to the critical Efforts of Nature.

The former of these Intentions is excellently well answer'd, by diaphoretic and gently nitrous Powders exhibited frequently in small Doses. Thus;

Take of the Ceruss of Antimony, of prepar'd Mother of Pearl and Crabs Eyes, each one Dram; of the Solution of Crabs Eyes, and depurated Nitre, each half a Dram; reduce them to a Powder, of which, every three Hours, fifteen Grains may be exhibited in a Decoction prepared of two Ounces of the Roots of Vipers-Grass, one Ounce of the Shavings of Hartshorn, one Ounce of Currans, and half an Ounce of the Roots of Succory, boil'd for half an Hour in four Quarts of Water.

The same Intention is answered, by exhibiting every three Hours a Spoonful or two of the resolvent and diaphoretic Mixtures, prepared of the pectoral and analeptic Waters of Lily of the Valley, Galangals, Carduus Benedictus, Vipers-Grass, and black Cherries, with the distill'd Vinegar of Crabs Eyes, diaphoretic Antimony, the Mixtura Simplex, and the Syrup of Carduus Benedictus.

By Means of these, the Sordes of the Primæ Viæ, which produce the Disorder, being corrected and diluted, are best evacuated by Solutions of Manna, with a due Portion of Cream of Tartar, Rhubarb, Raisins, and Sal Polychrestum; for these, without any Commotion of the Blood, Irritation of the nervous Parts, or Loss of Strength, cleanse the Intestines, and greatly contribute to remove the Infarctions of the Mesentery. This Intention is, also, answered by balsamic Pills, prepared of bitter Extracts, resinous and balsamic Gums, and depurated Aloes, together with the precipitating nitrous Powder, moderately but frequently used. If the more subtle Parts of the Sordes, are, by an increas'd Perspiration, to be eliminated through the cutaneous Pores, the Essence of Scordium mixed with an equal Quantity of the anodyne mineral Liquor, is of all other Medicines the most safe and efficacious.

All Cures are to be so managed, as never to disturb or interfere with the critical Efforts of Nature, but rather to assist them when defective, and moderate them when excessive.

Hence, 'tis highly prejudicial to exhibit Purgatives, especially in the Beginning of a Semitertian, since, by that Means, the unprepared Matter is agitated, the Inflammation increas'd, and the Disease dispos'd to a speedy, tho' a fatal Event.

Saline Deterfives exhibited by themselves, are not to be us'd in a Semitertian, especially in large Doses, except antimoniated Nitre; to which, and the Sal Polychrestum, *Baglivi* justly ascrib'd so much; for these are possess'd of an aperient, diuretic, and gently laxative Quality, and may sometimes be commodiously exhibited to the Dose of fifteen Grains, in a sufficient Quantity of some proper Decoction.

But if a Semitertian seizes a Person who is costive, or if he is long costive during it, his Body is only to be render'd soluble, by Clysters prepared of Paregoric and emollient Substances, the carminative Seeds, and *Venice* Soap, that thus the Primæ Viæ may be freed from the excrementitious Sordes; for if this is neglected, Nature seeks a Way upwards, and excites a Vomiting, especially when the biliary Ducts in the Liver are turgid with an acrid Bile.

In the Decline of the Fever, the Physician is to follow the Tendency of Nature, which often terminates the Disorder by a Flux, so that on this Occasion the above-mentioned Laxatives and balsamic Pills are commonly used.

In a Semitertian, the Physician is to be very cautious in exhibiting Emetics, lest he should create a Vomiting, or Hiccup, or dispose the Stomach to an Inflammation: But if the peccant Matter is to be evacuated by Vomit, in consequence of the Tendency of Nature that Way, the Intention is sufficiently answer'd by drinking tepid Water with Salt, or a very gentle antimonial Stimulus.

In a Semitertian, Venesection is not proper, except there is a violent Plethora, and an intense Heat in Persons as yet vigorous, and labouring under a Suppression of critical Hemorrhages; for in this Case, Venesection is absolutely necessary, in order to prevent a mortal Inflammation of the Intestines; but it is to be us'd in the very Beginning, since the sooner a proper Quantity of Blood is taken away, the sooner the Cure is accomplish'd.

The Patient is, also, carefully to avoid all hot Substances, alexipharmic Essences, bezoardic Tinctures, a hot Regimen, and

and large Quantities of hot Liquors; for by Means of these, the Heat is increas'd, the critical Discharge of the Fomes of the Disease through the Intestines is disturb'd, and the Strength impaired by profuse Sweats.

Astringent, too fix'd, earthy, testacious Powders; and Peruvian Bark, are not to be us'd in a Semitertian; for Baglivi observes, that by Means of these, either mortal Inflammations, or slow and hectic Fevers have been brought on.

Though the Patient should be afflicted with an exquisite Pain of the Abdomen, and frequent Stools, he is nevertheless to abstain from Sedatives, and is only to be reliev'd by anointing his Abdomen with spirituous and corroborative Liniments, whilst the Tumult and Commotion is to be check'd by an internal Exhibition of Diaphoretics.

For ordinary Drink, the most proper is the Decoction before mentioned; as, also, a Decoction of Oats prepared in the following Manner:

Take of clean wash'd Oats, one Pound; of the Roots of Succory, Sarsaparilla, and Vipers-Grass, each one Ounce; of the Flowers of red Poppy, six Pugils; of antimoniated Nitre, half an Ounce; Leaves of Scabious, half an Handful; and of pure Nitre two Drams; boil them in five Quarts of common Water, to a Consumption of a third Part, and edulcorate with Syrup of Carduus Benedictus, wild Poppy, or Citron Juice.

In Semitertians, I have, also, found happy Effects produced by Decoctions of Chamomile Flowers, and the Tops of Yarrow, or by Extracts prepared from these; for such Decoctions and Extracts safely alleviate the Pains, especially of the hystERIC and complicated Kind, and, at the same Time, by their Bitterness, prove excellent antiscorbutic Medicines, and restore the due Tone of the Parts.

As no Fever more readily recurs than a Semitertian, so the Patient is, after it, carefully to avoid the Things already enumerated, as the procolartic Causes of the Disorder. All Things are to be us'd temperately; the Body is to be kept soluble by mild Laxatives; the Increase of Crudities is to be prevented by Stomachics; and, which is of all other Circumstances the most important, the Perspiration is carefully to be kept free and unobstructed; for as in all Fevers, so, also, in those of the semitertian Kind, the Relapses are far worse and more obstinate than the original Disorder.

These are the general Precepts, founded on Reason, and supported by the Indications of Nature, by the Observation of which the Cure may be judiciously attempted, and successfully perform'd: But the particular Method is to be suggested by the Sagacity of the Physician, which is to direct him to the Order, Dose, Time, and Use of proper Medicines, which being the same with those employ'd in the Cure of continual quotidian, tertian and quartan Intermittents, may be seen under these Articles. *Frederic Hoffman.*

SEMIVERBERATORIUS IGNIS. A Sort of reverberatory Fire, which only surrounds the Bottom of the Vessel.

SEMOTIM: Achors, or Pinez. *Castellus from Valescus de Taranta.*

SEMPERVIVUM. See **SEDUM**.

SEMUNCIA, or SEMIUNCIA. Half an Ounce.

SENA. The same as **SENNA**.

SENDANEGUM. The *Lapis Hamatitis*, Blood-Stone. *Rulandus.*

SENECIO. *Senecio*.

The Characters are;

The Calyx is monophyllous, cylindrical, multifold, very slightly squamous in the lower Part, of a conic Figure when the Flower is fallen off, and when it is ripe, generally bending downwards.

Boerhaave mentions ten Species of *Senecio*, which are;
1. *Senecio*; minor; vulgaris. *C. B. P.* 131. *Tourn. Inst.* 456. *Boerb. Ind. A.* 117. *Erigerum*, *Senecio*, *Offic.* *Senecio vulgaris*, *Park.* 671. *Raii Hist.* 1. 291. *Synop.* 83. *Senecio-vulgaris* *sive* *Erigeron*. *L. B.* 2. 1041. *Erigeron*, *Ger.* 217. *Emac.* 278. **GROUNDSEL OR SIMSON.**

Groundsel has a small, stringy Root, full of Fibres, from which springs round, succulent, striated Stalks, which are shorter or taller, according to the Soil it grows in, and frequently of a reddish Colour. The lower Leaves are about two Inches long, and half an Inch broad, cut usually into five Jags or Sections, whereof the last is usually tripartite. The Leaves which grow on the Stalks are set on with a broad Base almost encompassing them: The Flowers grow on the Tops of the Branches, without any Petala, or Border, consisting only of fistular, yellow Flowers, growing in a green striated Calyx, which after turns into a Down. It

grows on Banks, and Walls, and amongst Rubbish, flowering the greatest Part of the Year.

The Juice of this Herb taken in Ale, is accounted by some a gentle Vomit, and of Use to help Pains in the Stomach, and evacuate Cholera, and to help the Jaundice: It likewise destroys Worms. Outwardly apply'd, it is useful in scrophulous Tumors, and Inflammations of the Breast, and helps scald Heads. *Miller's Bot. Off.*

It has an herby Taste, a little inclining to acid; it gives a pretty deep red Colour to the blue Paper.

By the chymical Analysis, it yields, besides several acid Liquors, a great deal of Oil and Earth, no volatile concrete Salt, but a little urinous Spirit; so that it is probable its Salt may resemble that of Coral, being involved with a great deal of Sulphur, and mixed with a little Sal-ammoniac.

Groundsel is emollient, lenifying and resolving; two Ounces of its Juice kills Worms, and eases the Cholic; the whole Plant is used in the ordinary Decoction of Clysters, and in the Cataplasms for assisting Suppurations. A Cataplasm of it boiled in Milk, or fried with fresh Butter, is good for the Gout, Piles, and dissipates curdled Milk in the Breast. *Martyn's Tournefort.*

The Juice taken in Beer, or the Decoction thereof with Currans or Honey, is a gentle Vomit, as we are taught by daily Experience. *Tragus* says it is rarely taken inwardly; others write that it is good in many Cases thus administered, for Instance, in the Cholera Morbus, Jaundice, a hot Distemperature of the Liver, Worms, Vomiting, and Spitting of Blood, Sciatic Pains, and the Fluor Uterinus. Outwardly, it is of Use in Inflammations of the Breast, Scald Heads, Strumæ, Pain of the Stomach, Stoppage of Urine, Gout and Wounds.

It is very likely to be good for the Worms, because our Farriers give the expressed Juice thereof to Horses, for the Worms of the Stomach and Intestines, commonly called *Botties*, whose Effects are suddenly fatal. *Raii H. P.*

N.* 274. p. 943. **BASTARD CHINA.**

It grows in the Kingdom of Malabar.

This is the Plant which some Years ago was sent to the *English East India Company* at London, under the Name of *Parin-Chakka Malabarica*, by *Samuel Brown*. The Description of it by *Dr. Dillenius*, in his *Hortus Elthamensis*, is as follows:

"This Plant is here [in Madraspatam] called *China Root*; but it is very different from that which you call *Spinosa* [that is, *Petiver*]. *Mr. Ingram* of *Newcastle* was cured by it of a Hectic Fever, under which he had laboured many Years. It is two Feet in Height, and has a Root like that of *China*. If Experience shall supply me with any further Observations, I will take Care to inform you."

Some Specimens of this Plant were presented by the Company to the Royal Society at London, and published in the Philosophical Transactions for the Year 1702, No. 274. with Observations. A few Years after the famous *G. Commelin*, *M. D.* was presented with the same Plant, and published a Description of it in *Hort. Medic. Angliæ*, under the Name of *Senecio Asiaticus, Jacobææ folio, Radice lignosa, China Offic. dicta*; "the *Senecio* of *Asia*, with a Leaf like that of the *Jacobæa*, and a woody Root, called the *China* of the Shops."

"Shops," with the following Note; "I had the Knowledge of this Plant from that skilful Surgeon *Andreas Hammel*, who brought it with him from the *East Indies* into his own Country." This gave Occasion to the Authors of the *Catalogus Simplicium*, in the *Pharmacop. Londin.* and the *Indices Medicamentorum* in the *Pharmacop. Paris.* to commit a Mistake, in improperly setting down this *China of the Shops* for the Root of the Plant.

The famous Botanist *Switsen* sent me a Figure with a Description of the *Japanese China*; but this is quite another Plant from what we are speaking of. Its Root indeed is very thick, as in the other; but then it is also tuberous, which is otherwise in the *Senecio*; and is a scandent Plant, like the *Clematites* of *Canada*, or Ivy, or Briony, which last it most resembles. I imagine that our *Senecio* is not so penetrating as to cure the Leprosy; for it is better qualified for an Emollient than an Expeller. But the *Japanese* is far more acrimonious, so as perhaps to be sufficient for the Cure of the Lues Venerea, as it is said of the Root of *China*, tho' I never, as yet, saw any such Effect performed by it. This Root is very dear, and for that Reason very often adulterated; for when it is corroded, and exhausted with Age, they fill up the Perforations, and sell it for good and sound; and therefore I never prescribe it before Examination, for there is no trusting to it unseen. *Hist. Plant. ascript. Boerhaave.*

10. *Senecio*; *montanus*; *altissimus*; *Limonii folio*. *Vaill. Conyza, montana, foliis longioribus serratis, flore sulphureo albicante*. *Comment. Ac. Reg. Soc. Boerb. Ind. Alt. Plant. Vol. 1.*

This Plant is commended for its singular Efficacy in Inflammations of the Fauces, the Juice being used with Oxycras in a Gargarism; it is recommended, also, for scirrhus Tumors. A certain Botanist, *Peter van Hoy*, by Name, told me that all the *China Root* brought from the *Indies* was the Root of this Plant, and that its thick Root is used by the *Chinese* in Decoction, as a general Purger of the Blood, and they say that it cures the Leprosy; and it must be granted, that these Virtues do in some Measure belong to this Plant. *Hist. Plant. ascript. Boerhaave.*

SENECTA ANGUIM. The *Exuvia*, or Sloughs of Serpents. A Decoction or Infusion of these is recommended against Pains of the Ears, Teeth, and Eyes. Some superstitious Women tie them about their Waistes, in order to prevent a Miscarriage, and about their Thighs, to accelerate Delivery.

SENELLA. The Hawthorn.

SENEMBL. An American Lizard, about four Foot long, and half a Foot in Thickness. Certain Stones found in the Head of this Animal, are esteemed, by the Inhabitants, good for the Stone in the Kidneys and Bladder, taken in the Quantity of a Dram.

SENICA. A Sort of Gum. See *ACACIA SILIQUIS COMPRESSIS*.

SENNA.

The Characters are;

It has a rosaceous, pentapetalous Flower; the Pod is flat, incurvated and bivalve, and the Seeds are like Grape-Stones, and separated from one another by small Partitions.

Boerhaave mentions seven Sorts of *Senna*, which are;

1. *Senna*; *Italica*; *foliis obtusis*. *C. B. P. 397. Tourn. Inst. 618. Boerb. Ind. A. 2. 57. Senna Italica, Park. Theat. 225. Raii Hist. 2. 1792. Ger. 1114. Senna foliis obtusis, Ger. Emac. 1297. Senna Florentina, J. B. 1. 377. ITALIAN SENA.*

This is distinguished from the true *Senna*, by the Largeness and Roundness of its Leaves. This Leaf is, also, much thinner, and more brittle than the other. It is a very weak Cathartic, but gripes violently, and therefore is seldom used. *Geoffroy.*

2. *Senna*; *Alexandrina*; *five foliis acutis*. *C. B. P. 397. Raii Hist. 2. 1742. Tourn. Inst. 618. Boerb. Ind. A. 2. 57. Senna Alexandrina, Offic. Senna Orientalis, Ger. 1114. Emac. 1247. J. B. 1. 377. Senna Alexandrina, Park. Theat. 225. ALEXANDRIAN SENA.*

Senna is a shrubby Plant, having many woody Stalks arising to be two or three Foot high, full of winged Leaves, composed of three Pair of Pinnæ, with an odd one at the End, which are oval and sharp pointed; the Flowers are yellow, five leaved, full of purplish Veins, with several crooked Stamina in the Middle. The Seed, which is of a yellowish, green Colour, flat, and in Shape like a Grape-Stone, is inclosed in a broad flat membranous Bladder, sticking so close together, that they are with Difficulty parted. *Senna* grows in *Egypt*, *Arabia*, and other Parts of *Turkey*; the best comes from *Alexandria*, and ought to be of a pale, yellowish, green Colour, not broken, but free from Stalks; and of a pleasant fresh Scent.

Senna is a Purging Medicine, of frequent Use, being one of the milder Sort of Cathartics, yet working pretty briskly, and carrying off cholic and phlegmatic Humours out of the Stomach and Bowels; but being somewhat griping, and of a nauseous Taste, it ought to be corrected with Spices or other Carminatives.

Official Preparations of *Senna* are, the *Decoctum Sennæ*, the *Syrupus Rosarum cum Senna*, the *Pulvis Senna Compos. major, et minor*. *Miller's Bot. Off.*

Geoffroy remarks, that this is the true Oriental *Senna*, smoother to the Touch, and not so green as that of *Tripoli*, and its Infusion is of a pale Colour. The Leaf is of a pretty strong Consistence, and shaped like the Point of a Spear. This is the best Sort of *Senna*. It purges Phlegm in a particular manner; but as it is subject to gripe, it ought to be given with Caution to those who have weak Viscera, or are of an inflammatory Habit of Body. It is usually mixed with Carminatives, such as Coriander Seed, Cinnamon, &c. or more effectually with alkaline Salts. It ought to be well cleansed from its Stalks, and then the Dose in Substance is from a Scruple to a Dram; and in Infusion, from two Drams to half an Ounce. Some have endeavoured to correct *Senna* with the *Scrophularia magna aquatica*; but that is now left off, common Tea having the same Effect. Some Physicians order *Senna* by the Name of *Folia Orientalia*.

The Follicles or Fruit of the *Senna Tree* purge in a less Degree than the Leaves. The common Dose is from three to six Drams in Infusion or Decoction. *Geoffroy.*

Senna is a very usual Purgative, proper for eliminating hot and serous Humours; and, consequently, yellow Bile and Phlegm from the Head, Liver and Spleen. Because it is of a hot and drying Quality, it is to be corrected by the Flowers of Violets and Borrage, and by Prunes; and because it is flatulent, and might prove hurtful to the Stomach, it is to be corrected with Cinnamon, Galangals and Ginger. *Dale from Schroder.*

DECOCTUM SENÆ.

Take of the Leaves of Alexandrian *Senna*, one Ounce and a half; of the Seeds of the lesser Cardamons, two Drams; and of Salt of Tartar, three Drams: Infuse the whole in one Pint of boiling Spring Water, and strain it off for Use.

PULVIS DIASENÆ.

Compound Powder of *Senna*.

Take of *Senna* Leaves, and Cream of Tartar, of each two Ounces; of Cloves, Cinnamon, Galangal, and Seeds of Bishop's Weed, of each two Drams; of Diagyridium, half an Ounce. Make them into a Powder.

This is the *Pulvis Sanctus* of *Brasavolus*, and is preferable to either the *Pulvis Sennæ Compositus major*, or the *Pulvis Sennæ minor Compositus*, as the Quantity necessary for a Dose is much less, and therefore easier to be taken in a Bole or Mixture. Its Dose is from one Scruple to one Dram.

PULVIS SENÆ COMPOSITUS MAJOR. See **PULVIS**.

PULVIS SENÆ MINOR COMPOSITUS. See **PULVIS**.

SYRUPUS ROSACEUS SOLUTIVUS CUM SENA.

Solutive Syrup of *Roses* with *Senna*.

Take of *Senna* Leaves, picked clean, six Ounces; of Caraway and sweet Fennel Seeds, of each three Drams. After these are first sprinkled over with white Wine, let them be steeped in three Pints of an Infusion of Damask *Roses* for the space of two Days; then strain the Liquor, and boil it up into the Consistence of a Syrup, with two Pounds of white Sugar.

This is in the new Dispensatory of the College exactly as in the *Syrupus à Succo Rosarum*; but therein are also many other solutive Syrups of *Roses*, with *Agaric*, *Hellebore*, &c. which are very justly expunged here.

3. *Senna*; *orientalis*; *fruticosa*; *Sophera dicta*. *Sophera Indiæ Orientalis*, *Brayn. Prodr. 1. 51. Galega affinis, Sophera dicta, C. B. P. 352. Securidaca Ægyptia, Park. M. H. 2. 78. Ponnam Tangera, H. Mal. 2. 101. Efcapathi, altera. Hernand. 376.*

4. *Senna*;

4. Senna; Occidentalis; odore Opii virofo; Orobi Panonici foliis mucronatis glabra. *H. L. Cassia Americana, fœtica, foliis oblongis glabris.* T. 619. *Pajornirioba*, Pisonis. 185.

5. Senna; Occidentalis; odore Opii virosissimum; foliis Ebuli hirsutis.

6. Senna; Occidentalis; foliis Ebuli acutis, glabris; odore minus virofo.

7. Senna; Occidentalis, odore Opii minus virofo; foliis glabris obtusis majoribus. *Boerh. Ind. Alt. Plant. Vol. II.*

One Dram, or half an Ounce of the first and second Species, made into an Infusion, is an excellent Purge; but now diffused, on account of the nauseous Taste, and the Gripes, they produce. The Gripes are removed by an Addition of Fennel-seeds, and the nauseous Taste by Figwort. The Indians put the bruised Leaves of the fourth and fifth Species into the Waters, and by that means catch the Fishes, as it were, sleeping near the Surface of the Water. These Leaves are also said to alleviate Pain. *Hist. Plant. ascript. Boerhaave.*

Besides the foregoing Species of *Senna*, *Geoffroy* mentions the two following.

1. SENNA TRIPOLITANA. This Sort is greener, larger, rougher, and of a more disagreeable Smell than the common Senna. It does not yield so much by Infusion; that is, a greater Quantity is required to make the Infusion of equal Strength; but it is of a greener Colour.

2. SENNA DE MOCHA. The Leaves of this Kind are longer and narrower than those of the common Sort; its Smell stronger, and it gripes more violently. It is not used in this Country.

SENSIBILIS, αἰσθητός, sensible; is applied to whatever is capable of making an Impression on the Senses. *Galen, de Dign. Puls. Lib. 3. Cap. 1.*

SENSIFICUS, αἰσθητικός, sensific; according to the best Philosophy, is the proper Epithet of the Nerves of the external Senses, which convey the animal Spirits, as the efficient instrumental Cause, to the sensory Organs. *Galen, de Hip. & Plat. Decr. Lib. 7. Cap. 5.*

SENSIO, SENSATIO, αἰσθησις, is properly spoken of actual Sensation, which consists in the Perception of any sensible Thing, affecting and causing some Alteration in the Organ of Sense.

SENSITORIUM. The same as SENSORIUM.

SENSORIUM, αἰσθητήριον, according to the ancient Hypothesis, the Instrument of any Sense. *Galen, de Odor. Instr. Cap. 5.* Agreeably to the same Doctrine, *Sensorium commune*, κοινὸν αἰσθητήριον, the common Sensory, is what receives the Impressions of all sensible Objects, conveyed to it by the Nerves of each particular Organ of Sense, and consequently is the immediate Cause of Perception. This Office is, by *Dr. Willis*, assigned to the striated Parts of the Brain, and by *Des Cartes*, to the *Glandula Pinealis*.

SENSUS EXTERNI. The External Senses, are the Means, or Instruments, of external Sensation, and are commonly reckoned five in Number, which may be found under their proper Articles. The Exertion of the External Senses, that is, external Sensation, consists only in a Change made in the Superficies of a Nerve by the Contact of an external and sensible Object; and propagated by a free Communication of that Nerve to a certain Place in the medullary Substance of the Brain, or what the Schools call the *Commune Sensorium*, on which Occasion there is excited in the Mind some Idea of the sensible Object.

SENSUS INTERNI. The Internal Senses, are those Actions of the Mind or Intellect, to which it is excited from its Perception of Ideas, and are generally reduced under four Heads, *Memory*, *Imagination*, the *Passions*, and *Attention*; some add *Hunger* and *Thirst*. A more particular Account of these, more than what may be found under *Imaginatio*, and occasionally under other Articles, we think unnecessary.

SENTIS. A Name for the RUBUS. *Blancard.*

SEPARATIO, διαχωρις, διαχωρίσις. The same as SECRETIO, or SEGREGATIO. See SECRETIO.

SEPARATORIUM. A Separatory. A chymical Vessel contrived for separating Liquors. It is of an oblong, and, in some measure, uniform Figure, with an Orifice as big as one's little Finger for pouring in Liquors, and a small Hole in the Bottom, about the Bigness of a Needle for discharging them; in the Middle it is bellied for the greater Capacity. It is also called HYPOCLEPTICUM. *Separatorium* is also a Surgeon's Instrument for separating the Pericranium. *Rulandus, Castellus.*

SEPEDON, σπεδόν. See PUTREDO.

SEPHIROS. A kind of hard and dry Imposthume, a spurious Scirrhus. *Paracelsus de Ulc. & Apost.*

SEPIA. Offic. Schrod. 5. 332. Ind. Med. 109. Salr. de Aquat. 165. Mont. Exot. 6. Aldrov. Exang. 44. Charlt. Exer. 51. Jonf. Exang. 7. Bellon. de Aquat. 336. Rondel. 1. 498. Gefn. Aquat. 851. *Lalige, Sepia*. Mer. Pin. 191. THE CUTTLE-FISH.

This Fish is a kind of Polypus; it has a Bag in its Neck, containing a black Liquor, like Ink, which it emits to trouble the Water, when pursued by other Fishes. The Bone recommended in Physick as a good Diuretic, is found about its Middle. Others make a Powder of it for cleaning the Teeth. *Geoffroy.*

The Parts in Use are the Bone, or Shell, the black Liquor or Humor, and the Eggs. The first is a testaceous Substance, white and smooth, and tumid on each side; on the upper Part it is somewhat hard, smooth and glabrous; on the lower, fungous, softish, somewhat rough and friable. It grows on the Back of the Fish, and tastes a little acrimonious.

This Substance dries and absterges; cures Spots, Freckles, and the humid Itch; is good for the Eyes; removes Swellings in the Gums; gives Relief in the Asthma; stops a Gonorrhœa; expels the Stone, and provokes Urine. The black Humor found in the Bladder within the Body, is said to loosen the Belly; and the Eggs absterge the Kidneys and Ureters, and provoke Urine and the Menfes. *Dale* from *Schroder.*

SEPIUM. The Bone or Shell of the *Sepium* before described.

SEPLASIARIUS. Properly a Seller of Perfumes, sweet Balls, and Ointments; from *Seplasia*, the Market-place of *Capua*, famous for those Commodities; but it is, also, frequently used to signify one who deals in the *Materia Medica*; the same as MATERIALISTA, a Druggist or Apothecary.

SEPS. Offic. Jonf. de Serp. 14. Charlt. Exer. 32. Gefn. de Serp. 118. Aldrov. Hist. Serp. 186. *Seps* sive *Lacerta Chalcidica Calumna*. Raii Synop. A. 272. Aldrov. de Quad. Ovip. 638. THE SERPENT SEPS.

This is a very poisonous Serpent, about three Foot long, and proportionably thick, said to be found in *Syria*, *Croatia*, and many other Countries. *Dioscorides* informs us, that taken in Wine, it cures its own Bite. The Poison of its Bite acts like that of the Viper, and is cured by the same means.

SEPTA, according to *Blancard*, are Septic Medicines.

SEPTANA. A septinary Fever; that is, one which performs its Period in seven Days.

SEPTENTRIO. The North. *Aquasfortis* is, also, called by this Name. *Rulandus.*

SEPTICA. Putrefactive, or corrosive Medicines.

SEPTINERVIA. A Name for the *Plantago*; *latifolia*; *sinuata*.

SEPTUM CORDIS. The Partition betwixt the two Ventricles of the Heart.

SEPTUM LUCIDUM. The thin Partition which divides the two lateral Ventricles of the Brain. See CEREBRUM.

SEPTUM NARIUM. The Partition betwixt the Nostrils.

SEPTUM TRANSVERSUM. The Diaphragm.

SEQUESTRATIO, in Chymistry, is Separation.

SERANGODES, σερανγώδες. Cavernous; having many Pores or Interstices; spongy.

SERAPIAS. Salep. See ORCHIS.

SERAPINUS. Gum Arabic. *Rulandus.*

SERAPIUM. A Syrup.

SERBET. The same as SCHERBET.

SEREX. *Rulandus* explains this *Lac Acetosum*.

SERGETICUM, σεργητικόν. An Epithet in *Galen*, for the *Unguentum Irinum*.

SERJANIA.

This Name was given to this Genus of Plants by *Father Plumier*, who discovered them in *America*, in Honour to the Reverend *Father Philip Sergeant*, who was of the Order of the *Minims*, and a Person well versed in the Knowledge of Botany and Physick.

The Characters are;

It hath a rose-shaped Flower, consisting of four or more Leaves, which are placed in a circular Order; from whose Flower-cup arises the Pointal, which afterwards becomes a Fruit composed of three Cells, having three Wings, and each Cell containing one round Seed.

The Species are;

Serjania Scandens; *Polyphylla* et *racemosa*. *Plum. Nov. Gen.*

Serjania Scandens; *Enneaphylla* et *racemosa*. *Plum. Nov. Gen.*

Serjania Scandens; *Triphylla et racemosa*. *Plum. Nov. Gen.*

These Plants were found by the late Dr. *William Houftman*, at *La Vera Cruz* and *Campechy*; where they grow to a great Height, whenever they grow near large Trees to support them; for they have Tendrils by which they fasten themselves to whatever Trees grow near them. *Miller's Dict.*

SERICIACUM. Arsenic. *Rulandus*.

SERICUM. Silk. See **BOMBYX**. The red Jejube is, also, called *Sericum*. See **ZIZIPHUS**.

SERINUS. The Canary Bird; more remarkable for its Song, than any medicinal Virtues; though it is said to be good for the Epilepsy, if eaten.

SERIOLA. A Name for the *Cichoreum*; *latifolium*; *five Endivia vulgaris*.

SERIPHIMUM. A Name for the *Sisymbrium*; *annuum*; *folio Absinthii minoris*. A Species of Wormwood is distinguished by this Epithet.

SERIS. A Name for the *Cichoreum Sativum*. *Serides*, *cicidus*, are esculent Pot-Herbs.

SEROSUS. Serous, aqueous, abounding with Serum.

SERPENS. See **ANGUIS**.

SERPENS INDICUS. See **COBRA DE CAPELLO**.

SERPENS MARINUS. Offic. Aldrov. de Pisc. 346. Gefn. de Aquat. 864. Rondel. de Pisc. 409. Bellon. de Aquat. 157. Sale de Aquat. 58. Jonf. de Pisc. 9. Charlt. de Pisc. 6. Raii Ichth. 107. Ejusd. Synop. Pisc. 36. *Serpens marinus quindecim Pedes longus*, Johnf. Iter. Cant. 410. 1632. p. 17. **THE SEA SERPENT.**

It is found in the *Mediterranean Sea*. The Flesh is said to cure Incontinence of Urine, if taken with Lily Root. *Dale*.

SERPENTARIA NIGRA. See **ASARUM VIRGINIANUM**.

SERPENTARIA VIRGINIANA. Offic. *Serpentaria Virginiana*, *Contrayerva Virginiana*, *Viperina*. Mont. Exot. Med. 7. *Tres Radices sub hoc nomine in Officinis nostris veniunt, ut nos monuit eruditissimus ille Botanicus*, Leonard. Plukenetius. *M. D. in Literis ad me datis, viz. (I.) (II.) *Aristolochia Violæ fruticosa foliis Virginiana, cujus Radix Serpentaria dicitur*, Pluk. Phytog. T. 15. Almag. 50. Raii Hist. 3. 394. (III.) *Aristolochia, Pistolochia, seu Serpentaria Virginiana, caulenodosa*. D. Banister. Cat. MS. Raii Hist. 3. 394. Tourn. Inst. 162. *Aristolochia polyrrhizos Virginiana, fructu parvo pentangulari*, Hist. Oxon. 3. 310. *Pistolochia Virginiana*, Ger. Emac. 848. (*ubi confundit cum Pistolochia Cretica Clusii*) *Aristolochia polyrrhizos Virginiana*, Park. Theat. 420. *Radix Snagrolnothæ Creticus* (**SNAKE ROOT** *Novæ Angliæ*) Corn. 214. **VIRGINIAN SNAKEWEED.**

We have two or three Sorts of Roots, which are sold under this Name in the Shops; the first is the *Pistolochia, Virginiana* Ger. Emac. and the *Pistolochia Polyrrhizos, Virginiana*, Park. The second is figured by Plukenet, in his *Phytographia*, Tab. 15. And a third, whose Description was sent by Mr. Banister from Virginia to Mr. Ray, and is in the *Philosophical Transactions*, N°. 247. for December 1698; being to this Purpose.

The *Pistolochia*, or *Serpentaria Virginiana*, hath a bushy Root, consisting of a Number of small Strings of a yellowish Colour, and a hot aromatic Scent and Taste; thence grow one or two smooth or very little hairy Stalks, round and not square, upright and not trailing. The Leaves grow alternately on the Sides, and that one at a Joint. They are thin, long, and pointed, coming in like a Heart at the Foot-stalk; a little hairy above, and rough, with many protuberant Veins underneath, and in handling stick a little to the Fingers. Near the Ground grow one or two hollow Flowers, each upon its own Foot-stalk, terminating in a Heel, which supports a broad, round, galericulated Lip, the Center of which opens into the Hollow of the Flower. The Lip is of a light russet Colour. The Seed-Vessel is hexagonal, shap'd like a Pear, about half an Inch Diameter, when ripe. It grows in May, and the Seed is ripe in August. The Leaves and Stalks die in Winter.

Snake-Root is a Cordial, alexipharmic, and sudorific; good in all kinds of Fevers, particularly malignant and contagious Ones, and the Plague itself. It is carminative, expelling Wind, strengthening the Stomach, and helping the Colic. It cures the Bite of a mad Dog, and other venomous Bites, particularly that of the Rattle-Snake. *Miller's Bot. Off.*

It is given as a Diaphoretic in the Small-Pox, Measles, and to kill Worms. It is, also, Emmenagogue and Diuretic. The Dose is from ten Grains to a Dram. *Geoffroy*.

There is another Species of Snake-Root, called the *Senekka Rattle-Snake-Root*, which is said to cure effectually the Bite of a Rattle-Snake, if taken immediately after it. The

Bite of this Snake is sudden Death, for the most Part; that is, Death follows often in fifteen Minutes, sometimes sooner; and at other times the Patient may live some Days. The Reasons of these Differences, in the Time of Death, are various, such as the Season of the Year, Constitution of the Patient, and Part bit. Those that travel or hunt in the Woods, carry this Root powdered in their Shot-Bags, to chew and swallow as soon as they are bit by the Snake, the Stagnation of the Blood being prevented by its peculiar Activity.

A Nation of Northern Indians, called the *Senekkas*, were the Discoverers of the Efficacy of the Root of this Plant; they observing that the Root and Flowers resembled the Rattle of the Snake, concluded that Providence had impressed that Characteristic to point out its Use. From that Indian Nation this Root is named *Senekka Rattle-Snake-Root*, to distinguish it from the other Plants called Rattle-Snake-Root, which are much inferior in Efficacy. These Indians returning from a War with a southern Nation called *Catawbaes*, in the Year 1712, communicated the Efficacy of this Root to *William Caniko*, a Planter in the Frontiers of *Virginia*, which he imparted to the Country about him, and so it was soon known throughout *America*.

The Root of this *Senekka Rattle-Snake-Weed*, has since been used, as is said, with Success, in the epidemical Fevers of *Virginia*; in Pleurifies, Peripneumonies, Gout, and Rheumatisms, either in Decoction, Infusion, or Substance; and in these it should seem to be a good Medicine, if the Accounts we have of it could be depended on.

SERPENTARIUM Lignum. See **COLUBRINUM LIGNUM**.

SERPENTINA, a Species of **STELLARIA**. *Blancard*.

SERPHEA. The Name of a Medicine in *Paracelsus*, *Lib. 2. de Tart.* that will liquify the Stone.

SERPIGO. The same as **HERPES** or **IMPETIGO**, for both which Affections this Word is sometimes used.

SERPILLUM.

The Characters are;

The Leaves are broader than those of Thyme. The Stalks are procumbent, less woody and hard. Its other Characters very much resemble those of Thyme.

Boerhaave mentions six Sorts of *Serpillum*, which are;

1. *Serpillum*; vulgare; majus. *C. B. P.* 220. *Raii Synop.* 3. 221. *Boerb. Ind. A.* 133. *Tourn. Inst.* 197. *Serpillum verum*, Offic. *Serpillum majus*, Park. Theat. 8. *Raii Hist.* 1. 522. *Serpillum majus flore purpureo & albo*, Ger. 456. Emac. 570. **GREAT MOTHER OF THYME.**

It is cultivated in Gardens, and flowers in Summer. The Herb, which is the Part used, provokes Urine and the Menfes, and is good for the Gripes, Ruptures, Lacerations, and Inflammations of the Liver, eases Pains of the Head, and is particularly serviceable in Phrenesies and Lethargies; stops Vomiting of Blood, and is good for the Bites of Serpents. *Dale from Dioscorides*.

2. *Serpillum*; vulgare; minus. *C. B. P.* 220. *Park. Theat.* 8. *Tourn. Inst.* 197. *Boerb. Ind. A.* 155. *Serpillum* Offic. *Serpillum vulgare*, Ger. 455. Emac. 570. *Raii Hist.* 1. 521. *Synop.* 3. 230. *J. B.* 3. 269. **MOTHER OF THYME.**

Mother of Thyme has a small, stringy, creeping Root, from whence spring a great Number of very slender, leaning woody Stalks, having two small, roundish green Leaves, set at a Joint on short Foot-stalks. The Flowers grow on the Tops of the Stalks among the Leaves, in small loose Spikes, whorle-fashion, labiated, but with a very small Galea, of a reddish Purple Colour, set in small hairy Calyces. The Leaves and Flowers have a strong pleasant Smell; it grows frequently upon Heaths and Commons, and flowers in June and July. The whole Herb is used.

Mother of Thyme is cephalic, stomachic, and uterine; good for the Palsy, Epilepsy, and green Sickness, promoting the Catamenia. It is good against catarrhus Defluxions, and old Coughs, and helps spitting of Blood. The distilled Oil is good for the Tooth-Ach. *Miller's Bot. Off.*

Mother of Thyme is a little bitter, acrid, spicic, odoriferous, and stains the blue Paper with a pretty deep red. It is likely that it abounds with an aromatic and oily volatile Salt; but this Salt retains still a Part of the Acid of the Sal Ammoniac of the Earth; whereas, in the aromatic, oily, artificial, volatile Salt, the acid Part of the Sal Ammoniac has been stopt by the Salt of Tartar, or by the Ashes. Thus the Mother of Thyme is cephalic, stomachic, and good for the Vapours. It destroys the explosive Matter which causes convulsive Motions; it restores the spirituous Parts of the Blood, and re-establishes the Functions of the Primæ Viz. Infuse all Night a Handful of Mother of Thyme in red Wine, strain the Infusion through a Cloth, and give it to drink fasting to those that have the Green-Sickness for seven or eight Days

Days together, adding to each Dose four or five Drops of essential Oil of Sassafras: The Spirit of the Mother of Thyme, and its distilled Water, are very good for soporific Disorders, and the Vapours. The essential Oil is commended for the Epilepsy, or the Water drawn from its Flowers, macerated in Aqua Vitæ, and distilled afterwards, for a Rheum or an old Cough; throw two great Handfuls of Mother of Thyme into one Quart of Water; let it give but one Boil; then take the Pot off the Fire, cover it, and add two Spoonfuls of white Honey to the Infusion, or else pour a Quarter of a Pint of the same Infusion boiling, into two equal Quantities of Cows Milk, and make the Patient drink it hot at nine o' Clock at Night. A Dram of the Powder of the Mother of Thyme is diuretic. The Conserve of the Flowers and Leaves of this Plant relieves those that are troubled with the Falling-Sickness. *Martyn's Tournesfort.*

3. *Serpillum*; vulgare; minus; folio ex albo & viridi vario.

4. *Serpillum*; angustifolium; hirsutum. *C. B. P.* 220.

5. *Serpillum*; Africanum; hirsutissimum. *Vaill.*

6. *Serpillum*; foliis Citriodore. *C. B. P.* 220. *Tourn. Inf.* 197. *Boerb. Ind. A.* 155. *Serpillum citratum*, *Offic.* *Ger.* 458. *Emac.* 573. *Park. Theat.* 6. *Raii Hist.* 1. 522. *Synop.* 3. 231. *Serpillum Citriodore.* *J. B.* 3. 270. **LEMON THYME.**

It grows in hilly Places, and flowers in August, and agrees in Virtues with the other Species of *Serpillum*.

SERRA, a Saw, a chirurgical Instrument used in Amputations; there are two Sorts, the greater Saw, which is used in cutting off a Limb, as an Arm, or a Leg; and the lesser, which is employed in taking off a Finger or Toe.

SERRATA. A Name in *Blancard* for the **CHAMÆDRYS**.

SERRATULA.

The Characters are;

The Margins of the Leaves are much, and minutely serrated; the Heads are smaller than those of the greater Centaury.

Boerhaave mentions five Sorts of *Serratula*, which are;

1. *Serratula*. *Offic.* *C. B. P.* 235. *J. B.* 3. 23. *Raii Hist.* 1. 331. *Synop.* 88. *Boerb. Ind. A.* 144. *Serratula purpurea*, *Gen.* 576. *Emac.* 713. *Serratula vulgaris flore purpureo*, *Park.* 474. *Jacea nemorensis*, quæ *Serratula vulgo* *Tourn. Inf.* 444. **SAW-WORT.**

It grows in Woods and Meadows, and flowers in July. It is esteemed vulnerary, and is said to mundify Ulcers, and promote the Generation of Flesh therein; to mitigate the Pains of the Hæmorrhoides, and to cure an Intestinal Rupture. The Herb and Root are recommended in Case of Bruises in Falls from Eminences.

2. *Serratula*; flore candido, *C. B. P.* 235. *Jacea nemorensis*, quæ *Serratula vulgo*, flore albo. *T.* 444.

3. *Serratula*; Virginiana; foliis rigidis. *Par. Bat.* 227. *It. & Deser. M. H.* 3. 133.

4. *Serratula*; Noveboracensis; altissima; foliis Doræ molli-
libus, subincanis. *Par. Bat. Prodr. M. H.* 3. 133.

The following Species is elegantly crowned with a hairy Crown.

5. *Serratula*; annua; semineciliari elegantissimo. *Jacea*, annua, foliis laciniatis, serratis, purpurascente flore. *T.* 444. *Cyanus*, pulchro semine Centaurii majoris, *J. P.* 130. *Senecio-Carduus*, *Apulus.* *Col.* 1. 34. *Boerb. Ind. alt. Plant. Vol.*

SERRATUS MAJOR.

This is a broad, fleshy, and pretty thick Muscle, lying on the lateral Part of the Thorax, between the Ribs and the Scapula, by which it is covered. Its Figure is that of an irregular Square, its greatest Breadth being in the Back-Part, where it terminates by Digitations of unequal Lengths, in a radiated Disposition, their Extremities describing an Arch or Curve; and from these Digitations its Name is taken.

It is inserted backward in the internal Labium of all the Basis of the Scapula, from the superior to the inferior Angle. From thence running forward wholly fleshy, it increases gradually in Breadth, is inserted in all the true Ribs, and often in one or two of the false Ribs, by the same Number of Digitations.

The Insertion in the first true Rib is about five Fingers Breadth from the Cartilage; in the second, something less; in the third, about four Fingers Breadth; the fourth, three; in the fifth, two; in the sixth, one; in the seventh, one half; and in the first false Rib, two Fingers Breadth; but in all these Measures, some Latitude is to be allowed. The Breadth of each Insertion in the Ribs, is at least an Inch.

Tho' the Digitations of this Muscle give it a radiated Appearance from the Scapula to the Ribs, yet these Radii do

not at all lie in that Disposition which at first Sight we would be subject to imagine. The Muscle is made up of two Planes, the one great, the other small.

The small Plane looks like a distinct, narrow Muscle, closely adhering to the superior Edge of the great Plane. It is fixed by one Extremity under the superior Angle of the Scapula, and by the other to the first Rib, by a small Insertion, and to the second Rib, by a broad Insertion. This Plane is easily seen by turning the Scapula forward, having first separated the *Rhomboides*; but when that is turned back, the *Pectoralis minor* being first cut off, this Plane does not appear, being covered and hid by the broad one.

The broad Plane may be divided into two Portions, one superior and one inferior, adhering to each other by their Edges.

The superior Portion is thin, and takes up about three Quarters of the Basis of the Scapula, reckoning from the superior Angle. From thence it contracts, by small Degrees, and forms two Digitations, very like those of the small Plane, which they cover by their Insertions in the two first true Ribs, or in the second and third, and sometimes in all the three.

The inferior Portion is fixed in the lower Quarter of the Basis Scapulæ, from whence it expands itself by six or seven very long fleshy Digitations, which decrease in Breadth as they descend and are inserted in the Manner already said, in the six or seven Ribs which follow the two first. It must be observed, that the three first Digitations take up almost all this Quarter of the Basis Scapulæ, the three last being fixed precisely in the inferior Angle. The Extremities of the three or four lowest Digitations mix Fibres with those of the *Obliquus externus* of the Abdomen.

The Direction of the Fibres and Digitations of the *Serratus major*, will be easily comprehended, by recollecting, that the Ribs are inclined downward in different Degrees from behind forward; for which Reason the Fibres of the superior Portion of the broad Plane, cross over the Ribs at less acute Angles than those below them, so that in the natural Situation of the Scapula, the lowest of these Fibres which run up very obliquely cross over the third, fourth and fifth true Ribs.

The upper Fibres of the inferior Portion of the broad Plane, run up proportionably more obliquely, and therefore cross over more Ribs, and at more acute Angles than the others, which are less oblique; and tho' some of these run transversely, yet the Ribs being oblique, they must cross over some of them, tho' in a lesser Degree. The lowest of these Fibres or Digitations run a little downward, and consequently fall in more with the Direction of the Ribs, but not so much as may be imagined. These Digitations are very small and weak.

The *Serratus major* raises the Shoulder or Top of the Scapula, brings it forward, and hinders it from sinking. In all these, it is the principal Actor; and it is impossible to conceive how Labourers raise and support, by the Shoulder alone, the heavy Burdens with which they are loaded, without the Assistance of this Muscle.

The Thickness, Length, and particular Disposition of its Fibres, but above all, the Insertion of the greatest Portion of them, near the Angle of the Basis Scapulæ, prove sufficiently what I advance; and the general Action of the radiated Portions is to draw the inferior Angle from the Spina Dorsi, toward the lateral Parts of the Thorax.

The uppermost and strongest Portions pull this Angle upwards at the same time, and consequently raise the Acromium, which cannot be pushed forward, by reason of its Connexion with the Clavicula.

These superior Portions cross over the greatest Part of the true Ribs; and accordingly, in raising great Burdens, we find ourselves obliged to hold in our Breath, that is, to lessen Expiration as much as we can, in order to fix the Ribs, and to hinder them from sinking, that they may serve for a solid Fulcrum to this Muscle, in Proportion to the Force with which it acts.

The next Portions run according to the Length of the Ribs, and consequently do not much constrain them in their reciprocal Motions, not being in a Condition either to raise or depress them; and the most inferior and weakest Portions are only Assistants to the rest, in bringing the lower Angle of the Scapula forward, toward the lateral Part of the Thorax.

The small distinct Plane (above described) is not an Assistant to the radiated Portions or inferior Part of the great Plane. It seems designed to regulate the Motion of the superior Angle backward and downward, while the inferior is carried forward and upward by the radiated Portions; and when their Action ceases, to bring the Scapula back to its natural Place.

The superior Portion of the great Plane is an Assistant partly to the radiated Portion, and partly to the small Plane, according

according to the different Places of its Insertions in the Basis of the Scapula.

From all this we see, that the principal Use of the *Serratus major* is to raise the Shoulder, and not for Respiration. When both Planes act together, this Muscle may in some Cases bring the Shoulder directly forward, or rather hinder it from going back; as when we push any Thing with great Force directly forward, with the Hand, especially when the Arm is extended. *Winslow's Anatomy.*

SERRATUS MINOR ANTICUS. Douglas describes this Muscle in the following Manner:

It arises tendinous from the *Processus Coracoideus Scapulae*, but soon grows fleshy and broad, and is inserted tendineo-carnous into the lower Edge of the bony Part of the third, fourth and fifth Rib.

Its Use is either to assist the *Serratus major*, or to draw the Scapula forwards.

SERRATUS POSTICUS SUPERIOR.

This is a flat thin Muscle, situated on the upper Part of the Back. It is fixed on one Side by a broad Aponeurosis to the lower Part of the posterior cervical Ligament, and to the spinal Apophyses of the two last Vertebrae of the Neck, and two first of the Back.

From thence it runs down a little obliquely forward, and is inserted by broad fleshy Digitations, in the posterior Part of the second, third, fourth, and sometimes the fifth, true Ribs, near their Angles; but sometimes it has no Insertion in the second Rib. It is covered by, and closely united with the Rhomboides.

The *Serratus Posticus superior*, is disposed to move upwards the three or four upper Ribs next the first: And if any Portion of this Muscle should be observed to be inserted in the first Rib, that could only serve for the Motion of the Vertebrae, with which that Rib is articulated, and not for the Motion of the Rib itself, because of the Stiffness and Immobility of its cartilaginous Portion.

SERRATUS POSTICUS INFERIOR.

This is a flat, thin Muscle, lying on the lower Part of the Back. It is fix'd in the last spinal Apophysis of the Back, and in the three first of the Loins by a broad Aponeurosis; from thence it runs up a little obliquely, and is fix'd by fleshy broad Digitations in the last four false Ribs: Its Insertion in the lowest Rib is near the Cartilage, and in the other three near their Angles. It is covered by the *Latissimus Dorsi*, to which it adheres very closely, and it covers the *Sacro-Lumbaris* and *Longissimus Dorsi*.

The *Serratus Posticus inferior*, is better disposed for depressing and keeping down the last three or four false Ribs than the *Serratus Posticus superior*.

The Use which has been assigned to these two Muscles, of being Vaginae, or moveable Fræna, to the *Longissimus Dorsi* and *Sacro-Lumbaris*, is without Foundation; for the Portions of these Muscles covered by the *Serrati*, have no more Need of such a Contrivance, than those which are not covered by them. *Winslow's Anatomy.*

SERRIOLA. A Name in *Blancard* for the *CICHO-REUM*.

SERTOLARA. A Name in *Boerhaave* for the *Opuntia marina*; quæ *Corallina latifolia*, & *Opuntia marina*.

SERTULA, Campana. The same as *MELILOTUS*.

SERVITUS, δελία, Subserviency, is spoken of the Functions and Uses of the Parts which are subservient to others. These subservient Parts are distinguished into *Preparatory* and *Deserent*; the *Preparatory*, for Instance, with respect to the Testicles, are the *Vasa Spermatica Preparantia*: The *Deserent* are the *Penis* and *Vasa Deferentia*.

SERUM. Whey. The thin Part of the Blood is, also, called its *Serum*. See *ALBUMEN, LAC,* and *ALIMENTA*.

SESAMION, σισάμιον, or, σισάμις, a Sort of Cake prepared of *Sesamum*, Honey, and Oil. *Foetus.*

SESAMOIDEA OSSA. The *Sesamoide* Bones.

The *sesamoide* Bones, in general, are very small, being denominated from a Seed to which they are supposed to bear a Resemblance. Several such Bones are found in the Joints both of the Toes and Fingers.

Two of them, however, are big enough to be preserv'd in Sceletons. They resemble a large, flat, oval Pearl, hollow'd on one Side.

They are about the third Part of an Inch in Length, and half as broad as long; and they are connected near each other, by a small, short Ligament, to the Basis of the first Phalanx of the great Toe, so as to slide on each Side of the middle Eminence of the double Pulley in the first metatarsal Bone, like two small Patellæ.

Though they are generally fasten'd in Sceletons, to the first Bone of the Metatarsus, they nevertheless belong only to the first Phalanx of the great Toe, as the Patella belongs not to the Os Femoris, but to the Tibia. *Winslow's Anatomy.*

SESAMOIDES.

The Characters are;

The Leaves are oblong and intire, and the Flower is like that of the *Reseda*. The Fruit consists of a Congeries of little Pods, Horns, or Rays, full of a Kidney-shap'd Seed.

Boerhaave mentions but one Sort of *Sesamoides*, which is, the *Sesamoides*; *salmanticum*; *parvum*. *J. Clus. H.* 296. *Beirh. Ind. Alt. Plant. Vol. I.* See *CATANACE*.

Botanists have not determin'd what the *Sesamoides* is, which is frequently order'd by *Hippocrates* to be us'd with black Hellebore. *Dioscorides* describes it in the following Manner.

The *Great Sesamoides* in *Anticyra* goes by the Name of *Hellebore*, because it is mixed with white Hellebore in Purges. It is an Herb like *Senecio*, or *Rue*, with long Leaves, a white Flower, a slender and inefficacious Root, a Seed like that of *Sesarnum*, and of a bitter Taste.

A Pugil of the powder'd Seed, with a Scruple and an half of white Hellebore, taken in Hydromel, purges Bile and Phlegm by Vomit. *Dioscorides, Lib. 4. Cap. 152.*

SESAMUM.

The Characters are;

The Root is annual; the Calyx proceeds from the Wings of the Leaves, almost without a Pedicle, and is small, and consisting of five long, slender Segments; the Flower is monopetalous, and much resembles that of *Digitalis*. The Ovary is filiquous, tetragonal, oblong, divided into four Cells, which are full of many eatable Seeds.

Boerhaave mentions three Sorts of *Sesamum*, which are;

1. *Sesamum, Offic. I. B. 2. 896. C. B. P. 27. Raii Hist. 2. 1327. Park. Theat. 254. Sesamum vel Sisamum, Ger. 1054. Emac. 1232. Sesamum seu Semp. seu Alpin. Egypt. Vol. II. p. 47. Digitalis Orientalis Sesamum dicta, Tourn. Inst. 164. Sesamum congentibus Gangya, Lusitanis Girgilium, Mareg. 21. Gangila sive Sesamum Africanum, Pison. 111. Schit-Elu, Hort. Mal. 9. 105. Tab. 54. Tala Herm. Mus. Seyl. 58. OILY PURGING GRAIN.*

It is heating, moderately moistening, emollient, and pargoric; and is of a viscid, pinguius, and consequently of an emplastick Quality. It dissolves a Hardness of the Nerves, being rubbed therewith, and cures the Pain of the Cholic. *Dale from Schroder.*

Sesamum is very much used by the *Egyptians*, both in Food and Medicine, because it is of quick Growth, as are other Fruits after the Inundation of the Nile, and very well rewards the Planter for his Pains by the Fullness of its Pods, which never fail. *Parkinson*, I know not from what Author, says, that *Sesamum* grows spontaneously in the *East-Indies*, but that it is cultivated in *Egypt*, *Syria*, *Greece*, *Crete* and *Sicily*. The *Arabians* call the expressed Oil of the Seeds *Zeid taib*, that is, good Oil, by way of Eminence; because it is of very frequent Use in Meats; and in *Egypt* it is sold dearer than Oil of Olives.

Margrave describes this Plant with a tender strait Root, furnished with numerous Filaments, reddish on the Outside, and white within, if he does not mistake the Plant.

I am of Opinion, says *Ray*, with *J. Baubine* and *Stapel*, that this Plant is not the true *Sesamum* of the *Antients*; and, therefore, it is to be doubted, whether the Virtues ascribed to the *Sesamum* by *Dioscorides*, really belong to it; we shall, therefore, omit them, and only insert those which *Prosper Alpinus*, in his Book of *Egyptian* Plants, ascribes to the *Sesamum*.

The Decoction of this Plant is used, he says, in Fomentations for Ophthalmies, Coughs, Difficulty of Breathing, Pleurisy, Peripneumony, and hard scirrhus Tumors. It is of Service, particularly to the Women, for Infections, in Hardness of the Uterus: It is of Use, also, in scald Heads, and Sugillations. The Plant and its Seeds boiled with Honey, are of Service in Dryness of the Nerves, Combuitions, and hot Inflammations. The Decoction is of Use in Clysters for the Cholic, to render the Belly soluble, and to promote the menstrual Discharges. The Women very commonly drink the Oil and its Lees, in their Baths, in order to grow fat. The Oil serves the *Egyptians* for many other Purposes, as for Pustules, Asperities, and all other cutaneous Defections from a melancholy Humour, being either drank, frequently taken with Food, or apply'd externally to the Parts affected. Four Ounces thereof taken in the Morning, for many Days together, is an Arcanum with some for Itchings of the Skin, Difficulty of Breathing, desperate Pleurisy, Peripneumony, for provoking the Menstrues, and as a Demulcent both

both inwardly and outwardly, for violent Pains of the Stomach, Intestines and Uterus. *Raii Hist. Plant.* 1327.

2. *Sesamum*; alterum; foliis trifidis; Orientale; semine obscuro. *Pluken. Phyt.* 169. 4. *Digitalis, Orientalis, altera, semine obscuro.* T. 165.

3. *Sesamum*; Orientale; trifidum; flore niveo. *Hort. Compt.* T. 165. *Digitalis, Orientalis, trifida, flore niveo.* T. 165. *Boerb. Ind. Alt. Plant.*

This Plant is very serviceable, being used by Way of Alimentation, in the Pleurisy, Ophthalmy, and scirrhus Tumors; and administer'd in Clysters, is good for the Cholic. The Indians extol it above all Plants, because it procures, as they say, Beauty and Gracefulness to the Body; for their Women anoint themselves with Oil of *Sesamum*, which clears the Face of all Spots contracted by Sun-burning, or otherwise. The Fruit is very nutritive and eatable, and with an Addition of Poppy-Seeds, is made into Cakes. The Oil is the softest of all Oils, and is, therefore, proper in all hot Diseases. *Hist. Plant. ascript. Boerhaave.*

SESBAN.

The *Sesban* is a Shrub of the Bigness of the Myrtle, with the Leaves of the *Securidaca*, only longer and narrower, with nearly an equal Number of tender herbaceous Branches on each Side, if the Plant be pretty well grown. These Branches are of a watery green, somewhat inclining to red, and have something of a Roughness to the Touch. The Flowers are of a Saffron-Colour, very like those of the *Anagyris*, and hang in Bunches from a smaller Branch or Spray. From these Flowers are produced long Pods, nearly resembling those of *Fenugreek*, and containing Seeds not much unlike the Seeds of that Plant. The Pods, as *Veslingius* observes, are divided into distinct Cells, according to the Number of Seeds they contain; and the same Author observes, that the Trunk of this Shrub is armed with rare and short Spines, for which Reason the *Egyptians* plant the *Sesban* in Hedges, which serve to separate their Fields.

The Seeds are said to corroborate and dry a too humid Stomach, and to restrain all manner of Fluxes of the Belly, and to be no less serviceable in repressing an immoderate Flux of the Menfes, whether they be taken in Decoction or Powder. *Prosper Alpinus. Veslingius.*

Morison, in his *Histor. Oxon.* blames *C. Baubine* and *Parlinsin*, for describing this Plant with articulated Pods, when they did not clearly understand what an articulated Pod, properly speaking, was; for an articulated Pod, he says, is divided transversely into many Joints, distinguished by their Interstices; each Interstice, when the Pod is dried and broken, containing a single Seed.

As for our part, says *Ray*, we never yet saw this Plant; nor did *Morison* himself ever see it, as he owns; and therefore we cannot tell whether its Pods are really articulated, or only nodous or protuberant, where the Seeds are, and depressed or narrowed in the Interstices. *Raii Hist. Plant.*

SESCUNCIA, or *SESQUIUNCIA*. Half an Ounce.

SESELI.

The Characters are;

The Root is perennial, in the last biennial; and the Leaves are wider and shorter, and the Seeds longer than those of *Fennel*.

Boerhaave mentions four Sorts of *Seseli*, which are,

1. *Seseli*; perenne; folio glauco breviori. *Boerb. Ind. A.* 50. *Feniculum sylvestre*, Offic. *Feniculum sylvestre perenne.* *Ferula folio breviori*, Tourn. Inst. 311. *Meum latifolium adulterinum*, C. B. P. 148. *Meum alterum Italicum quibusdam*, J. B. 3. 15. *Raii Hist.* 1. 433. *Meum spurium*, Ger. 895. *Meum alterum Italicum*, Ger. Emac. 1152. *Meum spurium Italicum*, Park. Theat. 889. *Saxifraga montana minor Italica, foliis in breviores partes divisis*, Hist. Oxon. 3. 272. **BASTARD SPIGNEL.**

It grows on dry Hills, and flowers in June. The Root, which is in Use, is of a very dry and burning Quality, and offensive to the Stomach. Outwardly it is an Escharotic.

2. *Seseli*; perenne; folio glauco longiori. *Vaill. Feniculum sylvestre, elatius, Ferula folio longiori.* T. 311. *Saxifraga Matthioli, tenuifolia, & umbellifera*, J. B. 3. 2. 18.

3. *Seseli*; quæ *Ferulae facie*, *Thapsia*, five Turbith Gallorum. J. B. 3. 2. 45. *Boerb. Ind. A.* 50. *Turbith cinerium, Pseudo-Turbith*, Offic. *Thapsia ferulae facie, five Turbith Gallorum*, *Raii Hist.* 1. 420. *Thapsia feniculi facie*, C. B. P. 148. Park. Theat. 877. **FRENCH TURBITH.**

It is found in the Mountains of *Aquitain*, and the Root, which is the Part used, agrees in Virtues with the *Thapsia*.

4. *Seseli*; quæ *Saxifraga Pannonica*, *Clusii*, H. 196. *Saxifraga montana minor, multifida folio, Pannonica*, M. H. 3. 273. *Daucus montanus, multifido brevique folio*, C. B. P. 150. *Boerb. Ind. Alt. Plant.*

The Name *Seseli* is ancient, but given to so many Plants, that there is no End of them. *Lobel* first called it *Meum Adulterinum*, by which Name it has been called almost by every one since; and *Morison* reckons it among the *Saxifrages*. There is nothing of it used in Medicine but the Root, which purges in a very violent manner both upwards and downwards. Outwardly it is used in Ointments in all cutaneous Diseases. *Seseli* is not so sweet scented as *Fennel*. *Hist. Plant. ascript. Boerb.*

SESELI is also a Name for several Sorts of *SILAUM*.

SESELI ÆTHIOPICUM. Offic. *Seseli Æthiopicum frutescens*, Ger. 1233. Emac. 1241. *Raii Hist.* 1. 476. Park. Theat. 907. *Seseli Æthiopicum salicis folio*, C. B. P. 161. *Seseli Æthiopicum fruticosum, Periclymeni folio*, J. B. 3. 197. *Eupatorium arborescens, Salicis folio*, Tourn. Inst. 310. *Boerb. Ind. A.* 71. **SHRUB HARTWORT.**

It is sometimes to be met with in the Gardens of the Curious, and flowers in August.

The Seed is much more acrimonious and scented than that of the *Seseli Massiliensis*; whence it is supposed to have some extraordinary Virtues.

SESELI ÆTHIOPICUM is, also, a Name for the *Laserpitium*; foliis latioribus; lobatis.

SESELI CRETICUM. A Name for the *Tordylium*; *Narbonense*; minus; and for the *Tordylium*; *Apulum*; minus.

SESELI MARITIMUM. A Name for the *Ligusticum*; *Scoticum*; *Apii folio*.

SESELI MASSILIENSE. Offic. *Raii Hist.* 1. 414. *Seseli Massiliense alterum*, Ger. 894. Emac. 1051. Park. Theat. *Seseli Massiliense, Ferulae folio*, C. B. P. 161. *Seseli Massiliense nuperorum, folio aliquatenus simili Vissagæ*, J. B. 3. 33. *Libanotis Massiliensis, Ferulae folio*, Hist. Oxon. 3. 310. **ITALIAN HARTWORT.**

The Part used is the Seed, which is of principal Service in Diseases of the Head, the Epilepsy, Weakness of Sight, Convulsions, and the like, and in Affections of the Breast and Lungs, Coughs, Catarrhs; also, in Obstructions of the Liver, Dropsy, Crudities of the Stomach, in the Stone of the Kidneys and Bladder, and in a Stoppage of the Menfes. It is a specific Remedy against the *Cicuta*. *Dale*, from *Schroder*.

SESELI MASSILIENSE is, also, a Name for the *Feniculum*; *toruosum*.

SESELI MONTANUM. A Name for the *Oreoselinum*; *Apii folio majus*.

SESELI PALUSTRE. A Name for the *Thyselinum*; *palustre*.

SESELI PELOPONENSE. A Name for the *Cicutaria*; *latifolia*; *foetida*.

SESELI PYRENAICUM. A Name for the *Apium*; *Pyrenaicum*; *Thapsiae facie*.

SESELI VULGARIS. A Name for the *Siler*; *montanum*; *majus*.

SESQUI. This Word, joined with any Number, Weight or Measure, signifies one Integer and an half.

SESQUIALTERUM. The same as *HEMIOLIUM*. *Sesquialtera*, in *Helmont*, is a sort of irregular or compound Fever.

SESQUIHEMINA. An *Hemina*, and an half.

SESQUILIBRA. A Pound and an half.

SESQUIOBOLUS. An *Obolus* and an half.

SESQUIPLUM. The same as *HEMIOLIUM*.

SESQUISEXARIUM. A Sextary and an half.

SESQUIUNCIA. An Ounce and an half.

SESSILIS. An Epithet for that Species of Wart called *MYRMECIA*.

SETACEUM. A Seton.

Mr. *Bernard* observes, that a Seton was described by *Lanfranc* four hundred Years ago. Dr. *Freind* adds, that *Roland*, who lived earlier in the Thirteenth Century, not only mentions the Thing, but uses the very Word, and gives a Description how the Needle with the Thread should be passed.

Cámanusali, a Physician of *Baldach*, or *Bagdet*, who, at the latest, lived before that City was taken by the *Tartars* in one thousand two hundred and fifty eight, mentions a Seton twice in the Cure of a Cataract, and what he calls the *Lunella*, an Impostume between the Cornea and the Uvea.

Dr. *Freind* thinks, that *Albucahis* describes the Operation plainly, where he treats of cauterizing the Arm-pit, for a Dislocation of the Shoulders, when it arises from too great a Flux of Humors, and makes use of a Cautery, which has two or three Spits or Branches very small and sharp, and runs into the Skin till it comes out on the other side.

The same Method he uses in Tumors of the Spleen, and advises that the Ulcers should be kept running for a long time.

Franciscus Pedemontanus, who was Physician to *Robert King of Sicily*, about one thousand three hundred and ten, transcribes the Words of *Albucasis*, in speaking of a Dislocation in the same Place. The Discourse of *Rhazes* concerning Cauteries, makes it clear, that it was a familiar Practice in his Age. He describes the several Places it should be made in; as in the Neck, between the Ribs, in the Belly, &c. and for what Distempers, &c. The Translator calls it *Sectorium*; and these Ulcers, he says, must be kept open *cum tentis & petiis*; which is as plain a Description of a Rowel, or a Seton, as Words can express. For Pains in the Ears, Eyes or Teeth, he particularly advises one to be made either in the Middle or Pulp of the Ear; and the Running to be continued as long as it can.

Dr. Freind is of Opinion, that the Hint of a Seton was first taken from the Cattle-Doctors; and quotes a Description of it from *Columella*, who wrote in *Claudius's* Time, and says this Method is still in Vogue amongst the Herdsmen. What is proposed by *Columella*, is, with regard to the Plague, or some epidemical Infection amongst Cows; and we find Issues were afterwards applied to the humane Body in the same Distemper; first by *J. Arculanus*, who flourished in the 15th Century; and after his Example, many Physicians in the succeeding Age recommended them as the most effectual Preservatives in that terrible Disease.

In the Time of *Albucasis*, and for some hundred Years after, the way of making a Seton was always by a Cautey. *Hollerius* was one of the first who made it with a Needle unheated; which makes it surprising, that *Hildanus* should so long after describe it as an Invention of his own. However, there seems to be some Ground for the Criticism of *Severinus*, that by the Word *Sectorium*, used in the Translation of *Rhazes*, it is implied that it was not done by Ustion; and indeed it is plain, that *Rhazes* distinguishes the two ways of performing this Operation, either by Burning or Cutting, and sometimes by both jointly; and in the Article where he orders a Seton to be cut between the Navel and the Clavicle, for an Asthma, Phthisis, Pleurisy, &c. he adds, that a Cautey likewise may be applied in the same Place, for the same Complaints. *Freind Hist. Phys.*

When a few Horse-Hairs, a Thread, or Linnen Cord, are drawn through the Skin, particularly in the Neck, with a kind of large Needle, it is called a Seton. There are three Methods of performing this Operation. First the Surgeon takes up the Skin at the lower Part of the Neck, and an Assistant lays hold of it about an Inch higher, both keeping it tight; then the Surgeon passes a large broad crooked Needle (See Tab. 39. Fig. 12. or Tab. 43. Fig. 9.) armed with a Cord of Linnen, Silk or Cotton, or with a long narrow Piece of Linnen, or with twenty or thirty Linnen or Cotton Threads, gently twisted together, (Tab. 42. Fig. 17.) thro' the Skin, and removing the Needle, leaves the Thread behind. Then the Wound must be dressed with some digestive Ointment, and over each Orifice, by which the Thread is transmitted, apply a Plaister; and thus the Seton is compleated, which derives its Name from *Setæ Equinæ*, or Horse-Hairs, that were used by the Ancients for this purpose; in the Room of which the Moderns substituted Linnen or Cotton Threads, as occasioning less Pain to the Patient. The Cord must be twice a Day, in the Morning and Evening, drawn first a little on one Side, and then on the other; and the Matter which is by these means discharged, as in an Issue, must be wiped off. Thus will it become an Ulcer with a double Orifice, daily emitting a large Quantity of purulent Mattee; and this ought to be continued so long as the Disorder of the Patient requires. When the Cord becomes foul, a new one may be fastened to the End of it, and by drawing the old one out, the new one be gently introduced in its stead.

The second Method differs little from the first, except that in Place of a Needle, the Wound is made with a double-edged Knife; (See Tab. 22. Fig. L or B.) and the Cord is introduced by a Probe. Thus the Knife making a larger Wound than the Needle, a greater Quantity of Matter may be discharged. For the more convenient Performance of this Operation, use an Instrument fitted with a Handle, like that in Tab. 44. Fig. 5. for when it has pierced the Skin to the Part B. the Cord or Thread may be drawn out at the Aperture A. and by drawing the Instrument back out of the Wound, it may be left behind.

The third Method of performing this Operation, is with a peculiar Instrument, as exhibited by *Bartisch*, *Andreas a Cruce*, *Hildanus*, *Fabricius ab Aquapendente*, and *Glandorp*; while the Skin is held tight by it, a Perforation is made with a sharp-pointed red hot Iron, and then the Cord is introduced. As this Method of Operation occasions violent Pain, and great Suppuration, it has been preferred as the most effectual, by eminent Physicians, for causing a copious Revulsion of

super-abundant, peccant Humours from the Eyes, and other principal Parts of the Head.

Some think a Seton made longitudinally in the Neck is preferable to the transverse. But though I have purposely tried this Method, I never could discover its Advantage over the other; but always found the Operation more difficult, as the Skin cannot be so easily raised transversely as longitudinally, nor the Needle or Knife be so conveniently introduced. In executing this Method, the Head is to be inclined backwards, and the Skin being taken up, must be perforated with a very crooked Needle, (See Tab. 43. Fig. 9.) But the Operation may be the more conveniently performed, by laying hold of the Skin with a Forceps, than with the Fingers, such as is made for the Polypus of the Nose, having two oblong Perforations towards the Extremities, (See Tab. 40. Fig. 10.) through which the Perforation of the Skin may be made.

Dimis, *Garangeot*, and others, think a Seton of little or no Benefit in the Cure of Diseases. On the other hand, many skilful Physicians have regarded it as a most excellent Remedy against obstinate Diseases, particularly of the Head, as Drowfiness, Head-Achs, Epilepsies, and Disorders of the Eyes. And as a plentiful Revulsion is, by this Operation, made of the superfluous corrupted Humours, from the Head to the Neck, it is not surprising that some Physicians have reckoned one Seton a more efficacious Remedy than two Issues. A Seton has by Experience been proved beneficial in Distempers of the Head, as the Hydrocephalus, Catarrhs, intense Pains, with the Loss of Memory, Epilepsies, Drowfiness, and even the Apoplexy. And, also, in Disorders of the Eyes, as in violent Inflammations, Gutta Serena, and a Cataract or incipient Suffusion. But the Pain and Trouble produced by a Seton, prevent many from experiencing the good Effects of so excellent a Remedy. *Heist. Inst. Chir.*

SETANIOS. *ovaria.* An Epithet for a Sort of Wheat, sown in the Spring, and reaped in the Summer, so as to be but about three Months in the Ground; whence it is called *Trimestre*, *Hornus*, or *Hornotinus*. *Setanios*, according to *Hesychius*, sometimes imports pure or fine.

SEVATIO. A *Steatoma*. *Castellus* from *Ingraffias*.

SEVERI COLLYRIUM. See **ALBUM SEVERI COLLYRIUM**.

SEULO. Lead. *Rulandus*.

SEUTLOMALACHE. The Beet, according to some; but others call the Spinage thus. *Blancard*.

SEVUM. The same as **SEBUM**.

SEXTANS. The sixth Part of a Pound, or two Ounces, or sixteen Drams. *Galen. de C. M. P. G. et de C. M. S. L.* It is, also, used for the sixth Part of any other standing Weight or Measure.

SEXTARIUS. *ærys.* A Measure as well for Liquid as dry Things. See **MENSURA**. We shall only add here, that the Parts of the *Sextarius* were like those of the *As*, *Uncia*, *Sextans*, *Quadrans*, *Triens*, *Quincunx*, *Semis*, *Septunx*, *Bes*, *Dodrans*, *Dextans*, *Deunx*; by which Words a certain Number of *Cyathi* is meant, a *Cyathus* being one twelfth of a *Sextarius*.

SEXTULA. The sixth Part of an Ounce, or four Scruples.

SEXUNX. The Weight of six Ounces, or Half a Pound.

SFERRO CAVALLO. The Italian Name for the *Ferum Equinum*, Horsehoe Vetch.

SHERARDIA.

This Name was given to this Genus of Plants by *Mr. Vaillant*, who was Professor of Botany at *Paris*, in honour to *Dr. William Sherard*, who was the most famous Botanist of the Age.

The Characters are;

It hath a labiated Flower, consisting of one Leaf, which is divided into five Parts at the Brim; the upper Lip being divided into two, and the under Lip into three Parts. The Ovary, which is at the Bottom of the Flower-Cup, afterwards becomes a dry Capsule, containing two oblong Seeds. To these Notes may be added, that the Leaves grow opposite by Pairs.

Miller mentions thirteen Sorts of this Plant; which are;

1. *Sherardia*; repens; nodiflora. *Vail. Nov. Gen.*
2. *Sherardia*; repens; folio subrotundo; crasso; nodiflora. *Vail. Nov. Gen.*
3. *Sherardia*; incana; nodiflora. *Vail. Nov. Gen.*
4. *Sherardia*; nodiflora; Stachadis ferrati folii, folio. *Vail. Nov. Gen.*
5. *Sherardia*; ocyimi folio lanuginoso; flore Purpureo. *Vail. Nov. Gen.*
6. *Sherardia*; teucris folio; flore Purpureo. *Vail. Nov. Gen.*

7. *Sherardia*; frutescens, teucii folio; flore cæruleo; Purpura scente amplissimo. *Vail. Nov. Gen.*
8. *Sherardia*; teucii folio; flore coccineo. *Vail. Nov. Gen.*
9. *Sherardia*; spicata; folio angusto; serratis; flore coccineo. *Houst.*
10. *Sherardia*; spicata; flore purpureo; seminibus majoribus, longioribus, & laxius digestis. *Houst.*
11. *Sherardia*; verbenæ folio; subrotundo; crasso; floribus cæruleis; spica longissima & crassissima. *Houst.*
12. *Sherardia*; foliis oblongis; serratis; flore cæruleo; spica longissima. *Houst.*
13. *Sherardia*; aborescens; nodiflora; foliis rugosis & serratis; flore purpureo. *Houst.*

The first of these Plants is a Native of *Egypt*, so will thrive in the open Air in this Country.

All the other Sorts are Natives of the warm Parts of *America*, so are too tender to thrive in the open Air of *England*.

The second Sort was found by Dr. *William Houston*, growing plentifully in *Jamaica*. This Plant trails its Branches on the Ground, emits Roots from the Joints as the former Sort, so doth not produce many Flowers.

The fourth Sort was found in great Plenty, at *La Vera Cruz*, by Dr. *Houston*; as were the ninth, tenth, eleventh, twelfth and thirteenth Sorts, at *Campesby*, by the same Gentleman.

The third, fifth and sixth Sorts, grow plentifully in *Jamaica*, and several other Places in the *West Indies*, from whence I have received their Seeds.

The seventh Sort is a very specious Plant, which merits a Place in every good Collection of Plants. This produces long Spikes of large blue Flowers, which continue a long Time, and make a fine Appearance. The Seeds of this Sort were sent to *England* by Mr. *Robert Miller*, Surgeon, who gathered them near *Panama*.

The thirteenth Sort rises to be nine or ten Feet high, and hath a wooden Stem.

Miller's Dictionary.
SIAGONAGRA. From *gagron*, a Jaw, and *agron*, a Prey. The Gout in the Jaws.

SIALOGOGA.

In the Class of *Evacuants* are to be reckoned *Sialagogues*, or *Salivants*, which potently excite a lymphatic and salival Flux, that discharges itself by the Mouth. And tho' there be several Things in the Kingdom of Vegetables, which, received by the Mouth as Emetics, or chewed with the Teeth, provoke the salival Humor from the Glands and Fauces, yet there is scarce any thing in Nature which puts the whole Mass of Lymph in so strong a Motion, and so forcibly acts upon the salival Glands and Ducts, as to cause a continual and copious Flow of Spittle, not only for Weeks but Months together, as some Substances with which we are supplied from the Mineral Kingdom, and especially those which belong to the Mercurial or Antimonial Tribe, prepared by the Art of Chymistry. As for Mercury, it is of that peculiar Force and Virtue, that whether used outwardly by Inunction, or taken inwardly in a small Quantity, it excites a most copious Salivation, by the Benefit whereof, if rightly managed, some very stubborn and otherwise incurable Diseases, which proceed from an impure Lymph and Serum, such as the Lues Venerea, Herpes, malignant Scabies, and malignant and spreading Ulcers, may be perfectly cured and quite extirpated. And this singular, and, in a manner, peculiar Virtue, belongs not only to Quicksilver well pounded with Sugar, and taken inwardly with Conserve, but to all artificial Preparations thereof, as *Mercurius Dulcis*, red Precipitate, white Precipitate with Spirit of Sal Ammoniac, Precipitate from a Solution of Mercury in Aqua fortis, Turpeth Mineral, Arcanum Corallinum, *Mercurius Diaphoreticus Jovialis*, Solaris, *Aethiops Mineral*, and *Cinnabar* itself, as well native as antimonial, or common, prepared of Sulphur with Mercury, and the *Antiquarium of Riverius*. Preparations from the reguline Substance of Antimony, which deserve to be mentioned, are the *Crocus Metallorum*, *Monk's Powder*, Sulphur Auratum so called, and prepared either the common Way, by Precipitation with Vinegar, or a Solution of Steel, or even of Gold, or precipitated after a singular manner, as the *Panacea Glauberiana*; which, in the *Brunswick Dispensatories*, is called *Panacea Conordingiana*.

These *Sialagogues*, or salivatory Remedies, before mentioned, may very well be divided into two Classes, the mild and the strong. Of the first Kind, which are, also, mercurial, are, also, *Aethiops Mineral* and *Cinnabar*, when exhibited in large and repeated Doses; in which Case they provoke a Flux of Spittle, and put the lymphatic Humors in Motion; and are beneficially administered in Diseases proceeding from Obstructions of the Glands, or Coagulations of the Serum, or Extravasations of the same in the Head, by resolving and fusing the coagulated Juices. To this last, also, belong Antimonials, because the Sulphur being in a manner incorporated

with the reguline Substance which is in them, they act but gently, nor excite such Perturbations and severe Symptoms, as are the Effects of most chymical Preparations of Mercury. Among the gentler Sorts of *Sialagogues*, may also be reckoned *Mercurius Dulcis*, well washed and prepared, and Quicksilver itself, duly depurated, and reduced by Art into a solid Form and Powder, excepting Quicksilver externally applied; for when it is reduced with unctuous Substances into an Ointment, and rubbed on the inferior nervous Parts of the Feet, of the Hams and Knees, and much more on the Spine of the Back, it frequently, and often suddenly, raises so strong and plentiful a Salivation, as is hardly to be restrained.

The Manner of Operation seems possible to be conceived and accounted for as follows: First, Quicksilver is to be considered as the heaviest of all Fluids, the least of whose Particles, in Solution and Division, always preserve their specific Gravity superior to that of all Fluids. Secondly, the Quicksilver itself may, by all the salival Menstrua, be resolved into infinitely small and subtle Molecules, which, by their corroding Force, together with their specific Gravity, may be enabled to penetrate into the innermost Parts of the Vessels and Pores in the human Body. That the Parts and Pores of Quicksilver may be diffused in a surprising manner, is evident to Sight; in that only one Grain of sublimate Mercury, dissolved in two Ounces of Water, will not only communicate to it a very sensible acrimonious metallic Taste, but, also, endue it with so efficacious a Virtue, that this Mercurial Water, used internally or externally, shall potently excite Excretions by Salivation, Sweat, Stool, or even Vomiting, according to the Disposition of the Subject and Humors; applied outwardly, it shall, on a sudden, dry up and repress the Itch and all cutaneous Defections. Whenever, therefore, Mercurials either externally applied in Suffumigations, Plaisters or Ointments, or taken inwardly, are, by the bilious-alcaline Humors of our Body, dissolved, or reduced into very minute Parts, they speedily and effectually exert their Force upon the Nerves, and especially upon the nervous Fibres of the conglobate and conglomerate Glands, and even upon the very Membranes of the Lacteals and Lymphatics; and, by increasing their Systole and Contraction, accelerate the Motion of the Lymph; by which means the Obstruction in the Glands and capillary Vessels of the Humors are opened, and the Stagnation and Stoppages of the coagulated Lymph, are at length effectually opened and resolved.

By such Ways and Means, then, are the Lues Venerea, and other Diseases of a like Nature, extirpated; but it does not follow, that there is always a Necessity for Salivation in the Cure of these Distempers; for a skilful Person, who is acquainted with the Secret, knows how, by the dextrous Use and Application of well-prepared Mercurials and Antimonials, to cure these stubborn Diseases without Salivation. For, as all skilful and experienced Physicians will readily acknowledge, the Flux of the Saliva is not the Cause of the Cure of the Lues Venerea, but the Removal of the Obstructions of the Glands and capillary Vessels, and the Colliquation of the viscid Humors settled therein; the accidental Consequence of which is a copious Profusion of the salival Humor.

Under a Salivation excited by Mercury, the exterior, especially the lower Parts, particularly the Feet, are generally cold and contracted; there is a Stoppage, also, of the ordinary Evacuation by Stool and Urine; the free Circulation, then, of the Lymph and Serum, as well as the Blood, being, by this Stricture of the lower Parts, interrupted in the capillary Vessels, the serous and lymphatic Humors are diverted upon the superior Parts, and most of all upon the Glands of the Fauces, which are appointed for their ordinary Reception; from which they take their Course where they can first find a Vent, and run off in one continued Current by the Mouth, preventing both Sleep and Eating. I have observed in some who lay under an immoderate Salivation for three Months together, or longer, and were, at last, carried off by a Lipothymy, or suffocated by a Catarrh, a Coldness of the external Parts to such a Degree, that it was impossible by any Medicine, Baths, or Frictions, to recal the Heat into them. And that an Interruption of the free and equable Motion of the Blood and Lymph through all the Parts of the Body, will raise a Salivation, appears from that continual Spitting so incident to melancholy and hypochondriacal Persons, in which, for the same reason, that is, a Constriction of the inferior Parts, the Lymph and Saliva are thrown off in greater Measure upon the glandulous Structure of the Mouth and Fauces.

The Reason of that fetid and putrid Smell, which proceeds from the flowing Humour under Salivation, especially from Persons salivated for the venereal Infection, seems to be, that the very fine Parts of the Mercury exceeding all the other Humours in Gravity, and being intimately united with them, do, by their circumvoluntary Motion, commence a Dissolution of the Mix-

Mixture, Crasis, and Contexture of the Blood, in the same manner as it happens in a Putrefaction, which is the Cause that there exhales a sulphureous Foetor with something of a Volatility, so as to blacken the very Teeth.

All the Panaceas, so highly celebrated by the Chymists, and especially the solar Kind, which owe the greatest Part of their Virtues to metallic and mercurial Elements, if they are rightly prepared, and skilfully used, are not to be defrauded of their just Commendations in the Cure of stubborn and desperate Diseases, which will not yield to ordinary Means. Such Medicines are endued with the highest Activity of Parts, and, though exhibited in a small Dose, have a potent Influence upon the nervous System, and produce very considerable Effects. And I know how to prepare several Medicines of that kind, and especially Antimonials, which, with due Respect to the Dose and Regimen, and a proper Regard to the Subject, shall in a very small Quantity purge, vomit, and even raise a Salivation; but very few Physicians know how to administer them skilfully, and in a right manner. *F. Hoffman.*

SIALISMUS. The same as **PTYALISMUS**.

SIALOCHOOS. *σάλιχος*, from *σάλας*, Saliva, and *χρῶ*, to pour out. In *Hippocrates* it imports a Person in a Quinsy, who discharges a large Quantity of Saliva. *Sialocboi*, *σάλιχος*, is expounded, by *Erotian*, Persons whose Mouths abound with a bitter Saliva; and by *Hesychius*, such People as spit in a Persons Face whilst speaking to him; an Inconvenience often attending, when the Tongue is too large.

SIBAR. Quicksilver.

SIBARE, in *Avicenna*, is a violent Sort of *Phrenitis*; or, according to others, an erysipelatous, or gangrenous Inflammation of the Brain, and its Membranes.

SIBEDATA. In *Paracelsus*, is Swallow-Wort. *Rulandus*. It, also, imports a Stone, on which Colours are ground.

SIBETINA. In *Paracelsus*, is an Epithet for the Cholic.

SIBILUS. A hissing Noise; such as is heard during the Respiration of asthmatic Patients; or as sometimes is perceived in the Ears. The *Uvula*, is, also, called *Sibilus*, by *Vesalius*.

SICCANTIA. Drying Medicines.

SICCHASIA. *σικχασία*. In *Maschion's* Treatise *de Morbis Mulierum*, C. 18. is that Loathing of Food, and Uneasiness at the Stomach, which Women perceive during Pregnancy.

SICCUS. Dry. A dry Belly imports Costiveness: A dry Constitution is one which does not abound with Moisture: A dry Dropsy is a Tympanites; and a dry Ophthalmy, is an Inflammation of the Eye, not attended with a Discharge of Humours.

SICELICA, or **SICULA.** An Epithet for a Medicine recommended against the Cholic by *Galen*, de C. M. S. Loc. L. 9. C. 5.

SICILIANE. See **ANDROSÆNUM**.

SICILICUM, or **SICLIUM.** A Weight, equal to four Drams, according to *Galen*. *Rhedi*, in his Notes to *Scribonius Largus*, makes it only two Drams.

SICUA. A Cupping-Glass.

SICYEDON. *σικυεδον*. The Name of a Species of Fracture; the same as **CAULEDON**. See **FRACTURA**.

SICYOIDES. Single-seeded Cucumber.

The Characters are;

It hath an expanded Bell-shaped Flower, consisting of one Leaf, which is cut into several Segments at the Brim. Of these Flowers, some are Male, which adhere to no Embryo; and others are Female, which rest on the young Fruit, which is afterwards enlarged to the Size of an Almond-Kernel, and is flat and prickly, containing one Seed of the same Shape.

Boerhaave mentions but one Sort of this Plant, which is, the *Sicyoides Americana*; fructu echinato; foliis angulatis, T. 103. *Cucumis Canadensis*, monospermus, fructu echinato. Par. Bat. 133. *Colocynthis monococcos*. Vulgo *Bryonia Canadensis*, *semine Anguria*. Volkham. Boerb. Ind. Alt. Plant.

Boerhaave conjectures this Plant to be poisonous.

Miller takes Notice of another Species of this Vegetable, by the Name of *Sicyoides*; *Americana*; fructu echinato; foliis laciniatis.

SICYONE. *σικυον*. This signifies, in *Hippocrates*, *Colocynthis*; a Species of Gourd in the Shape of a Pear; a common Cupping-Glass; and a conical Cupping-Glass, open at the small End. *Galen*. *Exeges*. *Erotian* explains it, a Wild Fig.

SICYONIUM OLEUM. *Paulus Aegineta*, L. 7. C. 20. gives the Preparation of three Sorts of Oil under this Title. The first is the

SICYONIUM SIMPLEX, which is thus prepared: Take of the Root of the Wild Cucumber, two Ounces, and put them into an Italian Sextary, or Pint of Oil, and boil the same in a double Vessel.

The second Sort of *Sicyonium Compositum*, is prepared in the following Manner:

Take of Oil, ten Sextaries; Root of Wild Cucumber scraped, one Pound; Serpyllum, Melilot, each six Ounces; of pinguious Torches of the Pine, [See *DAIS*.] Marsh-mallows, each five Ounces; of *Scolopendrium*, six Ounces; of *Fænugreek*, two Sextaries: Macerate the *Fænugreek* a Day in Water, then strain it, and put therein the other Ingredients, together with the Oil, and two Sextaries of Wine. Boil them all together, and then add thereto of Stags Marrow, beaten with a moderate Quantity of Oil, four Ounces, and a like Quantity of Fat of Hens. This done, strain off the Oil into proper Vessels: Some, after Boiling, expose it forty Days in the Sun.

Another Preparation of *Sicyonium Compositum*, of greater Virtues, is as follows:

Take Juice of *Elaterium*, three Sextaries; round and long Birthwort, *Styrax*, *Elecampane*, *Hyssop*, *Iris*, *Colocynthis*, *Penyroyal*, *Origanum*, *Cyperus*, Wood of *Libanus*, *Centaury*, Bay-leaves, each two Ounces; Oil, five Sextaries. Mix them together, and boil them till but little of the Liquor remains. *P. Aegineta*, Lib. 7. Cap. 20.

SICYS. A Cucumber.

SIDA. *σίδα*. The Pomegranate. *Sidia*, is the *Putamen*, or Rind of the Pomegranate. *Hippocrates*. *Blancard* says, that *Sida* signifies the *Althæa*, Marsh-mallows, but I don't know his Authority.

SIDA-POU. The Name of a Tree which grows in *Malabar*. It is only remarkable for bearing no Fruit; at least till it is very old. *Raii Hist. Plant.*

SIDERATIO. An Apoplexy; or a Sphacelus; or a Species of *Erysipelas*, which the Country People call a Blaft.

SIDERITIS.

The Characters are;

The *Galea* is erect, the Beard tripartite, long, and pendulous; the Flowers grow in Whorles at the Wings of the Leaves, which are cut like a Crest, and differ from the other Leaves of the Plant.

Boerhaave mentions thirteen Sorts of *Sideritis*, which are;

1. *Sideritis*; Alpina; *Hyssopifolia*. C. B. P. 233.
2. *Sideritis*; vulgaris; hirsuta, erecta. C. B. 233. Boerb. Ind. A. 171. *Sideritis*, Offic. *Sideritis vulgaris*, Ger. Emac. 697. *Raii Hist.* 1. 563. *Sideritis vulgaris hirsuta*, J. B. 3. 425. *Sideritis vulgaris Clusii*. Park. Theat. 585. COMMON IRON-WORT.

It grows common in Germany, Italy, and France, and flowers in June. The Herb is used, which is said to be good for Wounds, and Ruptures, and to be so drying as to cure a *Fluor albus*.

Dale takes Notice of a Species of *Sideritis*, of which this is esteemed only a Variety, tho' he makes them different. It is thus distinguished.

SIDERITIS. Offic. *Sideritis hirsuta procumbens*, C. B. P. 233. *Raii Hist.* 1. 564. *Tourn. Inst.* 191. *Sideritis Clusii Hispanica*, hirsuta, J. B. 3. 426. *Sideritis prima herba Judaica*, Park. Theat. 584. *Sideritis herba Judaica*, Ger. 559. *Sideritis Judaica Lobelii*, Ger. Emac. 690. IRON-WORT.

An Application of the Leaves cures Wounds, without any Danger of Inflammation.

Botanists have not determined what the three Species of *Sideritis* mentioned by *Dioscorides* are. *Dale* thinks this Plant the first; the *Pimpinella Sanguisorba*, the second; and the *Geranium Robertianum*, the third.

3. *Sideritis*; hirsuta; vulgaris; humilior. C. B. P. 233.
4. *Sideritis*; arvensis; latifolia; glabra. C. B. P. 233. *Raii Hist.* 1. 566. Park. Theat. 587. Ger. Emac. 699. Boerb. Ind. A. 171. *Sideritis glabra arvensis*, J. B. 3. 427. *Betonica arvensis annua flore ex albo flavescente*. *Tourn. Inst.* 203. IRON-WORT WITH SMOOTH LEAVES.

This grows amongst Corn, and agrees in Virtues with the other. *Dillenius* thinks this the right *Sideritis* of the Shops.

5. *Sideritis*; Persica; odorata; latissimo folio, hirsuta; flore ex luteo albicante. Ex *Tourn.*
6. *Sideritis*; Hispanica; frutescens; foliis rigidis profunde dentatis. *Jussieu*.
7. *Sideritis*; frutescens; folio incano Oleæ.
8. An *Sideritis*; *Stæchados folio*?
9. *Sideritis*; minima; Ægyptia; ramosa. *Lippii*.
10. *Sideritis*; Lusitanica; minor, flosculis luteis.

11. *Sideritis*; *Hispanica*; *procumbens*; *flore albo major*. T. 192.

12. *Sideritis*; *Hispanica*; *frutescens*; *five lignosior*. T. 192.

13. *Sideritis*; *Orientalis*; *folio Phlomidis*. T. C. 12. Boerb. Ind. Alt. Plant.

It has its Name *Sideritis* from *sidēros* (*Sideros*) Iron, so *Di-scorides* calls those Herbs which are adapted to the Cure of Wounds inflicted by Iron. It is also called *Ferruminatrix* for the same Reason, and *Herba Judaica*, because the Jews formerly used it in Medicine. These Plants are very scarce, because the Seeds are sometimes three or four Years in the Ground before they appear, whence the Time of their Shooting is very uncertain. They are never used in Medicine, except sometimes by Way of Cataplasm in Hernias. Hist. Plant. ascript. Boerhaave.

Dale mentions another Species of *Sideritis*, which is the *Sideritis foliis hirsutis profunde crenatis*, C. B. P. 233. Tourn. Inst. 191. *Sideritis Monspensulana*, J. B. 3. 426. *Sideritis Monspelienfis Lobellii*, Park. Theat. 585. GERMAN IRON-WORT.

It grows in Meadows, and flowers in June and July. It is much used in the Shops of Germany, and is said to be possessed of the same Virtues as the other Species of *Sideritis*.

SIDERITIS, is also a Name for the *Sanicula*, *Officinarium*, for the *Stachys*, *major*, *Germanica*; and for several Sorts of *Marrubiastrum*.

SIDERITIS ARVENSIS. A Name for the *Galeopsis*; *patula segetum*; *flore purpurascens*.

SIDERITIS SPINOSA. A Name for the *Stachys*; *spinosa*; *Cretica*.

SIDERITIS VISCOSA. A Name for the *Galeopsis*; *angustifolia*; *Cretica viscosa*.

SIDEROS. *sidēros*. Iron. See MARS.

SIDIA. See *SIDA*. Rulandus explains *Sidia*, a File.

SIDOIDES. *sidōidēs*, from *sidōn*, a Pomegranate. A yellowish Colour, like that of a Pomegranate.

SIEF. A dry Collyrium. The Word is Arabic.

SIEF DE PLUMBO.

Take of Lead burnt and wash'd, Copper burnt, Antimony, Tutty wash'd, Gum Arabic, Gum Tragacanth, each one Ounce; Opium, half a Dram; Rose-water, a sufficient Quantity; make them into Troches according to Art.

SIEF DE THURE.

Take of Frankincense, Lapis Calaminaris, Pompholyx, each ten Drams; Cerufs, five Ounces; Gum Arabic, Opium, each six Drams; fair Water, a sufficient Quantity; make them into Troches. Pharmac. Londinens.

SIELISMUS. *sielōis*. Salivation.

SIELOCINETICA, from *sielōs*, *Saliva*, and *cinōs*, to move. The same as *SIALAGOGA*.

SIGHA. Liquid Storax.

SIGILLATA TERRA. Seal'd Earth. See *TERRA*.

SIGILLUM SOLOMONIS. Solomon's Seal, a Name for the *Polygonatum*; *latifolium*; *vulgare*.

SIGILLUM HERMETICUM. An Hermetic Seal. A Glass Vessel is said to be Hermetically sealed, when the Glass is melted, and the Vessel by this Means closed.

SIGMOIDES. Sigmoidal, or in the Shape of a Sigma; three Valves of the Heart have this Epithet applied to them. See COR. The Coracoide Process of the Scapula is called the Sigmoidal Process. The Semicircular Cavity of the Cubit, at the Articulation of the Fore-arm, with the *Humerus*, is sometimes called the Sigmoidal Cavity: And the Cartilages of the *Astera Arteria*, have the Epithet *Sigmoidal* applied to them by some Authors.

SILACH, or *SILAC*. A Disorder of the Eye-lid, consisting in a preternatural Thicknes thereof.

SILAUM.

The Characters are;

The Leaves are pretty thin and short, and much like those of Fennel, only wider. The Seeds are long, fulcated, and furnished with a Sort of foliaceous Margin.

Boerhaave mentions five Sorts of *Silaum*, which are;

1. *Silaum quibuscum*; *flore luteolo*. J. B. 3. 2. 171. Boerb. Ind. A. 51. *Saxifraga vulgaris*, Offic. Mill. Bot. 399. *Saxifraga Anglica facie Sefeli pratensis*, Ger. 890. Emac. 1047. Raii Hist. 1. 453. *Sefeli pratense nostras*, Park. Theat. 905. Raii Synop. 3. 216. *Sefeli pratense Silaus forte Plinio*, C. B. P. 162. *Anglica pratensis Apii folio*, Tourn. Inst. 313. MEADOW SAXIFRAGE.

This Saxifrage has a Root about a Finger thick, striking deep in the Ground, of a brownish Colour on the Outside, and whitish within, of a hot aromatick Taste and Smell, from which spring several winged Leaves, not very large, cut into long narrow Segments. The Stalks are channell'd, arising to be two Foot or more in Height, beset with smaller Leaves, and having on their Tops Umbels of pale, yellow,

low, small, five-leaved Flowers, and after them come short striated reddish brown Seeds: It grows common in Meadows and Pasture Grounds, and flowers in August.

The Root, Herb, and Seed are used, being all accounted excellent in provoking Urine, and of great Service in the Gravel, Stone, and other Distempers of the Kidneys, as also in expelling Wind. Miller's Bot. Off.

The Herb and Seed are substituted in our Shops for those of the white Saxifrage.

The Juice, Decoction, distilled Water, or Seed pulverised, are found by common Experience to be effectual in provoking Urine, in diminishing and expelling the Stone, dissolving Flatulences, and easing the Pain of the Cholic. Raii Hist. Plant.

2. *Silaum*; quod *Ligusticum*; *Ferula folio*. T. 324.

3. *Silaum*; quod *Ligusticum*; *Creticum*; *folio Fœniculi*; *caule nodoso*, T. C. 23.

4. *Silaum*; quæ *Angelica*; *pratensis*; *altera*; *Apii folio*. T. 313.

5. *Silaum*; quod *Ligusticum*; *Cicutæ folio*, *glabrum*. T. 323. *Sefeli montanum*, *Cicutæ folio*, *glabrum*. C. B. P. 161. Boerb. Ind. Alt. Plant.

SILER.

The Characters are;

The Leaves are lobated, and of a pretty large Size, with long, intire, blunt Segments, divided at the End into Parts: The Seeds are oblong, large and striated.

Boerhaave mentions three Sorts of *Siler*, which are;

1. *Siler*; *foliis Aquilegiæ*. M. U. 7. 8. *Ligusticum Rauwolfii foliis Aquilegiæ*, J. B. 3. 2. 148. *Libanotis latifolia*, *Aquilegiæ foliis*, C. B. P. 157. *Angelina montana*, *perennis*, *Aquilegio folio*. T. 313.

2. *Siler*; *montanum*; *majus*. Boerb. Ind. A. 52. *Sefali vulgaris* & *Siler montanum*, Offic. *Sefeli five Siler montanum vulgare*, J. B. 3. 168. *Siler montanum Officinarium*, Ger. 892. Emac. 1048. Raii Hist. 1. 439. *Siler montanum vulgo Sefelios*, Park. Theat. 909. *Ligusticum*, quod *Sefeli Officinarium*, C. B. P. 162. Tourn. Inst. 323. COMMON HARTWORT.

Hartwort has a large, thick Root, that strikes deep into the Ground, with a great many stringy Fibres at the Bottom. The Stalk arises to be as high as an ordinary Man, full of Branches, having many large winged Leaves as it were encompassing the Stalks with a thin Sheath, cut into several Segments, each of which is usually divided into five, and at the End three oval smaller Leaves, smooth and pointed at the End. It has large Umbels of small five-leaved white Flowers, each of which is succeeded by two large, long Seeds, striated on the Back, and having a leafy Border on each Side, of a brown Colour, a pretty strong Smell, and a hot, bitterish Taste. It grows upon the Alps, and the Mountains of Italy, and flowers in June. The Herb and Seed is used.

They are both heating and drying, provoke Urine and the Menstrues, expel the Birth and After-birth, and are good in Disorders of the Head and Womb. The Seeds are put both into the Theriaca and Mithridate. Miller's Bot. Off.

3. *Siler*; *montanum*; *minus*. M. U. 7. *Ligusticum*, five *Siler montanum*; *angustifolium*. C. B. P. 162. Boerb. Ind. Alt. Plant.

SILESIAICA TERRA. See *TERRA SILESIAICA*.

SILEX. Offic. Boet. 515. Mer. Pin. 213. Worm. 39. Charlt. Foss. 16. Aldrov. Mus. Metall. 724. Kentm. 44. *Lapis Silex dictus niger*, Cup. Hort. Cath. Supp. 2. 53. *Silex niger*, Imp. THE FLINT.

Flints, according to Schroder, may be us'd internally for inciding tartareous Mucilage, resolving the Stone, and opening Obstructions. They are, also, us'd as Dentifrices.

Flints, like all other Stones, are form'd of Salts, or acid Liquors, which penetrate and intermingle with the Earth, that is an Alkali, in such a Manner, that from this Mixture results a *Coagulum*, which is insensibly harden'd by the subterraneous Heat, or petrified by the Cold. And here it is to be observed, that, according to the Quantity of Earth which unites with an acid Liquor, we find produced the various Sorts of Stones; and that precious Stones and Crystals owe their Denseness and Transparency to such a Proportion as was necessary to make an exact Penetration, and close Union of the Acid with the Earth.

It is very probable, that Stones are hardest when but Earth mixes in the Solution, for then the acid Water acting upon all Parts of that Earth, dissolves it intirely, after which, the Coagulation being a long Time in forming, the Parts intermix and unite incomparably better than when there is much Earth. And it is very easy to conceive, how a large Body may be composed of very small Corpuscles; for if they had been large, they would have left great Spaces, or Pores, in their Conjunction; and great Pores are contrary to hard and compact.

When much Earth mixes with the acid Liquor, the Solution is perform'd but by Halves, and the Coagulation being

too quick in forming, there results nothing but an opaque Stone, with no considerable Degree of Hardness.

Flints are formed of a Combination of a good Quantity of acid or saline Water, with a small Portion of Earth; but they are opaque, because the Earth of which they are composed is sulphureous, and sometimes metallic.

Crytals are compos'd of a perfect Solution of Earth, or Stone, in acid or saline Waters; this Solution must be clear, or limpid like Water, either because it is filtrated in passing through some Earth, or happens in a clean Place. When it settles, it becomes fixed, in the same Manner as when Saltpetre is crystallised in Water, the Crytals retain the Purity of the Solution, and are transparent.

Precious Stones are form'd by a Solution, at least, as perfect and clear as that which forms Crytal; but then in the Solution there is an Intermixture of metallic Particles, which gives them Variety of Colours, and a Degree of Hardness much above Crytal.

Grains of Sand are small Crytals, which appear to us but like Powder of Crytals, but discover their Figure in the Microscope.

We meet with Waters in many Countries, which falling upon Rocks, at the same Instant petrify, as it happens in the Grotto of *Arfi* in *Burgundy*. The Reason that may be given for their Petrification, is, that these Waters contain an Acid, which in passing over the Earths, dissolve some Portion of them, which might be capable of inducing a Petrification; but the great Agitation they suffer in this rapid Descent from the Mountains, hinder their Coagulation, which cannot be effected before these Waters are fallen into some proper Place where they may rest.

In other Places we meet with Waters at Rest, which petrify Woods, Plants, Fruits, and Parts of Animal, cast into it. These Waters are of the same Nature with those just mentioned, only they have more of Phlegm, for which Reason they cannot coagulate themselves, but when you immerge a solid Body in them, they so penetrate it, and unite and fix themselves to it in such a Manner, as to fill all its Pores, so that the Body seems to have chang'd its Nature, and to be turned into Stone.

CALCINATION OF FLINTS.

This Operation teaches the Manner of opening *Flints* and Crytal in such a Manner, that they may be easily reduced to Powder.

Heat *Flints* in the Fire red-hot, and quench them in common cold Water; repeat this Heating and Quenching three or four Times, until they become friable, and may be reduced to an impalpable Powder, after they have been dry'd.

Crytal is calcin'd after the same Manner, but it is sooner render'd friable than *Flints*. A Liquor and Tincture may, also, be extracted from it, as well as from *Flints*, and of like Virtue.

OBSERVATIONS.

River-Flints, which are mark'd with Veins of different Colours, are esteem'd the best, because they are supposed to yield the most Tincture.

The best Way to calcine them well, is to put them in an earthen Pot, cover it well, and then put it in a Furnace in the Middle of a great Fire; the *Flints*, when heated, will sparkle and look red; continue a violent Fire till they no longer sparkle, then uncover the Pot, and cast them, red-hot as they are, into common cold Water, where let them be quenched, and remain about an Hour, after which, separate the Liquor, by stooping the Vessel, and letting it run off into an earthen Pan. If the *Flints* are not yet friable enough, they must be heated red-hot again, and thrown into the same Water.

This Water receives from the *Flints*, a Salt, or Kind of Saltpetre, which, in Conjunction with the Impressions of the Iron, communicated to it from the Pot, render it aperitive, and proper for the Gravel, and Chlorosis. The Dose is a Glas at a Time.

Flints and Crytal are too hard to be reduced to a Powder in the ordinary Way, and, therefore, Methods must be taken to soften them, in order to render them capable of being pounded with Ease. Cold Water renders them friable, when thrown quite red-hot into it; because, Calcination having opened their Pores, the Coolness of the Water stops them all on a sudden, by which Means the small Particles of Fire, which are thus imprisoned within, make impetuous Efforts to free themselves, and breaking their little Prisons, render the Matter porous and brittle. This Heating and Quenching are repeated three or four Times, that the Substances may be penetrated and soften'd in all their Parts. Some use Vinegar instead of Water, for extinguishing *Flints* ~ Crytal.

This Operation is no other than an Exaltation of some Parts of the *Flints*, and of Salt of Tartar in Spirit of Wine.

Mix four Ounces of *Flints* calcin'd and reduc'd to an impalpable Powder, very exactly, with four-and-twenty Ounces of Potash; put this Mixture in a large Crucible, which cover, and set in a Wind Furnace; make a Fire about it by Degrees, in order to give it a gentle Heat, which, afterwards, increase to the highest Degree, and continue it in that State during five Hours, so as that the Matter be always in Fusion; thrust a Spatula into it, and when you have taken it out again, you will see whether your Matter begins to grow transparent like Glas; if it does, pour it into an Iron Mortar heated, and it will immediately congeal into a hard Mass, which must be reduced to a Powder while it is hot, one Half of which is to be put into a very dry and well-heated Matras; pour thereon highly rectify'd Spirit of Wine, till it rises above the Matter four Digits; stop well your Matras with another whose Neck enters into that which contains the Matter, lute exactly the Junctures with a wet Bladder, and place it in the Sand; make a Fire under it, strong enough to cause a Simmering in the Spirit of Wine, for two Hours, and it will assume a red Colour; unlute your Matras, and having separated them, pour off by Inclination the Tincture into a Bottle; pour some more Spirit of Wine on what Remains, and make a Digestion as before; separate the Liquors, which will still be a little red, and having mixed it with the other, put the whole into a Glas Cucurbit, which cover with its Head, and having adapted to it a Receiver, and exactly luted the Junctures, distill off two Thirds of the Spirit of Wine in a Vapour-Bath; take your Vessel off the Fire, and keep what remains in the Bottom of the Cucurbit in a Vial well stop'd.

This Tincture is said to be a good Medicine to remove Obstructions; it is of Use in the Scurvy, and hypochondriac Disorder: The Dose is from ten to thirty Drops in some proper Liquor.

OBSERVATIONS.

The Lime of the *Flints* unites so closely with the Salt of Tartar, by Calcination, that you might say the whole Mixture is converted into Salt, and this is what we shall shew in the following Operation.

The Spirit of Wine you use must be perfectly alcalified, or rectify'd, otherwise you will obtain no Tincture: You must, also, take Care to put the pulverized Matter, as hot as possible, in Infusion. We distil two Thirds of the Spirit of Wine, that the Remainder may be redder and stronger.

Almost all Chymists will have it, that this red Tincture comes from the Sulphur of the *Flints* being diluted with the Spirit of Wine; but it is more probable, that this Colour proceeds from the Exaltation of the alkaline Salt in the Spirit of Wine, since a like Tincture is produced from Salt of Tartar.

LIQUOR OF FLINTS.

This Operation is a Resolution of *Flints* into a Liquid, by means of Salt of Tartar.

Take equal Parts of calcin'd *Flints* and Potash, expose them to the cold and moist Air of a Cellar, in a flat Vessel of Glas, and they will dissolve into a Liquor, as clear as common Water, which filtrate, and keep for Use.

This Liquor is said to be diuretic. The Dose is from five to five-and-twenty Drops in some proper Liquor.

If you mix together equal Parts of this Liquor, and some corrosive, acid Spirit, they will immediately form themselves into a Kind of Stone.

OBSERVATIONS.

The Salt of Tartar, or Potash, attenuates the *Flints* to such a Degree, as to render them dissoluble like itself, as we may observe in this Operation, in which the Humidity of the Cellar entering through the Pores of the calcin'd Matter, insensibly dissolves it; and if this Solution be evaporated, you will find at the Bottom an alkaline Salt.

If this Liquor be mixed with an acid Spirit, there immediately arises an Ebullition; because, the acid Spirits penetrate the Alkali, and afterwards there is form'd a Coagulation stronger than when you throw the acid Spirit upon the Liquor of Salt of Tartar, because their Alkali contains more Tartar, than does Salt of Tartar.

This Liquor is capable of dissolving some sulphureous Obstructions which sometimes stop up the Passages, in which Case it provokes Urine; but if it meets with some acid Humour, it forms a Coagulation, which may possibly be converted into a Stone, for which Reason I would not advise the Use of this Remedy.

From the Coagulation of these two Liquors might be explain'd, in a sensible Manner, the Formation of Stones in different Parts of our Bodies, since acid Liquors and Alkali's frequently enough meet together in those Places.

The Liquor of *Flints* is of Service in extracting the Sulphur from several Minerals: The Alchymists have given it the Name of *Alcabest*, that is, the *Universal Dissolvent*, a Name first used by *Paracelsus*, and compounded of two German Words, *Al Geest*, which signify *All Spirit*, (Tout Esprit.) *Van Helmont*, who borrowed that Word from *Paracelsus*, apply'd it to the pretended universal Dissolvent, of which, he says, he was the Inventor. The Name, however, seems to me to be but ill adapted to the Liquor of *Flints*, as well as to several others on which it has been bestowed, since we find nothing in them but fixed Parts, without the least thing spirituous. *Lemery, Cours de Chymie.*

SILICETUS, in *Paracelsus*, imports flinty, and is us'd by him as an Epithet for very much indurated Tartar, or Gravel, in the urinary Passages.

SILIGNIS. *silignus*. The finest Wheat-Flower.

SILIGO. A Name for the *Triticum*; *Hybernum*; *Aristis carens*.

SILIPIT. Copper. *Rulandus*.

SILIQUA. A Weight in Use among the Antients, equal to three Grains and $\frac{1}{2}$.

SILIQUA, in Botany, is the Carob. See **CAROB**.

SILIQUA HIRSUTA, is the COWHAGE, which see.

SILICUASTRUM.

The Characters are;

The Wings [of the Flower] surmount the Standard; the Keel consists of two Petals; the Pointal, or Pistil, which arises out of the Calyx, is wrapped with the Stamina, and becomes a flat, membranous Pod, full of Kidney-shap'd Seeds. The Leaves are alternate.

Boerhaave mentions two Sorts of *Silicuastrum*, which are;

1. *Silicuastrum*. *Tourn. Inst.* 647. *Boerb. Ind. A.* 2. 23. *Arbor Juda*, Ger. 1240. *Emac.* 1428. *Park. Theat.* 1554. *Raii Hist.* 2. 1717. *Judaica Arbor*, J. B. 1. 423. *Siliqua silvestris rotundifolia*, C. B. P. 402. *Cercis prior Theophrasti quibusdam, aliis Colytea Theophrasti*, *Raii Hist.* 1717. **JUDAS'S TREE**.

The Pod of this Plant is esteem'd astringent.

2. *Silicuastrum*; *Canadensis*. T. 647. *Siliqua, silvestris, rotundifolia, Canadensis*, H. R. Par. *Boer. Ind. Alt. Plant.*

SILPHIUM, *σίλφιον*, was a Root of great esteem in *Lybia*, about *Cyrene*, for its excellent Uses, either at the Table or in Medicine. It was originally called *σίλφι* among the Natives, and thence *σίλφιν*, which at last was formed into the *σίλφιον* of the Greeks. *Salmasius, Exercit. Plin. in Solin.* takes *σίλφι* to be a barbarous Word; but I conceive it was the old *Chaldee* Word for Gum, which is *סִרְפִּי*, *Sereph*. See *Schindler's* and *Castellus's* Heptaglot Lexicon, under the Word. From hence the *Latins* deriv'd their *Serpe*, and the Juice of this Root they called *Lac-serpitum*, which became, afterwards, the *Latin* Name for *Silphium*, and was corrupted into *Laserpitium*, which they falsely deriv'd from *Lafer*. This Juice or Gum of *Cyrene* was of so high Value, that the *Romans* deposited what they could get of it in the public Treasury, as the greatest Rarity, and which *Julius Caesar* carried away in the Time of the Civil War, as *Pliny* says: And whatever was costly and rare, was, by the Greeks, called from hence *βάττα σίλφιον*, the *Silphium* of *Battus*, that is, of *Cyrene*, of which Colony *Battus* was Founder. This *Silphium* of *Cyrene* has been long lost, even before *Pliny's* Time; so that we know nothing of it more than by Conjectures, about which there are many. Modern Philosophers, and Botanists, seem to find it in our *Asa Fœtida*. This is the Opinion of Mr. *Evelin*, Dr. *Bentley*, and Mr. *Laurence* in his new *System of Agriculture*. I must take leave to dissent from these great Authorities; for first, the *σίλφιον* of *Cyrene* is call'd by *Theophrastus* *εὐσμου*, sweet smelling: By *Dioscorides*, as yielding, (*ἵερὸν ὑποσώματον*) a very sweet Saviour: By the old Scholiast on *Aristophanes*, *ἔνδοξον ἰσὶα ἡδύσμου*. How well this Description of the old fragrant *Lybian Silphium* agrees with the detestable Stink of *Asa Fœtida*, I shall submit to the Nose of every Man.

Kempfer indeed, in his Account of the gathering of *Asa Fœtida*, tells us, That beyond the Territory of *Disguun*, the Plant of *Asa* is said to have lost almost all its offensive Smell, and grown so sweet, that Goats are fond of the Leaves, and feed themselves exceedingly fat with them; but neither will this amount to the *εὐσμου σίλφιον* of *Cyrene*.

And to this Description *Kempfer* has added the Figure of the Plant, which I have here given from him. Tab. the last.

Now as the strongest Argument, that I think can be furnished against Dr. *Bentley*, who says that he convinced Dr. *Mead* that the *Asa* of the Moderns was the genuine *Silphium*, I shall give a Medal or two, upon the Reverse of which we have the Figure of the old *Silphium* of *Cyrene* preserved. See TABLE the last.

The first Medal is of *Alexander*, the Son of *Ammon* who is, therefore, horned. The Reverse is the *Silphium* of *Cyrene*, in token of the Oracle of that Country, which declared him to be Son of *Hammon*.

The Legend we see is **KYPA**, implying *Cyrene*, which was represented by its Symbol the *Silphium*, as a Plant proper only to that Place, and the Σ , I conjecture, stands for *σίλφι*, or *סִרְפִּי*, *Sereph*, the original Name of this Plant, as is before mentioned. The Reason why the *Chaldee* *סִרְפִּי* is implied under the Greek Characters Σ is, because this Medal was struck by the Greeks, in Honour of *Alexander*. As this Circumstance, therefore, on the Medal, is what was never taken Notice of by *Agostino*, *Angeloni*, *Spanheim*, or others, it may be worth our Observation, as giving a great deal of Light to the present Etymology of the Word; and shewing us, what we now call *σίλφιον* in Imitation of the Greeks, was originally known by the Name of *סִרְפִּי*, or *Sirpi*, and from hence we may undoubtedly derive our *Sirrup*, or *Syrup*. We may, also, observe, on the other Side of the Plant, a Star in Designation of the Sun, to the intense Heat of which, in that Climate, perhaps, they ascribed all the remarkable Virtues of the *Silphium*.

The other, I suppose is either of *Hammon*, or else of *Old Battus*, according to the Epithet that *CATULLUS* gives him.

Et Batti Veteris Sacrum Sepulchrum.

The Reverse, as the first, is the *Silphium*, with the Legend **KY** for *Cyrene*, without the Σ .

Now if any one will compare the *Asa* of *Kempfer* with this Description of the *Silphium* of *Cyrene*, he must observe that there is not the least Resemblance in the World between these two Plants, the Juice or Gum of which Dr. *Bentley* convinced Dr. *Mead* and others to be one and the same.

Let us now consider the Proof upon which Dr. *Bentley* grounds his Assertion, that good *Asa* is the same with *Silphium*.—*Pliny* describes it thus, *Probatio sinceri prima, in colore modice rufa (Dioscorid. ὑπόκρουστος) et cum frangitur candido*. The good *Silphium* is of a reddish Colour, and white within when it is broken. Now the Doctor rests his Proof upon this, that his *Asa* answered in all Respects this Description of *Pliny*; and therefore concludes that good *Asa* is the same with the genuine *Silphium*. It might be the same, I grant; for the Description of *Pliny* relates to the *Silphium Persicum*, or what we call *Asa*, but not to the *Silphium Cyrenaicum*. *Pliny* owns, that *Multi jam annis in ea terra (Cyrene) non invenitur*.—That the *Silphium* of *Cyrene* had not been found for many Years. And a little after he adds, *Diutius non aliud ad nos invehitur Laser, quam quod in Perside aut Media et Armenia nascitur, sed multo infra Cyrenaicum*. From whence we may conclude, that the *Silphium* he describes was that of *Persia*, or what we call *Asa*, which was that which was common in his Time, and not that of *Cyrene*, which he never saw. So that Dr. *Bentley's* Proof, by which he convinced Dr. *Mead* and others, is no Proof at all to the Purpose it is brought. All it proves is, that the *Asa* of this Day, when it is good, is of the same Marks with that which *Pliny* describes, and that this was *Persian Silphium* is hence evident; because he says no other had been found for many Years, (*diutius*) but what grew in *Persia*, *Media*, and *Armenia*. This ought to teach us, to be a little cautious how we give up our Assent to great Authorities, that have nothing oftentimes to support them but a Name.

This same Observation will likewise hold good with respect to *Dioscorides*; for when he described it *ὑπόκρουστος, colore rufa*, he meant the *Persian Laser*, or *Asa*, as we have it at this day; and which I make no doubt of, from the Figure of the Plant, which *Salmasius* has taken out of a manuscript Copy of *Dioscorides* 1100 Years old, and which seems to resemble very much the Figure in *Kempfer*, but to be widely different from that on the Medals, as may be seen by comparing them; for which purpose I had them engraved.

The Question that immediately presents itself here, is, how do we know that the Figure on the Medals is that of the *Silphium Cyrenaicum*?

The Answer is, that this Medal agrees with what *Aristotle* the Scholiast of *Aristophanes*, and *Tzetzes*, say of the Medals of *Cyrene*, that on one side they had the King *Βασιλεύς*; for so I read it in the Scholiast of *Aristophanes*, not *Βασιλίας*; and On

on the other the *Silphium*. But *Hesychius*, under *Βάρρε δάριον*, is more express. He says, the *δάριον* was so honoured among the *Cyrenians*, *ὅτι ἐν τῷ νόμισματι οὗτος μὲν Ἀμμων, οὗτος δὲ δάριον ἐκχρησίζετο*, as is to be seen on their Medals, where was engraved on one side *Ammon*, and on the Reverse the *Silphium*. How well the Medals agree with this Account of the Ancients, is too evident to need any thing more to be said in Proof, that the Plant on the Reverse of these Medals is a true Representation of the *Cyrenian Silphium*, and which is very different from either that of *Dioscorides*, or *Kempfer*. From whence we may, with great Certainty conclude against Dr. Bentley and others, that the *Asa* of the Moderns is not the same with the celebrated *Silphium* of *Cyrene*. Upon the whole, it is to be supposed, that the *Silphium* of *Cyrene* is quite lost; and that we know no more of it but its Figure, and that it was of great Value for its medicinal and culinary Uses.

The *Asa Foetida* of the Moderns is thus distinguished.

ASA FOETIDA, Offic. C. B. Pin. 499. Worm. Mus. 222. Mont. Exot. 11. Scrod. 4. 184. Park. Theat. 1569. *Asa foetida nostrā Officinarum*, J. B. 3. 133. *Asa foetida*, Ind. Med. 16. *Alitib. seu Asa foetida, Javanis & Malaisi Hindistā*, Bont. 41. *Asa foetida Disgunensis, Hinaiseb, umbellifera, Levisticū affinis, instar Pæoniæ ramosis; caule pleno maximo; semine foliaceo, nudo, solitario, Brancæ Ursinæ vel Pastinacæ simili; radice Asam foetidam fundente*, Kempf. Amæn. Exot. 535. Fig. 536. DEVIL'S DUNG.

Silphium grows in the Countries of *Syria*, *Armenia*, *Media*, and *Libya*. Its ferulaceous Stalk is called *Maspetum*; the Leaves are like those of Smalage, and it has a broad Seed. The Root is heating, hard of Digestion, generates Inflations, and is hurtful to the Bladder. Made into a Cerate, it cures strumous Swellings, and Tubercles, and applied with Oil in a Cataplasm, removes Lividness contracted by Blows in the Face. Mixed with Cerate of Iris or Cyperus, it helps the Sciatica. Boiled in Vinegar in a Pomegranate Shell, and applied by way of Cataplasm, it takes off Excrecences about the Anus; the same drank resists Poisons. In Sauces and Pickles, it makes a grateful Ingredient to the Palate. They collect the Juice that distils from Incisions made in the Root and Stalk. The best is what is reddish, transparent, somewhat like Myrrh, and of a strong Smell, not porraceous, nor of a harsh Taste, but when diluted turns white.

The *Cyrenian* Juice, if you taste but a little of it, raises a Moisture over all the Body, and diffuses a most fragrant Odour, so as almost to take away the Breath of him who tastes it. The *Median* and *Syrian* Kinds are weaker in Virtue, and have a ranker Smell.

All the Liquor, before it is inspissated, is adulterated with *Sagapenum*, or Bean-meal, which may be discovered by the Taste, Smell, Sight, and by diluting it. Some give the Name of *Silphium* to the Stalk, but call the Root *Magudaris*, and the Leaves *Maspeta*. The Liquor is of most Virtue, next to that the Leaves, and least of all the Stalk. This Liquor generates Inflations, is of an acrimonious Quality, and cures an Alopecia, being mixed with Wine, Pepper, and Vinegar, and rubbed on the Part. Made into a Litus with Honey, it clears the Sight, and dissolves a Cataract in the Beginning. For Pains of the Teeth, it is put into their Cavities; or mixed with Frankincense, and tied about them in a Linnen Rag; or, lastly, serves in a Collution, or to wash the Mouth, being mixed with a Decoction of Hyssop and Figs in Oxycras. It is good to be applied to the Wounds made by the Bite of a mad Dog; and is effectual against the Poison of all venomous Creatures, and envenomed Weapons, being either drank, or used to anoint the Part. Diluted with Oil, it makes an Ointment for the Sting of the Scorpion, and is infused into Gangrenes after Scarification. It is, also, applied to Carbuncles, either alone, or mixed with Nitre, Honey and Rue; and extirpates Corns and Calluses, after they have been first cut or pared; for which Purpose it is made into a Malagma with Cerate, or the Infuse of dried Figs. Used with Vinegar, it cures a recent Lichen, and removes a Sarcoma or Polypus, being mixed with Vitriol or Verdigrease, and rubbed on the Parts affected for several Days together; but the Exuberances are to be extracted with the Forceps. It cures an inveterate Roughness of the *Aspera Arteria*; and diluted in Water and supped, it immediately relieves those who are taken with a sudden Hoarseness. Made into a Litus with Honey, it represses the Swelling of the Uvula; and with Oxymel, makes a good Gargarism in the Quinsy. It procures a good Colour to those who use it in Food; and taken in a poach'd Egg, is good for a Cough, and in forbile Liquors for a Pleurisy. Exhibited with dry Figs, it is effectual against the Jaundice and Dropsy; and taken in Wine with Pepper and Frankincense, it removes a Rigor. It is given, to the Weight of an Obolus, in a Tetanos and Opisthotonos; and used in a Gargarism with Vinegar, it expels Leeches adhering to the Throat. Taken in Oxymel, it relieves under

Coagulations of Milk within, and in the Epilepsy. Taken with Pepper and Myrrh, it provokes the Menfes; and with Grape-Kernels helps the *Cœliac* Passion; and the same drank with a Lixivium, gives Relief under sudden Convulsions and Ruptures. For Potions it is dissolved by bitter Almonds, Rue, or hot Bread. The Juice of the Leaves has the same Virtues, but in a much inferior Degree. It is good, eaten in Oxymel, for the *Aspera Arteria*, [*περὶ ἀσπέρτου*] and particularly for a broken Voice [*ἀπώρευσις τῆς φωνῆς*]; it is eaten, also, with Lettices instead of Rocket.

There is another sort of *Magudaris*, said to grow in *Africa*, whose Root resembles the *Silphium*, tho' not so thick, but is acrid, fungous, and void of Juice, yet works the same Effects with the *Silphium*. *Dioscorides*, Lib. 3. Cap. 94.

Asa Foetida is a Gum Resin, brought to us in Lumps of different Colours, white, yellowish, blue or brown, which last is the worst Colour of all. It has a very strong fetid Smell, and we are obliged to *Kempfer* for a very exact History of the Tree which produces it, and of the manner of gathering it.

Asa Foetida is an excellent Remedy in all hysteric Disorders, whether only smelled to, or mixed with what is taken inwardly. It is, also, reckoned a good Sudorific, and strengthens the Stomach. The Dose is from twelve Grains to half a Dram, but with a View to the Stomach only, it must be given in smaller Doses. Externally, it is a good Resolvent; and in that Intention, is an Ingredient in the *Ceratum de Galbano*, and is sometimes tied to the Bits of Horses Bridles. *Geoffroy*.

THE HISTORY OF THE ASA FOETIDA OF DISGUUN.

The *Hingiseb* is an umbelliferous Plant, a-kin to Lovage, with branched Leaves like Piony; a full and large Stalk; an edged Leafy-winged Seed, naked and single, like that of Branc-Ursin or Parsnep; and a Root yielding *Asa foetida*. Its Root lives for many Years; is large, heavy, naked, black on the Outside, which in a Clayie soil is smooth, in a Gravel rough, and, as it were, wrinkled; for the most part single like a Parsnep, but often branched into two or three at a small Distance from the Top, some of which grow perpendicularly down; others run obliquely and irregularly, just as they are bent and twined by what they met in their Way. The Top of the Root throws itself out of the Ground, and is set round and thick like the *Peucedon*, with rough Fibres standing up like Bristles of a reddish-brown Colour. It has a fat juicy Rind, that easily comes off as one pulls up the Plant, and on the concave Part of it is smooth and moist. The Substance of the Root is heavy, solid and white, like a Turnep full of a fat, very white, and very fetid Juice, with a horrid ungrateful Smell, of the Garlick-kind, which is called by the *Persians* and *Indians*, *Hing*; and by the *Europeans*, *Asa foetida*. The Leaves spring out from the Top of the Root in the latter End of Autumn, six or seven in Number, and always more or fewer in proportion to the Greatness of the Root; all Winter they flourish greatly, and wither away about the Middle of the Spring. The Leaf is branched out into several Parts, even about a Cubit long, shaped for the most part like the Piony, and of the Substance, Colour and Smoothness of Lovage. It has a Smell not so strong as that of the Root, and a rank Taste, joined with a Bitterness and aromatic Keeness. It consists of Stalk and Branches. The Stalk is a span or more long, not so thick as a Man's Finger, with Ridges winding round, like a Screw, stringy and of a grass-colour, channelled towards the Bottom, by reason of the Leaves inclosing one another, in the upper Parts round. Each Branch has upon it five, more rarely seven Wings, placed on the opposite Sides, but not directly over against one another, somewhat more than a Hand's-breadth long, running obliquely upwards; the lower one is longer than the others. Each Side of the Wing is divided into several Lobes of uncertain Number, and unequal Bigness, oblong and somewhat oval; in some Plants very narrow and long, distinct and at a good distance from one another, quite to the Ribs; and thus being few and separate from each other, every one looks like a Leaf by itself; in others they are broader, shorter, and more grown together, with oval or circular Indentures in them, according as Nature has been pleased to divert herself in forming them, which she does with such Variety, that the Difference of the Leaves shall make the Plants appear as if they were not of the same Species. The Lobes run obliquely upwards, are narrow at the Bottom, and lie along by the Sides of the Rib, of a sea-green Colour, smooth, juiceless, stiff and brittle, a little hollow on the lower Side. They have one small String running from the Rib unequally along them, very rarely accompanied with others on each Side of it. The Bigness of the Lobes is uncertain; but one may reckon

reckon them, at a Medium, about three Inches long and one broad. Before the Root dies, (which generally happens in the latter End of Summer) there rises, with a Number of Leaves round it, a single, strait, round, furrowed, smooth, herbaceous Stalk or Stem, which grows up to the Height of six or nine Foot or more; at the Bottom it is larger than the Grasp of a Man's Hand; it grows less by degrees, and is divided into a small Number of Branches, and they again subdivided into Umbrellas, like the rest of the ferulaceous Plants. It is surrounded with very small Leaves, which grow alternately about the Distance of a Hand's-breadth from one another; which, with their broad, membranous, and swelling Bases, cling about the Stalk unequally and cross-ways to each other; and when they fall off, leave Marks behind them, which make a false Appearance of its being divided into Joints. It is exceeding full of a white fungous Pith, not broken by Joints, but with a few short Fibres amongst it running irregularly lengthways. The Umbrellas are upon a Stem of a Foot, others of a Span long, or yet shorter, and shoot out into several Radii disposed circularly; each of which making a kind of smaller Umbrella, ends in a few little Radii of about two Inches long; and on these grow the Seeds, naked and upright, upon short or very small Stalks. The Seed is plain and edged, (or leafy, *foliaceum*) of a reddish-brown, oval, nor unlike the Seed of *Sphondylium*, or Garden Parsnep, but somewhat larger and blacker than the latter, a little hairy and rough, marked with three Furrows, one of which runs through the Middle, and the others wind along the Edges, and all reach from End to End. It has a small Scent of Garlic, and a strong smart bitter Taste. In the Middle of the outward Shell or Husk is contained the true Seed, which is black, flat and oval, ending in a sharp Point. The Flowers I did not see; but they say they are very small ones, and of a whitish pale Colour; and I do not question but they consist of five Petals or Leaves.

The Plant of *Asa foetida* is called by *Avicenna* *Andsjudaan* and *Haltut*; which Word *Dioscorides* renders *Asper*, and *Matthioli* *Laserpitium*. In its own Country, both the Root and the Juice it affords, are called *Hingisheh*, and in *India Hung*. But in common Speech, the Word *Hingisheh* is used for the Plant, and *Hung* for the Juice; and in these Senses I have used these Words in my present Description. Whence the Name *Asa* is derived or corrupted, I enquire not. The *Germans*, from its strong and offensive Smell, give it the Name of *Devil's Dung*. This Plant, by the Conjectures of Botanists, has been referred to several different Species, and by the famous Criticks, *Scaliger* and *Salmasius*, set forth by its proper Marks and Names. I shall here give a genuine History of it from my own Inspection and Observation, having for that purpose taken a tedious and fatiguing Journey from the City of *Gamroon* to the Country where it grows.

Persia, only, is its native Country, not *Media*, *Lybia*, *Syria*, or *Cyrene*; wherefore, all the several Distinctions that are to be found in Authors, between the Juice of this or that Country's Growth, are insignificant. I was informed by two *Chinese* Dealers in Spices, that this Plant grows in their Country near the great Wall which divides *China* from *Tartary*, and has a Juice gathered from it. But I am not satisfied of the Truth of this, because I do not find any mention made of this Plant in the *Chinese Herbal*; for the importing the Gum by the Way of the Wall may have given Occasion to such a Mistake among the Ignorant. There are, at this time, but two Tracts of Land in *Persia* which produce this Plant, the Fields and Mountains near *Heraat*, which is a Market-Town in the Province of *Chorasaan*, and a Range of Mountains in the Province *Laar*, which reach from the River *Cabul*, to the City of *Congo*, along the Bay of *Persia*, at the Distance of two, or in other Places three or more Parangs from the Shore. But it is not in every Part of either of these Tracts, that the Plant yields any Plenty of Juice; but about *Heraat*, that only which grows in the wild Champaign Country; and in the Province of *Laar*, that only which is found upon the Mountains near the Town or Territory of *Disguun*. What grows on either side of these Countries, either yields a small Quantity of Juice, and is therefore not worth the Pains of gathering; or if it will yield any, there is no body to gather it. For on this side of *Disguun*, the Inhabitants of the Country, who are *Arabians*, Husbandmen brought over from the opposite Shore, and Strangers to every other way of Life but that of Shepherds, never attempt to gather any of it, but concern themselves only for the Supply of a low and humble Life, which they lead in poor Tents, and become supine and thoughtless of every thing beyond their own wretched Subsistence, and the Care of their little Flocks. Beyond *Disguun* the Plant is said to have lost almost all its offensive Smell, and grown so sweet, that the Goats are fond of the Leaves, and feed themselves exceeding fat with them. In order to fatten them the Day before they graze there, they are fed once

with Mountain Salt, (the only Salt they have there) and for the first fourteen Days after they begin to feed on it, they are never suffered to drink. The Plant grows indifferently in Thickets and craggy Places, and indeed wherever the Wind scatters the Seeds; but most plentifully, and often at no more than a Foot's Distance between the several Plants, in Places flatted and sunk into a Plain, as being fitter for retaining, and (on account of the better Condition of the Soil) nourishing the Seed.

It seldom grows in a moist or rich Soil, but more frequently in a stony, rocky, dry Soil, with a small Mixture of Clay; and if the upper Part of the Land furnishes not Moisture enough, it supplies itself with it from below, by striking the deeper Root. The People of *Heraat* account that which is called *Hingisheh*, and grows (they say) upon the Mountains, and in the Woods of *Disguun*, a different Species from that which they call *Husseh*, growing in their own Fields. The former, they tell you, affords but a small Quantity of Juice, and even that thin and weak; whereas theirs at *Heraat* yields Abundance of *Ouze*, more fat, unctuous, and fetid, and therefore much the better Sort. To try the Truth of this, and to observe in what respects they differed, I carefully compared a Plant of the Growth of *Heraat* (which while I dwelt at *Gamroon* I procured from *Chorasmia*, and had lost a great Part of its Strength) with one of *Disguun*, and I profess I found no Difference in the Shape. I then shewed the Plant of *Disguun* to the Carriers of the *Asa* of *Heraat* (who yearly brought it to *Gamroon*) not telling them of which Growth it was, and they immediately declared it to be their own, the *Husseh* Plant the Parent of the true and genuine *Asa*. Whence I gather, that the Difference between the Plants of *Disguun* and *Heraat* arises only from the Difference of Soil in those two Places. That of the Fields of *Chorasmia* is perhaps a fatter Soil, and therefore furnishes the Root with a larger Quantity of Juice, than the barren Ridges of the Mountains of *Laar* can afford it; to say nothing of the Juices of the Plants of each Province, which, compared together, afford not the least Suspicion that they are of a different Species; but are exactly alike, except in Cases where a Difference is made either by Adulteration, or by the Season or Manner in which they were gathered, as will appear more fully by what follows. The People of *Disguun* distinguish between the Male and Female Plants; those of the former Sex, they say, yield no Juice, but shoot up into a Stalk, which produces Seed, and by that means they die at the Root; the latter afford the Juice, and have no Stalk: However, this is a false Distinction, and made through want of due Attention; for there is no Root ever found but what will yield Juice, if it be cut before it runs to Seed like Fennel; for it will, if left to itself, sooner or later shoot out a Stalk; after which being deprived of its vital Moisture, it withers and dies, which is common to it, with most other Plants of the umbelliferous kind. The Root is said to live a vast while, even to vie with the Life of a Man for Duration; wherefore 'tis no Wonder if the Roots sometimes be found of a monstrous Size. If the Nature of the Soil be such, that it rises not to a Head in the former Part of its Life, (as it sometimes so happens) they affirm the Stem will grow to six Foot in Length, and to the Thickness of an ordinary Man's Wrist. In its middle Age 'tis as thick as a Man's Leg or Arm, and the Thickness got by one Years Growth is that of one's Thumb, always answered with a proportionable Length. The Fibres around the Head are sometimes a Mark of Age, and I am inclined to think they are the Remains of the Stalks of the Leaves which have fallen off, and were too nervous and firm for the Teeth of Time to destroy.

All *Asa foetida* flows from the Root when 'tis cut, and none either flows of itself, or can by any Art be pressed out of the Stalk; that Distinction, therefore, of the famous *Wormius*, between the *Asa* of the Root, and that of the Stalk, comes to nothing. A Root under four Years Growth, yields very little Juice, and is never cut; but as it grows older and larger, it yields proportionably more Liquor.

If it be taken out of the Earth, and not cut till the next Day, yet a milky Juice will flow from it; such a Quantity of Juice it abounds with, that it becomes uncommonly heavy. If it be cut through cross-ways, its whole upper Surface will be overspread with this milky Juice, which springs up in a continued Line winding irregularly. If we observe the Root carefully, we shall not find it all of the same Substance; but in some Parts of a fibrous and harder Substance, the Fibres running lengthwise in an irregular manner; and in others of a softer, more spongy, and homogeneous One; the latter seems designed for retaining the Liquor, and digesting it in its Vessels, the former for the Circulation and Conveyance of it to nourish the Stem. And I add, also, that it contributes to the making the Root firmer and more durable, which is of itself brittle and fragile. When the Root is dried from

all its Moisture, it looses all its softer Parts, and the fibrous ones only remaining, are contracted into a stringy Pith; but the rough Bark loses little of its Dimensions. The Liquor, when it first flows from the Vessels of the Root, is very white, liquid and fat, exactly like the Cream of sweet Milk, and therefore not in the least clammy; but by being kept in the Air or Sun, it changes its Colour to a light brown, and grows firmer and glutinous. Its Scent is the Test of its Excellency; the stronger it is, the better the *Asa*. When it first comes from the Root, it is of a prodigious strong Scent, above what it is, when grown firmer by Age, and brought into Europe; insomuch that one Dram of *Asa* fresh from the Root, will cast a stronger Smell than a hundred Pounds of what is dried by long keeping, and is usually sold by our Drug-gists. When I returned from the Mountains, I carried home with me a pretty many Roots, (into a very large House with a Court in the midst of it) but they filled every Room of it with so noisome a Scent, that I was forced immediately to throw them away. When the *Casila* (a Word they use for a Drove of laden Cattle and their Drivers) arrives with *Asa*, from *Chorasnia*, this Sort of Ware is always unloaded in a Field at a good Distance from the City; but notwithstanding this, if the Wind blows from that Quarter, the whole Air of the Place is infected with its Stench. It must be carried into India in a Vessel by itself, not with any other Goods that are liable to be corrupted; for Experience teaches, it will infect and spoil them all, and does the same by all Liquors. The Vessel in which I crossed over into Arabia, had one single Sack of *Heraat Asa* hanging at her Stern, which made us prodigiously uneasy with its offensive Smell; and the Master of the Ship was apprehensive, that even in that little Way, it would do harm to the Rose-Water, *Schiras* Wine, and the Eatables on board.

Dioscorides, Book 3. Chap. 78. has given us a long List of the medicinal Virtues of *Asa*; and *Garcias Arom. Hist.* B. i. C. 3. has said a great deal of its Excellency that Way. The *Persian* Physicians, by reason of the Nicety of that People, hardly ever use it. The Peasants of the Province of *Laar* became acquainted with its Efficacy in curing Colic Pains, the Dropsy, and especially the Tympany, from the Advice of the *Banjans*. A Citizen of *Disguun* himself told me, that he was afflicted with the Tympany, and that by swallowing a Bolus or large Pill of *Asa*, every Morning for six Weeks together, he was perfectly recovered. During this Course of *Asa* the Wind discharged itself so frequently upwards and downwards, and was of so abominable a Scent, that he was forced to banish himself from all Society and Conversation. The Seed of the Plant has the same Effect, but in a less Degree, and, therefore, the *Indians* fetch it hence for physical Uses. Wounds are said to be healed to a Miracle by the Application of *Asa* fresh gathered. If this Plant be laid in any Furrows where Water drains, and from thence runs into any Gardens or Groves of Palm or Date Trees, that Water will kill all the Worms at the Root of any Plant whatsoever. The *Indians* (especially the *Banjans*) use *Asa* commonly in their Sauces.

The famous *Renodanus* could hardly be brought to believe this Account of it given him by *Gazzia*; for, says he, if this be true, surely either *Asa Foetida* does not stink in India, or the *Indians* Palates are made of Brass. I myself have tasted Cakes that have been mixed with this Liquor, which have had a far more tolerable Relish than I expected from them. 'Tis a common Thing among *Banjans* to rub the Rims of their Cups with this Liquor, to raise an Appetite.

There is a very great Dispute between the Men of *Heraat* and *Disguun*, whose *Asa* is to be preferred; each think to advance the Worth of their own Commodity, by depreciating that of the others. At *Heraat*, the *Asa* of the Mountains of *Disguun* is decried, as lean, dry, and of a bastard Kind; while their own is declared to be fat, soft, and of the highest Scent. The Men of *Disguun* reply in behalf of their *Asa*, that the Fatness of the *Heraat Asa* is not natural but forced, by their mixing it at its first Gathering with the Cream of Camels or Goats; by these Means, they think it does not harden so soon, nor will it keep so long when it is thus sophisticated; thus, say they, the Buyer is cheated into a Belief, that what is really the Fatness of the Mixture, is the genuine Richness of the *Asa*. Envy, and the Love of Gain, engendered this Quarrel; but there is no Reason thence to conclude the *Asas* of these two Places to be of a different Species; wherefore, without Regard to this or any other Distinctions made by Druggists, I shall only distinguish between the Plants themselves, and the *Asa* they produce, as they grow in Fields or Mountains; at *Heraat* or *Disguun*; or, if you would rather use the Names of the Provinces in which they grow, of *Chorasnia* or *Laar*; the one is for the most Part fatter and softer, and brought over wrapped in Sheep's and Goats Skins; the other is drier, and comes in Bags made

of the Leaves of the wild Palm-tree. As all my Observations were made upon the latter, so I here give you an Account of the Manner of gathering it, which is the same with that of gathering the *Asa* of *Heraat*, except in a very few Circumstances.

The Harvest of *Hingisib* or *Asa*, is gathered by some of the Inhabitants of the neighbouring Villages, but principally, by the major Part of the People of *Disguun*, who are, in all, about three hundred, and is completed in four Seasons, or, which is the same, in going four times from the City to the Hills where the *Hingisib* grows, which are distant about two, three or four Parafangs. I will relate the Order of the several Times, or Seasons, in which the Harvest was reaped by the People of *Disguun*, that Year I visited these Mountains, which was 1687. The Order is indeed always the same, tho' perhaps the Day on which they begin their Harvest, or the Distances between the several Seasons of it, be not always exactly the same.

FIRST SEASON.

Before ever they began their Work, they made Enquiry what the foreign Demands for *Asa* were, that they might not spend their Time and Labour in vain; as soon then as they are assured of a Vent for it, they flock to the Mountains about the Middle of April, because that is the proper Season to prepare the Root for yielding its Moisture; of which the *Palenefs*, Drooping, and Withering of the Leaves, is a certain Sign. If the Peasants of the neighbouring Villages determine to gather any, they repair thither in the same Month. When they arrive, they disperse themselves, and keep at a great Distance from one another, so that they who have agreed to make one common Stock of what they gather, whether they are a single Family, or a Number of Families related to each other, or the People of one particular Street thus agreed, pitch severally upon a certain Tract of the Mountain, and gather there. Here each Man cheerfully falls to Work on the Plants he finds; and first, with a Spade, takes away the Earth a little Distance around the Root, which is commonly a firm Sand or Gravel, to about the Depth of a Span, so that the Root appears naked a good Height out of the Ground. Secondly, he takes the Stalks of the Leaves cross-ways in his Hand, and twists them off from the Root, which, in that Season of the Year, is easily done; then takes off the rough Crown of Fibres from its Head, which appears underneath bald and wrinkled. Thirdly, with his Spade, or Hand, he breaks the Clods of Earth he had dug up, and covers the Root again with them to the Top; then upon the Earth he lays the Leaves he has pulled off, or any other that chances to be near him, with a Stone upon them, lest the Wind, which is here often exceeding violent, should carry them away, and he, at his Return, not know where to find the Root.

The Reason of thus covering the Root, is to defend it from the Sun's Heat; for were it exposed to it, it would, in twenty four Hours, putrefy, and yield no Profit to the Labourer. After they have thus prepared many thousand Roots for gathering, (four or five Men usually prepare two thousand) they leave the Mountains and return home, having, in about three Days time, finished the Labour of the first Season, which they call *Kustian*, that is, to kill, as if this were the Season of Slaughter; because, in this Season, the Plants are condemned hereafter to die, by being drained of their vital Juice.

SECOND SEASON.

After forty Days spent at home (this Year they staid longer than they usually did) the whole Number of Gatherers leave the City in the Evening, and in the Morning, the twenty fifth of May, arrive at the Mountains; they then divide themselves, and each Company goes to its allotted Tract of Ground, to collect the Liquor from the Roots, prepared in the Manner described above; which being here got together for the Nourishment of the Leaves, now all stagnates at the Top. The Instruments they had, were, a sharp Knife for cutting the Root, a Sort of Slice or Spattle made of Iron, broad at the End, to scrape the Juice from off the Root, and a Dish or Cup fixed upon their Side, to put the Juice into, as they scraped it off, and two Baskets hanging by a Yoke from the Shoulders, in which they carry off the whole Quantity of Juice they gather. It ought to be mentioned, that every Company divides its Portion of Land, and consequently the Roots, into two Parts, and all in the Company work in each Part every other Day; because, after the Root has afforded a good deal of Moisture, it requires Time both to yield fresh Liquor, and to thicken what it has already yielded.

Each Man takes a Root, and removes the Bundles of Leaves and Earth which cover its Top. He then cuts off the rough Top cross-ways, and leaves the upper Surface concave, whether the Liquor flows, without any Danger of running over, till after two Days it is scraped off. Then, as in the former Season, he again covers the Root from the Injuries of the Sun's Heat, and takes Care to lay the Leaves over the Surface arch-wise, that they may not, by pressing upon it, wipe off the Juice. When their Task is finished for that Day, the next Day, the twenty sixth of May, is spent from Day-break in the like Labour, in the other Division of their Land: On the twenty seventh they revisit the first Part with which they began, and after having taken away the Shelter of Leaves, they scrape off the Liquor they find at the Top of the Root, and put it into the Dish that hangs by their Side. Then they take away a little more of the Earth about the upper Part of the Root, and with their Knife cut off the dry Surface, about the Thickness of an Oat-straw; for it is enough if just the Outward Surface be cut off, which stopp'd up the Pores, which, when that is removed, discharge themselves of their Liquor; and indeed they have experienced, that the thinner the Parings are, the freer and more plentifully the Root flows again. The same Persuasion they have of the Preferableness of one Manner of cutting it, which they require should be performed by striking the Knife through, and not the common Way of drawing it backward and forward; which, they say, does not make them ouze so plentifully as the other.

The Reapers frequently empty the Dishes which hang by their Sides, and then put the Juice into larger Vessels, or pour it into Leaves laid upon the Ground; that the Sun's Heat may stiffen it; by which means also it loses its natural Whiteness; for its Substance being soft and differently situated, admits the Sun's Rays in a greater Quantity in some Parts than in others; its Colour also may be affected by what it is laid upon when fresh gathered.

Thus, after the Root is covered again, the Work is done. On the twenty eighth, the same Business is done in the same Manner, in the second Division. On the twenty ninth they return to the first Division; and when they have gathered the Liquor from the Root a second time, they take away the Earth, cut it, and cover it again as before. On the thirtieth, the Liquor in the Roots of the second Part, is gathered a second Time, and the Roots cut. This is the Work of the second Season, in which the Roots are thrice cut, and the Liquor that pours out of them twice gathered. Then each Man puts his whole Collection into the Baskets, which hang on each Side of him, from a Yoke laid across his Shoulders; and carries it away. Each Company of four or five Men carry off about ten or twelve *Maad* of *Disguin*, that is, about fifty German Pounds. This *Afa* of the first Gathering, is not esteemed the best, but rather a meaner Sort.

THIRD SEASON.

After ten Days time (eight will do) allowed for the Roots to supply themselves with fresh Liquor; on June tenth, at Day-break, they return to the first Division, and go on with their Harvest. Having removed the Shade of Leaves, and the Earth from about the Root as before, they scrape off the Liquor from the Top of it, and then cut it again, and cover up the fresh Wound as before. On the eleventh they do the same in the second Division.

This Liquor, which in ten Days time flows from the Roots in a larger Quantity, and is of a due Consistency, is called *Pispaas*, the other is called *Sjur*, that is *Milk*, from its Whiteness, and want of Consistency. The *Pispaas* is commonly esteemed much better, and is a great deal dearer than the *Sjur*, whether on account of its Scarcity, or its greater Consistency, I know not; this I am sure of, that the *Sjur*, tho' it is thinner, is not of a worse Substance than the *Pispaas*; for if it be longer exposed to the Air, it grows full as firm, and cannot be distinguished from it. I am, therefore, inclined to think, that the People of *Disguin* never before sold the *Afa Sjur* pure and genuine, but always adulterated it, which was easily done, when it was fresh gathered, because it was so liquid and thin; whereas the *Pispaas* being much more consistent and firm, will not mix with any other Substance, and is therefore sold neat and pure. All *Afa* is of itself simple and unmixed; therefore, all heterogeneous Matter in *Afa* comes by Adulteration. The Reapers themselves confessed to me, that they used to mix with the *Sjur Afa*, not Meal, nor any Sort of sagapenous Gum, as most Writers have thought; but a pure Clay, which was just at Hand on the Mountains where they gather it. Most, they said, put an equal Quantity of this to their *Afa*; others twice as much, or in Proportion to their Desire of Profit, still putting in the more, the thinner the *Afa* was. This made the Price of this

Afa very low; and after the Cheat was discovered, the *Afa* of this Sort was despised; and indeed, they who thus adulterated it, suffered enough for it; for no body would buy any *Disguin Afa* for Fear of this Imposition; having therefore learned more Prudence, they no longer use any Kind of foreign Mixture, but put the *Afa*'s of each Sort and Gathering promiscuously together, and carry it in Bundles to *Congo* and *Ormus*, whence 'tis exported. And if there is yet any Mixture in it, it is through the Negligence of the Gatherers, in not covering the Roots carefully after they have cut them: Tho' indeed all their Care cannot prevent Dirt and Dust from falling from the Leaves that shade the Roots, or from being blown upon them by the Wind, which will, in some Measure, foul the Liquor.

On the twelfth Day, in the first Division, and on the thirteenth, in the second Division, they gather the Juice *Sjur*, and cut and cover the Root again; and on the fourteenth they do the same again in the first Division, and on the fifteenth again in the second; so the Roots, after having yielded once the thicker *Afa Pispaas*, and twice the thinner *Sjur*, are left under their Covers.

FOURTH SEASON.

After three Days Stay at home, on the third of July, they visit the Roots again; having been taught, by Experience, that in a longer Intermission, after they have been so often drained of their Moisture, and brought nearer and nearer Death, they will be subject to putrefy, and whatever Liquor they have then in them, would be lost, by deferring the Gathering of it any longer. The first Day is spent in gathering the *Afa Pispaas*, in the first Division, in the Manner before described. The fourth Day is spent in the second Division, in the same Work. On the fifth Day they gather *Afa Sjur* in the first Division; and on the sixth, in the second Division. On the seventh Day they finish the Work in the first Division; they get what Juice they find there, and cut the Roots no further, but leave them uncovered, whereby the Air and Sun presently kill them. On the eighth Day, they concluded the Business in the second Division, and leave the Roots, in the same Manner, to be destroyed. Thus is the Harvest of *Hingeseb* or *Afa* completed.

In three Excursions to the Hills, they gather the *Sjur Afa* eight Times, and the *Pispaas* three times from each Root. But it is to be remembered, that the larger Roots, such as are above twenty Years old, and are found in the furthest Parts of the Mountains, whither they cannot climb without great Difficulty, are not so soon laid aside, but they will yield the *Afa Pispaas* four or five times, and the *Afa Sjur* so much oftener in Proportion. So that these Roots are not compleatly drained of their Juice till September. However, in these Mountains few Roots are found above ten Years old, and none ever exceed twenty. For the great Price that *Afa* hath bore for many Years together, made the Reapers gather all the Roots that ever they could find, so that there has not, of late, been Time enough allowed for any to arrive at so great an Age and Bulk. The Roots being drained of their Moisture, and left uncovered, do every one of them putrefy: Tho' one of the Reapers affirmed to me, upon his own Experience, that if they were covered with Earth, they would grow again; but in this Point none of the rest agreed with him. *Kempfer*.

SILURUS. Offic. Schw. Theriot. Sil. 444. Schonef. Ichth. 69. Rondel. de Pisc. 2. 180. *Silurus Rondeletii*, Raii Ichth. 128. Ejujd. Synop. Pisc. 70. Geln. de Aquat. 867. *Glanis*, Aldrov. de Pisc. 567. Salv. 210. Charlt. de Pisc. 40. Jons. de Pisc. 101. The SHOAR FISH.

This Fish is found in the *Damube*, and its Flesh is nourishing when eaten fresh, and loosens the Belly; but seasoned with Salt, affords very little Nourishment, but clears the *Aspera Arteria*, and mends the Voice. The salted Flesh applied draws out Splinters, and the Pickle cures a recent Dysentery, being used by Way of Insestion, by attracting the Flux of Humours in the Superficies; a Clyster of the same cures the Sciatica. *Discofidus*.

SILYBUM. A Name for several Species of Thistles. Thus there is the *Carduus Lacteus, peregrinus, major, semine fuso*, which is called by Parkinson, *Silybum minus annum*. And the *Carduus lacteus peregrinus Camerarii*. J. B. *albis maculis notatus exoticus*. C. B. is called, *Silybum minus Patricum*, by the same Author. See AGA CRETENSIMUM.

SIMAROUBA.

The most celebrated Plants which have been pointed out and recommended, either by the ancient Botanists in general, or modern Travellers in particular, as specific Remedies, are not really specific, but in certain Cases. Diseases seem not to resemble one another more in some certain Symptoms, which are common to them, than they sometimes differ as to the Causes

Causes on which these Symptoms depend. Hence it must of Necessity happen, that the same Remedies being employed in Diseases, which resemble one another only in Appearance, seldom or never produce the same Effects; and this has given Occasion to the ill Usage which is every Day made of the most salutary Plants, and that Neglect and Disregard which have afterwards been shown to those which were, at first, the most in vogue.

The Plant *Ipecacuanha*, which *Piso* had observed to be one of the most effectual Remedies for a Dysentery with the People of *Brazil*; that famous Root which the late *Helvetius* first employed with so good Success in this Country, and which, from that Time, justly passed for a Specific against that Disease, is on the Point of sharing the common Fate of all wonderful and extraordinary Plants imported from foreign Countries.

Ought we then to condemn as useless that Remedy, because it has not always succeeded in Dysenteries when prescribed? Or ought we not rather to lay the Blame on the Want of Experience in those, who being no Physicians, directed the Use of it on improper Occasions? And indeed what Remedy, tho' ever so effectual, would not be subject to lose its Reputation in such Hands?

The true Reason why *Ipecacuanha* is sunk in its Esteem among us, is, that instead of a prudent Use of it, in a Collection of Crudities in the *Primæ Viæ*, or the abdominal Viscera, it has been prescribed sometimes in hepatic Fluxes, sometimes in dysenteric Fluxes occasioned by an immoderate Use of Purgatives, frequently under an Inflammation about the Abdomen, and sometimes when a pungent and fixed Pain, which attends some Dysenteries, gives Room to suspect a cancerous Ulcer in the Intestines.

To direct the Use of *Ipecacuanha*, on any of these Occasions, would be, in a Manner, to force Nature to produce, by Means of this Remedy, Effects for which she never designed it. If the little Success which attended its Administration in all these Cases, was an evident Proof that they were all out of its Sphere, would it not be prudent and advisable for the practical Physician to abstain from the Use of it, because, in these Circumstances, it had not answered his Expectation? And since he was convinced by his Observations, that this Root cured no Dysenteries but such as were of a certain Character, should not that Experience have put him upon the Search for new Specifics, for the Cure of those which might be of another Kind?

It can hardly be doubted by those who have never so little consulted the antient Botanists, but that such there are in Being; and if the Ancients had the Knowledge of some of them, why should we despair of retrieving them from that State of Oblivion into which they are fallen since their Time?

Dioscorides speaks of a Root of a yellowish Cast, pretty thick, and very astringent, which, he says, was brought from *Barbary*, a Name given in his Time to the remotest Countries of the East. The Bark of this Root was then used in Decoction for Hemorrhages at the Mouth and Nose, for Dysenteries and Fluxes [*Deveyements*]; he gives it the Names of *Maxig* (*Macer*) and *Maxig* (*Macir*).

Pliny calls by the same Names of *Macer* and *Macir*, the Bark of a Tree which was brought from the *Indies*, and which, he says, was of a reddish Colour.

Galen, who in the Description and Uses which he gives us of it, agrees with these two Authors, only adds, that it is aromatic.

And it is not at all strange that *Averroes*, and other *Arabian* Physicians, had the Knowledge of the *Macer*, since it is the Bark of a Tree which grows in the Eastern Countries.

All that has been said by ancient Authors concerning the *Macer*, may be found in the Relations given us by some who have travelled into the *East Indies*, and particularly those who have visited the Coasts of *Malabar*, and the Island of *Sainte Croix*. They tell us of a greyish Bark, which being dried, becomes, as they say, yellowish, is very astringent, and has the same Virtues as the *Macer* of the Ancients.

Christopher Acosta, who has given us one of the first Accounts of simple Drugs imported from the *Indies*, and was Physician to the Viceroy, says, that the Tree which bears that Bark, was, by the *Portuguese*, called *Arbore de las Camareras*, and *Arbore Sancto*; that is to say, "a Tree for Dysenteries," and, for its Excellence, "The Holy Tree;" by the Christians, *Arbore de Sancto Thome*, "the Tree of St. Thomas," by the Natives of the Country, *Macruyre*, and by the Brachman Physicians *Macré*, which agrees with the ancient Word *Macer*.

The same Historian, who is the only one that has given us a Figure of that Tree, compares it with one of our Elms; and as to the Virtues and Use of its Bark, he relates such particular Matters of Fact, of which, he says, he had been an

Eye-witness, that there is hardly any Remedy which might with more Justice claim the Name of a Specific.

To shew the Value which they have for this Bark in the *Indies*, I shall only quote a Passage from the Works of that Physician, being an Elogy, or Commendation, given, he says, by an *Indian*, to the Tree which he called *Macré*, as he was shewing it to him. It was a Tree, he said, pointed out by Angels for the Health of Mankind, and that it was to be preferred in its small Dose before the large Quantity of Barks of *Myrebalans*, *Areca*, and *Coris*, which are usually prescribed, and have been always reputed by the *Indians* the most excellent Remedies against the Dysentery.

Clusius, a Botanist of the sixteenth Century, and particularly famous for his learned Inquiries into foreign Plants, had a Suspicion even in his Time, that a certain small Quantity of Bark, like that just before described, and which he saw at a Physician's at *Amsterdam*, for whose Use it was imported from the *Indies*, as a Specific against the Dysentery, was the same Bark which *Monardes*, a Physician of *Sevil*, says, in his *History of Drugs*, he had so happily made use of in that Distemper, without knowing what it was.

All these Descriptions, which seem to agree to the same Tree, and that Tradition of the Virtues of its Bark, proved true by the Experience of those Authors, have excited my Curiosity, in order to attain the Knowledge of so sovereign a Remedy, and to enquire into the Causes whence it comes to be intirely lost, since the Time of *Galen*, in the Western Parts of the World.

About the Year 1713, there was first imported from *Cayenna*, to M. le Comte de Pontchartrain, Secretary of State, the Bark of a Tree called in that Country *Simarouba*, and which he was assured was used, in those Parts, with good Success, in Fluxes and Dysenteries. This Account of its Usefulness induced that Minister to make a Present of it to the Academy of Sciences, and to M. *Fagon*, at that time first Physician to the King, who presented a Part to the Professors of the Royal Garden. But the small Quantity which was distributed to them not permitting them to make many Experiments, it only served to lie in their Druggery, as a Sample of a rare Drug, whose Effects were not as yet well attested in those Parts.

All that was then discovered relating to it, by the Experiments which M. *Fagon* caused us to make, was, that this Medicine was, at least, safe, and not dangerous, since it had no sensible Effect, neither by any manner of Evacuation, nor by the least Pain in the Intestines.

But in the Year 1718, when the Heats of the Summer were excessive, and gave Rise to vast Numbers of Dysenteric Fluxes, which were so far from yielding to Purgatives and common Astringents, or even to *Ipecacuanha* itself, which was accustomed to be used, with good Success, in repressing those extraordinary and violent Kinds of Evacuations, that, on the contrary, they were rather the more exasperated and increased by the Repetition of those Remedies, we had Recourse, as to the last and most sovereign Remedy, to the small Quantity of *Simarouba* which was left us, of the Distribution which M. *Fagon* had made to us, and we were soon satisfied, in short, that of all the Remedies which we had hitherto put in Practice, none had so readily succeeded as this Drug.

This happy Success having raised more and more my Esteem for this Bark, I intreated M. *Randot*, Intendant General of the Navy, to procure for me another Quantity, with a Design to use it not only in Dysenteries, which were ceased at the Beginning of 1719, but in Fluxes of Blood, which are so common in the Women of this Country, and so dangerous, on Account of the Use of Alum, which has been for some time past the Remedy in Vogue.

The Conjectures which I had entertained of the near Affinity of the Causes which produced those Fluxes, and certain Dysenteries, which are pretty common, induced me to make Trial of the same Drug in both these Disorders; and the continual Success which attended the Use of it on both Occasions, was so far from tempting me to make a Secret of the Discovery, that, on the contrary, it engaged me to compare all those Observations with those I had seen in our ancient Botanic Authors, concerning the Description and Effects of *Macer*, with a View of retrieving, and restoring to the Public, that previous Specific, so much extolled by them.

And such is the Matter of Fact, that in Truth it may be said, that if the *Simarouba* of the *Americans* be not the *Macer* of the Ancients, it has, at least, a very great Resemblance to it, both in Form and Effects.

The Colour of the *Simarouba* is a yellowish Grey. *Dioscorides* says, that the *Macer* is of a yellowish Colour.

Our Bark is more or less thick, in Proportion to the Age of the Tree; the same Author makes the Bark of the *Macer* to be of a competent Thickness.

It is generally acknowledged, by all those who have spoken of the *Macer*, that it is of a very astringent Quality; this, also, is the specific Virtue of the *Simarouba*, the Decoction of which being drank, has the same Success as that ancient Specific exhibited in the same Manner.

It will, indeed, be difficult to demonstrate a perfect Agreement between the *Simarouba* and the *Macer*, because the Antients who speak of the *Macer* are not agreed, as to the Tree which bears that Bark; nor about the Quality of its Smell nor Taste; and it is to the Variety of their Relations on this Head, and the Ignorance of Commentators, who confound *Macer* with *Macis*; that, I think, we ought to impute the Cause of that Oblivion into which that Drug has fallen since *Galen's* Time; for as to the Point of its being a Native of the *East-Indies*, whence *Pliny*, *Serapion*, and *Averroes*, all make it to come, *Garcias ab Horto*, *Acosta*, and *John Morquet*, who travell'd thither in the sixteenth Century, assure us, that it was a Remedy then used in the Hospitals, and that at *Bengal* they made a considerable Traffick with it.

With regard to the *Simarouba*, I shall now give you an Account of what I had an Opportunity to observe, after I had received fifty Pounds of that Drug from *M. Barrere*, Physician and Botanist, at his Return from *Cayenna*, in the Year 1723. This Bark, both as to its Inside and Outside, pretty much resembles that of the Linden-Tree, and is of the same stringy Consistence, which render it flexible, and hard to break; and being chew'd in the Mouth, it has a little bitterish Taste, which is very tolerable, and communicates the same to the Water in which it is boiled.

It is observ'd, that in the boiling, the Liquor grows white and spumous, like Milk, and rises, considerably more in the Vessel, than the Decoctions of common Drugs; and, when it is settled after boiling, takes a reddish Colour, much like that of Small-Beer.

During almost fifteen Years last past, in which I have used the *Simarouba*, I have observed, that two Drams of that Bark boiled in a Pint and half of Water to a Pint, is enough for three Glasses, one of which is the ordinary Dose.

This simple Decoction having always better succeeded with me than the Powder of the Bark and its Wood, I prescribe it with the more Freedom, in that it is not at all disagreeable to the Taste: But since we meet with some Patients, who had rather take the *Simarouba* in Powder, the Bark or its Wood must be rasped, almost in the same Manner we rasp Tobacco, and exhibit twelve or twenty Grains every three Hours, either in Pills, or in a Spoonful or two of Broth. This Manner of exhibiting it, seems preferable to that practis'd by the *Indian* Physicians, who give it, as *Acosta* says, in four Whey.

Before I ventur'd to publish what I now write, I satisfy'd myself by my own Experience, that the Effects of the *Simarouba* were almost constantly the same in obstinate and slimy Dysenteries, and in bilious and bloody Fluxes, which very rarely failed of stopping at the third or sixth Glass, without any Pain, or Evacuation upwards or downwards, except in a more plentiful Discharge by Urine, which becomes high-colour'd, and sometimes, in particularly qualify'd Subjects, copious Sweats.

Almost all those who have been cured by it, have inform'd me, that as soon as they had taken the second Glass of the Decoction of *Simarouba*, they felt inwardly a dull Kind of Motion throughout their whole Body, which they call'd a *Combating with the Disease*, much like to the Effects produced by the *Quinquina*, when being seasonably administer'd it puts a sudden stop to the Return of the feverish Fit.

In short, though I have seen sick Persons, who were very much extenuated, and had lost all Appetite, recover, after the Use of this Medicine for two Nights, a Serenity and Composure of Spirits, which were the Prognosticks of approaching Health, and have their Sleep and Appetite, in a surprizing Manner, restored, yet I have met with some Subjects, who, either through Want of Regimen, or from some Remains of the Disease, have relapsed some Days after their Restoration, but by renewing the Use of the same Drink for two or three Days together, the Disease has at last been totally subdued.

Though such are the good Effects of the *Simarouba*, as I can attest from my own Experience, it must, however, be confessed, that it would be dangerous, or at least of no Service, to use it in Fluxes, Floodings and Dysenteries, where an Evacuation of the *Primæ Viæ* might first be necessary before we think of strengthening the Intestines; because the Constipation which succeeds the Use of this Remedy, and continues for two or three Days, might occasion some Congestion and Settlement of the Humours in some particular Part, especially in Subjects where the Kidneys are obstructed, or when the Party is not free to sweat: Hence it appears to me adviseable, not only to have recourse to general Reme-

dies, before the Use of the *Simarouba*, but also to be careful to proportion the Dose to the Condition of the Patient.

If we might judge by that slight Reliëf of Bitterness perceiv'd in chewing the *Simarouba*, as well as by the whitish and milky Colour it communicates to the Water in which it is boiled, and by the Readiness with which it represses the most stubborn and inveterate dysenteric Fluxes, not only by putting a Stop to the Blood mixed with the Stools, but by restoring the Excrements to their natural Consistence, we may be pretty confident, that there enters into its Composition an acrimonious, saline Matter, involved in oily and balsamic Particles; for its Bitterness, and the Recovery of lost Appetite, which it procures, depend on that acrimonious Matter, which becomes stomachic; the milky Colour which the Water receives from it in boiling, indicates it to be endu'd with an unctuous, balsamic Quality, the certain Proofs of which are, that calm Composure of Spirits, and sudden Cessation of all griping and wringing Pains, and others of any Kind whatever; and, lastly, by its quick Suppression of the Hæmorrhage, and that considerable Constipation of the Belly which it procures, we are convinced of its vulnerary and astringent Virtue, which was the most valuable Qualification of the *Macer* of the Antients.

The Discovery of a Specific for the Cure of certain Dysenteries, which yielded not, in these Countries, to the Use of *Ipecacuanha*, nor to other Remedies celebrated for curing that Distemper, is not the only Fruit which the Public may reap from the Observations here made; they instruct us besides, and let us see that all Plants have their Use, and that we ought not slightly to lessen the Number of those which are useful, by retrenching such as have not all their Properties display'd before us; that it is the Duty of the practical Physician to cause a proper Value to be set on such Remedies, and Assistances, which would come insensibly to be neglected, if Botany were to be regarded only as a Science of pure Curiosity; but that without the Lights afforded us from Botany, it would be impossible to come to the Knowledge of a considerable Number of Specifics indicated by the Antients, and lost for many Ages; and, lastly, we learn what Precautions are necessary in the Use of Things recommended to us and extolled by Travellers, that we may not employ them but in such Cases, and under such Circumstances as require their Assistance. *Memoires de l'Acad. des Scienc. 1729. par M. de Jussieu.*

SIMBOR MANGIANAM, *sive Cornu Alcis*. *Bontii*. The Name of an *Indian* Plant, which grows near the Sea in *Java*, and the Kingdom of *Bantam*, of the Figure of an Elk's Horn. It is said to be emollient and resolute; to loosen the Belly, and kill Worms, if bruis'd and apply'd to the Region of the Navel. It is, farther, us'd as a Resolver of cold Tumors. *Lemery des Drogues.*

SIMIA. *Raii Synop. A. 148. Aldrov. de Quad. Digit. 225. Jonst. de Quad. 96. Schw. de Quad. 121. Charlt. Exer. 16. Gefn. de Quad. Digit. 147. THE APE.*

The Parts in Use are the Stone, or *Bezoar Simia*, which is sometimes found in the Stomach of this Animal, the Heart, and the Flesh. The Heart roasted, or boiled in Hydromel, sharpens the Sight. The Flesh is cold and dry, austere, of very bad Juice, and unfit to eat. *Dale from Schwentfeld.*

SIMIA is, also, a Name for a Fish found in the Nile.

SIMILA, or **SIMILAGO**. The same as **SEMIDALIS**. Fine Flower, or Meal.

SIMITAS. A Flatness of the Nose.

SIMIVULPA. The Name of an Animal mention'd by *Aldrovandus*. It is thus call'd, because it resembles an Ape; and a Fox. It is of no Use in Medicine.

SIMITIUM. *Cerufs. Rulandus.*

SIMOS, or **SIMOTHES**. *Cerufs. Rulandus.*

SINAPELCEON. Oil of Mustard Seed.

SINAPI

The Characters are;

The Pod is full of very tart Seeds, which are of a roundish Figure, and of a very hot Taste, and ends in a fungous Horn full of the like Seeds.

Boerhaave mentions fourteen Sorts of *Sinapi*, which are;

1. *Sinapi, Rapi folio*. *C. B. P. 99. Tourn. Inst. 227. Boerb. Ind. A. 2. 13. Sinapi, Offic. Sinapi sativum, Ger. 189. Sinapi sativum alterum, Ger. Emac. 244. Sinapi sativum secundum, Raii Hist. 1. 803. Synop. 3. 295. Sinapi sativum Rapi folio, Park. Theat. 83. Sinapi siliqua latiusculâ glabrâ, semine rufo, sive vulgare, J. B. 2. 855. Eruca Rapi folia, Rupp. Flor. Jon. 64. COMMON MUSTARD.*

Common Mustard has the lower Leaves large, rough, and pretty much resembling Turnep Leaves. The Stalk grows to be three or four Foot high, smooth, much branched, and having several smaller Leaves than those below, thick,

thick, smooth, and less cut in, but yet a little sinuated about the Edges, and hanging downwards on long Foot-Stalks. The Flowers are small and yellow, of four Leaves a-piece, set many together, and flowering by degrees; before they have done flowering, the Spike of the Seed-Vessel is extended to a great Length; they are squarish, clasping close to the Stalks, and sharp-pointed at the End, full of round, dark, brown Seed, of a hot biting Taste. The Root is whitish, branched, and full of Fibres, but perishes after it has ripened it; the Seed grows frequently in waste Places, and among Rubbish, and is frequently sown in Gardens, flowering in June.

The Seeds are used, and of them is made the Sauce of so common Use, called Mustard, which is a wholesome Condiment, provoking an Appetite, strengthening the Stomach, and helping Digestion. It is, also, good for the Head, and useful in Apoplexies, Lethargy and Palsy, especially of the Tongue. The Seed bruised and infused in Wine or Ale, is of great Service against the Scurvy and Dropsy, provoking Urine and the Menstrues. Mustard outwardly applied, is very drawing and ripening, and laid on paralytic Members, it recalls the natural Heat. *Miller's Bot. Off.*

Mustard Seed, by the chymical Analysis, gives a much greater Indication of an acid than an acid Salt; but it affords a considerable Quantity of Oil, very little fixed Salt simply saline, a great deal of Earth, a little urinous Spirit, and no volatile concrete Salt.

This Seed is stomachic, diaphoretic and antiscorbutic; it is good for the Hypochondria, Green Sickness, Cachexy, and sleepy Distempers. It is proper for such as are threatened with an Apoplexy, to chew Mustard-Seed in the Morning fasting. The following Cataplasm gives great Relief in Rheumatisms of the Breast:

Fry some Leeks, cut small, with a little Vinegar; when they are enough, strew them with a little bruised Mustard-Seed: Apply this Cataplasm to the Part affected; it is very resolvent, and will raise Blisters if you put in a good deal of Mustard.

Some make a Cataplasm with Turpentine, Pidgeons Dung and Mustard, and apply it to the Parts affected with the Gout, and even to the Jaw in a violent Tooth-ach. *Martyn's Tournefort.*

It heats and dries, incises, attenuates, and attracts. Its principal Uses are to excite an Appetite, promote Chylification, and purge the Head. Outwardly it is used in a Sinapism, being put in the Nostrials, or applied to other Parts. It breaks mature Tumors, and excites Sneezing. *Dale from Schroder.*

When Mustard is calcined, it leaves very little Salt in the Ashes, because the Salt is volatile, and flies off in the Calcination.

We have given the Distillation of Mustard-Seed under the Article ALCALI. And must here remark from *Boerhaave*, that Mustard, and other acrid Vegetables, prove excellent Medicines, when prudently given in Distempers attended with an indolent, watery, or cold phlegmatic Humor, no way saline, where acid Humors are lodged in the first Passages; where the Bile is sluggish, and where no alkaline, fetid, or oily putrid Matter is lodged; but the Body remains cold, torpid, and swelled all over; as, on the other hand, they prove hurtful, where the Body is hot and feverish, the Bile sharp, the Juices putrid, the Parts inflamed or wasted; or where the putrid Scurvy abounds.

Oil of Mustard, by Expression, is prescribed with Success in the severest Fits of the Stone. But this Oil, by Expression, is more mild, and by no means like Oil of Mustard-Seed, which is procured by Distillation, and is extremely acrid and igneous.

2. Sinapi; Apii folio; siliqua hirsuta; semine albo, aut rufo. *Boerb. Ind. A. 2. 13. Tourn. Inst. 227. Sinapi album, Offic. Sinapi Apii folio, C. B. P. 99. Sinapi album, siliqua hirsuta, semine albo vel rufo, J. B. 2. 856. Raii Hist. 1. 802. Synop. 3. 295. WHITE MUSTARD.*

This Mustard seldom grows so tall as the former, but it is rather more branched; its Branches are fuller of Leaves, which are rough and hairy, and more divided than the former. The Flowers are larger, and of a deeper yellow Colour; the Seed-Vessels stand out farther from the Stalks, are very hairy, ending in a long empty Point, containing four or five white Seeds, which are larger than the common, and make the Seed-Vessels appear knotted. They are not quite so hot as the other. This grows wild in several Places, but not so frequently as the former, flowering about July.

This is much of the Nature of the common Mustard, and some prefer it before that to make their Sauce, because it is less bitter, and pleasanter to the Taste. *Miller's Bot. Off.*

3. Sinapi arvense; præcox; semine nigro, *Tourn. Inst. 227. Boerb. Ind. A. 2. 13. Rapistrum, Offic. Rapistrum arvenum, Ger. 179. Emac. 233. Park. Theat. 862. Raii Hist. 1. 802. Synop. 3. 295. Rapistrum flore luteo, J. B. 2. 844. C. B. P. 95. Eruca arvensis vulgaris, Rupp. Flor. Jen. 64. CHARLOCK.*

It is frequently found among the Corn, flowers in Summer, and the Seed is used. It is of a drying, deterfive, and somewhat digestive Quality, and provokes Urine. *Dale from J. Bauhin.*

4. Sinapi; Indicum; Lactuce folio, *Par. Bat. 230.*

5. Sinapi; Indicum; Lactuce folio; minus, seu angustifolius profundius crenato, *Par. Bat. 230.*

6. Sinapi; arvense; album; hyemale; folio Rapi; semine luteo.

7. Sinapi; Hispanicum; pusillum album, *T. 227.*

8. Sinapi; quod Sinapistrum; luteum; minus; folii quernis.

9. Sinapi; quod Sinapistrum; Siculum; siliquis Irionis.

10. Sinapi; arvense præcox; semine nigro; foliis integris, *T. 227. Rapistrum flore luteo, foliis non incis, C. B. P. 95.*

11. Sinapi; Siculum; luteum; minus; folio Rhapon-tici.

12. Sinapi; quod Sinapistrum; Syriacum; folio Irionis; altissimum.

13. Sinapi; Chinense; folio Acanthi.

14. Sinapi; Hispanicum; folio glaucii violacei. *Nasturtium sylvestre, Eruca affine. C. B. P. 105. Boerb. Ind. Alt. Plant.*

If Mustard-seed be eaten crude, the Vapour excited in the Mouth not only provokes Tears, but a Tumor, Itching and Sneezing. Externally it serves for the Sinapismus of the Ancients, which consisted in bruising the crude Seeds into a Poultrice, and applying it to the Part where an Exulceration was to be raised; but if this be often repeated, it causes a Gangrene. As to internal Uses, it is proper where an inert, aqueous, or phlegmatic Humor is predominant. I observed a surprising Effect of it on a Girl at *Amsterdam*, who labouring under Convulsions, after she had tried all manner of Remedies in vain, was, at last, by the Advice of *Ruyfch*, cured by the Use of crude Mustard bruised with Wine. What is commonly called *Mustard*, is a Sauce made of the bruised Seed, and is so named because in *Italy* they made it with *Must*, whence they called it *Mustum ardens*, and by Contraction *Mustard*. This Sauce, with Vinegar, is very serviceable in digesting Food, and would be very proper for our (*Dutch*) Sailors, because it is an excellent Preservative against the Scurvy. The Seeds are attenuating and incising; for which reason Mustard is always added as a proper Sauce to Meats dried and hardened in the Smoke. The Seeds are, also, of Service, whether used internally or externally, in hypochondriac Disorders, Inflations of the Stomach, Obstructions of the Spleen, and other Diseases proceeding from an Acid, of which Nature are the Scurvy, Cachexy, Chlorosis, and soporous Affections; they also stimulate to Veneries, and provoke Urine. The expressed Oil is externally applied in the Palsy and cold Diseases; the Seeds are also applied in a Quartan, and sometimes in a quotidian Fever.

There is a new Plant, which may be reckoned a fifteenth Species under the Name Sinapi; luteum; Chelidonii quernifolio. *Hist. Plant. ascript. Boerhaave.*

SINAPI ALBUM. A Name for the *Turritis; foliis inferioribus cichoraceis; ceteris Persiliata.*

SINAPI ECHINATUM. A Name for the *Eruca segetum.*

SINAPI MONSPESSULANUM. A Name for the *Sisymbrium; palustre; minus; siliqua aspera.*

SINAPISIS. Armenian Bole. *Rulandus.*

SINAPISMUS, *συναπισμός*. A Sinapism; that is, a Cataplasm of Mustard-Seed, applied with a View of exciting a Heat and Redness of the Skin.

SINAPISTRUM.

The Characters are;

The Leaves grow three or five on one Pedicle, and are digitated. The End of the Pedicle thickens into a Placentula, whence arises the Calyx, consisting of four small Leaves of the Colour of the Flower. The Flower is tetrapetalous, the four Petals being erected above, and six Stamina taking up the inferior void Part of the Flower. The Ovary grows out of the lower Part of the Placenta, three balsamic Spheres being seated at the upper Parts, is extended forwards, and becomes a cylindrical, bivalve, unilocular Pod, full of many roundish Seeds placed all in one Row.

Boerhaave mentions four Sorts of *Sinapistrum*, which are;

1. Sina-

1. Sinapistrum; Orientale; triphyllum; Ornithopodii filiquis. *T. Cor.* 17.

2. Sinapistrum; Indicum; pentaphyllum; flore carneo; minus; non spinosum. *H. L. Pentaphyllum; peregrinum; filiquosum; bivalve minus*, M. H. 2. 288. *Quinquifolium filiquosum*, *Alpin. Exot.* 322.

3. Sinapistrum; Lusitanicum; triphyllum; flore rubro; filiquis corniculatis. *H. L. Trifolium; Lusitanicum; bivalve; flore rubro*, M. H. 2. 289.

Sinapistrum; Indicum; triphyllum; filiqua maximâ; flore albo. *Boerb. Ind. Alt. Plant.*

This Plant was so called by *Herman*, as if it were a smaller Kind of *Sinapi*, because in Figure and Acrimony it is so very like the *Sinapi*, that it may be used in its stead. *Hist. Plant. ascript. Boerb.*

SINAPIUM. Mustard; that is, a Preparation of Mustard for culinary Uses, and such as is used in Food.

SINCIPUT. The anterior Part of the Head. See CAPUT.

SINE PARI. The *Vena sine pari* is the same as *Azygos*. The *Emplastrum sine pari*, the matchless Plaster, is the pompous Title of a Plaster described in the Old College Dispensatory, but left out of the last.

SINGULTUS. The Hiccup.

As Respiration consists of Inspiration and Expiration, so it may be injured with respect to either of these two. The Faults of Expiration are treated under the Article Tussis; but to the Disorders incident to Inspiration, belongs that by the *Greeks* called *αἰσχυρὸς*, or *αἰσχυρὸς*, and by us the *Hiccup*, which may be defined a Spasmodico-Convulsive, interrupted and uneasy Concussion of the Diaphragm, and some of the Parts affix'd to it, made in Inspiration, and accompanied with a sonorous Explosion of the Air thro' the Mouth.

In order the better to explain the Nature of this Disorder, we shall premise some Things concerning the Structure of the Parts which concur to its Production. The first, then, of these which occurs, is the Diaphragm, which in all its Circumference is muscular; has Fibres which run from the Center to the Periphery; is tendinous in its Center; divides the middle from the lowest Cavity of the Body, by its transverse, and at the same time somewhat oblique Situation, since it is higher before, and somewhat depressed towards the posterior Parts. Towards the Thorax it is convex, but towards the Abdomen concave. It is furnished with pretty large Nerves, partly from the vertebral Nerves of the Neck, and partly from the intercostal Branch and the Par Vagus. It has two Perforations, the Right of which, in a tendinous Circle, transmits the Vena Cava; the Left, in its muscular Part, transmits the Oesophagus and Par Vagus. The Diaphragm, also, adheres to various Parts; for on the anterior Part it adheres to the Ribs, Sternum and intercostal Muscles; in the middle Parts, by means of the Pleura surrounding its convex Surface, to the Mediastinum; to the Stomach, not only by the Nerves, and exterior Coat produced from the Peritonæum, common to them both, and surrounding the concave Part of the Diaphragm, but, also, by means of the left superior Mouth of the Stomach, by the *Greeks* called *αἰσχυρὸς*; to the Liver and its gibbous Surface, by the Ligamentum latum. And at the posterior Region, it is firmly fix'd to the Lumbar Vertebrae, by two musculous and tendinous Appendices.

In Consequence of this Connexion of these Parts, a Change of Place in one of them must be succeeded by the Motion of the others, as we are taught by Respiration in its natural State; for in the first Act of Respiration, which is Inspiration, the intercostal Muscles partly draw the Ribs upwards, and partly forwards; and partly the Fibres of the Diaphragm, which is muscular, contracting, and becoming short from the Center to the Periphery, the Diaphragm is chang'd from a convex to a more plain Figure. Immediately the adjacent Parts imitate this Motion, and the whole Abdomen is drawn upwards and forwards, the Stomach, in the mean time, being compressed by the Abbreviation of the Fibres of the Diaphragm. But all these Parts return to their former Situation, when in Expiration the Diaphragm resumes its convex Figure. Hence it follows, that when the Thorax and Abdomen are drawn upwards and forwards, and the Cavity of the Breast enlarged, then Inspiration is performed, and Expiration when the contrary happens.

Now to apply this Doctrine to the Hiccup; Though the Diagnostic of this Disorder is easy, yet from accurate Attention, we find its History to be as follows. The Breast is exagitated with a quick Impetus, accompanied with an acute Sound. Under this Exagitation, the Thorax and Abdomen are raised, the Cavity of the Breast becomes larger, the Speech of the Patient is intercepted; and the Pain is fre-

quently so great, that, according to *Delaus*, in *Encyclop. Medic. Lib. 3. Cap. 2.* the whole Body seems to be thrown into a Commotion, and the Ribs, as it were, broken. The Sound with which this Disorder is accompanied, is sometimes so great, as to resemble the Barking of a Dog, and be heard by Persons passing in the Streets, or living in the Neighbourhood, as we are informed by *Lazarus Riverius, Obs. 1. Thomas Bartholinus, Histor. Anat. rarior. Cent. 2. Histor. 4. and Vitus Riedlinus, in Obs. 31.*

These Circumstances, compared with the Phenomena of Inspiration, sufficiently inform us, that the Hiccup is a Disorder of that Part of Respiration, or at least happens under it. For as in natural Inspiration, a Motion of the intercostal Muscles is observed to precede; and a Constriction of the Diaphragm, and, at last, an Elevation of the Abdomen to follow; and all these are performed in a slow and gentle manner; so, on the contrary, in a Hiccup, as being a preternatural Inspiration, there is first observed a Constriction of the Diaphragm, and in consequence of the Consent, a Motion of the Parts affix'd ensues; but all these happen quickly, and with Violence. When the Diaphragm is thus suddenly exagitated, the Throat and Stomach must of Course be so too. Hence a Part of the Air taken in being lodged in the Gula, is with a violent Impetus forced upwards thro' the whole Oesophagus, and, at last, in the Palate, which is vaulted, forms that Noise commonly called the Hiccup. See *Langius in Pathol. Animat. Cap. 36.* At last the exagitated Diaphragm, when the Noise is discharged, is more or less slowly rendered convex; that is, its muscular Fibres are again lengthened. Hence arises Ease, and the convulsive Exagitation only returns by Intervals.

Since, therefore, the Hiccup is a very quick Convulsion of the Diaphragm, but remits and recurs at certain Intervals, it is to be distinguished from that spasmodic Distension which keeps the Diaphragm long rigid, and produces a perpetual Difficulty of Breathing. See *Caspar Hoffman, Inst. Med. Lib. 2. Cap. 86. Sect. 6.* and *Galen de Sympt. Lib. 2. Cap. 2.* The last mentioned of these Disorders is observed to approach to a convulsive Colic, or to violent hysteric Paroxysms, but is not accompanied with that Noise familiar to those afflicted with the Hiccup.

It is, also, to be observed, that there is a great Difference between a chronical and an acute Hiccup; since the latter is observed to accompany acute Disorders, such as continual, malignant, exanthematous and pestilential Fevers, and Inflammations of the more noble Viscera. This Species of the Disorder is not only of a short, but also of a dubious Termination. A chronical Hiccup, on the contrary, generally accompanies long protracted Disorders, such as those of the hysteric and cachectic Kind; a bad State of the Primæ Viæ, or a bad Conformation of the Parts subservient to Respiration. And this Species of the Disorder may remain for several Days, Weeks, Months, or even Years. Thus *Bartholine, in Cent. 3. Epist. 61.* gives us an Account of a Woman, who for two Years laboured under so violent an Hiccup, that she seemed to be possessed by a Devil. And in *Cent. 2. Hist. 4.* he mentions an Hiccup which lasted for four Years. Other Authors give other Instances of the same Kind; a large Number of which are found in *Marcellus Donatus, Lib. 4. Hist. Med. Cap. 5.* and *Schenckius, in Obs. Lib. 3.*

Physicians entertain various Opinions with respect to the Seat of the Hiccup. The Ancients, and among the rest, *Hippocrates, in Aph. 36. Sect. 6.* accused the Stomach alone, and affirmed that the Hiccup was a violent Commotion of it, by which it endeavoured to expel something offensive to it. But left by this means they should confound it with a Vomiting or Eructation, they asserted, that by an Hiccup those Things which were lodged in the superior Orifice of the Stomach, were exagitated; whereas, in a Vomiting, the Substances in the Bottom of the Stomach were thrown into a Commotion. See *Forestus, Obs. 12. Lib. 18.* Others, the most considerable of whom is *Felix Platerus, in Lib. 2. de Funct. Læsson. Cap. 5.* have placed the Seat of the Hiccup in the Diaphragm alone, when they saw that the former Opinion would not account for all the Phenomena of the Disorder. Others steering, as it were, a middle Course, affirm that the superior Mouth of the Stomach is primarily affected, but that by Consent the Diaphragm is always exagitated. The most considerable Abettor of this Opinion is *Delaus, in Encyclop. Med. L. 3. Cap. 2.*

But, in my Opinion the principal Seat and Organ of this Disorder is the Diaphragm; for without the Assistance of this transverse Muscle there could be no Inspiration; a preternatural Effect of which the Hiccup is: for since the superior Mouth of the Stomach firmly adheres to the Diaphragm,

phragm, that, as well as the Oesophagus, must necessarily be affected in this Disorder. Hence appears the Reason of dividing Hiccups into those of the idiopathic and those of the sympathetic Kind; the former of which is, when the immediate Cause of the Disorder is lodged in the Diaphragm itself; and the latter when the Cause resides in the Stomach, whose Vellication is propagated to the Diaphragm.

The immediate Cause of the Hiccup, is an Irritation or Stimulation, either of the Diaphragm or Stomach, and a convulsive Exagitation of the Parts induced by that means. For this Reason, the weaker the nervous System is, the more readily any Person is seized with this Disorder. Hence Infants, Children, and old Persons, are more subject to the Hiccup than others; so that they easily fall into that transitory Species of the Disorder which we do not here treat of, and which is produced either by a Refrigeration of the Stomach, greedy Drinking, drinking excessively cold Liquors, or Laughter. But the more secondary and remote Causes which concur to promote a morbid Hiccup, which requires the Physician's Aid, easily exert their Influence on such Patients, and are these following.

This Disorder, then, is very readily produced by a cold and moist Air, especially when the Patient is hot. Those who, contrary to their Custom, walk with their Breasts bare, or only slightly covered, or who walk upon cold Floors with their Feet bare, the more tender they are the more readily they are seized with an Hiccup. And Infants whose Fontanels continue to beat, and are not yet closed, are very frequently seized with this Disorder. *Carolus Raygerus*, in *M. N. C. Dec. 1. Anno. 6. Obs. 211.* gives us an Account of an Hiccup which lasted for three Days, and was produced by staying too long in the Water. But *Riverius*, in *Cent. 3. Obs. 42.* furnishes us with a still more memorable Case of a certain Girl, who was violently afflicted with the Hiccup during the Winter, but was freed from it every Summer.

Aliments either of a bad Quality, or used in too large a Quantity, produce an Hiccup. Voracious Eating alone, in which one Mouthful or one Draught immediately follows another, and remains in the superior Orifice of the Stomach, by vellicating it, produces an Hiccup, though of a slight Kind. Thus *Forestus*, in *Lib. 18. Obs. 12.* informs us, that an Hiccup was produced by a Piece of an Oxes Lungs remaining in the Oesophagus. Aliments, also, which by their too great Quantity load the Stomach, produce the same Misfortune, as is obvious in voracious and glutinous Children. And *Epiphanius Ferdinandus*, in *Hist. Med. 43.* informs us, that Bread alone eaten too greedily and in too large a Quantity produces an Hiccup. Liquors drank in too large a Quantity, especially if the Person is exposed to cold, or if the Liquors themselves are too cold, produce a Cough, as we find from Experience, among those Topers, who remain with their Breasts bare when drinking; and among sucking Children, if cold Malt Liquors are exhibited to them. *Timaeus a Guldenkleee*, *Lib. 3. Cas. 5.* gives us an Instance of an Hiccup produced in a Man, who being pretty hot, drank a large Quantity of cold Water with Nitre. And *Riverius*, in his *Treatise de Morb. infrequent. Obs. 1.* informs us, that a violent Hiccup of half a Years Continuance was produced by a Draught of cold Water.

Whatever Aliments are either too acrid of themselves, or from various Causes degenerate within the Stomach into an acrid and viscid Sordes, capable of vellicating its Coats, produce a more or less violent Hiccup. Every one knows, that Milk and its Preparations becoming corrupted in the Stomachs of Children, produce the Hiccup; a fatal Instance of which is alledged by *Bartholine*, in *Act. Med. Hassn. Vol. 2. Obs. 28.* The same holds true, with respect to acrid and caustic Substances, or such as are absolutely poisonous. *Guldenkleee*, in *Lib. 7. Cas. 4.* mentions an Hiccup produced by eating Hemlock. The same Author, in *Cas. 7.* gives us an Instance of one produced by Euphorbium. *Gatinarias*, de *Cognit. & Curat. Aegrit.* gives us Instances of its being produced by Onions, Garlick and Ginger. *Barbette*, in his *Prax. Med. Lib. 4. Cap. 2.* informs us, that he knew an Hiccup produced, by taking Oil of Vitriol instead of Balsam of Sulphur. And *Schenckius*, in *Lib. 3.* tells us, that Hiccups are produced by the too liberal Use of refrigerating and acid Julaps in acute Disorders. Among the Things capable of exciting this Disorder, we may, also, reckon drastic Vomits and Purges, especially those prepared with Hellebore, which, by corroding, stimulating, and inflaming the Stomach and Intestines, dispose to an Hiccup.

Acrid and corrupted Humours, impregnated with many saline Parts, and acting on the Diaphragm, excite the quickest and generally fatal Exagitations of it. I knew a Man, who being for thirteen Days afflicted with a violent Hiccup, at last died; and upon opening his Body, some Ounces of extravasated acrid Serum were found in his Thorax. To this Species,

also, belongs that kind of Hiccup which is produced by the Translocation of an arthritic or gouty Matter to the Diaphragm. An Instance of this Kind arising from repelled arthritic Pains is mentioned by *Georg. Hieron Velschius*, in *Hecat. 2. Obs. 54.* Hiccups are, also, produced when Diarrhaes or Dysenteries are check'd in the Beginning, or suppressed by means of Opiates, or other Astringents, as is observed in *Hoffman's Notes, ad Pater. Cent. 2. Cap. 47.* A repelled Erysipelas, or in old and weak Habits, one not sufficiently expelled, is frequently accompanied with an Hiccup. All these Effects depend on an acrid, and, as it were, caustic Matter insinuating itself into the nervous Parts of the Diaphragm, or the superior Orifice of the Stomach.

An acute Hiccup is the Concomitant of such Disorders as have a quick and speedy Termination, of which the most considerable are Inflammations of the more noble Viscera. Thus an Hiccup succeeds Wounds or Inflammations of the Diaphragm; as appears in a Paraphrenitis; as, also, Wounds or Inflammations of the Stomach or Intestines, according to *Forestus*, in *Lib. 18. Obs. 12.* Hiccups, also, succeed Phlegmons of the Liver; according to *Celsus*, *Lib. 2. Cap. 7.* and *Barbette*, *Prax. Med. Lib. 4. Cap. 2.* And the pathognomic Sign of this Disorder, is a Pain ascending to the Throat. Inflammations, and violent Wounds of the Brain and Meninges, by reason of the Consent these Parts have, by means of the Par Vagus, with the Stomach and Diaphragm, also, produce Hiccups in a violent Degree. See *Hippocrates*, *Secl. 7. Aph. 3.* and *Heurnius*, in his Comment upon the same Aphorism.

An Hiccup generally accompanies continual, malignant, and exanthematous Fevers, when various remote Causes concur to its Production; for an Hiccup is either produced by a concomitant Inflammation, which, according to *Diemerbroeck*, *Cap. 13. Secl. 5.* and *Cap. 15. Annotat. 15.* principally happens in the pestilential Fever, from a Carbuncle on the Diaphragm or Stomach; or if the due Progress of Fevers is preposterously disturbed by Anodynes and Opiates, an Hiccup succeeds; a memorable Instance of which we have in *Riverius*, *Cent. 3. Obs. 17.* Hiccups, also, succeed the Repression of Sweats, and the Stopping or Repulsion of exanthematous Disorders; or Hiccups accompany an acrid Sordes of the Stomach; an Instance of which, in that Species of Fever called *Hemitritaea*, *Forestus* gives us in *Lib. 5. Obs. 15.* In these Cases, dangerous Symptoms appear, such as insatiable Thirst, considerable Weakness, Watchings, Deliriums, an unextinguishable Heat, a tremulous Motion of the inferior Jaw-Bone, Convulsions of the Nerves, Interception of the Voice, and a Thinness of the Urine; On the contrary, if the Hiccup happens about the critical Days, and the other Signs, especially that of Coction in the Urine, are good, it portends no Ill, but prognosticates a critical Vomiting or a Flux, after which it ceases. These acute Fevers are, also, sometimes attended with an Hiccup, which remains with them, and is augmented through the whole of the Fever. An Instance of which we have in *M. N. C. Ann. 4. Obs. 48.* Of this Kind, also, is the memorable Case related by *Peterius*, in *Cent. 2. Cap. 47.*

To the acute Hiccups of a dubious Event, we must, also, refer those which, according to the Ancients, succeed Inanition, or too large an Excretion of the Humors. That excessive Vomiting or Purging are accompanied with an Hiccup, is confirmed not only by Experience, but also by *Hippocrates*, in *Secl. 7. Aph. 3.* and *41.* and *Secl. 5. Aph. 41.* and by *Sydenham*. Hiccups, also, succeed violent Haemorrhages, whether natural from the Uterus, or from the Nostrils, or by a Spitting of Blood, or produced by violent Wounds, as *Hippocrates*, in *Secl. 5. Aph. 3.* informs us. In these Cases, the Hiccup, generally, as the last Efforts of Nature, precedes universal Convulsions and Death.

A chronical Hiccup sometimes arises from a peccant State of the Blood and Humors; when, for instance, these are either impregnated with any Acrimony, or in Consequence of a Retention of the usual Excretions, too copiously congested in the Vessels of the Diaphragm and Stomach. Hence the Hiccup is very familiar to pregnant Women during the last Months of their Gestation; as also to hysterical Women, whose Menfes do not flow duly. Thus *Schurigius*, in *Parthenol.* gives us an Account of a Woman who, before the Eruption of her Menfes, was always afflicted with an Hiccup, which ceased as soon as these began to flow. Chronical, as well as periodic Hiccups, generally afflict cachectic Patients, and such as labour under Indispositions of the Liver; in which Cases, the Cause is to be sought for in the Bile become acrid and vellicating the nervous Coats of the Stomach and Duodenum. Hence *Lentilius*, in *Jatrom.* mentions an Hiccup, which in a cachectic Patient lasted till a Vomiting ensued.

The Faults of the bony Parts surrounding the Breast, and a bad Conformation, sometimes contribute to the Production of

of a chronical Hiccup. Thus, if the Cartilage Eniformis is relaxed, or by any other Cause bended too much inwards, so as to stimulate the Stomach, it is forthwith observed to produce an Hiccup. Accordingly, *Fernelius* in *Lib. 6. de Part. Morb. and Symp. Cap. 3.* mentions an Hiccup produced by a Depression of this Cartilage, which lasted for three Months. 'Tis, also, certain from Experience, that Hiccups are produced by Luxations, Fractures, and Contorsions of the Ribs; hence *Fernelius*, in the Part last quoted, gives us an Instance of an Hiccup arising from a luxated Rib, which ceas'd immediately upon the Reduction: And *Rhodius*, in *Centur. 2. Obs. 61.* makes mention of a continual Hiccup arising from a Compression of the twelfth Vertebra of the Neck.

As for the Prognostic of an Hiccup, that Species produced by Viscidities, Crudities, or an Acrimony of the Primæ Viæ; is by no Means dangerous, nor is that familiar to hysterical Women much to be dreaded. Much less is an Hiccup dangerous, when it proceeds from Refrigeration, or drinking cold Liquors, provided too large a Quantity of them is not drank when the Body is covered with a Sweat. Hiccups are frequent in sucking Children, in whom it prognosticates no Harm, but is more inauspicious in old Persons. I know a Gentlewoman of forty Years of Age, who for twenty Years has been daily afflicted with an Hiccup, without any apparent Disadvantage to her Health. But an Hiccup is more dangerous, when it happens in acute Fevers, especially those of the burning and pestilential Kind; and if a Delirium, or Convulsions are brought on, it proves mortal. An Hiccup which principally arises from an Inflammation of the Liver, is generally mortal; nor is that Species of Hiccup to be less dreaded, which is produced by acrid Purgatives, Emetics and Poisons. All Hiccups succeeding Inanition, Purging, or liberal Vomiting, are bad; but still worse, when coming after Hemorrhages and Wounds of the Head. Hiccups produced by stopping Diarrhæas, or Dysenteries, or repelling erysipelatous, gouty or arthritic Disorders, are not free from Danger. As the Hiccups attending the Fevers of old Persons labouring under Hernias scarcely admit of a Cure, they generally prove mortal, according to *Forestus* in *Lib. 18. Cap. 12.* Sneezing join'd to an Hiccup, especially that which arises from Repletion, is beneficial, and prognosticates that it will cease.

Every Hiccup does not require a Cure; for that gentle Species which arises from a long protracted Inspiration, or any Distraction of Mind, is easily terminated by exciting Pain in any Part of the Body, by thinking carefully upon any Object, or by Terror unexpectedly rais'd. But a morbid Hiccup, not yielding to these Means, calls for the Assistance of the Physician, who is principally to follow three Intentions of Cure: The first of these is, to mitigate and allay the preternatural, spasmodic, and convulsive Motions: The second is, to remove the material Causes: And the third is, to restore the Parts affected and weakened.

In order to answer the first of these Intentions, the Ancients us'd Opium, and the Medicines prepar'd of it, such as the Laudanum Opiatum, Mithridate, Philonium, Dia-scordium, and the Theriaca, by which, they affirm, that they cur'd the Hiccup. But I prefer gentler, antispasmodic and anodyne Substances; such as Amber, Cinnabar, Saffron and Castor; which last is so highly extoll'd by some Authors, that *Alexander Trallian*, in *Lib. 7.* seems persuaded, that an Hiccup may be cur'd by its Means, us'd in the Form of an Amulet. From a long Series of Experience, I prefer in this Disorder the anodyne Liquor, to all other Medicines, and exhibit it, either alone, or in Conjunction with Tincture of Castor. Nor is the Spiritus Nitri Dulcis less efficacious; provided it is mixed with a small Dose of the Balsam of Life. An Ounce, or half an Ounce of the Oil of Sweet Almonds mix'd with a few Drops of the distilled Oil of Dill, is by some thought a Specific for the Hiccup.

But the Physician is, in a particular Manner, to pursue the second Intention, which is, to remove the material Causes. When, therefore, any Sordes lodg'd in the Stomach, by stimulating its superior Orifice, produces an Hiccup, this Sordes is to be corrected, and gently eliminated. If it is of an acrid and bilious Quality, Absorbents impregnated with Citron Juice, or the precipitating Powders, are to be exhibited in cold Water. A viscid Sordes, obstinately fixed in the Foldings of the Stomach, is to be treated with digestive Salts, especially with the Liquor of the Terra Foliatæ Tartari, and such Roots as are at once of a resolvent and corroborative Quality; such as the Roots of Swallow-wort, which has something of an anodyne Nature in it, and those of the Calamus Aromaticus. The peccant Matter, when duly concocted, is to be eliminated either by Vomit or Stool; the former of these Intentions is answer'd by the Root of *Ipecacuanza*, or, which is best of all, by four or six Grains

of the Powder of Squills, mix'd with three Grains of purified Nitre. The Body is render'd soluble by Preparations of Manna and Rhubarb, by the Pilulæ Aloephanganæ, the Pilulæ Macrocoftinæ, or the Pilulæ de Succino Gratonis prepar'd with a large Quantity of Amber. With these Pills may be commodiously mix'd a few Grains of the Pilulæ de Sytracæ, or of the Pilulæ de Cynoglossæ, by which Means they answer a double Intention. In this Case, also, gently carminative Clysters are sufficiently safe, especially in Infants, whose Hiccup is produced by corrupted Milk, in which Case, Sulphur of Antimony duly corrected, or Aurum Fulminans well prepared, and exhibited in a small Dose, are, also, of singular Service.

If an Hiccup arises from a Suppression of Perspiration by Cold, or any other Cause, the Physician ought principally to attempt the recalling of this Evacuation, besides being kept temperately warm; this Intention is answer'd by Fomentations of the Parts affected, liberal Draughts of warm Liquors, and Infusions of resolvent and corroborating Roots and Herbs, in which it will be expedient to exhibit a proper Quantity of the bezoardic Powders prepar'd of Amber, calcin'd Hartshorn, Diaphoretic Antimony, Cinnabar, and a small Quantity of the Extracts of Saffron and Castor. In this Case, the Spiritus Bezoardicus Buffi, mix'd with the anodyne mineral Liquor, and the Essence of Castor, is an excellent Medicine. When in acute and exanthematous Fevers an Hiccup arises from a Suppression of Transpiration, besides a proper Regimen, Frictions and fix'd Diaphoretics are most properly us'd. In a chronical Hiccup arising from a Refrigeration, and of an obstinate Nature, drinking the Hippocratic Wine affords Relief: Besides this, hot Baths are of singular Efficacy, since they not only recall a Diaphoresis, but, also, soften the spasmodically constricted Parts, which *Riverius* in *Obs. Infrequent.* evinces by an Example.

The same Method of Cure is to be observ'd in an Hiccup arising from an erysipelatous, arthritic, or gouty Matter repell'd, or not sufficiently expell'd: For in this Case, besides the Diaphoresis to be obtain'd by the already mention'd Medicines, it is expedient to recal the acrid and peccant Matter from the phrenic Nerves to its former Seat. For answering this Intention, mild Laxatives and Clysters are of singular Efficacy; Sinapisms, also, and Vesicatories applied to the Scapulæ, or Calls of the Legs, afford great Relief, by drawing off the acrid Serum. When a Gout is receding, it is of singular Service frequently to bathe the Feet in warm Baths: For this Reason *Trallian* in *Lib. 7.* and *Riverius* in *Prax.* highly commend the Immersion of the Hands in warm Water.

When by the Exhibition of an Emetic, a Purge, a caustic Medicine, or a Poison, an Hiccup is excited, such Things are to be us'd as destroy and enervate the Force of the Poison, among which none are more valuable and efficacious than pinguious Substances, Oil of Sweet Almonds, Oil of Olives, mucilaginous Substances, Milk and Cream exhibited seasonably, and before the Inflammation has seiz'd the Part; thus the Poison being sheath'd up, its irregular Motion is to be check'd by the above-mentioned Anodynes. But if the Hiccup proceeds from a Poison received by Contagion, as in the Plague, from the Bite of a mad Dog, or the Sting of any Insect boiling with Rage, then theriacal Medicines, Treacle-Water, and the Theriaca Celestis, in Conjunction with nitrous, antispasmodic and diaphoretic Substances, and Camphire and Cinnabar, afford the greatest Relief. This Method of Cure is, also, to be observ'd, when the Hiccup arises from a malignant, caustic, or exanthematous Matter repell'd from the Surface of the Body to the internal Parts; in which Case, a Powder consisting of a few Grains of Camphire and Nitre, as, also, Emulsions of sweet Almonds, and the four greater cold Seeds prepar'd with the diaphoretic Waters, afford surprizing Relief.

Hiccups arising from violent Hemorrhages, are hardly to be remov'd, till the Effusions of Blood whence they proceed are stopp'd. Now, violent Hemorrhages are to be check'd by internal, temperating, tonic and astringent Medicines, and by external Means; such as proper Applications to the Part affected. When the Effusion is stopp'd, we are to use safe Anodynes, in Conjunction with efficacious Anæsthetics. And, lastly, the Patient is to be supported by Cordials and restorative Aliments.

Nor for the Cure of an Hiccup are we to despise corroborating Medicines, especially in the Decline of the Disease; of these the most considerable are the corroborating Oils, such as those of Mace, Mint, and Worm-wood, mix'd with a few Drops of my Balsam of Life, and exhibited in some of the spirituous Waters, such as those of Cinnamon, Mint, and Baurin, or aromatic Aqua Vitæ, as, also, the carminative Essence of Wedelius, the carminative Water of *Dornrellius*, or a Draught of generous Wine. The Medicines in an Hic-

arising from a Retention of Flatulences, and a Vellication of the Stomach produced by them, answer both Intentions of Cure, when join'd with carminative Clysters. Among Topics, considerable Relief seems to be promis'd by applying to the Præcordia, antispasmodic, pargoric and anodyne Liniments prepared of express'd Oil of Nutmeg, human Fat, the Oils of Mace, Mint and Worm-wood, Saffron, Castor and Camphire. Nervine Cerates, and Plaisters applied to the Pit of the Stomach, as, also, Contrictions of the Parts affected by proper Bandages, seem not to be entirely useless.

An Hiccup arising from an Acrimony or Viscidity of the Stomach, is often cured by the copious drinking of warm Fluids, which sheath up the Acrimony, dilute the Viscidity, and remove the Cause of the Stimulus. But all cold Liquors render the Disorder worse.

An Hiccup succeeding a Diarrhæa, or Dysentery, unseasonably check'd, is of a dangerous Nature; for which Reason, the Means of Relief ought to be speedily us'd. In this Case, therefore, the safest and most efficacious Remedies are, Clysters prepared of emollient and gently laxative Substances, such as the Pulp of Cassia, with an Addition of Extract of Rhubarb frequently injected: But it is not expedient to exhibit Laxatives by the Mouth, for it is rather proper to correct the bilious and acrid Humours, which may be done by the Magnesia Alba, and other Absorbents, but especially by drinking sweet Whey; then we may, also, join internal Anodynes, and external Pargorics.

The Hiccup attending acute Fevers is cur'd by curing the primary Disorder, which is accomplish'd by an equable Promotion of a Diaphoresis. In this Case, we are to take great Care not to exhibit saline, much less laxative Medicines, aloetic Pills, too hot a Regimen, or very warm Drink; for as Cold, so, also, excessive Heat is unfriendly to the nervous Parts, especially if they labour under any Disorder.

For the like Reason we are to guard against the same Practice in Hiccups arising from an Inflammation of the Viscera, in which Case we must, with all Expedition, open a Vein in the Foot; if the Inflammation is as yet recent, and the Patient plethoric, then we must exhibit internally, Discutients, and other Medicines, which promote Sweat and resolve the stagnant Juices; to which, if the Pain is intense, we may add gentle Anodynes; but, particularly, the Body is to be always kept soluble by injecting Clysters; externally, Preparations of Camphire and Saffron, and discutient Bags are to be applied, the Physician at the same Time taking Care of his Reputation by a prudent Prognostic.

Hiccups seizing cachetic Persons, or those labouring under Disorders of the Liver, are cur'd by such Medicines as correct acrid Bile; that is, by resolvent, attenuating, bitter, and evacuating Infusions; and if these should prove ineffectual, nothing is more powerful and efficacious than hot Baths and mineral Waters. A memorable Instance of this is recorded in *Boet. Med. Sept. Lib. 5. Sect. 5. Obs. 6.*

An Hiccup which accompanies hypocondriac Disorders, and is generally owing to a Suppression of the natural Excretions of Blood, is not to be cur'd till the primary Disorder is remov'd. In this Case, if all other Means prove ineffectual, the hot Baths, especially the *Caroline Springs*, using at the same Time those of *Tœplitz*, are of Use for corroborating the Parts. In scorbutic Patients, an Hiccup is most properly cur'd by Asses Milk mixed with the *Selteran Waters* warm'd. This Method is commended by *Paulini* in *Onograph. Cur. Sect. 4. Cap. 3. Par. 1.*

If fractured, distorted, or luxated Ribs produce an Hiccup, the Reduction of the Luxation, and the Consolidation of the Fracture by proper chirurgical Measures, are only capable of affording Relief. The *Cartilago Ensiformis*, when luxated and bended inwards, is most properly cur'd by blind Cupping Glasses applied to the Pit of the Stomach. This Practice is greatly extoll'd by *Vitus Riedlinus Lin. Med. Anno 1695. Mens. Aug. Obs. 4.*

Anodynes must be cautiously us'd in checking Hiccups: If the peccant Matter is large in Quantity, it is above all Things to be corrected and eliminated; especially if it is of an acrid, caustic, or virulent Quality; for Anodynes, before this Matter is discharg'd, would be only adding Fuel to the Flame. As in all Disorders where an anodyne and soothing Quality is requisite, so more especially in spasmodico-convulsive Disorders of all Kinds, Opiates are rarely to be exhibited alone; but when mix'd with proper Evacuants, they are highly safe and efficacious: And this Secret of checking the Force of Opium is of an old Date, as is obvious from that celebrated Medicine of *Asclepiades*, mentioned by *Galen* in *Lib. 8. de Compos. Medicam. Cap. 3.* *Avicenna Lib. 4. Fen. 13. Tr. 5. C. 19.* and which consists of Costus, Saffron, Spikenard, Asarum, Mastich, Aloes,

and Opium. In Imitation of this Medicine are made the *Pilulæ Rondeletii*, the *Pilulæ Poterii*, the *Pilulæ Platerii*, the *Pilulæ Riverii*, the *Pilulæ Wildegansii*, the *Pilulæ Starkii*, and the *Pilulæ Anglicanæ*. In Asthmas, Chincoughs, Hiccups, and other painful and spasmodic Disorders, I with great Advantage use to mix the *Pilulæ Aloephanginæ*, or my *Pilulæ Polychrestæ*, with two or three Parts of the *Pilulæ de Stryace*, or de *Cynoglossio*.

An Hiccup arising from a slight Cause is often happily stopt, without the Use of Medicines: When, for Instance, under a voluntary Motion of the Thorax, made on purpose, the Diaphragm is so press'd, that its moving Fibres are either more stretch'd or relax'd; the former is done by strong Inspiration, by Running, Jumping, or violent Riding; and the latter by strong Expiration, Vociferation, or by tying the Thorax with a Bandage, which is a simple, and often an instantaneous Remedy. Of the same Kind is Sternutation, which as (according to *Hippocrates*) it removes an Hiccup when spontaneous, so the Physician ought artfully to promote it for the same Purpose; and especially when either a viscid or flatulent Matter is lodged in the Coats or Corrugations of the Stomach, Sneezing is to be excited, in order to remove it by violent Expiration, during which the abdominal Viscera, and especially the Stomach, are strongly exagitated. But an artificial Sternutation is by no means to be produced, when an Inflammation, or a subtle Caustic and virulent Matter have deeply insinuated themselves into the nervous Parts.

As for Prevention, a due Use of the Non-naturals, and especially the avoiding a cold Air, is of great Importance. Those whose Solids are weakened by long Diseases, must preserve themselves against an Hiccup by the prudent Use of chalybeate Baths, and chalybeate Medicines, drinking at the same Time proper Liquors, and using due Exercise. *Frederic Hoffman*,

The Hiccup generally happens to the Aged after an immoderate Looseness, but principally after excessive Vomiting, and frequently prognosticates imminent Death. I ingenuously own, that I have not been able to satisfy myself in my Enquiry into the Cause of this Symptom; but I have frequently observed it to arise from some Disturbance raised in the Stomach, and adjacent Parts, by violent Medicines; not without great Danger to the Patient, because Nature is unable to check and quiet this Commotion; and on this Account, I judg'd it proper to assist her by Art, by giving a large Dose, of no less than two Drams of *Dioscoridium*, which seldom failed to remove this Symptom; when the Seeds of *Dill*, and other celebrated Specifics had proved ineffectual. *Sydenham*.

The famous *Jalapum Meschatum* of *Fuller*, so much recommended as a Remedy for the Hiccup, is thus prepar'd.

Take of Damask Rose-water, six Ounces; of the Waters of Orange-flowers, one Ounce; of Barley Cinnamon-water, two Ounces; of Compound Piony-water, one Ounce and an half; of Musk and Ambergrease, triturated with one Grain of Salt of Hartshorn, each two Grains; of Saffron, cut and tied in a Bag, one Scruple; of the Oil of Cloves, one Drop; of the Confection of Alchermes, two Drams; and of the Syrup of Cloves, an Ounce and an half.

This Medicine is a temperate, but powerful Cordial, and highly beneficial in malignant Fevers, which convey deleterious Vapours to the Stomach, irritate the languid Spirits, produce Spasms, and an Hiccup. But notwithstanding its almost divine Energy, I have not always found it sufficient for subduing this last-mentioned Symptom. The Dose is five Spoonfuls every three Hours. *Fuller's Pharmacop.*

PRESAGES FROM HICCUPS.

The Event of a Disease may be prognosticated from a Hiccup, though, indeed, it comes under the general Notion of Convulsions, being a Kind of Convulsion of the Stomach, as we are taught by *Galen* in his Comment on 5 *Apb. 3.* And the same Author, in his Comment on the Book of *Hippocrates de Rat. Viâ. in Morb. Acut.* calls the Hiccup a convulsive Motion; and more expressly to the Purpose in his Commentary on the sixth Book of the *Aphorisms*, he tells us, "That though we may be allow'd to call a Hiccup a Convulsion of the Stomach, when we would describe its Nature, it would, perhaps, be better not to call it by that Name, but rather a Motion of the same Kind as Vomiting, only more, intense and violent: For the Stomach, while it labours to expel its Contents, is excited to two Kinds of Motions, the most violent of which is a Hiccup; the other is Vomiting, in which latter it endeavour

endeavours to expel what is contained in the wide and open Capacity of the Stomach, but in the Hiccup only what molests the Mouth of that Part." Hence it appears, that an Hiccup is an expulsive Motion of the Stomach, endeavouring to discharge itself of some offensive Matter. We may then very properly call a Hiccup a Convulsion of the Stomach, but of such a Kind of Motion as is observed in epileptic Patients, whose Brain is injured, or rather with *Galen Com. in Lib. de R. V. J. A.* a Sort of convulsive Motion. These Motions, according to *Hippocrates*, 6 *Aph.* 39. are excited either by a Repletion or Inanition of the nervous Parts, and particularly, of the Mouth of the Stomach. A Repletion happens from an Excess in Eating or Drinking, from a Redundance of Humours, a Phlegmon, or Flatulences. A Dryness or Inanition, is caused by a burning Heat, all immoderate Evacuations, Purgations, Watchings, Fastings, and the like. That a Hiccup is excited by the same Cause as a true Convulsion, we may infer from *Hippocrates*, where he speaks of a true Convulsion of the Stomach, proceeding from one or other of these Causes. A Hiccup often happens from a biting Sensation in the Mouth of the Stomach, which excites Motions that many justly enough call convulsive, and is occasioned by all such Things as either oppress the Stomach by their Redundance, or injure it by some offensive Quality. For when the Stomach is loaded with a Redundance of Humours, or Foods of bad Juices, or is vellicated by some acrimonious Matter, or distended with Flatulences, or irritated by Heat or Cold, or any other Quality, or suffers through Dryness, or is agitated in a Manner not unlike Convulsions, it endeavours to expel what offends it. To this Purpose we find *Galen* expressing himself, *Lib. 8. de Comp. Med. Cap. 8.* "Thus, he says, a Hiccup sometimes happens either from a Coldness or Repletion of the Stomach, or from a Vellication of acrimonious Humors, or such as are endued with some medicinal Quality." And a little after, "a Hiccup may be occasioned by some acrimonious or serous Humours, or some Medicine vellicating the Stomach, which being expelled by Vomiting, the Hiccup immediately ceases." Marty after taking the Medicine composed of the three Species of Pepper, and drinking Wine immediately upon it, are molested with a Hiccup, of which Number I myself am one; and every Body knows that some Persons are subject to be taken with a Hiccup after Foods of a stimulating Quality, which, upon vomiting, immediately ceases; sometimes a Hiccup is occasioned by a Rigor of the Mouth of the Stomach. Children are very subject to the Hiccup, from a Corruption of the Aliment in the Stomach, and from a Coldness of the Part. Hiccups in Fevers are sometimes occasioned by a dangerous Inflammation of the Stomach, Brain, small Intestine, or Liver, from a Compression of the Mouth of the Stomach, from a Tumefaction of the concave Part of the Liver, a Communication of the burning Heat of that Part, or the Flux of an acrimonious Humour from the inflamed Part upon the Mouth of the Stomach and vellicating it, or some acrid Exhalation irritating the same. But let this suffice for the Causes of a Hiccup and let us now consider the Prognostics which may be drawn from it.

A Hiccup then is only not to be dreaded, when it happens without a Fever, or any other Disease, and is occasioned by Wine, or Foods, or even by some acrimonious, cold, hot, or corrupted cold or hot Humour. In Fevers they are always dangerous, as well as Convulsions, and most of all when succeeded by a Fever. Some Fevers are called Singultuous, because the Patient is almost continually molested with the Hiccup, which increases and remits with the Fever, which, for that Reason, is called by the Greeks *σινγυλτικός*, *Lingodis* [from *σινγυλ*, the Hiccup]; mentioned by *Hippocrates*, *de R. V. J. A.* And *Galen*, in his Comment thereon tells us, that a Fever takes the Name of Singultuous from the Hiccup, which continually attends it, and is exasperated, together with the Disease, through the whole Stage of the Disorder; but Hiccups are most to be dreaded when they proceed from an Inflammation of the Stomach, small Intestine, or Liver. *Celsus* tells us, that a frequent Hiccup indicates an Inflammation of the Liver; a Hiccup, however, does not simply proceed from an Inflammation of the Liver, but from an extraordinary Inflammation of that Part, as *Galen* observes, in his Comment on 5 *Aph.* 3. tho' *Hippocrates*, in that Aphorism, says absolutely, "That the Hiccup succeeds an Inflammation of the Liver." The Hiccup then, under an Inflammation of the Liver, is generally mortal, and the same is true of an Inflammation of the Brain or Stomach, and especially when it comes after vomiting, to which Purpose *Hippocrates*, 7 *Aph.* 3. says, that after Vomiting, the Hiccup and Redness of the Eyes are bad Signs. *Galen* says of the Hiccup, that it is the same Disorder with respect to the Stomach, that a Convulsion is to

the Muscles, and that sometimes it affects the whole Stomach, sometimes its Mouth, and the Oesophagus, which are molested with Humours; and if these can be discharged by Vomiting, the Patient is immediately freed from the Hiccup; but if this has no Effect, it shews either that the Brain, the Original of the Nerves, or the Stomach, labour under a considerable Inflammation. A Hiccup, therefore, which comes after vomiting, is generally pernicious, and most of all in the Iliac Passion, according to that of *Hippocrates*, 7 *Aph.* 10. "The Ileus, succeeded by Vomiting, Hiccup, or Convulsion, is of bad Prognostication." And *Galen*, in his Comment thereon, says, that the Patients, in that Disorder, do not always vomit, but only when it proves mortal, and if they are vehemently affected, the Excrements ascend, and a Hiccup is excited. In acute Fevers, then a Hiccup succeeding Vomiting, and especially that of a bad Kind, is to be esteemed mortal. An Instance of this we find in *Hippocrates*, 3. *Epid.* of a Woman, who, on the twelfth Day of her Illness, vomited much black, fetid Matter, and was extremely molested with the Hiccup and a Thirst, and died the next Day. We may well then venture to pronounce all Hiccups, especially if frequent and troublesome, in acute Fevers, mortal, and most of all, if consequent upon a bad Kind of Vomiting, I mean that wherein fetid, black, virulent, or sincere Humours are discharged; justly, therefore, in *Coac.* is a Hiccup condemned, which follows a Vomiting of sincere Matters. An Hiccup, consequent upon immoderate Evacuations, or Purgations, is generally mortal, as proceeding from a Vellication of the nervous Parts of the Stomach, occasioned through Dryness. Hence *Hippocrates*, 5 *Aph.* 3. pronounces a Hiccup or Convulsion, succeeding a copious Hæmorrhage, a bad Sign; and in the following Aphorism he says, that the same Symptoms supervening upon an immoderate Purgation, are bad Prognostics. The most fatal of all Hiccups, is what is consequent upon an immoderate Purgation, where the Body is naturally weak; agreeably to these of *Hippocrates*, 7 *Aph.* 41. where we are told, that a Hiccup coming after an immoderate Purgation, is no good Sign; and the like may be said of a Hiccup, excited by a Tumor or Inflammation of the Liver under the Jaundice, according to that in *Coac.* 470. where it is said, "They who are affected with the Jaundice, and a Hebetude of the Senses, if a Hiccup supervene, fall into a Looseness, or perhaps labour under a Constipation of the Belly, and become of a greenish yellow Aspect." A Hiccup is not consequent upon every Affection of the Liver, but when that Part is highly inflamed, or the whole Stomach is oppressed or irritated by a Redundance of Bile, or labours under a violent Inflammation, the Hiccup is exasperated to a high Degree. To confirm, however, our Predictions of the fatal Event of a Hiccup, we ought to take into our Consideration other pernicious Signs, both preceding and consequent to that Disorder, which is never mortal, but in Conjunction with other destructive Symptoms, appearing either before, or attendant upon it. To this Purpose we are told by the Author of the *Prorrhetica*, "That an Aphony, attended with Hiccups, is a very bad Sign;" and *Coac. Prasag.* "That a Lassitude, with a Hiccup and a Stupor, portend a bad Event. Other very bad concomitant Signs, are cold Sweat, an invincible Coldness of the extreme Parts in a burning Fever, no Thirst, a Loathing of Food, copious Sweats, without an Intermission of the Fever, Blood falling by Drops from the Nose, with many other Signs of the like Nature, which you will find mentioned in the History of the Woman who lay ill in Childbed, 3. *Epid. Sect. 2. Ægr.* 12. *Prosper Alpinus de Prasag. Vit. & Mort.*

Euriximachus, according to *Plato*, says, there are three Ways of curing the Hiccup; to hold ones Breath some time; to wash the Throat with Water; and to sneeze.

Alexander Trallian says, That any Surprize, or Intenseness of Thought (as counting of Money) will immediately remove a Hiccup.

SINOPICA RUBRICA. See RUBRICA SINOPICA.

SINOPIS. The same as RUBRICA SINOPICA.

SINUS. In Anatomy, the *Vagina* is called the *Sinus Muliebris*, or *Sinus Pudoris*; and certain Cavities in the *Dura Mater*, are called the *Sinuses* of the *Dura Mater*. See CAPUT. A Sinus of a Bone, is a Cavity which receives the Head of another Bone. In Surgery, a *Sinus* is a Collection of Matter, with a small Orifice for the Discharge thereof.

SION. See SIVM.

SJOUANNA *Amelodi*, H. M. *Frutex Indicus pentapetalos Gemina Bacca, Calyce, excepta*. It is an umbelliferous and bacciferous Shrub, growing in the East Indies. The Fruit comes forth in the lower Branches, while the upper ones are adorned with Buds and Flowers, and the whole Umbella, with its Buds, Flowers and Fruit seen altogether, afford a most pleasant Sight.

The Virtues are only in the Root, which is effectual against the Poison of Serpents and Scorpions. *Raii Hist. Plant.*

SIPHAC. The *Peritonæum*.

SIPHILIS. The Pox.

SIPHITA PARVA, in *Paracelsus*, is the *Chorea Sancti Viti*, St. Vitus's Dance. *Siphita Stricta*, in the same Author, is Walking in the Sleep.

SIRA. Orpiment. *Rulandus*.

SIRACOSTUM, or ALSIRACOSTUM. The Name of a Medicine, recommended by *Mesue*, in acute Fevers.

SIRÆUM. *disaus*. The same as SAPA, or any sweet Decoction.

SIRENES. See DRACUNCULI.

SIRIASIS. The Name of a Distemper to which Children are subject, which consists in an Inflammation of the Brain, and its Membranes, attended with a Depressure of the *Fontanella*; a Cavity of the Eyes; a burning Fever; a Paleness, and Dryness of the whole Body; and an utter Prostration of Appetite. *Castellus*.

SIRICON DE PLUMBO, is explained by *Rulandus*, *Cinis Plumbi*.

SIRINGA. Calx. *Rulandus*.

SIRONES. The same as SIRENES.

SIRYPUS. See SYRUPUS.

SIRSEN. A *Pbrenitis*.

SIRZA. An Eschar. *Rulandus*.

SISARUM.

The Characters are;

The Roots are like the *Napus*, and hang in great Numbers to one Head. The Leaves are pinnated, grow to a Rib, and end in an odd Lobe; the Seeds are narrow and striated.

Boerhaave mentions but one Sort of *Sisarum*; which is, *Sisarum Germanorum*. C. B. P. 155. *Tourn. Inst.* 309. *Boerb. Ind. A.* 54. *Sifer*. Offic. *Sifer vulgare*, Park. *Theat.* 945. *Sisarum* *Raii Hist.* 1. 442. Ger. 871. *Emac.* 1026. Park. *Parad.* 506. *Sisarum multis*, J. B. 3. 153. SKIRRET.

The Root of the Skirret is branched into many long, glandulous Parts, of a whitish Colour, and a pleasant sweet Taste when boiled. The Stalk arises to be three or four Foot high, thick, and channelled; clothed with long pinnated Leaves, composed of three or five long, sharp-pointed Pinnæ, serrated about the Edges, two opposite, the odd one at the End, being roundest and largest. The Flowers grow in Umbels, being small and five-leaved. The Seed is somewhat like Parsley-Seed, but larger. It is planted in Gardens, and flowers in June.

The Roots only are used, and that but seldom in the Shops, being eaten at the Table like Parsneps, which they excell in Sweetness of Taste, though somewhat windy. They are accounted nourishing and provocative, are diuretic and good for the Stone. *Miller's Bot. Off.*

The Root is of culinary rather than officinal Use, and is of a bitterish and somewhat astringent Taste. It is good for the Stomach, excites an Appetite, is diuretic and lithoritriptic; affords good Nourishment, is easy of Digestion, and esteem'd a specific Antidote against Quicksilver. *Dale from Schroder.*

Cordus takes it to be the wholfomest of all esculent Roots. *Dodonæus* says they are moderately hot and moist; are easy of Digestion, and not flow of Passage; are moderately nutritive, and of no bad Juice: It is, however, flatulent, whence it provokes Lust. *Raii Hist. Plant.*

Scarce any Root has a sweeter Taste than that of a Skirret; and *Pliny* tells us, that the Emperor *Tiberius* exacted it of the Germans by way of Tribute. It is of excellent Virtues, and very proper for those who spit Blood or make bloody Urine, if they confine themselves to eat no other Root but this boiled in Milk, Whey, or Fleth-Broth; for by such means they would procure a due Laxness of the Belly, and a Removal of the Disorder. It is recommended, also, for the Strangury and Tenesmus, and is esteemed a very good Remedy against a Dysentery and Fluxes of the Belly. The Root boiled as aforesaid, then bruised, and taken in the Morning before the Patient rises, is very good in a Phthisis, or great Extenuation of the Body; as it is, also, in all pectoral Disorders. *Hist. Plant. Ascript. Boerhaave.*

SISARUM SYRIACUM. A Name for the *Tordylium*; *Orientalis*; *Secacul Arabum dictum Rauwolfio*.

SISER. The same as SISARUM.

SISON. A Name for the *Sium*; *aromaticum*; *Sison Officinarium*. See AMOMUM.

SISYMBRIUM.

The Characters are;

It has a thin Pod, the Valves not bursting, nor wreathed into a spiral Form, nor forcibly discharging the Seeds; it has also a singular Appearance, the Leaves being jagged or cut into Pinnæ.

Boerhaave mentions thirteen Sorts of *Sisymbrium*, which are,

1. *Sisymbrium*; *Pyrenaicum*; *latifolium*; *purpurascens* flore. T. 226. *Nasturtium Pyrenaicum, aquaticum*, Pon. Bat.

2. *Sisymbrium*; *aquaticum*. *Tourn. Inst.* 226. *Boerb. Ind. A.* 2. 15. *Nasturtium aquaticum*, Offic. *Nasturtium aquaticum vulgare*, Park. *Theat.* 1239. *Raii Hist.* 1. 816. *Nasturtium aquaticum supinum*, C. B. P. 104. *Nasturtium Cardamine, sive Nasturtium aquaticum*, J. B. 2. 884. *Raii Synop.* 3. 300. WATER CRESSES.

The Roots of Water-Cresses consist of a great Number of white Strings, fixed in the Earth under the Water, from which arise many pinnated Leaves, of six Pair of blunt-pointed long Pinnæ, with an odd one at the End, larger than the rest, a little waved about the Edges, many times of a dull green Colour. The Stalk grows to be about a Foot high, hollow and channelled, having smaller Leaves growing at the Joints. The Flowers grow in Tufts of small four-leaved white Flowers, flowering gradually, so that the Stalk, with the Seed-Vessels, run up into a long Spike. They are round and slender, full of very small red Seed. It grows in Ditches and Rills of Water, and flowers in June. The Leaves are only used.

They consist of fine volatile Parts, and are warming and opening, and of great Service against the Scurvy, and all its Symptoms, being one of the Plants whose Juice, mixed with that of Scurvy-Grass, and other Herbs of the like Nature, is given against all scorbutic Affections. They are, likewise, good for the Stone, Gravel, Dropsy and Jaundice, and are frequently eaten as Sallad in the Spring. *Miller's Bot. Off.*

This Plant is acrid, and gives no Tincture of red to the blue Paper. It contains a Salt pretty much resembling the *Oxyal Diaphoreticum Angeli Salæ*, which is an alkaline Salt, over saturated with Acid. Besides this Plant, there is in the Water-Cresses a little Sal Ammoniac and Sulphur, and a great deal of Earth. For,

By the Chymical Analysis we obtain from this Plant a great deal of Acid and Alkali, a little urinous Spirit and Sulphur, and a pretty deal of Earth. It is aperitive, diuretic, and antiscorbutic. They boil a Handful of it in lean Broth of Cray-Fish Soup. These Broths purify the Blood, and very much relieve those that are dropical, scorbutic, or hypochondriac. The Juice, Extract, and urinous Spirit of this Plant have the same Virtues. They affirm that this Juice takes away the Polypus of the Nose, and makes it fall off, if it be often washed with it. *Martyn's Tournefort.*

3. *Sisymbrium*; *Orientalis*; *facie Barbarea*; *folio Plantagini*. T. Cor. 16.

4. *Sisymbrium*; *Eruca folio glabro*; *flore luteo*. See BARBAREA.

5. *Sisymbrium*; *Eruca folio glabro*; *minus*; & *præcoctus*. T. 226. *Eruca latifolia, lutea, seu Barbarea minor*. M. H. 2. 230.

6. *Sisymbrium*; *Eruca folio glabro*; *minus*; *folio eleganter variegati*.

7. *Sisymbrium*; *aquaticum*; *Raphani folio*; *siliqua brevior*. T. 226. *Raphanus aquaticus, alter*. C. B. P. Edit. 1. 97. Prodr. 38. *Rapistrum aquaticum*, Tab. Ic. 408.

8. *Sisymbrium*; *aquaticum*; *foliis in profundas lacinias divisis*; *siliqua breviori*. *Tourn. Inst.* 226. *Boerb. Ind. A.* 2. 16. *Raphanus aquaticus*, Offic. *Raii Hist.* 1. 818. Ger. 187. *Emac.* 240. Park. *Theat.* 1228. *Raphanus aquaticus foliis in profundas lacinias divisis*, C. B. P. 97. Prodr. 3. 8. *Raii Synop.* 3. 301. *Raphanus aquaticus Tabernemontani*. J. B. 857. *Armoracia foliis laciniatis*, Volck. WATER-RADDISH.

It grows in marshy Ditches, and flowers in June and July. It is supposed by some to agree in Virtues with the Horse-Raddish.

9. *Sisymbrium*; *palustre*; *repens*; *folio nasturtii*. T. 226. *Eruca palustris, & nasturtii folio, siliqua oblonga*. C. B. P. 98.

10. *Sisymbrium*; *annuum*; *folio absmithii minoris*. *Tourn. Inst.* 226. *Boerb. Ind. A.* 2. 16. *Sophia Chirurgerum*, Offic. Ger. 910. *Emac.* 1068. Park. *Theat.* 830. *Erysimum Sophia dictum*, *Raii Hist.* 1. 812. *Synop.* 3. 298. *Nasturtium sylvestris tenuissime divisum*, C. B. P. 105. *Scirpium Germanicum sive Sophia quibusdam*, J. B. 2. 886. *Accipitrina Romæ & Loniceri*, Rup. Flor. Jen. 64. *Thalictrum Dodonæi*, Lued. 1146. *Cardamine sylvestris tenuissime divisus foliis*. H. Monsp. FLIX-WEED.

Flixweed has a white, hard, woody Root, full of small Fibres at the Bottom, perishing after having ripened Seed. The Stalks arise to be about two Foot high, more or less, beset with many long, winged, and very finely and neatly divided green Leaves, pretty much resembling those of the true Roman Wormwood, beset with very short fine Hairs. The Flowers grow at the End of the Branches, being small, yellow,

low, and four-leaved, and are succeeded by very slender Seed-Vessels, about an Inch or thereabouts in Length, full of very small reddish Seed. It grows frequently in sandy Ground, and amongst rubbish, and flowers in June.

The Seed is the only Part used; and 'tis said, that the Decoction of it unbruised is a certain Remedy for the bloody Flux; but it will not have the same Effect, if the Seed be bruised. It is, likewise, commended for the Stone and Gravel. *Miller's Bot. Off.*

It has a Taste a little astringent, but acrid, and something like that of Mustard. It gives a faint red Colour to the blue Paper. The Sal Ammoniac predominates in this Plant, being mixed with a great deal of Sulphur and terrestrial Parts; so that it is vulnerary, deterfive and febrifugous.

Casparinus says, that its Seed kills Worms. *Tragus* allows that it stops the Dyentery, and all Sorts of Fluxes. They give a Dram of it in Pottage or Wine for a Looseness. The Water in which the Plant has been macerated cold, has the same Virtues. The Juice, Conserve, or Extract of the Leaves and Flowers, are good for spitting Blood, the Fluor Albus, and immoderate Fluxes of the Piles and Terms. Externally applied, it cures Wounds, and cleanses Ulcers. They sell the Seed at Paris under the Name of *Talitron*, which comes from *Thaliotrum*; for *Dodonæus* has given it that Name. *Martyn's Tournefort.*

11. *Sisymbrium*; annuum; folio absinthii minoris latiore. *Nasturtium sylvestre, tenuissimè divisum, folio latiore.* C. B. P. Var. 105.

12. *Sisymbrium*; minus; *Erucae* folio glabro, nigro, crasso, lucido. *Barbarea, minor, nigro, crasso, lucido, folio.*

13. *Sisymbrium*; palustre; minus; siliqua asperâ. T. 226. *Sinapi parvum, siliqua asperâ,* C. B. P. 99. Prodr. 41. *Erysimum annuum, minus, siliqua asperâ.* Vaill. Boerb. Ind. Alt. Plant.

The second Species is a medicinal Plant, and has the Smell and Taste of *Eruca*, or Rocket, accompanied with a Bitterness universally grateful; whence it is of Use in those scorbutic Affections in which *Cochlearia* and *Nasturtium* are proper, for which Purposes it is used in Salads. It cures all Diseases proceeding from a Viscidity and Ropiness of Blood. The Juice taken in the Morning for Months together, is an excellent Remedy for scorbutic Ulcers. It has the Virtues of the *Cochlearia*, tho' a much less Root, and, also, the Taste of that Plant, but is less acrimonious, and has very salutary Qualities, (especially the seventh Species) which have been observed before of the *Erysimum* and *Eruca*. The tenth is the most effectual of them all, in deterring malignant Ulcers, and depurating sanious ones, and for consolidating them, especially if used internally as well as externally. Hence it has the Title of *Chirurgorum Sapientia*, for it is of a saponaceous as well as astringent Quality; and being applied to a Wound, conglutinates it without a Suppuration: It, also, provokes Urine, and is of Service in the Stone and Dropsy. *Hist. Plant. Acript. Boerhaave.*

SISYRRHINCHIUM. Offic. *Sisyrrhinchium Theophrasti*, Raii Hist. 2. 1167. *Sisyrrhinchium minus angustifolium*, C. B. P. 41. *Crocus Italicus parvo flore, radice rostratâ*, Elem. Bot. 290. *Bulbocodium Crocifolium flore parvo, violaceo*, Tourn. Coroll. 50. **SPANISH-NUT.**

It grows in the Kingdoms of *Valencia* and *Murcia* in Spain, and flowers in March. The Root is said by the Inhabitants, where it is a Native, to be good for the Gripes; but the Body must be exercised with Dancing after taking it.

SITANIUS. The same as **SETANIOS**.

SITIOLOGICE. That Part of Medicine which treats of Aliments; from *σιτος*, Aliment, and *λέγω*, to speak.

SITION. *σιτιον*. Aliment in general; or Bread made of Wheat in particular.

SITIS. Thirst. This is excited either by a Defect of a due Quantity of Moisture in the Body; from a Thickness and Immeability of the Humours; from a redundant Heat; from a muriatic, ammoniacal, alkaline, aromatic, oleous and rancid Acrimony; or from Poisons.

It is worthy of Remark, that Thirst seems to be a kind of Instinct, which directs a Person to drink Fluids, at the same time when the State of his Body requires Dilution. Thus after Eating, a Thirst is excited, as a sort of Notice, that the Food wants something to dilute it. When the Humours of the Body are thick, viscid, and unfit for Circulation, Thirst gives a sort of Warning of the Condition of the Fluids, and a Persuasive to mend their Defects, by diluting them, and rendering them more thin, and fit for their due Distribution.

In feverish Disorders, Thirst seldom fails of putting the Patient in Mind, that it is necessary to temperate his Heat by aqueous and acefcent Liquors. In like manner, if any kind of Acrimony is offensive in any Part of the Body, Thirst gives notice of the Danger, and indicates the Remedy.

I am sensible, that the Thirst generally observed in Dropsies, may be esteemed a false Guide, and a Persuasive to drink, at a time that it is pernicious; but it must be considered, that the stagnating Waters in this Distemper putrify and contract an Acrimony, which is well corrected by drinking proper Liquors in due Quantities.

A Thirst arising from a Dryness of the whole Body is allayed by the liberal and long-continued drinking of warm, aqueous, and farinaceous Liquors, rendered grateful by the Admixture of a small Quantity of some proper Acid. Thin Decoctions of Barley, Oats, and Bread; Whey, Milk, and Water, Posset-Drink, and a thin unsalted Decoction of Veal, without its Fat, are beneficial. Among fermented Liquors, small Beer, though not that Kind impregnated with Aromatics, is serviceable. Baths, Fomentations, and Clysters, are, also, useful in this Case.

A Thirst arising from a Dryness of particular Parts, such as the Mouth, the Tongue, the Fauces, or Oesophagus, is allayed:

1mo. By the Use of the Things above recommended.

2do. By often washing and gargarising the Mouth with the same Things.

3tio. By opening the salival Glands and Ducts, by means of Epithems and Fomentations, consisting of laxative, moistening and aperient Ingredients. In this Case, Oxycrate with Crums of Bread is of singular Use.

A Thirst arising from an acrid lixivial Salt, or from an acrid aromatic Salt, is removed by the Things already mentioned, as being of a diluting Nature; but especially if acid and nitrous Substances are mixed with them. Hence we know how a Thirst, arising from a muriatic Salt, is to be allayed, since it only calls for aqueous Liquors.

But a Thirst arising from a Matter unfit for passing thro' the Vessels, is only to be removed by diluting and resolvent Liquors. *Boerhaav. Institut.*

SITOS. *σιτος*. Wheat, or any fumentaceous Grain, of which Bread is made; or Bread. In *Hippocrates* it frequently imports solid Aliment, in Contra-distinction from forbile Aliment; or Aliment in general; and sometimes the Recrements of the Aliment contained in the intestinal Tube.

SITOSPELTUM. *σιτοσπελτον*. A Name for the *ÆGYLOPS*, a Species of Grass. *Gorræus.*

SITTA. *σίττα*. The Name of a Bird, a Species of *Pye*.

SIUM.

The Characters are;

The Root is like that of a Colewort, fibrous and ligneous. The Leaves are pinnated, growing by Pairs to one Rib, and ending in an odd one. The Petals of the Flowers are bifid; and the Seeds are roundish, gibbous and striated.

Boerhaave mentions six Sorts of *Sium*, which are;

1. *Sium*; latifolium. C. B. P. 154. *Tourn. Inst.* 308. *Boerb. Ind. A.* 55. *Sium*, Offic. *Sium majus*, Ger. 200. *Sium majus latifolium*, Ger. Emac. 256. Raii Hist. 1. 443. *Sium maximum latifolium*, J. B. 3. 175. *Sium Dioscoridis frue Passinaca aquatica major*, Park. Theat. 1240. *Sium latifolium foliis variis*, Raii Synop. 3. 211. **WATER-PARS-NEP.**

It grows in Rivers and marshy Places, flowering in July. The Leaves eaten either crude, or boiled, are said to break and expel the Stone; to excite Urine and the Menes; to promote the Expulsion of the Fœtus; and to be good in a Dysentery. *Dioscorides*, L. 2. C. 154.

2. *Sium*; *Erucae* folio. C. B. P. 154. *Sium aquaticum, rugosis foliis, multifidis, trifidis, & dentatis*. M. U. 12. Ic. T. 5. *Sium aquaticum, foliis multifidis, longis & serratis*. M. H. 3. 283. *Sium alterum*, Dod. p. 589. *Cicuta, aquatica, Gesneri*. J. B. 3. 175. *Cicuta maximâ*; H. Eyft. Vern. O. 7. F. 2. Fig. 2. *Herba venenosa*, Lob.

Our *Oenanthe Cicuta facie, succo viroso*, which *Wepper* has described by the Name of *Cicuta Aquatica*, and of the dismal Effects of which in some Children, who by Mistake eat of it, he has wrote a large Treatise, was very probably the *Cicuta* so much in use of old, especially at *Athens*, for Killing. At least the Violence of this makes it a much sifter Instrument of Death than the common Hemlock, which is not by far so malignant a Quality.

Though we must withal allow differing Climates very considerably to heighten or abate the Virtues of Plants. And it is not altogether improbable, that the Poison with which the *Athenians* took away the Lives of Malefactors, was an inspissated Juice compounded of that of *Cicuta* and other corrosive Herbs.

But be this as it will, the Alterations which *Wepper* observed the Roots of *Oenanthe* to make in the Body, were a violent Pain and Heat in the Stomach, terrible Convulsions, with the Loss of all the Senses, Distortion of the Eyes, and flowing of the Blood out of the Ears, the Mouth so fast shut that no Art could open it, Efforts to vomit, but nothing thrown

thrown up, frequent Hiccups, with a great Distention and Swelling, especially at the Pit of the Stomach; and when Death had concluded the Tragedy, a continued Running of green Froth at the Mouth.

Stalpart Vander Wiel gives the like Account of two Persons killed at the *Hague* by the same Roots.

In a Dog, who, for Experiment's sake, died by this Poison, the Stomach, when opened, was found quite constricted, and shut up at both Orifices, its inward Surface red, with livid Spots here and there; the Intestines were empty; only the Rectum contained a little greenish Mucus.

Thus it appears that this Plant consists of hot, acrid, and corrosive Parts, which by rarifying the Juices of the Stomach, and wounding its nervous Membranes, are the Cause of all those Disorders which immediately follow.

For upon the Sense of a violent Irritation and Pain, the Fluid of the Nerves is presently in large Quantities determined to the Part affected; and this, if the Stimulus be not over-great, will be only to such a degree as is sufficient, by contracting the Fibres of the Stomach and Muscles of the Abdomen, to throw off the Cause of the disagreeable Sensation; but the uneasy Twitching being too terrible to be borne, the Mind, by a kind of Surprise, with Haste and Fury, as it were, commands the Spirits thither; thus the Business is over-done, and the Action of the Fibres becomes so strong, that the Orifices of the Stomach are quite closed; so that instead of discharging the noxious Matter, the Torment is made greater, and the whole Oeconomy put into Confusion.

This forcible Contraction of the Muscles was the Reason that one of the Children which *Wepfer* saw, made Urine in the Midst of the Agony, to the Height of five or six Foot, with a Strength and Violence surprising to the Spectators.

Nor is it any Wonder, if in these Circumstances all Sense be lost, Blood gush out at the Ears, Nostrils, &c. the Parts being all torn and broke by the Violence of the Convulsions, which though they began in the Muscles of the Belly, must at last prevail in the Members too, till the whole Fabric is shocked and overturned, and some of the corrosive Salts, perhaps getting into the Blood, and by the Rarefaction of it diffusing the Vessels, the membranous Coats of which being already over-stretched, will the more easily give way and let out their Fluid.

The Case of *Aconitum* is much the same; this is our *Napellus* or *Monks-hood*; and its Effects so nearly agree with those now related of *Oenanthe*, that I shall not need to recite them; the Experiments of *Wepfer* are full and convincing. And indeed as all the Histories which this same Author has so carefully given us of Trials made with several vegetable Poisons, *Salanum*, *Nux Vomica*, *Coculus Indicus*, and the like, on different Creatures, put it out of all doubt that the common Mischief of these is a Twitching and Inflammation of the Stomach; so it appears from hence that virulent Plants, although they may be distinguished even from one another by particular Virtues, do, however, kill by a like Operation and Force, which differs principally in Degree from that of noxious Minerals.

And therefore, in order to know what the specific Qualities of any such Herbs are, they must be given only in very small Doses; and then perhaps it would appear, that they are not made (as some imagine) to be deliterious and destructive, but for very good and beneficial Uses; as we particularly experience in the Case of Opium.

Nor is it at all strange that the Symptoms from a vegetable, and from a mineral Virulency, should be so different, although of the same Kind, and only of unequal Force; for the more solid Parts of Minerals, eroding the Coats of the Stomach, induce a perfect Mortification and Gangrene; and thus do their Work at once; whereas the weaker Salts of Plants can make but a slighter Excoriation, upon the painful Sense of which those Agonies and Convulsions that follow, rather gradually exhaust the Strength; and thus the Animal is not killed so speedily, nor with the same Appearances.

Upon this Score, tho' mineral Poisons do not pass the *Prima Via*, vegetable ones in some Cases possibly may; just as we find those Medicines which have a great Degree of Irritation presently to induce a Vomiting; whereas the same Twitching, a little weakened, suffers them to pass into the Intestines, and work downwards by Stools.

By this we may, perhaps, give some guess at the Nature of those Poisons, with which they tell us the Natives in some Parts of *Africa* and *India* are so expert at Killing, that they can do it in a longer or shorter time as they please. These are most probably either the Fruits or the inspissated Juices of corrosive Plants, which inflaming the Bowels, may cause little Ulcers there, whose fatal Consequences, we know, may very well be flow and lingering.

This I am the rather induced to believe, because an ingenious Surgeon, who lived in *Guinea*, told me, that the Anti-

dote by which the Negroes would sometimes cure those who were poisoned, was the Leaf of an Herb, which purged both upwards and downwards. For by these means the Stomach might be cleared from the adhering corrosive Parts of the Venom. Yet I can hardly think it possible at the same time, that they should be able, by varying the Composition or Quantity of the Dose, to ascertain the Time in which it will kill, to a Week, Month, and the like; nor indeed have I ever met with any Person who could attest this to be Matter of Fact. Though repeated Trials and Observations may help one well practised in such Tricks to give notable Conjectures in this Point.

The Ancients, indeed, pretended much the same thing with their *Aconitum*, of which they seem to have made a kind of Secret and Mystery, as we learn from *Theophrastus*, who says, *the ordering of this Poison was different, according as it was designed to kill in two, three Months, or a Year*. But this he relates only as a common Tale or Opinion, and not as a Story to which he himself gave any manner of Credit.

It is very plain, that the common Cure of all Poisons of this kind, must be by freeing the Stomach, as soon as possible, from the corrosive vellicating Particles, and defending the Membranes from their Acrimony, by such Things as are of a smooth, oily, and lubricating Substance. *Mead on Poisons*.

3. Sium; five Apium palustre; foliis oblongis. See *BERULA*.

4. Sium; medium; ad alas floridum. *M. U.* 63. *Apium, palustre, minus cauliculis procumbentibus, ad alas floridum.* *H. L.*

5. Sium; arvense five segetum. *Tourn. Inst.* 308. *Raii Synop.* 3. 211. *Boerb. Ind. A.* 55. *Selinum segetale*, *Offic. Park. Theat.* 932. *Selinum Sii foliis*, *Ger. Emac.* 1018. *Raii Hist.* 1. 443. **HONE-WORT.**

This Plant grows amongst Corn in moist Soils. The expressed Juice mixed with Ale, and taken every Morning fasting, is said to cure Tumors of the Cheeks. The Juice of one Handful of the Herb, is to be taken in half a Pint of Ale. *Raii Hist. Plant.*

6. Sium; aromaticum; Sison Officinarum. See *AMOMUM*.

Boerhaave says, that notwithstanding the Virtues ascribed to the first Species, he never durst use it, on account of the Resemblance it bears to the second Species, which is the famous *Cienta Aquatica*, of which *Wepfer* wrote an entire Treatise. This second Species has a thick bulbous Root, of a sweet Taste, but is one of the greatest Poisons known; for if taken into the Stomach, it excites horrid Convulsions, which soon prove mortal, unless discharged from the Stomach by Vomit. The Method of Cure is, to pour down large Quantities of warm Oil, with Water, and a little Honey, and by this means to excite Vomiting, that the Poison may be discharged from the Stomach. Under the Article *CICUTA*, I have referred the *Cicuta Aquatica* by Mistake to *PHELLEDRIUM*.

SMALTUM. Smalt. This is a chymical Preparation of a blue Colour, used by Painters and Enamellers, but of no Use in Medicine. It is commonly called Stone, or *Powder Blue*. It is made of *Cobalt*, Pot-ash, and Powder of Flint-Stones. The Manner of preparing it is described in the *Philosophical Transactions*, by *Dr. Krieg*, and by *Joh. Henry Linck* of *Leipsic*, in the same Work.

SMARAGDINUM EMPLASTRUM. The Name of a Plaster described by *Celsus*, *L. 5. C.* 19.

SMARAGDUS. *Offic. Boet.* 195. *Calc. Mus.* 212. *Geoff. Prælect.* 80. *Schrod.* 331. *Kentm.* 47. *De Laet.* 33. *Aldrov. Mus. Metall.* 973. *Charlt. Foss.* 38. *Smaragdus à nonnullis Prasimus*, *Worm.* 105. *Mont. Exot.* 14. **THE SMARAGD OR EMERALD.**

The Emerald is a green, diaphanous, shining Gem, very pleasant to the Sight, but excessively brittle, which has given occasion to many Stories. It is divided into Oriental and Occidental. The Oriental is the best in all Respects. The other, which comes from *Peru*, is not near so bright, and besides, has generally some foul Spots. There is a third kind of Emerald, or *Pseudo-Smaragdus*, found in the Mountains of *Switzerland* and *Auvergne*, which is extremely tender, and of the palest Green.

Fragments of Emerald thrown upon a clear Fire, emit a fine Flame, and totally lose their Colour, which is a Proof sufficient that this Gem contains some Sulphur of Copper. Besides the superstitious Uses ascribed to it, it is said to stop Fluxes of all kinds. It makes Part of the *Electuarium de Gemmis*, and *Confectio de Hyacintho*, together with the other precious Fragments. *Geoffrey*.

SMARIS. *Offic. Rondel. de Pisc.* 1. 140. *Bellon. de Aquat.* 226. *Gefin. de Aquat.* 522. *Aldrov. de Pisc.* 227. *Raii*

Raii Ichth. 319. Ejusd. Synop. Pisc. 136. Jonl. de Pisc. 55. Charlt. Pisc. 36. **THE WHITE CACKEREL.**

This is a Fish found in the *Mediterranean Sea*. The Head of this Fish salted and burnt, is said to repress the tumid Lips of Ulcers; to restrain phagedænic Ulcers; and consume Corns, and those Excrescences called *Thymi*. The salted Flesh is said to be a good Application in Case of the Sting of a Scorpion, or the Bite of a mad Dog.

SMECTIS. *σμεκτίς*. A Name for the **CIMOLIA TERRA**.

SMEGMA. *σμήγμα*. Soap.

SMELE. *σμήλη*. This is explained by *Gorræus*, a dry Powder of any kind sprinkled upon the Skin, with a View of deterring or cleaning it.

SMERILLUS. The same as **SMYRIS**.

SMILAX.

The Characters are;

It has the Appearance of a scandent Plant, with Claspers; or Tendrils. The Stalks are spinous, and the Flowers poly-petalous and rosaceous. The Berry is soft, roundish, and full of an oval Seed.

Boerhaave mentions four Sorts of *Smilax*, which are:

1. *Smilax aspera*; fructu rubente. *C. B. P.* 296. *Tourn. Inst.* 564. *Boerb. Ind. A.* 2. 60. *Smilax aspera*, Offic. *Ger.* 709. *Emac.* 859. *J. B.* 2. 115. *Smilax aspera fructu rubro*, *Park. Theat.* 173. *Raii Hist.* 1. 655. **ROUGH BIND-WEED.**

This Plant is cultivated in Gardens, and flowers in Summer. The Leaves, Tendrils, Root, and Berries are used in Medicine, which are said to evacuate noxious Humours by Sweat, and Transpiration; to cure Disorders of the Skin; to expel Poison; and ease Pains of the Joints. It is a *Succedaneum* for *Sarsaparilla*; and is celebrated for curing Venereal Disorders, taken either in Decoction, or Powder.

2. *Smilax*; *aspera*; minus spinosa; fructu nigro. *C. B. P.* 236.

3. *Smilax*; *aspera*; *Indiæ Occidentalis*. *C. B. P.* 296.

4. *Smilax*; *Orientalis*; sarmentis aculeatis; excelsas arbores scandentibus; foliis non spinosis. *T. C.* 45. *Boerb. Ind. Alt. Plant.*

Boerhaave takes Notice of some other Plants under the Name of *Smilax*, to which he gives the following Characters.

The Root is perennial and creeping; the Flowers are naked, hexapetalous, furnished with six broad and thick Stamina, and disposed in Spikes. The Ovary in the Bottom of the Flower is of a spherical Form, furnished with a short Tube, and becomes a Berry containing a single Stone.

1. *Smilax*; *aspera*; *racemosa*; *Polygonati folio*. *T.* 645. *Polygonatum racemosum*, *Corn.* 36. *Lilium convallium*, *Virginianum*, *Polygonati foliis racemosum*.

2. *Smilax*; *unifolia*; *humillima*. *Tourn. Inst.* 654. *Boerb. Ind. A.* 2. 64. *Monophyllum*, Offic. *Ger.* 330. *Emac.* 409. *Raii Hist.* 1. 668. *Monophyllum*, *frve unifolium*, *Park. Theat.* 505. *Unifolium*, *frve Ophrys unifolia*, *J. B.* 3. 534. *Lilium convallium minus*, *C. B. P.* 304. **ONE BLADE.**

This Plant grows in Woods and Thickets, and flowers in May and June. The Flower is used, which is esteemed alexipharmic and vulnerary.

SMILAX DALECHAMPII. A Name for the *Ilex*; *folio rotundiori*, *molli*, *modiceque sinuato*; *frve Smilax Theophrasti*.

SMILAX HORTENSIS. A Name for the *Phaseolus vulgaris*.

SMILAX HORTENSIS MINOR. A Name for the *Phaseolus hortensis minor*.

SMILAX LÆVIS MAJOR. A Name for the *Convulvulus*; *vulgaris*; *major*; *albus*.

SMILAX LÆVIS MINOR. A Name for the *Convulvulus*; *minor*; *arvensis*; *flore roseo*.

SMILE. *σμήλη*. A crooked Incision Knife, with two Edges. *Gorræus*.

SMILIMUM EMPLASTRUM. See **ABSCESSUS**.

SMIRIS. See **SMYRIS**.

SMODICON. *σμοδικόν*. A Remedy for Sugillations; from *σμοδική*, a Sugillation.
